Q. May I understand from your remarks under "Imperial Department" and "General official administration and organisation" that you advocate the formation of an Imperial Department of Chemistry and the deputation of officers of that department as professors of chemistry to the various Government colleges in the same way as an officer of your department is professor of geology?—*A.* That did not occur to me at the time, but probably such an arrangement might be made.

Q. If that was done and an officer of the chemical department were deputed to institutions for a period of three years at a time or some fixed period, how would you secure sufficient control over the teaching of science in the universities? It occurs to me that there may be some difficulty about obtaining continuity of policy in these matters?—*A.* I should not have thought that the question raised any great difficulty.

President.—*Q.* Are you a fellow of the Calcutta University?—*A.* No.

Q. Have you been a fellow of the Calcutta University?—*A.* Yes.

Q. Do you know how long a fellow is allowed to be a member of the Senate?—*A.* Five years.

Q. Has any difficulty arisen in this matter?—*A.* No.

Hon'ble Pandit M. M. Malaviya.—*Q.* Would you kindly give me a little clearer idea of the purely educational activity of your department? I understand that one of the members of the staff is deputed to lecture at Calcutta, another sometimes at Poona and another at Madras?—*A.* Yes.

Q. Is any period fixed for these lectures?—*A.* In the case of Madras it was fixed. In the case of Poona it is not definitely fixed, but generally it has been three years, that being regarded as a suitable period. In the case of Calcutta, it depends very much upon the exigencies of the service, because if a man after working in the field for some years has a good deal of material to work out, he is brought to headquarters and put in charge of the museum and laboratory where he can work out his results, and during that period, while curator, he is generally also lecturer on geology in the Presidency College. It means continuity of teaching for two or three years, and in many cases longer.

Q. You have found this arrangement to work satisfactorily?—A. Yes.

Q. But don't you think that a gentleman who lectures on geology ought to be a University professor and by virtue of his appointment *ex-officio* member of the Senate of the Calcutta University, would that not be an advantage?—A. I think perhaps it would. But of course he can be a member of the Board of Studies, which is the most important.

Q. Is he a member of the Board of Studies?—A. In practice he is not, because the Director of Geological Survey is usually on the Board of Studies and usually on the Senate.

Q. But the Director does not lecture at the university or the college?—A. No.

Q. The professor who does lecture is not on the Board of Studies?—A. Not necessarily.

Q. Who prescribes the course in geology for the Calcutta University examination?—A. It is laid down in the syllabus.

Q. Is the professor who lectures consulted, or is it done by the Director of the Geological Survey?—A. The courses are presumably laid down by the Board of Studies and the Faculty of Sciences and then submitted by the latter to the Senate. The Board of Studies in geology prescribes the course for geology.

Q. Are the course, in Calcutta, Poona and Madras the same or are they different?—A. In the Calcutta University and Madras the course for the examination, so far as I remember, is very much the same. Poona is on a different footing altogether, because an officer is only lent to Poona to teach a certain amount of elementary geology as required for the engineering course at Poona, and there is no university examination so far as I know.

Q. They do not have geology as one of the subjects for the degree examination in Poona?—A. I do not think so. Students may perhaps join the Bombay University; in the case of that University a member of the Geological Survey, Mr. Daru, who was formerly professor at Madras, is, I believe, on the Board of Studies.

Q. How does the standard prescribed for Geology for the Calcutta University examination compare with the standard in modern British Universities?—A. The standard aimed at is probably similar to that in the British universities, but the actual standard accepted here is undoubtedly considerably lower.

Q. Is a fair number of students attracted to the geological course in Calcutta?—A. I should think between 20 and 30.

Q. Do the greater number of these go up for the M. Sc. degree or are they content with the B. Sc.?—A. Only a few read up to the M. Sc. I should say, in the last few years the average is five a year.

Q. Is the M. Sc. course of the Calcutta university nearly as good as the honours course in the modern British universities, or is it inferior to it?—A. I really cannot tell you, because I am not in close touch with the teaching in the British universities at present. I happen to know, however, that certain students who have gone to England from here and who would probably have taken their M. Sc. after the ordinary two years' or three years' course, as the case may be, have taken honours in English universities after a similar course.

Q. How many officers are there in your department?—A. Twenty sanctioned. We are very short-handed.

Q. Have you got any Indian M. Sc. among these twenty?—A. No. We have an Indian who is not a M. Sc.

Q. How many are Indians among these officers?—A. One. He is not an M. Sc. He was educated in Bombay.

Q. Have you got in your department any Indians who have come back from Europe after studying in the Royal School of Mines?—A. We have an Indian who was in England and also in Canada where he was attached to the Geological Survey for some time. Other posts on the Geological Survey, those of Sub-Assistant, which are not recruited in England, are held by Indians.

Q. In view of the development of geological activities, do you think that some better provision should be made for imparting instruction in geology in this country, or are the present arrangements sufficient?—A. It would be advantageous to have professors of geology at Calcutta and Bombay and Madras, in fact in all the leading universities.

Q. You say, "It would be preferable to give those to a department to be created specially to deal with industrial development and research in all their branches, and I would place under its control not only the scientific departments but also all Government institutions and laboratories in which science is taught or practised, except those engaged in medical research." Do you include the universities in that category?—A. I was thinking of university laboratories at the time.

Q. Do you know of any country where universities and other higher technical and scientific institutions are not placed under the Department of Education?—A. I am afraid I am not conversant with the subject.

Q. So far as you are aware such institutions are not placed under the Department of Education?—A. I have no information.

Q. What is the case in the United Kingdom?—A. Some universities, at least, are independent. I know of several, which, I believe, have nothing to do with the Board of Education.

Q. It would be better in your opinion to give freedom to the universities? A poor Oxford without Government control is better than a rich Oxford with it, as said Lord Curzon?—A. The object of university education here is more economic than it is at home. The degree is taken rather for its market value than for the sake of pure academic instruction.

Q. Is that so generally?—A. Such is my experience. It is certainly so in the case of the Calcutta University, with which I am acquainted.

Q. Is it not a fact that graduates of the Calcutta University have gone up in more than one subject for the M.A. degree, and pursued their studies much longer after graduating, than perhaps graduates of other universities in India?—A. The only case that has come to my notice has been where the students in the Calcutta University take up law in addition to their other subjects, not after the other subjects; and I have heard complaints that students thus fail to give their undivided attention to their subjects.

Q. Putting aside law, are you not aware of instances where after having taken the M.A. degree in one subject, students have taken the same degree in other subjects also?—A. I have met with cases where students have taken research scholarships and worked with us after taking their M.A. degrees, but in such cases they were continuing their geological and mineralogical studies.

Q. So you have found them showing sufficient eagerness to pursue knowledge for the sake of knowledge after they have taken their degrees?—A. I am not prepared to say that it is purely for the sake of knowledge.

Q. Knowledge is not worth having if it has no value. Either the intellectual satisfaction that it gives, or some other value in relation to life?—A. I should be inclined to think that their object in taking up another subject after taking their M. A. degree is the commercial rather than the intellectual value of that instruction.

Q. You recommend a system of scholarships to members of private concerns to encourage them to go out to study foreign methods. In the case of experts, so employed, they would be men who have been established in life, who have taken service and are now doing work, and they would require to brush up their knowledge by a study of foreign methods. But you know that the system of scholarships at present prevailing is meant to enable students of promising abilities to go out to complete their education in foreign countries?—A. I should not wish to press the point about sending private individuals; that might be arranged by their firms or companies, but I do not see why we should not give a certain amount of encouragement and assistance in that direction. With regard to the diversion of State technical scholarships to that purpose, I really had in mind the case of promising young men in industrial works. I would recruit for the scholarships in a different manner from the method of recruitment at present in vogue.

Q. Your object is to secure a better system of recruitment and not to do away with scholarships for promising young men?—A. My object is to employ the scholarships more profitably than they have been employed hitherto.

Q. By helping young men to complete their education abroad and not by helping experts who are engaged in scientific work here to go abroad to brush up their knowledge of up-to-date methods?—A. I look at it rather from a different point of view. I should employ the scholarships to help industries rather than to help individuals. Industries, I should say, should take the first place.

Q. You want a certain number of young men trained to do scientific work relating to industries?—A. Yes.

Q. How would you train them up?—A. As regards scientific research?

Q. Not merely research, but general scientific work relating, for instance, to geology, work of ordinary investigation, and research of a higher kind?—A. That is a matter that ought to be carried out by the scientific departments of educational institutions, and the science laboratories of the universities.

Q. If you take away these scholarships, you do not substitute anything else in their place to enable students who have done some work here to go out and complete their education abroad?—A. I should not wish to prevent students having the advantage of these scholarships, but they should be students—students is perhaps hardly the correct term—they should be men who have shown their capacity for industrial work, selected from industrial concerns and connected with industries, because, after all, the scholarships are 'technical' scholarships and they are not merely for purely educational and scientific purposes.

Q. For a country like India, with its vast resources and a vast field for research, you do think that it is the duty of the Government to provide the highest kind of scientific instruction for its youth?—A. Yes.

Q. Either the Government must establish institutions here which should be very well equipped to give that kind of instruction, or if it does not, it is rightly regarded its duty to enable select students to go out to other countries, with the help of State scholarships, to complete their education?—A. Yes.

Q. That being the object with which these scholarships were instituted, you do not propose that the scholarships should be held back from students, but you want the recipients to be

selected with better care?—A. In this particular case of State technical scholarships, I think they ought to be given to definite industries and not merely to men who say they wish to go to Europe merely with a view to taking up, say, theoretical geology.

Q. Do I understand you to say that students who have qualified themselves to take up particular industries should be sent up? For instance, you want to send a man for mining engineering. Would you take up a student who have passed the M. Sc. with mining as one of the subjects and then send him out, or would you take up a non-graduate who had merely worked at the mines, but who had never graduated or obtained any scientific instruction higher than that required for the matriculation?—A. I should prefer to encourage a man who had shown a practical bent of mind.

Q. Do you mean that you would not attach any value to the theoretical knowledge that a student may have acquired, or would you give preference to one who combined practical with theoretical knowledge?—A. I find it rather difficult to answer such a wide question.

Q. The point is simply this. Do you think that the person who should be selected for the scholarship should be one who has acquired a knowledge of the scientific principles underlying the particular department of industry to which he wants to attach himself and who wishes to go to England to complete his education, or do you think that the scholarship should be given to a man, for instance, who might have worked at a works and risen from a lower to a higher stage like foreman or assistant foreman, i.e., that it should be given without any reference to the education that the candidate might or might not have received at a university?—A. He must be in a position to profit by the results of his work if he is sent abroad. I do not for a minute wish to say that no scholarship should be given to university men. I was merely considering the case of the State technical scholarships, which, I think, are given not quite satisfactorily.

Q. Of the British firm which was registered in London to take up the business in Travancore, the nominal holders were British who held it in trust for a German firm?—A. Yes.

Q. Who were the directors?—A. I do not know.

Q. Was Sir Richard Temple one of them?—A. I do not know.

Dr. E. Hopkinson.—Q. You have a chemist attached to your department?—A. Yes. He is a member of our staff.

Q. You want more chemical assistance and you say that if an Imperial Chemical Department is instituted you will be glad to get further chemical assistance from it. Then you go on to say, "The members of the staff, should, wherever employed, remain under the control of the head of their department and should not be transferred to Local Governments." Is that a feasible proposition that you in the Geological Survey should obtain a man from another independent department and that he should not come under your direct control but should remain under the control of the department from which he came?—A. I had not in view so much the loan of members of that Department to the Geological Survey as the aid to research on behalf of the Geological Survey by the chemists of that department.

Q. What will be the relation of these officers during the time they are with you, to your department and to the Imperial Chemical Department?—A. I have not thought this out. It might be advisable to put them under the Director of the Geological Survey while they are working in the laboratory, if they were expected to do miscellaneous work after they had completed the specific problem for which they were originally lent; but this is quite another matter.

President.—Q. Do you consider this practicable? A certain number of the members of this hypothetical chemical department might have their services transferred for a period of five years say, to the Geological Survey, and thereby come under the control of the Geological Survey for the time being, and they might be renewed in each case at the expiry of that period or transferred back to the chemical department. Do you think that is practicable?—A. That would be quite practicable.

Q. It would be possible and you think it would be practicable to transfer an officer of the chemical department for service under the Director of the Geological Survey?—A. It would be quite a feasible arrangement.

Q. What would you suggest about the pay of such an officer during the time of employment in the Geological Survey Department?—A. There is, I think, a definite rule of the Government of India; he gets either deputation allowance or gets the pay of his grade in the chemical department.

Q. The officers of your department have from time to time been examiners in the Universities of Calcutta, Madras and Bombay?—A. Yes.

Q. And this is not confined to officers who are, for the time being, lecturers in the university colleges?—A. No.

Q. Many officers have opportunities of knowing the university curriculum in this way?—A. Yes.

Q. In addition to those who are actually lecturers?—A. Yes.

Q. And that facilitates the work of transferring an officer for lecturership?—A. Yes.

Hon'ble Pandit M. M. Malaviya.—Q. How long has the Department of Geological Survey been in existence?—A. For about 60 years.

Q. Has the department kept it as an object before it that it should train Indians to qualify them for employment in the higher grades of the department?—*A.* It is open to the research scholars that we train to apply for appointments in the department, and in practice they not infrequently apply for posts in the ordinary way.

Q. My point is has the department kept it before it as one of its objects that it should train Indians to qualify them for higher appointments in the department?—*A.* We have been for many years training men in the subordinate ranks of the department, but they do not necessarily qualify for appointments in the higher grade. It is always open to them to apply for an appointment in that grade. We train them to the best of our ability with a view to making them good geologists, not with the specific object of appointing them to the Geological Survey.

Mr. C. E. Low.—*Q.* You have these research scholars. Is it not one of the objects of research scholarships, that the scholars, if possible, should qualify themselves for recruitment to the department?—*A.* That is one of the objects of the efforts we have made in educating them in geology in the Presidency College and the Calcutta University. I think geological education was initiated in Calcutta by the Geological Survey. We have had more Indians in the subordinate branch of the service.

Sir D. J. Tata.—*Q.* You are, of course, fully acquainted with the mining and prospecting rules. Don't you think that the time has come for some modifications in the rules?—*A.* My attention has not been drawn to the necessity for further modifications.

Q. The point is that these rules were framed in the first instance when the mineral industries of this country were not fully developed. Prospecting licenses were given to all sorts of people who really had no intention of developing the mineral resources of the country, but were selling them to outsiders. But now that a greater desire has arisen to work the mineral deposits of the country and to work them into finished articles, don't you think that there should be some modification of the rules for prospecting and mining leases so as to enable the *bona fide* workers who want to develop the minerals into finished products to do so?—*A.* I think you will find this entirely provided for in the mining rules. I think it is a question of the administration of the mining rules rather than of the actual rules themselves.

Q. The other thing is the area taken up. Formerly the area was very limited. The time has come when this limit should be removed as regards mining leases?—*A.* I consider that the present limit of ten square miles is generous. When the mining rules were revised in 1913, this point was considered and ten square miles was considered to be ample.

Mr. C. E. Low.—*Q.* Has not the independent prospector done very valuable work and is it not generally recognised that he should be in a position to get something for his discovery?—*A.* Certainly.

Q. A great deal of existing mineral workings owe their discovery to the independent prospector?—*A.* Yes.

Q. He entails great risk and works for a long time and he will have to be encouraged?—*A.* I think it is right to encourage him.

President.—*Q.* There is a scheme put before us that scholarships might be granted in England to men of the senior class, that is, assistant lecturers or demonstrators, or men who have done a certain amount of post graduate study, and it is proposed that they might be sent out to India and given scholarships partly at the expense of the Home Government and partly at the expense of the Indian Government, the share being a smaller one to the Indian Government. If a system of that kind were adopted and scholars were brought for two years at a time do you think there would be sufficient work for men of the kind in the way of geological research?—*A.* Yes.

Q. Have you a sufficient number of problems that you could hand over at once?—*A.* I have a great many.

Q. And that, you think, might facilitate recruitment to the department, that is to say, these men having come to India it is likely and probable they would be more willing to accept service than they would be if they were not in India?—*A.* It would enable me also to judge whether they were suitable for Indian conditions.

Hon'ble Pandit M. M. Malaviya.—*Q.* The department having been in existence for sixty years, is it not time that you should train a certain number of Indians to take up this kind of research rather than import young men from English Universities to take up this work?—*A.* We do our best to assist in geological education in India.

Q. The whole question is after 60 years of existence are you doing enough to train Indians for the highest kind of geological education so that it might not be necessary to import Englishmen to take up this kind of research work here?—*A.* That raises a very much larger and wider issue. There are great many reasons why we have not been more successful. It is not for want of effort on our part. Proposals were put forward from time to time, first of all during the time of Mr. Oldham, and subsequently by Sir Thomas Holland, who was responsible for the appointment of the present sub-assistants; and I have also given the matter much consideration.

Q. Take for instance the case of Japan. It did begin with inviting European and American professors to do their pioneering work both in education and industries, but it has trained up a large number of Japanese young men who are now working in the various

departments. What I mean to say is this, that with so well organised a department as the Geological Survey it should be quite possible to train up a sufficient number of Indian young men—graduates—who would take up the most responsible work?—A. I should be very glad to see them in the department if they were suitable; we do all we can in this respect and I can safely say that we have always had that end in view, particularly during the last fifteen years.

WITNESS No. 133.

Mr. J. N. Gupta.

MR. J. N. GUPTA, I.C.S., *Magistrate and Collector of Rangpur.*

WRITTEN EVIDENCE.

My views on most of the subjects referred to in the questions have been embodied in Part II of my "Survey of the Industries and Resources of Eastern Bengal and Assam, 1907-08". Most of these questions have also been recently reviewed in Chapter X, Part V of the Report of the District Administration Committee, 1913-14. With the conclusions reached by the Commission I am in general agreement and as I have no practical experience of either the management or the working of any industrial concerns, I do not think any useful purpose will be served by my writing out in detail answers to the questions framed by your Commission. Regarding the important question of the best form of assistance which Government might render to industrial enterprise in Bengal and the form of administrative organization which will be necessary to give effect to the decision of Government in this matter, I have discussed at some length in a note which I wrote recently and a copy of which I now enclose for the information of the Commission. I wish again to explain as I have already stated in my note that it was written with the special object of concentrating attention on those aspects of the question which seem to bear most directly on the aspirations of the people of a mofussil district in Bengal. I am clearly of opinion that a co-operation between Government and the people on the lines indicated in the note is likely to prove of the greatest practical benefit under the present conditions obtaining in Bengal. Under this scheme we shall be able not only to attract all such local capital as might be available but also to group all skilled labour of the locality which might be suitable for any particular industry. The scheme will also provide the most powerful practical education of the people in industrial undertakings; for people always take a keener interest in a business in which their own money is at stake, and the result of the infusion of Indian capital into such joint concerns will serve the purpose of exciting in the people not only a keen personal interest in the operations of the company, but probably an inducement to training their sons for their future management.

With regard to the enquiry committed to the Industrial Commission I have the following suggestions to offer:—

I. That for the industries which the Commission might consider desirable to recommend to Government to be undertaken for purposes of demonstration as pioneer industries, the people of the locality where the industry is to be started should be permitted to subscribe the capital.

In the Resolution of the Government of India indicating the scope of the enquiries to be made by the Commission, their recommendation with regard to such pioneer industries has been expressly invited. From this Resolution it would also appear that Government would even be prepared to render direct or indirect financial assistance to industrial enterprises, should the Commission recommend such assistance to be given. If Government be prepared to go so far and be willing to undertake pioneer industries it may be assumed that Government will see no objection to encouraging joint stock enterprise to finance such industries. In spite of all that has been said about the unwillingness of Indians, especially in Bengal, to invest capital in industrial concerns, it is my firm conviction that if Government permit people of the locality where a particular industry is undertaken by Government to subscribe the capital, there will be no lack of funds. In Bengal it may be true that the larger capitalists prefer investments in land and usury to industrial undertakings, and that the middle class bhadralogs have not very much capital to invest, but it is also true that if there is a reasonable prospect of financial success, there will be sufficient capital forthcoming even in Bengal. The shyness of Bengali capital to flow into industrial channels is due to causes which will to a great extent be negatived if Government undertake to run the industries till their financial stability is assured. I think I am not taking too sanguine a view when I anticipate that far from being any lack of capital Government may have to discriminate between capital which they will refuse and capital which they will accept.

In recommending joint stock enterprise to be developed simultaneously with the pioneering of selected industries I am aware that my views are not in line with the opinions of those who hold that at the present stage of industrial enterprise in Bengal successful individual undertakings must precede joint stock concerns, and that small industries and perhaps home industries are equally if not more important than large industrial undertakings requiring capital which can best be raised by joint stock combinations. These views are sound enough in their own way, and both individual enterprise and home industries have their legitimate functions in the industrial advancement of the country, but if we cast our

eye to the industrial world outside India and comprehend the full significance of the part played by joint stock in revolutionizing the industrial conditions of the modern world, we cannot possibly believe that India will be able to hold her own in the industrial competition of the world without the help of joint stock enterprise. I think the education of the Indian in the value of joint stock enterprise must form one of the most cardinal recommendations in any scheme for the industrial regeneration of the country.

I think the following arguments may be urged in favour of the adoption of the suggestion outlined above :—

(1) The education of the people in joint stock enterprise and the growth of confidence in collective action will form a most powerful stimulus in the industrial advancement of the country.

During the time the industry will be under Government control, the education of the shareholders of the concern will perhaps be indirect only, but this period of probation will be followed by the time when the entire responsibility of management will devolve upon them.

(2) The undesirability of Government competing with private enterprise has always been set forth as the chief objection to Government pioneering any industry. The Secretary of State has very often given prominence to this view. But if the capital is found not by Government but by private parties and Government undertakes only to be responsible for the expert and financial management of the business till it becomes a financial success, a great deal of the objection to Government's direct participation in industrial enterprise will disappear.

(3) Government will not, therefore, be necessarily confined to taking up such industries only as would come strictly within the category of pioneer industries.

No doubt it will be difficult to define what a "pioneer industry" is, for an industry which may be new to Bengal may be already a tried success in Madras, and in one sense no industry will really be a new experiment, for although new to India it is probably already a flourishing industry in more than one foreign country outside India. But perhaps Government would be justified in taking up an industry which is not likely to compete with another existing industry of a similar kind run by private enterprise, at a place so close to the new industry as to make it likely for the latter industry to encroach upon the existing sphere of influence of the older industry.

(4) If either the whole or a portion of the capital is found by the people of the country, it will be possible for Government to undertake many more industries than would be the case if Government have to find the entire capital for each business it takes up.

(5) There would be no difficulty in finding a successor to Government to whom the industry would be made over after it is proved to be a financial success.

All the above advantages appear to be important and therefore although this suggestion has not hitherto found a place in the recommendations made either by the Provincial Governments or pressed in the Councils by non-official members yet I venture to submit it for the consideration of the Commission.

Of course one can easily foresee many difficulties. In the first place we will have to decide about the class of persons who will be entitled to subscribe to the joint stock enterprise provided the offer of capital exceeds our requirements.

A second consideration will be whether Government will be justified in taking private money before it is assured that the particular enterprise would be a financial success. And in case of failure will not Government be running the risk of serious unpopularity? As a corollary to the above it might be asked whether it is likely that the people will subscribe money for an enterprise whose financial success is not a proved certainty.

Lastly the legal position of Government and the shareholders and their respective liabilities will have to be carefully adjusted before the parties could undertake any joint enterprise.

The above difficulties, however, do not appear to be by any means insuperable and a careful and patient examination of the situation may very likely reveal the details of the arrangements which might solve these difficulties.

As regards the first point one may perhaps venture the opinion at once that the people of the locality where the enterprise is started should have the first preference to subscribe the capital for it.

As regards the second group of our apprehensions it might be explained that Government is not likely to embark on any enterprise without adequate previous investigation. And as machinery, expert management, and adequacy of capital are likely to be well provided for under Government supervision there are no reasons for anticipating failure. As regards the uncertainty which must attach to all industrial enterprise it is assumed that the shareholders will be prepared to take the risk. Another further precaution might be that in undertakings of which the final success might be at all doubtful no private money will be taken, and in all cases the exact position in, and the nature of, the risk taken should be clearly explained to all intending shareholders. Such precautions are not likely to make any difference to the flow of capital or to shake the confidence of the people if they know that Government mean to do their best and the business will be carried on under Government supervision and control.

As regards the respective legal liabilities of Government and the shareholders the matter will require careful handling and patient examination of details. Amongst other points it will have to be considered whether Government should guarantee a certain rate of dividend and undertake to recoup a certain percentage of possible financial loss and in return claim a certain share of the profit in addition to the cost of management, etc.

II. That the work of Government in assisting industrial enterprise in the country should not be wholly centralised. The new Department of Industry which it is assumed will be organised for each Provincial Government should not remain a centralised force only, but there should be a Department of Industry in each district and the industrial resources of each district should be examined and developed. Industry should thus form a part of the ordinary programme of district administration like co-operative credit, education, and agriculture, and the District officer should be given a controlling voice in the affairs of this department of the administration also. If the main object of the present movement be the industrial education of the people it will be obviously unwise not to enlist the active co-operation of the District officer in the movement.

If the above view be accepted, the points for determination would be :—

- (1) What should be the relation of the District officer with the Department of Industry and the Director of Industries?
- (2) What should be the relation of the District officer and the Department of Industry with the public with regard to industrial matters?

To take the second point first it will be readily admitted that the control of Government over industries which are selected for demonstration should be thorough for the time Government is responsible for the success of the business. If it be decided to assist cottage industries through co-operative central banks or private individuals with money grants no such direct control of Government over these industries would perhaps either be desirable or necessary. In theory the attitude of Government officials towards the new movement should be the same as laid down by the Government of India (Resolution of 17th June, 1914) for the co-operation movement. "The movement must in its essence be a popular one and nothing should be done to weaken the feeling among co-operators that it is based upon self-reliance and independence." And if in the case of "pioneer industries" Government should elect to interfere in industrial enterprise and manage these industries through their own officers such interference will be only provisional and it will be with the object of encouraging the people to invest capital in such industries and to ensure the final success of the industries, it being clearly understood that Government control will come to an end the moment these objects have been attained. To ensure the co-operation of the public in the movement, it might be desirable to have an "Advisory Board" for each district for dealing with industrial questions.

As regards the first point the Director of Industries should no doubt be finally responsible for the selection of special industries and have direct control over the experts who might be appointed by Government to run the industries. The chief function of the District officer would thus be to bring the new department in touch with the people and give the people that assurance and confidence in the undertakings of the department which his close association with the movement is likely to inspire.

III. That while from one point of view it would be desirable to have decentralization in the schemes which might be proposed for the industrial development of the country from another standpoint we should aim at co-ordination between the different schemes which might be advocated for the different provinces. While each province will have no doubt its own special needs and requirements as also its special resources and capabilities, yet it is very important that all the schemes should be carefully co-ordinated with each other from an all-India point of view. To illustrate my meaning by a concrete example it may be submitted that on grounds of financial economy alone it would be unnecessary for each province to have separate technological and other technical institutions of a similar kind, but each province should specialize in some particular branch of industrial education. Similarly the want of a sufficient number of experts of the right type may also make it necessary for two or more provinces to combine for the purposes of appointing a suitable Director of Industries. Though theoretically it might be advisable for Bengal, Behar, and Assam to have separate Directors of Industries, yet it might be found of more practical advantage to have one Director of Industries for all the three provinces.

2. That the above suggestions have an important practical bearing on the issues raised at the present moment will be exemplified if we take the case of the Rangpur district for instance. Rangpur amongst mofussil stations took a very prominent part in the attempt to revive industrial enterprise in the country in the earlier days of the Swadeshi movement. A weaving and spinning factory, a tannery, and a tobacco factory were started in Rangpur, but all these ventures shared the fate of the other ill-equipped, ill-managed and insufficiently financed enterprises which then sprang up all over the country. The tannery has completely disappeared and the weaving factory was taken over by the promoters of the present Bengal Lakshmi Mill. The tobacco factory is still lingering on but it has practically ceased to work and the directors are on the look out to sell the concern on favourable terms to any of the other successful companies which have crushed it out of existence. But in spite of these failures, the people of this district are most anxious to take advantage of the present situation to start some

industries in the district which might have a reasonable chance of success. But every one who is interested in the matter in any way is unanimous in holding that we shall be courting disaster again unless provision is made for expert management of the concerns which might be started and for placing the financial responsibility of the schemes in the hands of persons whose integrity would be above suspicion. It has accordingly been suggested that Government should be approached with a view to ascertaining—

- (1) Whether arrangements could be made for deciding after expert enquiry what industries are likely to be successful in this district.
- (2) Whether the services of qualified experts would be available to take charge of such industries as might be selected, at least for a few years to come.
- (3) Whether arrangements could be made for the direction and management of the enterprise by a Board which will have a Government officer as its President or Managing Director.

If Government took the lead in making satisfactory arrangements regarding the above points there is a consensus of opinion that there will be no difficulty at all about the capital for any industries which might be selected to be most suitable for Rangpur. In fact it is confidently anticipated that the schemes are likely to be over subscribed.

As regards the industries which will be suitable for Rangpur, tobacco and sugarcane would obviously seem to offer the most likely scope for successful enterprise. It is true that tobacco has been tried and has failed, but management was defective, the machinery was old fashioned and capital altogether insufficient. Expert enquiry might of course show that there is no scope for another tobacco concern in the presidency as there are already other successful cigarette concerns possessing large capital which have captured the market and whose policy it has been to crush and choke off all new ventures by expenditure, if necessary, of lavish sums of money. But, on the other hand, due weight should be attached to the fact that Rangpur grows more tobacco than any other district in Bengal and Cooch Behar the other tobacco producing area in Bengal adjoins Rangpur and there is no other tobacco factory in East Bengal. If, however, a cigarette factory be considered inadvisable we may consider whether the manufacture of cigars specially of those kinds known as Burma cigars would not be a suitable industry for Rangpur. The soil of Rangpur has been found suited for the production of every variety of tobacco and there cannot be any doubt that the tobacco leaf required for Burma cigars could be locally grown in Rangpur. The demand for Burma cigars is growing every day and perhaps more Burma cigars are now smoked in Bengal than cigars of any other kind. There may be scope for the manufacture of stick tobacco in this district. The manufacture of sugar also would seem to offer a very good opening in a district like Rangpur. I understand that the Assam Government have started a large sugar factory and the results obtained have already been very encouraging. Rangpur already grows a fair amount of sugarcane. The area under this crop is daily increasing and there are large tracts of uncultivated lands in thanas Badargunj, Mithapukur and Pirgunj which are reported to be fit for the cultivation of sugarcane.

In connection with the manufacture of both tobacco and sugarcane it might be mentioned that experiments are being carried on at the Government farms in this district with the special object of introducing better varieties of these crops which will have a heavier yield and of which the produce will be of a superior quality.

Besides sugar and tobacco there are some persons who think that the manufacture of paper might also prove to be a profitable business in Rangpur. Comparatively large supplies of bamboo and grass of various kinds are available in this district and the railway communications are good. A paper factory in Rangpur will be within easy reach of possible markets for paper.

Another feasible scheme would be the starting of an aluminium factory in Rangpur. There is no such factory in Eastern Bengal where the demand for enamelled ware and aluminium ware is enormous and is daily increasing.

Of course the labour factor in connection with all these possible industries is not altogether favourable and the wages of labour in this district are comparatively dearer than in Behar and Western Bengal.

As regards the question of technical management, it is suggested that the expert who is to run the industry should be selected by Government on the sole consideration of capacity for managing the business, without any regard to his nationality or any other personal considerations. But the greatest stress is laid on Government appointing a Board of Directors with an official chairman just as the chairmen of the central co-operative banks are officials. A specially selected and trained deputy collector or an officer of the Financial or Account Department may be made the chairman. The other members of the Board might be selected from the shareholders of the joint stock concern.

3. There is still another particular in which Rangpur would desire local consideration. There is a scheme on foot for the establishment of a University college in this district which will teach the usual arts and science courses prescribed by the University. There is a strong feeling however that as the people are subscribing such a large sum of money amounting to five lakhs of rupees it would be eminently desirable if in addition to general education up to a certain standard arrangements could be made for imparting technical and industrial education on some well defined practical subjects which would help the young men of the

district to make their living in industrial avocations. The technical education might relate preferably to industries which it might be decided to start in Rangpur, and for which there may be scope in Rangpur. Another special reason which makes such a suggestion worth considering is that at Rangpur we have already got a technical school which teaches survey, carpentry and black-smithing and which is maintained jointly by the District Board and Government. It is felt that the amount of good done by this institution is perhaps not commensurate with the amount of money spent on it from public funds, and an expansion of the institution on industrial lines will be a very desirable improvement. The Rangpur public will be prepared to subscribe more money if the existing school were made an annexe of the proposed Rangpur College with an arrangement for some forms of practical industrial education. The Commission may, therefore, consider whether it may not be advisable to have one or two district industrial institutions on the above lines instead of having only centralized technological and industrial institutions at Dacca and at Calcutta.

4. It is hardly necessary to point out that this note deals with only one aspect of the intricate problems which the Industrial Commission have been asked to examine, and the suggestions offered in this note have special reference to the conditions which obtain in the Presidency of Bengal. The manner in which industrial enterprise can be developed and encouraged in Bengal through joint stock combinations under Government patronage and support has alone been dealt with. Even for Bengal such important questions as the encouragement of cottage industries through co-operative central banks and otherwise, the starting of a central State bank for advancing loans to individuals and companies on adequate security have not been touched. Nor have I expressed any opinion on such questions as the extension of railway facilities and the re-adjustment of railway rates, the abolition of excise duties, and the imposition of countervailing duties on import of State subsidised commodities from other countries. Not that I am not aware that the satisfactory settlement of these important questions will have a powerful influence in deciding the fate of any new industry which might be undertaken in any part of India but this note is written with the object of concentrating attention on those aspects of the question which seem to bear most directly on the aspirations of the people of a mofussil district in Bengal.

ORAL EVIDENCE, 12TH DECEMBER 1916.

Hon'ble Sir Fazlulbhoj Currimbhoy.—Q. You discriminate between capital which the Government will refuse and the capital which they will accept. What do you mean by that?—A. I mean that Government will have to fix a certain standard according to which they will have to decide about the financing of pioneer industries. In cases where a pioneer industry is over-subscribed, Government will have to decide whose money they should accept and whose money they should refuse to have.

Hon'ble Sir R. N. Mookherjee.—Q. It is not the intention of the Government to prevent anybody from coming forward to invest capital. In the case of a joint stock enterprise, why do you say that Government may say who can come in and who should not?—A. The whole point is that Government should encourage joint stock enterprise, and when any pioneering industry is taken up, Government should allow private persons to subscribe the money while they would undertake to manage the business for the persons contributing the money.

Q. Your idea is put in such a way as to give the meaning that Government may prevent anybody from putting in his money?—A. I think there is some misunderstanding. The idea which I put forward here is that instead of Government finding the money for the concerns capital should be found by the people of the locality, and that Government should only undertake the management of the business. What I mean is that Government need not go so far as both to find the capital and also to manage the business. But if people come forward to subscribe Government will only accept the management, allowing the people to subscribe. The two things are quite different.

Q. You mean that private people will form a joint stock company under the patronage of Government?—A. Yes, under the patronage of Government.

Q. Do you think you will get people in Rangpur to do it?—A. Everywhere in Bengal. The great difficulty is want of confidence. I am talking of Bengal only.

Sir F. H. Stewart.—Q. Have you tried to get together an Industrial Committee in Rangpur?—A. No.

Q. Have you got men in the district who would be suitable?—A. I think there are. They are not experts but they take an interest in industrial undertakings.

Q. Your suggestion is that they should meet together under the presidency of the District officer and in turn pass on information to the Provincial Director of Industries?—A. Yes and also to the people of the district. It will deal and keep itself in touch with both sides, on the one hand with the people of the district and on the other with the official organization.

Q. Do you think that labour is likely to present any difficulty in Bengal?—A. There may be difficulties in a certain way. Of course I do not know how exactly cooly wages in Bengal compare with wages in other parts of India but I know the rate is very high in Bengal.

Q. Is there any disinclination to work?—A. There is no such thing. People will work any length of time so long as they get the money. At present most of the labour is Beharce

labour. The agriculturists are very well off and employ hired labour for field work, consequently wages have risen in Bengal compared with the rates prevailing in the adjoining province of Bihar.

Q. As you greatly develop industry will you have to get imported labour or is the local labour sufficient?—*A.* I think a certain amount of labour will have to be brought from outside. I anticipate that the ranks of the poorer bhadralog classes will also supply workmen for the new industries.

Q. With reference to what you said in reply to Hon'ble Sir R. N. Mookherji don't you think that it would be a good thing if at the time Government declared its intention of pioneering an industry Government made arrangements with business people to take over the business side of it?—*A.* That could be done only in places where such business men are available and when Government had confidence in the business ability of the persons who might be asked to manage the business. But in such cases also, I would recommend that Government should watch over the management and see that the concern is run on sound lines and that the management is satisfactory.

Q. It would be a rather serious responsibility for Government to undertake?—*A.* Yes, and it would be for Government to decide what amount of responsibility it should take in such cases. But such a number of concerns which were started and managed by Indians failed in this part of the country that I think it would be a wise thing to begin with Government control.

Q. Who will manage?—*A.* Government will have to find experts for the technical management of the concerns, but ordinary responsible officers of Government could be deputed to be managing directors.

Q. The management could not be carried on by the ordinary Government officers? You could not ask the District officers to do the thing?—*A.* No. Experts will have to be appointed for the purpose.

Mr. C. E. Low.—*Q.* I understand that your principal point is that in starting a factory for any new industry, the consideration of the comparative readiness of the local men to invest money in local enterprises is important?—*A.* Yes.

Q. The local capitalist will more readily invest in local enterprises?—*A.* That is not the only point of view from which I have considered this matter.

Q. With reference to what you say about the manufacture of cigars, are the cigars made by machinery?—*A.* No, by hand. We have started the manufacture of cigars on a small scale only. The recommendations I have made in this part of my note are merely my suggestions I have no expert knowledge regarding these matters.

Q. You speak of the technical school at Rangpur. Can you say what happens to the pupils of the school?—*A.* We keep a register to find out what happens to boys. Most of them disappear. One or two have started shops. Some have become teachers. There is only carpentry and smithery taught.

Q. What are the class of people who want to take up smith's work?—*A.* Some of them are the sons of carpenters and smiths and some are poor men who have no other work.

Q. What becomes of the men of the artisan classes who come to the school?—*A.* Some start shops. One person in Bogra is doing very well. The majority disappear and it is not known what happens to them.

Q. Are they of the artisan type?—*A.* There are very few bhadralogs as the term is generally understood. Most of them follow the trade as a hereditary profession.

Q. Is it the object of the fathers when they send their sons to the school that they should become teachers?—*A.* Any how that is what most of them have to fall back upon. They must have some capital to start their own shops. They probably do not find the money.

Q. Do they take up positions as teachers?—*A.* They do. In our district we are starting manual training in most of our schools. That will give occupation to most teachers of this class because there were no such classes before.

Q. The Rangpur district is an average district for Bengal in point of wealth and development?—*A.* It is average. It is a little above the average in regard to wealth. It has got very important agricultural products. It is more prosperous than some of the East Bengal districts. It has tobacco which is not grown except in Cooch Behar and a few other places.

Hon'ble Pandit M. M. Malaviya.—*Q.* You say that if the Government will undertake to be responsible for the expert and financial management of a business then people will come forward to subscribe. But suppose that without being responsible for the expert and financial management, the Government merely lent the aid of some officer who would investigate a proposal and express an opinion about it, would that not encourage the public to subscribe?—*A.* That will to a certain extent, but not to the same extent as it would, if Government started pioneer industries on the lines I have recommended.

Q. That is a large proposition?—*A.* It is a question whether the Government will be prepared to go so far as that.

Q. Supposing Government guarantees a certain rate of dividend in a particular business, would that not be enough inducement?—*A.* It may be, but whether it will be wise or not, on that point I am not prepared to express an opinion. I do not think that Government ought

to guarantee dividend without knowing what is going to happen to any industry, for if a Government guaranteed industry fails, not only will that discredit this form of Government help, but it will probably strengthen the hands of those who are against Government help to industrial undertakings in any form.

Q. If the Government helps, it will help only after making due investigation. If the Government then helps, would it not encourage people?—A. I think it will.

Q. You say that you have a technical school at Rangpur and that the people have subscribed 5 lakhs?—A. That is for a college.

Q. Is not the importance of technical and industrial education sufficiently recognized in Rangpur to induce the people to put all this money in improving the technical school and raising it to an institution of the kind you recommend?—A. I doubt it. People do not put much value on industrial education at present for many reasons. As long as there are no industries in this country, there is not much scope for industrial education. I could not call on the people of the district to raise 5 lakhs for an industrial school of which the future is very indefinite.

Q. Can't the people sit together and discuss the kind of instruction for which there is room?—A. They will do so. At present the technical school does nothing but teach carpentry and smithery of a very elementary kind and it is a misnomer to call it an industrial school.

Q. Suppose you introduce electrical engineering and mechanical engineering?—A. There are engineering colleges in Bengal. There is not much object in starting another. What we want is some kind of industrial education in such subjects as leather tanning, sugar, paper and glass making. Our technical and industrial schools will not be much appreciated or sought after until they are able to impart such practical and theoretical instruction as will qualify the students to start successful business enterprises of their own.

Q. You want the Government to start co-operative central banks for industries on the lines of the banks for agricultural purposes for small industries?—A. Yes.

Q. You also want the Government to help cottage industries through these central banks?—A. Yes.

WITNESS No. 134.

Mr. F. Miller. MR. F. MILLER, *Mining Engineer and Agent, Villiers Colliery Company, Limited, Jainty Colliery, Karmatar.*

WRITTEN EVIDENCE.

Capital. Q. 1.—I have had some experience in promoting coal companies, chiefly, however, as a mining adviser. For a reasonably sound proposition I have always found that capital is fairly easily secured in the country.

Government assistance. Q. 4.—I have had experience of Government financial aid in West Australia where agricultural enterprises are largely and successfully financed on Government loans. Without this assistance the agricultural production would not have achieved half its success, in fact the country has been chiefly built up on loans to the settlers.

Q. 5. (3).—It is self-evident that something requires to be done to stimulate new industries and there must be reasons why enterprise is not forthcoming in a country rich in natural resources and cheap labour. Capital is easily secured in India to float an existing and sound enterprise: it fights shy however of a new industry in a country like this where there are no resident experienced experts to advise or initiate and train raw labour. Under these burdens the alternative seems to be Government aid to tide over the initial stages. I therefore think that a guaranteed dividend for a limited period would induce greater progress in new industries; otherwise privately they will only gradually be evolved.

Q. 5. (4).—Government aid or its equivalent could satisfactorily be loaned wherever the capital security, such as agricultural land and its improvements, would be a substantial mortgage against the loan. This should give an immense fillip to the productive possibilities where the ryot is too poor to finance the extension of his cultivation to any extent.

(5) India suffers through its crude and consequently expensive methods in subsidiary industries. To overcome this I think Government might originate on a large scale, schemes of practical demonstration, which would rapidly teach and spread the knowledge of the economic adaptability of mechanical means in lieu of the crude ways in vogue.

This should be followed by giving assistance in machinery and plant on the hire purchase system. I have in view the numerous possibilities of reduction in cost for reaping, winnowing, threshing, as well as the mechanical means utilised in other and allied agricultural productions. In industries in India where up-to-date methods are employed the cost of production is lower than the European standard on account of cheapness of labour, whereas in those productions where crude methods still prevail, it can either not or only just compete with other countries through the expense attached to hand labour without the assistance of mechanical means.

Q. 36.—Supplementary surveys of the unworked coal fields would be of advantage to the coal trade. The existing geological reports should be strengthened by a more detailed industrial practical arrangement suitable to modern requirements. Surveys for industrial purposes.

Q. 48.—My experience of the land policy of the Government is chiefly confined to the Sonthal Parganas where the policy is particularly retrogressive and has proved very detrimental to business progress. The law apparently gives all facilities for mining enterprise; but the application of these laws lies with the Government officers who may use their own discretion in their application and thereby cause endless delay. The acquirement of a bigha of land seems to be of profound importance, whilst two years retarding of an industry beneficial to the province is of no consequence. Land policy.

The Government of this province should, from a business point of view, define to its officers what the limitations are on the development of its mineral industries, instead of following, as now, an undecided policy, which kills enterprise.

Q. 97.—As regards coal the facilities offered by the railways are on the whole quite reasonable and progressive particularly with the Bengal Nagpur Railway which has been the gainer thereby. The East Indian Railway is more conservative and in numerous instances has been retrogressive. A railway, in my opinion, should adopt a liberal policy as far as the ultimate good to the country is concerned, though for the time being it may react in particular instances to the detriment of the railway company. Railways.

The short wagon supply to the collieries is proverbial, but I don't think an increase in the wagons would overcome the difficulty. The solution appears to lie in increased facilities to secure an accelerated despatch of wagons.

Q. 110.—It is an understood maxim that coal properties are handicapped owing to uncertain titles, especially in the exploitation of a new coal field. It seems reasonable to expect that Government should assist in a solution of this problem. Many properties are standing idle and future fields are avoided because of this uncertainty. General.

Labour shortage could, I believe, with the co-operation of an industrial Government, be very much overcome to the tremendous gain of the country.

It is noteworthy that the supply of 99 per cent. of the miners, come from within 30 miles of the coal fields and about one-half of these are migratory during the festive and cultivating periods and this probably affects the outturn as much as 30 per cent. Moreover the independence of this labour is intolerable, due to the fact that there is keen competition to secure it. There must be millions of labourers in the country who possess no cultivable lands or continual employment and from whom recruiting is possible.

I believe the dissemination of technical knowledge among the overseers would not be of any great utility to the coal industry. This class of labour requires to be essentially practical, and this result can only be gained by long experience in the mine. The introduction, through the medium of a technological institute, of a scientifically educated overseer, would not compensate for the lack of practical knowledge. To produce the combined practical and theoretical man is, I believe, unworkable at the present stage of Indian education among the working classes. A technological college at Dhanbaid would only serve a useful purpose in training intending managers and under-managers as is done at Sibpur.

The utilization of bye-products is a branch of industry which gives great promise of a successful future not only as a remunerative investment, but as tending to promote and improve other connected industries. Its late introduction is due to the shyness of capital to accommodate itself to a new venture in which India has had no experience. It also points to assisting materially in solving the greater utilization of second class coal.

I see no possible opening for establishing other industries of consequence. In Jharia or Ranigunge coal fields engineering may be advantageously increased.

ORAL EVIDENCE, 12TH DECEMBER 1916.

President.—Q. How long have you been in India?—A. 11 years.

Q. You were engaged practically the whole time as a mining engineer?—A. Yes.

Q. You say that you have some experience of Government financial aid in West Australia where agricultural enterprises are largely and successfully financed by Government loans. Could you give us very shortly any idea of the system by which this is done?—A. First of all there is the agricultural bank which loans money at the rate of 5 per cent. and this money has to be repaid within 30 years. In the first 5 years nothing is paid and then the capital and the interest begin to be paid together. The whole thing is paid off in 30 years. The man takes a certain number of acres from the Government according to the quality of the land suitable for him. He generally has £50 himself and by borrowing a certain sum of money from the agricultural bank he is able to start work. He is only allowed the money on making certain improvements. One is clearing the land, that is, clearing it of trees and preparing it for the plough. Another is a dam to provide against shortage of water; another is fencing, and another is a certain amount of stock for breeding purposes. Then over and above that, there is a tremendous arrangement with firms who give machinery on the hire purchase system. This help is not given by Government.

Q. Do the Government take any security for the loan?—A. They have a mortgage on the property.

Q. You say that you have been away from Australia for some time and you do not know whether many of these mortgages have been taken up or not?—A. It is not so long since I came from there, about three years. Very few are going into liquidation. I read the papers and there are very few such cases to my knowledge.

Mr. C. E. Low.—Q. Did you get a considerable amount of Indian capital or was your capital mostly European?—A. Mostly European capital.

Q. Some Indian capital did come forward?—A. Yes.

Q. Mostly from what class of people?—A. Marwaris.

Q. Not as a rule from Bengalis?—A. No.

Q. You think that Bengalis are now inclined to invest in coal companies?—A. They do as they get into the knowledge of things. When they get more knowledge of mining they realise things better.

Q. And that makes them more apt to invest in coal mines carried on by anybody whether European or Indian?—A. Quite so.

President.—Q. Have you got any supplementary remarks?—A. I think it would be a good thing if we had better conditions for labour. If their housing conditions and their domestic conditions generally were improved I think they would be attracted much more.

Q. Are there not improvements being made in the coal fields?—A. That is very gradual. It has taken 10 years to get, say, 25 per cent. of what we desire.

Q. What steps do you propose in order to accelerate the rate of progress?—A. I do not think it is possible for Government to take any steps.

WITNESS No. 135.

Mr. R. D. Mehta. MR. R. D. MEHTA, C.I.E., of Messrs. D. B. Mehta & Co., Managing Agents, Empress of India Cotton Mills Co., Ltd., Calcutta.

WRITTEN EVIDENCE.

Capital.

Qs. 1-3.—I am the sole partner of Messrs. D. B. Mehta & Co. I have been connected with a number of companies with limited liability, the Empress of India Cotton Mills, Limited, being managed by us. We have never experienced any difficulty in raising the capital required for the concerns with which we have been connected. In each case the share capital was subscribed within a few weeks after publication of the prospectus. We put our own money in the concern, and a good portion of the capital used to be subscribed by friends. If there remained a balance still, we had no difficulty in making it up by advances from our bankers. The condition of Bengal was in those days different from what it is now, and Europeans and businessmen alone thought of investing their money in joint-stock companies. Now the people have come to evince some interest in such investments. But the outstanding feature of the position is that shares in companies floated by respectable parties commanding public confidence would be easily taken up, while other companies would find considerable difficulty in raising the capital. A good deal depends upon the personality of the managing agent or agents. This must always be so. Of late there has been a wholesome expansion in light railways, and it has been due to a large extent to the fact that in most cases a minimum return is guaranteed either by the Secretary of State for India or by the Secretary of State for India and the Provincial Government or by the District Board concerned. A large portion of the share capital has been subscribed by Indian investors. Until, however, a few years ago Europeans figured largely as share-holders of joint-stock companies, Indian capitalists confining their investments to Government promissory notes, municipal debentures and port trust debentures. Of the Indian shareholders the bulk belong to the middle classes. The money subscribed by these people must be their savings.

Industrial enterprise in India has not reached that stage of full development when the contingency mentioned in question No. 3 should be faced as a serious factor. Some mills do work short time at intervals. Before the boom due to the War, the jute mills of Bengal, for instance, had to reduce their production by working only a few days in the week. A short time ago the Bombay cotton mills also wanted to work, and some did work, short time to remove the glut in the stock of finished goods. The oil mills of Calcutta and the suburbs also adopt that method for reducing production with a view to keep up prices. But in each case the circumstances justifying the measure are exceptional and of a more or less temporary nature. In my opinion, the broad proposition that in any industry here more mills have been started than can be maintained in full time employment lacks justification.

Q. 5.—(1) I would have this sort of help only in exceptional cases; for instance, in cases in which the individual or the company attempts to introduce and popularise a new but promising industry. The principle governing these grants-in-aid should be that the party

seeking the aid is engaged in work which would otherwise have to be undertaken by Government. By way of illustration I would just mention match, dye, glass and wood-pulp industries. This list is only illustrative and is by no means exhaustive. There may be other industries equally deserving of support. Each application for support will have to be decided on its merits, but the guiding principle should be, as noted above, that from the importance of the particular industry to the general interests of the people and the country, Government might well undertake it, and that the pecuniary help relieves Government of a duty which, but for the start made by the private party concerned, would have to be undertaken by Government sooner or later.

(2) Bounties and subsidies should be governed by the same principle. The main difference in the case of this sort of help is that it should be for a shorter period than money grants-in-aid. It is quite likely that certain industries, which from their influence upon the general interests of the country have an Imperial importance, cannot be run as profitable concerns for long years. In their case money grants-in-aid would be preferable. There may be other industries again, like the match industry, which would best be developed by starting a large number of small factories in out-of-the-way places—in hills and forests. A system of grants-in-aid would encourage such industries.

(3) The policy of guaranteeing dividends may be adopted with proper safeguards. The system has certainly helped the expansion of light railways or feeder lines.

(4) I thoroughly approve of the idea of granting loans to private concerns. Before now suggestions have been made at least in two cases for advances to such concerns—to the Dacca Bool Bool Soap Company and the Ambala Glass Works. If the system had been in vogue then, both those concerns could have been saved.

(5) I do not approve of the supply of machinery and plant on the hire-purchase system as a general proposition, but such a system would have a marked effect upon Indian agriculture. It is necessary in the case of agriculture which has not much capital to back it up. Concerns with command of capital do not deserve this help. In the case of the sugar industry which is mostly in the hands of petty capitalists, the system is equally necessary. Indian conditions at present make it difficult for the industry to be carried on in large centralised factories. Salt refineries can be developed in the suggested way.

(6) Provision of part of share capital would be necessary in the case of difficult industries which require a large capital for successful working. We want this sort of help also for the development of Indian industries, but the question where it would be more effective than any of the other methods, will always depend upon the circumstances of each case.

(7) The guaranteed Government purchase of products does not appeal to me. It must never be forgotten that Government money is public money, and the greatest caution must be observed in applying it to purposes for which it is not primarily raised. The condition that products must be purchased by Government for a limited period can only be imposed where these products replace foreign imports on Government account or when they are required by Government. Otherwise the products purchased with public money will be wasted for want of scope for utilisation. In this last case the industry could be helped as well with bounties and subsidies or in any of the other ways specified under the head of Government aid to industries. Why then this indirect help? At the same time I would certainly insist upon Government supplying their own wants by purchasing articles made in India in preference to those imported from abroad.

Q. 6.—As a matter of general principle when public money is applied for the support of industries, Government should have some control over those industries. This control need not be of a uniform nature. We should have Government directors in the two cases where dividend is guaranteed and part of the capital is subscribed by Government. No control is necessary where only money is advanced as loan, or machinery and plant are supplied, or the purchase of products is guaranteed. Loans to industrial concerns must be secured debts as in the case of takavi loans, or secured by mortgages of the land, building, etc. Machinery and plant can be supplied either on the hire-purchase system or lent by Government on the applicants finding proper sureties. This condition of sureties may be dispensed with when the supply is through a co-operative credit society. In case of money, grants-in-aid, bounties and subsidies, I would insist upon periodical inspection of the concerns by Government officers and audit of the accounts by Government auditors.

Q. 7.—I have no experience of pioneer factories. In India we have not done much in this line. The only experience before the Indian public is that of Madras. The chrome leather industry and the aluminium industry owe their development, according to general report, to State pioneering, but we here are not in possession of details. In Japan the State pioneers industries systematically. On this point too we have not got detailed information. Mr. C. J. Hamilton has been to Japan to study the whole question of the development of Japanese industries, but his observations are not before the public. Without claiming any experience of pioneer factories, I may state it as my general opinion that the State has a duty in the matter in an undeveloped country like India. The people are nervous and capital is shy. The best way to push forward new industries is by demonstrating their possibilities as dividend-earning concerns before the public. In my opinion, pioneer factories will be useful in this country.

Pioneer factories.

Q. 8.—Government should pioneer industries by starting factories which will be worked by them only so long as private capitalists do not come forward to buy them up. Purely pioneer factories cannot be converted into permanent Government enterprises. There may, however, be some factories which Government would like to retain in their own hands permanently for the supply of their own requirements. The Government Harness and Saddlery Factory at Cawnpore, for instance, has served in the days gone by the purposes of a pioneer factory, but is maintained, and rightly, as a permanent Government enterprise.

Financing agencies.

Q. 10.—In my opinion arrangements should be made for the establishment of special banks for the support of industrial concerns. They should have greater latitude as regards advances and investments. From the necessity of the case current accounts cannot be allowed in these banks, and greater restrictions upon withdrawals of fixed deposits are required. The law relating to liquidation too will have to be modified. It must not be open to one or two or even a few shareholders to force the concern to go into liquidation. The existing banks can help industrial concerns by making advances against the stock of materials and the finished products. I have heard it complained that the respectable banks are too strict in the matter of advances, and weak concerns, those that are most in need of it, find difficulty in getting money. Our firm, however, never had this experience. The point requires investigation. But I may take this opportunity to offer one suggestion. The rules relating to current accounts should be revised, and the minimum monthly balance upon which interest is allowed might be reduced with profit to trade and industry. Under the present arrangements the cash in the hands of the middle classes is not employed for the support of trade. This is a loss. The cash in the hands of the individual holders may be and is small, but the total will come up to a good round sum. Efforts should be made to attract this capital to trade and industry through the banks. This can best be done by having a low minimum monthly balance for current accounts. There would be an appreciable increase in loanable capital as a consequence, and perhaps in the bank rate of interest. The rate of interest at times is high. With more liberal rules for current accounts and a larger number of these accounts, the political situation will also improve. There will be fewer inducements for dacoity and burglary.

Limits of Government assistance.

Q. 11.—The principles indicated above will be enough to prevent Government aid competing with existing, or discouraging fresh, private enterprise.

Q. 14.—There should be no limitations on Government aid to a new enterprise if it competes with an established external trade. In view of larger interests to be served all considerations of prejudice to existing interests must be put aside in determining this question of Government aid to industries. Existing industries must be protected and new industries established with Government aid, and if in this scheme of State assistance individual interests suffer, we must boldly face that contingency.

Technical aid.

Q. 17.—The services of Government experts can be lent to private firms or companies on condition of the salaries of such experts during the whole period of deputation being borne by the private firms or companies concerned and all their travelling expenses being paid by them, and on the further condition that the recommendations of the experts shall be communicated to Government with full liberty either to publish them at discretion, or to communicate them privately to such firms or companies as may need them.

Q. 18.—The general principle to be followed in such cases is that the interests of individuals must be subordinated to national interests. Whenever therefore Government are of opinion that the results of researches should be published for public information or communicated to other firms or companies in the interests of the nation, there should be nothing to prevent such course being followed. Care should, however, be taken to minimise as much as possible the attendant loss, if any, to the firms or companies at whose instance the researches have been made. These firms or companies may be entitled to money compensation in some cases, the amount of which shall not exceed the money spent by them over the researches.

Demonstration factories.

Qs. 19 and 20.—There is ample scope for demonstration factories in India. We want them in Bengal too. The form is immaterial, and must vary with local conditions and the necessities of the industry sought to be improved in this way. No general rule can be laid down. In Bengal demonstration factories might with advantage be started for the silk industry and the sugar industry. A factory for the demonstration of the simplest and the cheapest process of decorticating rhea would prove highly beneficial to the whole province. Jute has done for Bengal a great deal; rhea might equally do a lot. The cultivation is not difficult; there is always a brisk demand for the fibre outside India. But the drawback is the rhea fibre cannot be removed so easily as jute. About 25 years ago a company, with some pretensions as to capital and directorate, started rhea cultivation near Tribeni, but the industry failed. Our cultivators are clever enough to learn a simple process of decortication, and once they know how to extract the fibre at a small cost and they know further for certain that there will be no difficulty in selling it, cultivation of rhea will expand rapidly, giving the people of the province a third important crop of incalculable potentialities. Demonstration farms for the improvement of agriculture are equally needed. Under the inspiring guidance of Sir Horace Plunkett Ireland has gained immensely by demonstrations in improved agriculture. There is no reason why the same method should not answer well here.

Research abroad.

Q. 22.—It may be advantageous to have researches made in England for special subjects in which India is interested. This matter of decortication of rhea, for instance, might be investigated in the United Kingdom with greater advantage. French people have been

engaged in this research for sometime past. Similar researches are being made in other countries on the Continent. The investigators in England will have near at hand a mass of information which no man in India can get easily. Besides, they will have a better knowledge of the conditions of the market. The general rule regulating apportionment of subjects for research between the two countries should be that, for subjects in which a certain amount of spadework has already been done in the West and the market for the article is in the West, the research should be undertaken in the United Kingdom rather than in India. Researches also which must be conducted by first-rate experts whose services can be had in India only at a prohibitive cost, must be undertaken in the United Kingdom.

The British Council for Research will best spend its energy in India and help Indian industries by communicating to the Imperial Board for India all important discoveries.

Q. 24.—An Imperial Board for Research is needed for the promotion of Indian industrial interests. I do not know how far the Indian Science Congress serves the purpose. As far as is publicly known nothing practical has so far resulted from the researches of that body. I doubt if any industry has profited by those researches. I want practical help to the industries. The best men should be gathered together for the Board, and the services of colleges and other scientific institutions may be availed of with advantage.

Qs. 25-27.—Further surveys of the resources of the country may or may not be necessary. It is difficult to say anything either way. But the great point is that the official reports have more or less an academic air, and hardly supply the special wants of the practical industrialist. No attempt again is made to popularise them such as they are. Surveys for industrial purposes.

Qs. 28-38.—Commercial museums, sales agencies and exhibitions should prove helpful to Indian industries. The museums and the emporia should be established at all important centres. It would be a great thing if the museums are utilised for the demonstration of improved processes of manufacture. They will have then an important educative value. These and the emporia must be of a more or less permanent nature. Sales agencies are absolutely necessary for the development, not only of unorganised cottage industries, but of some of the mill manufactures. Information about these manufactures is not so general as might be wished and as would influence the sale of the products. Many people, for instance, do not know of the existence even of such articles as Jessore combs, and yet they are manufactured in mills. The museums and the emporia should, in my opinion, work under Provincial Directors of Industries who in their turn must be subordinate to an Imperial Board of Industries. The object must be to disseminate as widely as possible useful knowledge regarding Indian products and to encourage their sale within the country. Commercial museums and sales agencies.

Exhibitions have been held all over the country, both at provincial headquarters and at district headquarters. Their influence upon industries must necessarily be slow and intangible, but this much is plain that they have helped to popularise Indian manufactures. Government will be well advised to encourage exhibitions. I would much rather have them periodically at provincial headquarters or suitable centres within the provinces. District exhibitions might be abandoned. There is at present some waste of energy. We should have one exhibition for each province, and this should be held under the Provincial Director of Industries, the cost being met partly by public subscriptions and partly out of provincial funds. The object should be to bring sellers and buyers into contact. Exhibitions.

In my opinion, the British Consulates should discharge the functions of our trade representatives in foreign countries. That will be an economical arrangement. We should follow the Japanese example. I am informed the Japanese Consulates in different countries are utilised for the purpose of pushing the sale of Japanese goods. Similar efforts of the British Consulates in Indian interest may have to be supplemented at intervals by the appointment of special commissioners for studying the needs of the foreign market and for pushing the sale of Indian products in that market. For market-pushing within the British Empire trade representatives are necessary. Men in touch with trade and industry only should hold that office. For interprovincial commerce trade representatives should not be necessary. All that is necessary to be done in this behalf may well be done by the Provincial Directors of Industries under the guidance of the Imperial Board of Industries. Trade representatives.

I think lists of articles used by Government departments but imported at present, from abroad should be published throughout the country, and samples should be exhibited in commercial museums. Both courses are necessary. Government patronage.

The only point I would impress upon the Commission in connection with purchase of stores is that the Government out here must have a free hand in this matter.

Qs. 46-55.—I have some knowledge on the subject of the training of apprentices in factories and workshops. In our mills we had arrangements for such training. We had every reason to be satisfied with the results. But apprentices are not taken in India except in a very few workshops and factories. The East Indian Railway trains apprentices at the Jamalpur workshop in some departments, and the result is satisfactory. The men turned out are well up in the practical part of the business. Facilities are also provided for instruction in the theoretical portion of the work in the night classes maintained within the workshop. Training of labour and supervision.

Apprentices are also taken at Lilooah and Kharagpur and the workshops of Messrs. Burn & Co. In some of the mines also, I am told, arrangements are maintained for the training of managers and overmen. I like the system, and it would certainly be advantageous to the industrial interests of the country if it could be made more general. For want of facilities in India the Indian youth has to be sent abroad for practical training in workshops. Workshop and factory training is different to training in industrial schools. In these latter institutions training can be had only in the small industries like carpentry, tailoring, weaving, book-binding and cane-work, while in factories and workshops the training is for the higher grades of industrial experts. Industrial schools are as much a necessity in India as any other institutions, and I would recommend their establishment all over the country. In Bengal there are only a few industrial schools. The reformatory schools are of course in the hands of the Government. Of the other schools, that at Baniadih is maintained by the East Indian Railway for the sons of its employes and the rest are all managed by missionary societies. Industrial schools should be under the Director of Industries, the Education Department confining its attention to supervision of administration. Technical institutes ought to be established for the training of supervisors and skilled managers, practical training being imparted to them in factories, workshops and collieries under some sort of arrangement with them. Supervisors, managers and technical experts of private firms should be sent abroad to study conditions and methods in other countries. Government should secure them admission into the factories and workshops of foreign countries. The cost should be borne primarily by the firms which employ them and which will benefit by their services, but Government might encourage them by granting scholarships tenable abroad. Private firms will not grudge the charge once the desirability of the deputation is realised by them. The company known as the Calcutta Pottery Works, for instance, has sent the manager twice to foreign countries. Industries assisted by Government may be required to train technical experts on payment by Government of the extra cost and on condition that the firms training them shall have the first claim upon their services on reasonable terms at least for sometime.

Mechanical engineers.

Q. 54.—I do not think there is so much a want of uniformity in the standard of examinations for mechanical engineers held in the various provinces where engineers in charge of prime movers are in certain cases required to be certificated. The standard is practically the same, but the form of the examinations and the questions are not uniform. But it would certainly be desirable to remove all differences such as they are, and any measures designed to remove them should be welcome. Reciprocation among Local Governments and Administrations in the matter of recognition of certificates is desirable. With regard to the law on the subject of qualifications in an engineer in charge of a prime mover, I am myself doubtful about its need. In my experience I have seen first-class hands in managing prime movers, with all the practical training necessary and desirable, lack sufficient general knowledge to pass examinations. They are practically illiterate; at the same time they know their business so well that no mill manager would like to dispense with their services. There is no reason for the step either. Their services are cheaper than those of engineers with higher general and technical qualifications, and it is a question how far this factor of cheapness in the special services can be neglected in the present stage of industrial development in India.

Official organisation.

Qs. 56-62.—A Director of Industries was to have been appointed for Bengal. In my opinion, every province should have a Director of Industries. He may be helped by a small Provincial Board composed of one official and two or three non-official experts. But this by no means is necessary. The Director who should be a businessman may be left to do everything himself. He must deal with all industrial questions, and in so doing he may consult expert opinion of the province. He should act directly under the executive head of the province as regards matters relating to finance, and under an Imperial Board of Industries as regards all matters of a purely technical nature. He will be in charge of supervision of industrial schools and other technical institutions for the training of skilled supervisors, etc. All applications for pecuniary aid to industries must be dealt with by him, and he will be the authority to decide, with the sanction of the suggested Imperial Board of Industries previously obtained, all questions about the establishment of pioneer factories, demonstration factories and assistance to private firms, and all other questions which directly or indirectly have a bearing upon the provincial industries. If there be a Provincial Board to help the Director, the functions of such Board shall be purely advisory.

I would like to have one Imperial Board of Industries for the whole of India, composed of one or two Government officers and some businessmen—men who have experience in the management of industries. For the present this Board may be placed under the Commerce and Industry Department of the Government of India, but it shall be the supreme head for all questions relating to the development of existing industries and the establishment of new industries. The Provincial Directors shall work under the Board.

Reference libraries.

Q. 79.—Libraries of technical and scientific works at different centres will certainly prove valuable agencies for the dissemination of useful knowledge among the people, and should prove helpful to industry. There is hardly any collection of the kind in Bengal. It may be that the number of readers in the suggested libraries will not be large, but the special knowledge gained by the learned few will in time filter down to the general public.

Colleges of commerce.

Qs. 80-81.—I should think a college of commerce will be a very desirable thing in Bengal, although I do not entertain high hopes about its influence upon the local industries. At the same time it cannot leave Bengal industry unaffected. In this province literary education has developed marvellously, with the result that the graduates turned out by the Calcutta

University do not find employment. The question of middle class unemployment has assumed a gravity here which it is difficult to exaggerate. Every effort must be made to create a healthy diversion in the course of university education. The best way to solve the problem would be to create among young men a taste for commerce and industry, and a college of commerce is calculated to do this much even if it fails to do everything else. Once this healthy taste is created in Bengal, industries generally are bound to benefit by the change. But to succeed in this direction, the college of commerce must provide facilities for practical training also under some arrangement with some of the respectable firms of Calcutta. In Bombay training in the college of commerce is supplemented by training in the big business houses. The point is the mental equipment of the graduates must be such as to fit them for undertaking some business on their own account as also to supply the brain power necessary for the success of the provincial people in business enterprise. I am well aware that the Government School of Commerce of this city has not been a great success, but the students there lack suitable preliminary general education and the standard of proficiency is not high. A college of commerce, organised on practical lines, ought to give a new direction to the youthful energy and talent of Bengal.

Qs. 82-88.—The statistics at present collected by the Director-General of Commercial Intelligence and the Director of Statistics are undoubtedly valuable, but, as far as I know, are not of much help and use to the practical industrialist. The only statistics which are of practical value are connected with the state of the crops. But even in this matter both the manufacturer and the dealer depend largely upon independent sources of information. Detailed information about the world's stock of materials and manufactures and the condition of the market both here and abroad, issued periodically under the authority of Government, will be far more valuable to the industrialist. It will be a good thing if such information could be disseminated in the country through the vernaculars.

I anticipate excellent results from special journals connected with commerce and industry. The "Indian Trade Journal" has not affected industry in the country. The special journals should be backed by Government, should have a vernacular section, and the rates of subscription must be fixed as low as possible.

The special monographs issued by the Government Departments have more or less an academic value. I am far from suggesting that they should be discontinued. They undoubtedly serve a very useful purpose, but I fear they have not influenced the course of Indian industrialism to any large extent. The aim should be to provide an easy and handy repertory of useful information about a particular industry, and this can perhaps be attained by adding a supplement to each monograph containing a resumé of the whole thing which may be examined at a glance. Easy vernacular translations should also be issued, helping the small industrialist with little or no English education to get a bird's eye view of the whole position. And all Government publications of this nature or containing statistical information must be offered for sale at as low prices as possible. The present level of prices is high.

Q. 96.—I strongly advocate registration of partnerships in the interests of trade. That will go some way to prevent business dishonesty, and facilitate business. Parties will know one another better. Litigation will also be simplified and reduced. In the case of big firms no serious consequences follow from non-registration of partnerships, but the danger is more or less acute in the case of comparatively smaller dealers carrying on business, not in their own names, but in those of others who may be men of no substance. The Marwaris, for instance, usually have a combination of two names for the name of the firm, and the persons whose names are thus used may not individually command either public confidence or respect. There is difficulty in case of litigation as a consequence, and there is some restraint upon dealings.

Q. 102.—Nothing has been done in Bengal towards ascertaining the possibilities of developing hydro-electric power. Investigation should certainly be made in the matter.

Q. 110.—I have been actively concerned in the cotton industry, and the first suggestion I have to make for its development is that the excise duty upon cotton goods made in India must be abolished, independently of the import duty. This latter duty should be maintained at a sufficiently high point, not only for revenue purposes, but for the protection of the Indian industry. In order to attract more capital into this industry, the margin of profits must be maintained as high a level as possible. It would be wrong to contend that we have reached the utmost limit of expansion. The market for cotton piecegoods is almost unlimited in India, and in the normal condition of things Indian manufactures would supply at least a large proportion of the demand. But, as a matter of fact, the cotton goods produced in India represent but a fraction of the total consumed annually, and the cotton imports, both for value and quantity, form the bulk of our total imports. There cannot therefore be any question of overproduction and glut. If this condition of the market is noticed at times, it must be due to adventitious circumstances. There is ample scope for expansion of the industry, and a heavy duty upon goods imported into India is sure to help development. The War has made this clear. A falling-off in the volume of cotton imports has ensured a ready market for Indian manufactures with an increase in the profits. Anything which goes to reduce the imports will *pro tanto* help the Indian industry. If a heavy import duty, not countervailed by an excise duty, is found impracticable, the Government of India should have ample powers to stop imports as a temporary measure for the relief and benefit of the industry.

Larger production of long staple cotton is another condition of development, and Government are rightly earnest about it, but a more active policy would best meet the requirements of the industry. Concessions, bounties, subsidies,—every one of these artificial means of encouraging production would be justified. Until the supply of long staple cotton becomes abundant, competition with foreign imports must be seriously handicapped.

An Imperial law penalising the mixture of baled cotton with water, and the movement of cotton and coal meant for Indian cotton mills over Indian railways at specially easy rates, or what are known as concession rates, should have a very beneficial effect upon the industry.

Prizes for fine spun yarn appear to me to be well suited to the needs of the industry as a whole. In spite of the growth in the mill industry, the handloom industry holds its ground. If Bengal could regain its lost art of spinning the finest yarn the world has ever seen, this handloom industry would stand upon an independent footing in the matter of supply, and receive an encouragement the importance of which must be obvious. To my mind, the best way to encourage fine spinning in India will be by initiating a system of prizes and in some cases of scholarships.

The cotton industry would benefit greatly by the cheap production of dyes in India. Indigo and coal tar are to be had in abundance here, and there should not be any serious difficulty in preparing the dyes wanted for the industry. Cheap dyes made locally will make us independent of the foreign supply and improve the prospects of both the yarn and the cloth industry.

The extensive use of hydro-electric power in mills will encourage development by reducing the cost of production.

It is also necessary to train our own men as mill managers, supervisors and skilled workmen. The employment of foreigners in the higher ranks as at present entails an expenditure too heavy for the industry. They should be gradually replaced by Indians with the requisite training and skill. That will have the surest effect of reducing the cost of production, and a corresponding increase in the margin of profits would follow. The larger profits would attract more capitalists into the industry and more mills would be erected in the natural course of things.

The question of mass education likewise is important to the cotton industry. Some sort of general education would, if anything does, increase the efficiency of the operative—a great point in Indian industry.

Two more measures would offer the greatest encouragement to the cotton industry here, both having for their objective the more profitable utilisation of waste products. The cotton seed and the waste cotton could be made to yield a much larger income to the mills than at present. Now both these materials are exported to the West where they help to maintain two lucrative industries. The cotton seed oil industry is a growing industry on the European Continent and in America, and Germany uses the waste cotton for various industrial purposes. These industries can be introduced in India with considerable profit to the people in general and to the Indian cotton manufacturers in particular. The ginning mills would make larger profits over the seed and the spinning and weaving mills over the waste cotton. With increased competition in consequence of the increased profits, ginning would be done cheaper in time, and that will keep down to some extent, however slight, the price of baled cotton such as is used in the spinning and the weaving mills.

Q. 111.—In my opinion the following industries could be either introduced or developed in India without any great trouble and with immense gain to the people and the country;—(1) expression of cotton seed oil, (2) glass manufacture, (3) match manufacture, (4) manufacture of dyes, colours, paints and varnishes, (5) jute cloth manufacture for shirting, (6) manufacture of chemicals, turpentine included, (7) carpet-making with waste cotton, (8) porcelain manufacture, (9) distillation of potable spirits from paddy, (10) manufacture of cheap manures from animal and vegetable matter, (11) manufacture of margarine, (12) manufacture of vegetable silk from rhea and other suitable materials, (13) utilisation of by-products of coal, sugar, etc., and (14) manufacture of the yarn used in making Kasi silk.

ORAL EVIDENCE, 12TH DECEMBER 1916.

President.—Q. In answer to question 102 you say that nothing has been done in Bengal towards ascertaining the possibilities of developing hydro-electric power and that investigation should certainly be made in the matter. Do you know of any proposition for hydro-electric power?—A. I know nothing about it.

Q. Schemes have been investigated in Sikkim?—A. I know nothing about them.

Mr. C. B. Low.—Q. Where is the Empress of India Cotton Mill situated?—A. In Calcutta, some 14 miles southwards.

Q. Are the shares quoted?—A. The shares were quoted. The mill has been burnt down now.

Q. Have you had any experience in promoting light railways?—A. No.

Q. Have you seen anything of the Indian firms promoting light railways in Bengal?—A. Yes.

Q. What degree of success had they in raising capital?—A. They have an English name attached. I am referring to Martin & Co. They have done a good deal of work with success.

Q. You have known other firms?—A. We had these light railways carried out by Bengali gentlemen here, and I think, they have done their part of the work very nicely.

Q. Did they succeed in getting capital?—A. I do not think there was much difficulty in raising capital.

Q. From what classes of people? From the bhadralogs?—A. Yes.

Q. Where did the money for the Empress of India Cotton Mills come from?—A. Our money as well of other Indian and European gentlemen.

Q. Has money come from the Bombay side?—A. Not a single rupee from Bombay; all from Calcutta side. When I say Calcutta side, I mean Bombay people located in Calcutta and doing business in Calcutta.

Q. Supposing you have a successful industry in certain provinces and supposing the Bengali people are not very ready to take up industries, would it be justifiable to give a demonstration of an industry in another province in order to help the Bengali people to take it up?—A. That is exactly what I mean. The industry might be flourishing in one large town, but that should not prevent the Government from coming forward to give their aid and making practical demonstration in out of the way places. Take for instance the match industry. Look at the amount we are importing from Japan and other places. If this industry had been taken up by Government and demonstration factories were started, the poorer classes of the people would certainly take them up and the people would be greatly benefited.

Q. Speaking about the Ambala Glass Works you give a rather incorrect idea as to its financial position. They are going very strong?—A. Possibly these are new works that you are speaking about. Then I do not know about them.

Q. You say that it must not be open to a few shareholders to force a bank to go into liquidation. Are you aware that the Companies Act gives considerable discretion to the judge to refuse such applications?—A. That is what I think, and that is why I have made that remark.

Q. Do you think that the judge is too ready to accede to insufficiently supported requests of that sort?—A. That is my idea.

Q. Have you any specific instances in your mind?—A. I have in mind the case of Har Kishen Lal of Punjab. Had not such a rush for money come upon him he would still have been able to go on.

Q. Do you think that Har Kishen Lal's case is an instance in favour of the relaxation of the present provisions of the Companies Act?—A. I think so.

Q. Have you seen anything of the Commercial Museum in Calcutta? Could you give us any criticisms or suggestions for making it more effective. In what way could it be developed?—A. It is very popular. But very few people know about it. The museums must be accessible to the lowest classes so that all may profit by them. I think no effective use has been made of them.

Q. Do you think there should be more of them?—A. There should be more of them and their existence made known in all the vernaculars so that the people may know and profit by them. Knowledge must filter down.

Q. Do you consider that its present site is not suitable? Do you think it should be located in the business centre?—A. The site is suitable. It should not be a mere show. It should be a medium of instruction.

Q. It is a commercial museum, and not an industrial museum. Do you want greater publicity regarding its contents?—A. Yes, and regarding its uses also.

Q. Have you seen of instances where it has been of use?—A. It has been of great use in cases where we are bent upon going into any particular thing. But at the present moment the lower classes have hardly made any use of it.

Q. Regarding your apprentices, what degree of education had they?—A. Ordinary education up to the matric standard.

Q. Did you find that that education was of assistance to them in picking up their work?—A. I think it was of very great assistance.

Q. How is the training in the college of commerce supplemented by practical training?—A. What I have been told here is that after coming out from the Bombay school they have been apprenticed in the factories and private firms, and they have proved a success.

Q. Is that apprenticeship looked on as a part of the college training or do they get these appointments themselves?—A. That is a subsequent idea. After acquiring certain knowledge in these colleges they go to finish their education in a practical way in some college or other.

President.—Q. The information that I got in Bombay was that no graduates have been passed out of these colleges. Their course is one of four years and they have done only 2½ years. You just told us that they had come out and had become apprentices and that they were successful. Is it possible that you might be referring to the Victoria Jubilee Technical Institute?—A. That is the information that we got in Calcutta.

Mr. C. B. Low.—Q. Why was the Government School of Commerce in Calcutta found to be unsuccessful?—A. The candidates turned out were not to my knowledge capable men.

Q. Have you seen any of those?—A. They came for employment. They were quite mediocre.

Q. What did they learn?—A. Shorthand, Typewriting, Book-keeping. I for one would not entertain their services at all.

Q. Were they badly taught or were they not taught long enough?—A. I do not know about the teaching that goes on there. I found these men not up to the mark. I cannot blame the method of teaching without knowing the facts.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. Many of the witnesses have told the Commission that the banks do not give money to Indians in starting enterprises. Does the Bank of Bengal give advances on security which is good?—A. I think they give on Government papers and port trust debentures and things of that kind. It all depends upon the personality of the firm applying for loan. The question is a broad one, and it must be narrowed down to its proper limit. I think firms having a reputation have no difficulty in obtaining money.

Q. Even if they are Indian?—A. Indian firms are not very many in number.

Q. They do not refuse because the firm is an Indian firm?—A. You will see from my statement that I say that everything depends upon the personality of the applicant. If a Bengali goes and asks for it, he will not get it. But the Bombay people can command anything. That is a positive fact.

Q. You mean in Calcutta?—A. Yes. If I go to the Bank of Bengal, I can get any amount I want.

Q. You say that existing industries must be protected and new industries established with Government aid and if in this scheme of State assistance individual interests suffer, we must boldly face that contingency. What is meant by individual interests?—A. If you are starting an industry here which has to face competition with a foreign industry, then I say that Government must aid that particular industry.

Q. You say that there should be an Imperial Board of Industries and business men must be taken on it. How should they be taken?—A. There might be a regular Board of Industries in the headquarters of the Government of India. I do not mind where it is so long as it is in India.

Q. How can you get business men to go to Delhi and remain there for twelve months without making their private interests suffer?—A. I mean in the way that your services have been obtained for this Commission. If business men are paid well, they will be ready to serve.

Q. Supposing you had Board of Industries, one in Bombay and in Calcutta and so forth, and if these Boards assisted the Director of Industries of those localities and if their recommendations went to the Imperial Director of Industries, would that not be better?—A. What I say is this. You have an Imperial Board of Industries and there are the several Directors of Industries in the provinces. You may give them an Advisory Board but the Director must be the supreme man. There should be no red tapism or correspondence. Too many cooks will spoil the soup. Such a thing should not be done.

Q. Have you got a Board of Industries?—A. I do not think we have any here.

Q. And then with regard to the long staple cotton, why do you want Government aid?—A. Formerly we used to spin cotton of a very high standard, but we also used to make muslins of such superior value that they could not be manufactured even in Great Britain. This is now a dead art in India. That ought to have been revived. I know cases where Government has been giving help. But it is on a limited scale.

Q. Are these ginning factories here making huge profits? What profits do they make?—A. I could not tell you. They make a good percentage. Ten per cent. of profits. That is my information.

Q. When you started this Empress of India Mills, you started with spinning?—A. Only spinning. Within the first three years we made cent. per cent. of profits and increased our mill by nearly half.

Q. Is there a prospect for the cotton industry in Bengal?—A. I think there is a prospect for it in Bengal also.

Q. Where do you get your cotton from?—A. We get in Bengal itself, and also from the Central Provinces and from the western districts.

Q. You get the cotton from the western districts and do you think you can stand competition from Bombay side?—A. Do you mean for spinning only or for weaving also? If you take weaving into consideration, then I think Bombay has the advantage over Bengal.

WITNESS No. 136.

MR. M. M. S. GUBBAY, C.I.E., I.C.S., *Controller of Currency, Calcutta.*

Mr. M. M. S. Gubbay.

WRITTEN EVIDENCE.

I would explain at the outset that the opinions expressed in the following memorandum are my own personal views, and are not based on any instructions from Government.

FINANCIAL AID TO INDUSTRIAL ENTERPRISES.

Q. 4.—With reference to question 4 under this head, I may explain that a number of Government cases in which Government aid to existing or new industries was given, or sought for, came up for consideration while I was serving in the Commerce and Industry Secretariat and in the Financial Secretariat, and in the ordinary course of Secretariat procedure it was necessary for me to examine these proposals and to form an opinion as to their merits and the expediency of extending or refusing the assistance sought for, or of modifying the form in which such assistance should be given. As to the various methods of giving Government aid as detailed in question 5, I am disposed to think that the circumstances of each particular case must necessarily largely determine the particular form of assistance to be extended. Thus, for instance, while in some cases a guarantee of Government purchase of products for limited periods might be the most suitable, or a suitable form of assistance, such a method cannot invariably be applied, or might prove, if the Government demand can only be for a limited quantity, to be inadequate. Again, the supply of machinery and plant on the hire purchase system appears to me a suitable form of assistance in the case of smaller industries or for experimental purposes, but could not clearly be adopted as a satisfactory method in all cases. I am not in favour of out-and-out money grants-in-aid, or bounties, or subsidies, which are the first two methods in question 5, as I do not believe either that Government can satisfy themselves, or the industrialist could satisfy Government, without inquisitorial enquiry that the money was being, or had been, legitimately expended on the purposes for which it was professedly taken. Generally speaking, where, and if, Government assistance is to be in the form of financial help, my feeling is that, wherever possible, the following two conditions should be observed :—

- (1) The whole financial risk should not, in my opinion, fall on the State, i.e., the industrialist must take his share of such risk, though it need not necessarily be equal to the share which the Government is to take.
- (2) The Government assistance should be repaid, when, and if, the industrialist's effort has reached a stage at which his enterprise has become ordinarily remunerative and brings him in an adequate return.

It may, however, be advisable and possible that in the case of the smaller individual industrialists, whose case can suitably be differentiated from those in which Government assistance is sought for concerns appealing to the public for subscriptions, the model of the assistance which Government places at the disposal of agriculturists in the way of loans at a reasonable rate of interest might be adopted.

As regards the Government control in cases where financial help is extended by the State, I do not personally attach much value to the presence of a Government director with defined powers on the Board. In such cases I should prefer to see a limitation on the powers of the directors in respect of their powers to embark on fresh financial liabilities, and a regular system under which the proceedings of the directors would be automatically reported to a Government officer or department, presumably the Director of Industries. In all cases it should be a condition of the grant of financial assistance that a Government officer or department should have access at all times to the proceedings of the directors or the manager, and the latter should be encouraged or probably required to work in close personal relationship with the officer or department referred to above.

Reverting to the question of Government purchase of products for limited periods, this method might, I venture to suggest, be more freely utilised than hitherto. I observe that the Commission have invited criticisms in regard to the working of the present rules regarding the purchase of stores by Government departments. I believe that there has always been a feeling in respect of these latter rules that they unduly favour purchase through the India Office: at any rate, this was certainly the case at the time when the Stores Committee was investigating the question of the amendment of the then existing rules.

Q. 10.—With reference to question 10, I am of the opinion that the creation of new Financing agencies, banking agencies, in order to give assistance to industrial undertakings, is a pressing problem. The existing banking agencies cannot, having regard to the class of business which they now undertake, be expected to finance industrial operations in regard to which a quick return of the money advanced is not to be expected. It might be necessary to impose, as a condition in the case of such industrial banks, that they should not receive deposits at call or at short notice.

III.—ASSISTANCE IN MARKETING PRODUCTS.

Q. 28.—The Calcutta commercial museum is, I understand, based on an experiment which was started shortly after the outbreak of the war by the Board of Trade and with which I was closely associated at home. It differs, however, from the home model in many important respects into which I need not perhaps enter. I have no doubt from the developments which have followed on the Board of Trade experiment that these sample exhibitions—as they were known—met a very definite want in the industrial organisation of a country like England; but my feeling is that so far as India is concerned the stage of industrial development at which such institutions can play a full part has not yet been reached. In any case, care should be taken to prevent the samples shown at the commercial museum in India from becoming antiquated and out of date, and they should be renewed as frequently as

Trade representa-
tives.

possible. There is also always a risk of exhibitions of such samples serving merely a spectacular purpose: and this should be guarded against.

As regards trade representation of India in Great Britain, the Colonies and foreign countries, I believe that it is very necessary to secure Indian trade representation in London without delay; but I think that similar representation in foreign countries and the Dominions might well wait. Looking back to my experience in London between September 1914 and February 1915, there was ample evidence that the appointment of an Indian Trade Commissioner filled a very necessary want. Just in the same way as the Board of Trade have found it necessary to open a City office to deal with commercial enquiries as regards tariffs, statistics, etc., so also for this purpose alone there should be representation of the India Office in the city. Also having regard to the numerous inquiries which reached me from Indian traders, desirous of entering into business relations with home buyers or sellers, it is clear that the present arrangements do not adequately meet all needs. But a far more important requirement is, in my view, to provide manufacturers or capitalists who are interested or likely to be interested in the purchase of, or the development of, Indian products with the facilities of ascertaining the preliminary data without which their operations cannot be begun or extended. It is at present a matter of sheer luck if on referring to the India Office an enquirer in England can be put into touch with some Indian official on leave who is competent to reply authoritatively to the enquirer. A considerable amount of routine information is undoubtedly available at the Commercial Intelligence Branch of the Board of Trade, and lists of persons or firms in India, classified according to the nature of the business in which they are engaged, have been drawn up and are furnished to enquirers. For the rest, however, the enquirer is left to pick out from this list any name that he may select and to get into communication with the firm or person in question. Where such information fails to satisfy the enquirer, he is recommended to communicate with India. In the case of the Dominions the presence, at all times, of commercial representatives of the Dominions in the City and also, at frequent intervals, of British Trade Commissioners, who are allowed to spend a certain amount of time in England, secures that an enquiry as to trade openings will be promptly, authoritatively and adequately dealt with. A similar provision is required in the case of India: that is to say, there should be a properly equipped and qualified office, whose function should be to deal with Indian trade or commercial enquiries big or small. It is true that we do not need to advertise India for the purpose of attracting settlers as in the case of Dominions: but it is necessary that we should advertise the resources of the country. We need to introduce some suitable method of attracting attention to these resources, and to the very complete data which many Indian scientific departments have put together as to the possibility of commercially exploiting these resources.

In my view the Indian Trade Commissioner should have recent personal experience of the country; he should have, if an official, filled appointments which have brought him into touch practically in the course of his official duties, and not merely as a Secretariat officer, with Indian commercial firms and Indian commercial and trade questions; he should, if an official, be of sufficient standing to carry weight with the India Office and other Government departments at home, as well as to admit of direct communication between him and departments in India. There should, I think, be a limit to the tenure of the appointment, and in the case of an official, it should not be regarded as an appointment to be held indefinitely after retirement. There need be no reason for limiting the departments from which this officer could be recruited. Indeed it is probable that a department like the Geological Survey, the Forest, or the Agricultural department, would frequently offer the best field of selection. The Trade Commissioner should be authorised to communicate with officers on leave who might be in a position to advise on any particular enquiry. In the initial stages of its development, the appointment should be attached to the Commercial Intelligence Branch of the Board of Trade, so as to pave the way for the introduction of a satisfactory system of the relations between the Trade Commissioner and the business community of London and other manufacturing centres. Subsequently, however, it seems to me that it would be possible to leave the Trade Commissioner to his own resources. With the appointment of such a Trade Commissioner it appears to me that the arrangement with the Imperial Institute may need to be revised, and I am certain that it will need to be clearly defined. The Imperial Institute at present in an undefined sort of way assumes that all commercial intelligence enquiries relating to Indian products should be directed to it. This appears to me to be a very unsuitable arrangement, as the Imperial Institute is situated at a distance of 3 or 3½ miles from the City, and whatever attractions the Imperial Institute may possess from any other point of view, no body could claim that at this distance from the City, it is an ideal site in which to locate a commercial intelligence office. Moreover, the absence in the staff of the Institute of knowledge personally acquired on the spot of Indian conditions or Indian commercial men, appears to me to establish conclusively the undesirability of entrusting to it the trade representation of India. The Trade Commissioner would, of course, be subordinate to the India Office, but it is essential that he should have the right of direct communication with India in respect of his work.

GOVERNMENT ORGANISATION FOR THE COLLECTION AND DISTRIBUTION OF COMMERCIAL INTELLIGENCE.

Commercial
Intelligence.

Question 53 has reference only to the system of collecting and distributing commercial intelligence, and I do not know whether the following remarks may be regarded as falling

within the scope of that question. There has been in the past, on certain occasions, what may perhaps be correctly described as a tendency to regard commercial intelligence work as including the giving of advice and encouragement with the ultimate object of effecting the development of possible industries. One particular result of this tendency has naturally been that enquiries and investigations have been started in different localities by the Director-General of Commercial Intelligence to enable him to fill this role of adviser. My personal view is that in this respect there has been a wrong conception of the functions of a Commercial Intelligence Department, and that the question of developing industries should be regarded as entirely outside the scope of the functions of that department. I should like to see a special Imperial department or departments created on the analogy of the model of the Geological Survey, or the Forest, or the Agricultural department with a fully equipped staff of experts to be placed, when required, at the disposal of the local Governments to deal with industrial problems arising in their provinces. With the creation of this department it will be possible for the Commercial Intelligence Department to devote itself to its proper functions which primarily are:—

- (1) To divert to the proper and competent authority enquiries which reach it; and
- (2) to assist in the marketing of the products of local industries by bringing buyers and sellers together.

ORAL EVIDENCE, 13TH DECEMBER 1916.

President.—Q. Your written evidence is so clear that I don't think we shall have to ask you any questions in the way of supplementing it; but there is one point that I should like to ask you to consider again, so as to be quite sure that we have your views. I refer to your remarks under "Trade representatives". Referring to the Indian Trade Commissioner in London, you suggest that there should be "no reason for limiting the departments from which this officer could be recruited. Indeed it is probable that a department like the Geological Survey, the Forest, or the Agricultural department, would frequently offer the best field of selection." Unless the Geological Survey has improved more rapidly, since I left it, than I expect, I should not think that an officer of that department would be a capable representative of general trade, if he remained a good geologist at any rate; but I should imagine that an officer of the Geological Survey might reasonably be attached to this Trade Commissioner, and I should like to know whether you think that it would be better this way. Or would it not be better to attach a geological officer and a forest officer and an agricultural officer to this Trade Commissioner partially to give information regarding conditions in India, partially to pick up information from people at home, in order to convey that information back to the department of India carrying on researches, and also that he may bring back the information afterwards when he returns to research work? Do you mean by this that you would actually select officers to act as trade representatives in London?—A. The object of that particular sentence in my evidence was to make it clear that I did not regard it necessary to restrict the selection to the Civil Service, and that it might be possible to find a qualified officer in other Imperial departments which come into contact with commercial men and commercial problems. The Geological Survey at any rate to my knowledge has had, at least two officers who, to my mind, would have been as well qualified as anybody to represent India. If the Trade Commissioner were at any time in need of assistance from the Geological Survey, or one of the other departments mentioned, I should most certainly suggest that he should have assistance as proposed by you. In fact, I go on to say that he should be authorised to communicate with officers on leave. He might have an enquiry which would necessitate a reference to a technical department, and he ought to be authorised to call on the services of officers of that department. I would adopt your suggestion of having an officer attached, but the main point I wanted to make there was that there is generally an impression that these appointments of Trade Commissioner—or any of these Commercial Intelligence appointments in India—are necessarily restricted to members of the Civil Service, or some Imperial department, such as the Customs. In my view there is no necessity for such restriction. The best man ought to be taken, whether he is an official or not an official; and it was in order to expand that idea that I quoted as an instance those three departments. I should, perhaps, have made it a little less down-right. I might have suggested, for instance, "it might conceivably happen" that suitable men would be found in those departments.

Q. You would replace the word "probable" by "possible" or "conceivable"?—A. Yes.

Q. I understand when you make the suggestion of one Trade Commissioner it is, really made with the view of economy; that is, you would not hope to get more than the one Trade Commissioner in London. Do you think that the business that could be done by this Trade Commissioner would be sufficient to warrant the appointment, not only of a Trade Commissioner, but of two or three technical officers associated with him?—A. Eventually I should hope that he might want the assistance of more than one. In the early stages I think he would have to go slow.

Q. But if you don't associate with him the kind of officer from India who can give up-to-date and accurate information of a technical kind, and who cannot deal on equal terms with the specialists who will be advising firms in London, don't you think that if you appoint a

single Trade Commissioner without these trade officers, he will be handicapped from the beginning, and consequently give the post a bad name. For instance, there must arise questions like the case of a mining company wanting to know conditions of mining in a particular area. The Trade Commissioner, if he were not a member of the Geological Survey, would practically be compelled to refer questions of that kind either to India or the India Office. Any information he would give would be information of a second-hand type out of books or from somebody in India, and there would be delay in any case. If you had a geological officer attached to this Trade Commissioner, the geological officer could be called in and the point discussed on the spot with the technical officer of the company in London. Would that not offer a greater chance of success?—A. Quite so, I quite agree in that.

Q. Otherwise don't you think there would be danger of the post being misunderstood; in other words, is it not dangerous to begin on too small a scale?—A. It is entirely a question of having men available, if these departments could spare a man; and it is also a question of financial economy. I think your suggestion is the ideal one, and one would like to see it adopted straight away, but I doubt whether the technical departments in India could indefinitely spare a member of their staff to be attached to the Trade Commissioner. They would have to be increased. All the scientific departments in India seem to me to want a considerable amount of strengthening, and if you postulate that there will be such an increase, and financial conditions don't stand in the way, I certainly agree to a larger organisation on the lines that you have indicated.

Q. It would only be an increase, in the case of the Geological Survey, one, Forest, one, and Agriculture, one, to meet this minimum of three specialists attached to the Trade Commissioner in London. That would not be a very large department to make?—A. You know more about the Geological Survey than I do. I have only seen it from the Secretariat point of view and I know nothing about the possibility with the staff at its present strength of detaching an officer from the Forest and Agricultural Departments. But I have always understood that the Geological Survey was working with a limited number of men. We could, from the business point of view, afford to expand that department considerably, and probably should do so. If that is granted, I entirely agree with you, regarding the attaching of specialists to the Trade Commissioner.

Q. Of course, so far as we are concerned, it is not a question of "can" or "cannot"; we have to decide whether the demand is worth it, and lay that matter before the Government. It is for them to find the means. What I had in view was a scheme of this kind, that these technical specialists should be attached to the Trade Commissioner, not permanently; in the case of the Geological officer for 2 or 3 years, and the Forest and Agricultural officer possibly two or three years too. They should be senior enough to have a good knowledge of India, and they should be junior enough to apply to India the lessons they have learned as technical attachés to the Trade Commissioner in London; in other words their service in London would be a form of study. They would be learning as much as they would be teaching, and they would come to India full of tips that would be useful in developing research work in India. That is the kind of officer I had in view. Do you agree with me that a retired officer is more a danger than anything in giving advice about India?—A. Entirely. I have also said in the case of the Trade Commissioner, that there should be a limit to the tenure of the appointment. He should not remain there for ever, but should come back to India. The Trade Commissioner should also conform to those standards you have laid down with regard to the technical officers. He should be of sufficient standing to carry weight at home, but not so senior as to regard the appointment as the end of his service.

Q. Now that we have got this new picture before us, can you tell us whether the enquiries made of you are of a kind that would justify the Government in having not only a Trade Commissioner but three technical specialists attached, i.e., if you had a Trade Commissioner alone would he really be misunderstood unless he was an exceptional officer, and would his post not only be of little use but would he be likely to be regarded with disfavour by the mercantile community particularly, because he would not be able to give prompt information, especially because any information he gives in matters of forest or agricultural products must be second-hand?—A. I think that, in a very short time after the creation of a Trade Commissioner so assisted, the results would be amply justified. I would not say that, when the office was created, you would see the results in the first two or three months, but I am perfectly convinced that within a year, with a carefully selected personnel, it would amply justify its existence.

Q. I want to get a little further than that. I want to know whether it is not, under normal conditions, dangerous to start with a single Trade Commissioner. He may be an expert in one subject, he cannot be an expert in all?—A. There is a risk undoubtedly.

Q. Of course we know that there were exceptional opportunities for you to be in touch with these departments, and you were also dealing with problems under war conditions. The conditions were not exactly the same, but you can form some picture of the kind of questions that will come before the Trade Commissioner, and I should like to know whether you think it would be safe to start with one Commissioner or—whatever the future may bring—it would not be safer to start with a Trade Commissioner plus three technical specialists?—A. Of course the answer is, it would be safer to start with three. You take a risk in starting with one, and the risk may be very serious. I mean the appointment may be entirely spoilt from the very beginning.

Q. You think we should be justified in urging this matter on Government as a very serious proposal; that it would be dangerous under normal conditions to start with one Trade Commissioner in London?—**A.** I considered that when I was there, I felt considerably handicapped in not having an expert to refer questions of any particular kind to. So far as my opinion carries any weight I think the Commissioner could say that they have had this point put to them as follows: the creation of an office of Indian Trade Commissioner so organised as to give him the assistance of a number of experts can certainly be regarded as the safest form of carrying out that particular policy; anything short of such an organisation entails a certain risk, and the risk is probably so great that it would be better not to take it.

Q. Don't you think that this Trade Commissioner ought to be a man who pushes Indian interests and does not act merely like a post office?—**A.** Yes, the whole thing rests on the question of personnel.

Q. I wonder if you have in your mind, as a Financial officer, the difficulty of getting a proposal through; from the financial point of view you know the tendency there is in every Government department of beginning on a small scale and growing. I want to know whether beginning on too small a scale is not really dangerous; whether you are not bringing about your own condemnation?—**A.** I don't think I am coloured in my views so much by the fact that I am an officer of the Financial Department; possibly my natural characteristic of caution predominates.

Q. You will admit that caution can be so overdone that it becomes a handicap?—**A.** I entirely agree with that statement.

Mr. C. E. Low.—**Q.** In reply to question 4, you say, "I should prefer to see a limitation on the powers of the Directors in respect of their powers to embark on fresh financial liabilities, and a regular system under which the proceedings of the Directors would be automatically reported to a Government officer or department, presumably the Director of Industries." Outside their Articles of Association or outside anything specifically laid down by Government? Suppose their authorised capital was 10 lakhs, and they had already called up 5 lakhs; would you forbid their calling up all their authorised capital, or would you forbid them to apply to Court for power to increase their authorised capital?—**A.** I had not in my mind anything connected with the Articles of Association. What I really meant was the financial liabilities which they undertake in connection with the ordinary working of their business. I mean that it is conceivable that having received Government assistance, and having expended it, they wanted further funds to carry on, and might then go to some other source for these funds.

Q. You mean with reference to their ordinary business working?—**A.** Yes. To translate it into official language, the prior sanction of the Director of Industries should always be taken to any expenditure over a certain figure.

Q. You have had suitable experience with regard to the Stores Department, because I believe you were a member of the Stores Committee; are you prepared to put forward any suggestion that would encourage industries in this country by any modification of the Stores rules? As you are aware, the suggestions of that Committee were not accepted in full?—**A.** No, and you know the reasons.

Q. Are any of the suggestions which you made, and which have not been carried out, such as you think might reasonably be accepted?—**A.** I am inclined to think that, generally speaking, the method of getting purchases from home is the easiest method for the department concerned. I mean we have been so accustomed to being able to indent by telegraph, and there has always been a very responsible official at the other end who is always ready to send out as much as is required, and therefore it is the easiest line of resistance. To get supplies in India requires a certain amount of beating up people for information, and of taking steps to see that one is not being done; whereas the articles which come out from home are supplied on the authority of someone else, and if you are not satisfied, you complain and the article objected to is replaced.

Q. That position is with regard to ordering stores from the point of view of the official who orders it. Supposing you look at it from the wider point of view of helping industries in this country, could not that responsibility, which you allude to, be taken off the ordering official by some such device as a Stores Department in India?—**A.** I had not thought of it in that way, of a Stores Department for the whole of India. Now that you mention it, I recollect that the point was discussed particularly in connection with the supply of the Military Department stores, and the question of creating a Director of Contracts arose. It was, however, thrown out, I am not sure on entirely sound grounds. Roughly speaking the Stores Committee inverted the language of the rules which previously had been to this effect, that everything must be obtained from home, unless you can get the thing in India at the same rate. We suggested inversely that nothing shall be got from home if you can get the same thing in India.

Q. With regard to the suggestion of having a Stores Department in India, is it not clear that the Indian producer is handicapped by the distance of the Stores Department here, while the Stores Department in the United Kingdom affords a considerable degree of artificial assistance at a cost which is never taken into account?—**A.** He is positively handicapped, because he is not allowed to tender simultaneously with the home people. If an order went home for a certain quantity of articles, the Indian producer would not be allowed to tender simultaneously with the English producer.

Q. With reference to your answer to question 10, supposing it were decided to start industrial banks, have Government at their disposal any funds from which they would, in normal times, be able to help the bank by placing any guarantees at their disposal? I invite your attention to the last sentence of your reply about the difficulty of using money for industrial purposes which is deposited at short call.—**A.** It is understood, of course, as put at the beginning of my written evidence that these are purely my personal views. This is a matter on which, if you were to press me for a reason, it would be difficult for me to state my reasons without definite authorisation, and therefore I could only give you an opinion without being able to give you the reasons therefor. An authoritative statement would not be of any particular value to the Commission, and would be no basis for rebutting contrary opinion if such was given.

Q. Have you formed any views about the usefulness of this Calcutta commercial museum, in respect to the following points: do you think its site is the most suitable, or you don't know Calcutta well enough to express an opinion?—**A.** I think that the site *qua* site is centrally situated in the business quarter, and it has the advantage of being in a Government office.

Q. That is, as you very rightly say, an advantage. It is in a business quarter, but is the quarter the kind where business is carried on which is the same kind of business that the museum is trying to facilitate?—**A.** Candidly I have never been quite sure as to the object of that museum. As far as I can recollect, the museum was intended to carry on in India an experiment carried out at home. The experiment at home was on entirely different lines.

Q. We may assume that the most useful functions it is fulfilling is helping the sale of certain Swadeshi industries, and that it is undoubtedly doing this to a certain extent?—**A.** Are you referring to retail sale?

Q. It puts the producer in touch both with wholesale and retail purchasers in certain cases. Possibly if it was removed to a different kind of business quarter, would it not be likely to effect that purpose better?—**A.** I think so. The retail sales effected through it would be undoubtedly increased, if it went into a quarter where the retailer was selling other people's wares.

Q. And its wholesale transactions?—**A.** Its wholesale transactions conceivably could be just as well done where it is situated at present.

Q. Do you think that the kind of man likely to buy, whether wholesale or retail, would be as likely to come up to the first floor of a Government office in Council House Street as he would on the ground floor of an office in Harrison Road, or Bowbazar or Bentinck Street?—**A.** Does the wholesaler want the same sort of attraction as the retailer? I take it that the wholesaler can just as easily go round to Council House Street and see what is being offered there, make his own choice as to the suitability of an article, and then proceed to get into touch with people who can supply it. The retailer is rather a different person. He is probably living from hand to mouth and would like to jump into a place and say, "I am short of this particular thing, can I have anything like it?" We found at home that the wholesaler would not come into any place where a retailer came. Until we gave a guarantee that retailers would not be admitted, there was no chance of our making a success of our experiment. None of the manufacturers nor the wholesalers would touch it. I am not at all certain what the Calcutta commercial museum is intended to effect.

President.—**Q.** I asked if they kept a record of the people who went into the museum, and they said they did at first, but gave it up. I suggested that it was an important matter to keep that record, so as to know what class of men went to that museum, and what class they were serving. Don't you think it would give us an idea how the museum was being used?—**A.** I entirely agree. We did not allow free admission to our thing at home. Admission was only on ticket, and record of any business put through was always given to us.

Q. You think it would be better used if there was a definite field for using it?—**A.** I think if the privilege was in some way restricted, it would probably be more appreciated. In these cases a certain degree of restriction gives the thing more value.

Mr. C. E. Low.—**Q.** Do you think that the opening of other museums, say, another one in Bombay, would be an advantage; or if not in Bombay, perhaps in some other large town?—**A.** I am very sceptical.

President.—**Q.** In Bombay there is a Swadeshi stores run entirely on commercial lines, and I believe the stores pays. Their business is mainly retail sale over the counter, and by V. P. parcels; so that we have two things going of a totally different type, the Calcutta commercial museum, which, so far as I can conceive, deals with wholesalers, and the Swadeshi stores in Bombay which is effecting retail trade. Would it be possible and advantageous to have two such institutions in a town like Calcutta, the commercial museum where it is, and the Swadeshi stores in Harrison Road, either undertaken as a private enterprise, or assisted in some way by Government?—**A.** How would you fill the Swadeshi stores?

Q. You mean with goods? They at present have a very big variety in Bombay. You can buy practically anything you want. They have an illustrated catalogue. I don't know where they get the material from altogether. It has an illustrated catalogue which is got up admirably.

Hon'ble Sir Fazulbhoy Currimbhoy.—**Q.** We send our goods there as samples, and they are kept there and sold. Other factories send sample things, and if they have to have a bigger lot,

if it is in demand, they ask us to send some more, and we send them. They are selling lakhs of rupees worth of goods?—A. I take it that your samples are not put under glass cases, but are shown in such a way that people can handle them?

Q. Yes, every article you can handle. Sometimes we have to give two or three hundred bales when we send two or three pieces there. They have got the proper staff to communicate with up-country people?—A. That is a different thing to a museum.

President.—Q. That is why I am putting this before you. You don't know the Bombay model and probably cannot form a clear picture of the conditions? From what Sir Fazulbhoy tells me, it is very much the same kind of arrangement we had at home. We had a big room and everybody who wanted a particular kind of article to be manufactured would send a sample, and the manufacturer would come and say that he would make or would not make it. We got into touch with makers who would manufacture from samples. We got samples from people who sold a particular kind of German article. The manufacturer would come and look at it and say, "I can do this," and the firm who had sent the samples would then go into the question of cost, etc., with the manufacturer. For this purpose, they would go into a private room and discuss terms of business, and the thing went through. It was not a case of show cases with gold letters and things ticketed. That really reveals to us three types; the one here, the commercial museum; the one in Bombay which is very attractive to the ordinary retail buyer, and the scheme which you describe in London, which has attracted the wholesale dealer?—A. Many wholesale dealers found their sources of supply cut off with the outbreak of war. We tried to put them in touch with the English manufacturers who could make the goods.

Q. Then is it your view that the commercial museum ought to be reformed and made more in accordance with the London model which you found successful?—A. We want to know clearly what the commercial museum is going to do. When you know what your object is, then you can sit down and consider means. If it is a question of retailing products of our Indian manufacturers, it seems to me that the model Sir Fazulbhoy describes is the one to follow. It should be situated in the bazar, and the supply of samples should be left to the firms to send. Really what you would then provide would be a sample room where a man could see all he required at one go, instead of having to go round and see a large number of different people; and I am entirely in favour of that.

Q. Is it your opinion that the commercial museum suffers from the muddling of two distinct lines of policy?—A. It seems to me to be the case. My view is simply based on what I have heard from people who created the museum.

Mr. C. E. Low.—Q. In your final paragraph you speak about the Commercial Intelligence Department diverting to the proper and competent authority enquiries which reach it; that is to say, if you have an Industrial Department you will turn it on to answer questions. With reference to the Indian Trade Commissioner, we have of course no Industrial Department at home. If we have one in India, do you think the Indian Trade Commissioner should give assistance to industrial enquiries either from the Industrial Department out here or from private individuals; with reference, for instance to the character of machinery available?—A. May I ask a first question; what is the Industrial Department contemplated?

Q. We don't know, otherwise we should not be here?—A. Then I find some difficulty in answering your question.

Q. We ought to assume that the department will be an efficient one with any number of experts and experimental appliances for solving such questions as can, with due regard to economy, be solved in this country. But all through the trend of the evidence has been to the effect that there would be certain things that could be better done at home, and there would also be the question of the supply of machinery. Do you think that the Industrial Department should, as a rule, correspond with the manufacturers of such machinery; or do you think that the Indian Trade Commissioner will be able to give substantial help to such department in conducting such enquiries? We may be in a position to say that the Trade Commissioner knows about certain things, and we would like him to call round on certain people and discuss further points with them?—A. I take it, this is the case you contemplate. You have an Imperial Department that deals with the chemical industry, and this chemical department comes to the conclusion that it wants a particular kind of machinery. It is to this extent in doubt in regard to it, that it does not want to commit itself; and wants to have advice from somebody at home. I don't see in that case how the Trade Commissioner can do anything more than place before him what information he gets from the manufacturers of the particular machinery. It seems to me in a case like that the chemical department should depute somebody home to make enquiries about the machinery required, if the enquiries are to be of a very real nature. If this is not the case, but it is simply a question of the placing of an order, it might go in the ordinary way direct from the Imperial Department to the manufacturers.

Q. That is to say, you don't think that, speaking generally, the Indian Trade Commissioner could be of great assistance on the industrial side of Indian work?—A. I rather doubt whether he could be of special assistance.

Q. In fact you are generally of opinion that the way in which, hitherto, our Commercial Intelligence Department mixed up commercial and industrial questions was really a very bad

thing, and threw a considerable degree of discredit upon the commercial side of the office of the Director-General, Commercial Intelligence?—A. I entirely agree with that point of view, and in using the words "competent and proper authority", I particularly had in view that there was a tendency on the part of the Commercial Intelligence Department to regard it as their business to tap the Imperial departments for information to enable it to answer an enquiry, instead of passing on the enquiry to the proper person whose business it is to deal with it.

Q. You will recognise that instead of their doing so, it is a great convenience to outsiders to be able to make all commercial and industrial enquiries through a single authority who will put them in touch with the right people to ask?—A. To put them in touch but not to pass on information which may not have been understood. There is always the double possibility of misunderstanding.

Q. You attach considerable importance to the definite separation of the functions of the industrial and commercial agencies?—A. Yes, I attach very great importance to that.

Hon'ble Pandit M. M. Malaviya.—Q. You say that the creation of new banking agencies, to give assistance to industrial undertakings, is a pressing problem. Have you any definite proposal to make about that?—A. I can only put it as I have done in this way that so far as things have come my way, it seems to me that there always has been some little difficulty in getting the existing banking institutes to undertake the financing of industrial ventures. It is not really their business as they are now constituted, which is the financing of commercial transactions. So far as the evidence goes, the facilities that exist are for the purpose of financing commercial transactions, which imply a quick return of money lent, and therefore they are not constituted for the financing of ventures which may involve a lock up of money.

Q. Are the financing facilities which exist sufficient even for commercial undertakings, in your opinion?—A. That question, I am afraid, I cannot answer.

Q. I see from the last Report on the operations of the Currency Department that the help which Government gives to existing banks does enable them to help commercial undertakings to a great extent?—A. Yes.

Q. The Government have been helping the Presidency Banks with their reserves for a number of years?—A. No, the position is that the Presidency Banks hold certain Government balances. But they only hold that portion which is not in the Government treasuries.

Q. What is the amount of the balance which was held this year in the Presidency Banks—four crores?—A. No, that varies from time to time. I don't think—except at the time when a loan is floated—it is ever as high as four crores at headquarters.

Q. I find it stated in "Capital" that on 2nd December 1916, it was 424 lakhs?—A. I think you are taking probably the balances in the reserve treasury.

Q. No, I am speaking of Presidency Banks; do you think I have made a mistake?—A. I think so; I won't swear to it.

President.—Q. Perhaps "Capital" has made a mistake?—A. I may say that the Presidency Banks' headquarters balances are daily reported to me and I see the figures from day to day but I have not seen them at four crores for some months.

Hon'ble Pandit M. M. Malaviya.—Q. Under ordinary circumstances the Government is under agreement to keep 70 lakhs in the Bank of Bengal?—A. I would not be quite certain as to the figure. I did not understand that you were going to examine me on this point, and I have not got the actual agreement, but I do not think, I mean roughly speaking, the balance that we keep at the headquarters of Presidency Banks—except at the time of a loan—exceeds 200 lakhs.

Q. Of which 70 lakhs is kept in the Bank of Bengal, 50 in Bombay and 50 in Madras?—A. Yes, those are, roughly speaking, the proportions.

Q. In actual practice does not the balance go up higher?—A. No, except when a loan has been floated. Ordinarily they vary; they are about two crores.

NOTE.—After the midday adjournment witness made the following statement on this point:—

I have verified that question which the Pandit asked about the Government balances at the Presidency Banks. He referred to a figure of four crores. I find that he included in the figure of four crores the public deposits at branches of the Presidency Banks. In certain places instead of having a treasury we have the Presidency Bank working our treasury and the money that they receive on Government account is treated by the Presidency Banks as public deposits. It is only received for the purpose of meeting Government obligations. It is not really free money. The really free money is that at headquarters. The amount of the Government balances at branches of the Presidency Banks is fixed by the Accountants-General with reference to the demand of the particular treasury and drawn away as soon as it exceeds a certain limit. It is the same procedure as that followed in our treasuries in districts where there are no Presidency Banks. The real balance which Government places at the disposal of the Presidency Bank is that at headquarters and that does not exceed ordinarily two crores.

Q. I find it stated in this Report on the operations of the Currency Department for the years 1915-16, that in order to provide Government with the necessary resources to enable them to place banks in funds, and also to meet any liabilities, power was taken at the

beginning of 1915 to increase the balance by £4 millions, by taking that sum out of the Paper Currency Reserve. Was that amount invested; was that power fully exercised?—*A.* £4 millions investments have been made. This limit was suggested in the first instance by the Indian Finance Commission, who said that among other things this increased power of investment would give us power to assist Presidency Banks, but we have not used it to assist Presidency Banks. All the assistance we have given has been from treasury balances.

Q. So far as commercial needs are concerned, do you think that the Presidency Banks meet them sufficiently well?—*A.* Yes.

Q. In regard to European business only, or both European and Indian?—*A.* Both.

Q. So far as you are aware, do Indian firms receive the same accommodation as European?—*A.* Yes.

Q. The cash balances in the Gold Reserve and Paper Currency Reserve are invested by the Secretary of State to a large extent in England?—*A.* You mean the Gold Standard?

Q. The Gold Standard and Currency Reserve?—*A.* No, a substantial portion of the Currency Reserve, 10 crores, has been invested in India.

Q. I find it stated in "Capital" that of the Paper Currency Reserve in India you have in :—

	Rs.
Silver coin and Bullion under coinage, and gold coin and bullion	6,55,22,645*
and in England, Gold Coin and Bullion	11,92,50,000
In Securities in India	9,99,99,946
In England	22,24,21,405

That shows that, roughly, you hold in India less than half of what you hold in England of this Paper Currency Reserve?—*A.* Yes.

Q. And in the Gold Standard Reserve too, you had in England—

Reserve held in sterling securities of the nominal value of seventeen million Pounds	£16,218,692
and Cash placed by the Secretary of State	£5,792,631?— <i>A.</i>

That is the Gold Standard Reserve which is different from Paper Currency.

Q. I know. I want to put them together. My Point is that you had a very enormous sum invested in England. Don't you think that you could, with advantage to industries in India, invest a fair portion of this in India?—*A.* The Gold Standard Reserve must be invested in England, must it not? It is to meet exchange, and you must hold it in England.

Q. Altogether?—*A.* Absolutely if I may say so. The Gold Standard Reserve is maintained in order to meet temporary falls in exchange; that is to say, where the obligations India has to meet cannot be paid except by the export of gold; therefore if you have your reserve outside the country you can pay your creditors outside India what is due to them, from the Reserve. We could not invest the Gold Standard money in India because it would not be of any use whatever for such a purpose.

Mr. C. E. Low.—*Q.* The point could be explained if you tell us what happened between America and England recently?—*A.* What happens when there is a fall in exchange? People want money due from India in England or outside India. If you have your investments here, nobody outside India will take them in discharge of what is due to them.

Q. But what about the Paper Currency Reserve?—*A.* The Paper Currency stands on a different footing.

Q. Do you think you could not invest in India even a portion of the sum which you invest at present in England?—*A.* Honestly with every desire to see industrial enterprise developed in India, I am quite convinced that we could not have the Paper Currency or Gold Standard investments invested in industrial undertakings in this country.

Q. Put aside industrial undertakings and take up the general question of investments in India?—*A.* The issue of those 10 crores which form the Indian portion of the Paper Currency Reserve is Government Paper, i.e., Government creates 10 crores of Government securities and says, "These securities are the backing of 10 crores of our notes." You cannot very well make these 10 crores of securities do double duty, i.e., both to support an edifice of industrial ventures as well as provide the backing to the currency.

Q. You know that this reserve has not to be utilised for a long time; does that not show that you could divert a portion of it to other purposes?—*A.* Oh; no.

President.—That would be equivalent to saying our present reserve is too big.

* Figure for Calcutta Circle only. The figure for the whole of India is Rs2,33,35,769.

Hon'ble Pandit M. M. Malaviya.—Q. So far as the cash balances are concerned, is the present practice the same as is described in Keynes' book on Indian Currency and Finance which was written about 1913, or has there been any change?—A. Mr. Keynes says:—

"The practice has been to keep a certain part of the balance at the bank (of England) and to lend the remainder at interest. The usual method is to lend to certain banks, discount houses and stock brokers of high standing, whose names are included in an approved list containing 62 names. The list is revised periodically and applications for admission carefully considered with reference to the standing and resources of the applicants and the nature of their business. Loans to borrowers on the approved list are granted as a rule for periods from 3 to 5 weeks, so that the whole balance could, if needed, be called in within six weeks."

Q. Is that the practice even now?—A. That is the Secretary of State's cash balance?

Q. I am referring to the Secretary of State's cash balance?—A. And treasury balances in England?

Q. Yes. Is that the practice which prevails even now?—A. He has a certain amount out at short notice. I think that particular point was taken into consideration in the Chamberlain Commission, and certain recommendations were put forward. I don't know exactly, but I take it that his cash balance is nothing like what it used to be. You are referring to the time when his balances were very high, but they have been reduced very considerably. I don't think he has much out.

Q. Apart from the amount, what I wanted to know was, has there been any change in the practice?—A. I don't know what the practice is at the present moment, whether he is following that list he had before. I would rather say that I don't know what it is at the present moment.

Q. Your duties are to watch the operations of the Currency Department and movement of funds, and the resource operations of the Government of India?—A. Yes, that is the description of the Annual Report issued by the Controller of Currency.

Q. Does that not fully describe the nature of your duties?—A. Yes, it is practically complete but it is not entirely complete.

Q. Then it is part of your business to know whether there has been any change in the system in the matter of the cash balance of the Secretary of State?—A. Yes, it is my business to know, but I cannot tell you whether that list has been reduced or added to.

Q. I did not ask if the list had been reduced or added to; I want to know if there has been any substantial departure from the practice described by Mr. Keynes?—A. None.

Q. Is the money lent out sometimes at 2 per cent. and sometimes at even less?—A. By the Secretary of State? I cannot tell you; that is not my business.

Q. You are not aware that it has been so lent in the past?—A. Not officially, but I understand that in 1913 when money was very cheap, the Secretary of State lent at that rate.

Q. Are you aware that the Secretary of State lent money at 2 per cent. and had to borrow at 2½ per cent. from the very same firms to whom he had lent at 2 per cent?—A. Not from those very firms; I am not aware of that.

Q. Don't you think that if the Secretary of State's balances, and generally the reserves of the Government were available in larger measure in India, they could help industries both commercially and industrially better; they could feed Indian industries better?—A. The balances in India are worked to a very low minimum, just enough to keep the operations of the Government of India going, excepting during the time when we get the proceeds of our annual Rupee loans.

Q. You have said that the creation of new banking agencies, in order to give assistance to industrial undertakings, is a pressing problem. Do you not think that if Government put a fair amount of its own reserves in these industrial banks, and organised them in a proper way, that that would give a great impetus to industries in India?—A. Yes, if one could make available these resources as you suggest. The result would be, as you indicate, but the reserves of the Government of India are, as I have said just now, never sufficiently large to embark on any very large policy of this kind. I am referring to the reserves held in India.

Q. Even so, bearing in mind the extent to which the Government helps Presidency Banks, you don't think that Government could help industrial banks or banks supervised by the State, even to the extent to which it helps Presidency Banks?—A. I should find it extremely difficult to work the balances of the Government of India with any further call on them.

Q. Then until a part of the reserves held in London—the Paper Currency and the Gold Standard Reserves—are made available in India, in your opinion Government could not help industrial banks?—A. I don't think those reserves can be made available in India.

Q. Whether they can or cannot be is another question?—President.—A. Everything depends on that question, otherwise it becomes a hypothetical question.

Q. I am looking forward to the possibility of part of those reserves being held in India?—A. My point is that I can only reply to the hypothetical question like this. If those reserves

were made available in India for investment as you propose, I do not think there would be any system to talk about.

Q. At page 60 of the Report of your Department for 1914-15, it is stated, "The Gold Reserve is held in the following securities :—

	Face value.
	£
British Government 2½ per cent. Consolidated stock	8,266,392
Local Loans, 3 per cent. stock	200,000
Guaranteed 2½ per cent. stock	438,720
Transvaal Government 3 per cent. Guaranteed stock	1,092,023
Exchequer 2½ per cent. Bonds	16,000
Exchequer 3 per cent. Bonds	6,885,600
Canada 3½ Per cent. Bonds	161,000
Corporation of London 3½ per cent. Debentures	45,000
New South Wales 3½ Per cent stock	118,000
New South Wales Treasury Bills	750,000
New Zealand 3½ per cent. Debentures	45,000
Queensland 4 per cent. Bonds	155,000
Queensland 4 per cent. stock	55,000
Southern Nigeria 4 per cent. Bonds	350,000"

Is it conceivable to your mind that instead of investing to this extent in foreign Governments, the Government of India may begin to invest a portion of the reserves in India?—

A. Not for the Gold Standard Reserve.

Q. Why?—A. Because the Gold Standard Reserve is intended to provide gold in England to meet the fall in exchange.

Q. Only to meet the fall in exchange?—A. Yes. When the war broke out eight million pounds had to be paid in gold from India.

Q. So that, until the Government adopts a gold standard for India, you think there is no hope of benefiting Indian industries by any portion of this?—A. I don't know what you mean by adopting a gold standard. We have a gold standard.

Q. I mean making gold the standard currency?—A. Demonetise the rupee?

Q. The rupee is already demonetised; adopting the gold coins as the standard currency?—A. The gold coin is already current here.

Q. Exchange does not go every year against India now, does it?—A. At the present moment it is in favour of India. At the time I was engaged on the wheat scheme it went against India; that was in June-July-August 1915.

Q. Can you say how many times in the last 16 years exchange has gone against India?—A. In 1907 it went badly. We had to send home eight or ten millions. Last year we had to send three millions. These are the striking cases. There have been other times when the knowledge that Government would come to the support of exchange helped to avoid a fall.

Q. Considering that it has happened so few times, you don't seriously contend that it is necessary to maintain the gold standard reserve where it is maintained, in order to meet the exchange difficulty?—A. Yes, I do most certainly.

Q. How many other occasions do you remember during these 16 years when exchange has gone down?—A. Do you mean actually falling below one and four pence? Many times. I could not tell you off-hand. Your general experience will suggest the answer to you. There have been many times when the rupee has been worth less than one and four pence.

Q. Has it been frequent, or has it been rare?—A. The number of times the rupee has been worth less than one and four pence is probably more numerous than the number of times it has been worth more but I would not like to say straight off.

Q. Are you aware that the Indian Specie Bank applied to the Government for a loan and was refused?—A. I am not officially aware of it. I was not holding my present appointment at the time but was in Bombay and heard something about it.

Q. That it had applied and was refused?—A. I was told that it had been refused.

Q. Are you also aware that silver was not purchased through the Indian Specie Bank though the offer was less than what it was purchased for?—A. There again I don't remember.

I have not seen any official paper in which Chuni Lal of the Indian Specie Bank offered Government silver. My information at the time was not acquired in the course of any official duties; it is just information acquired by talking to people. I understood that he was cornering silver.

I find it stated in this publication of the "Times of India" called the "Indian Currency and Finance" as follows:—

"The fact appears to be that the management of the currency has degenerated into operations to annihilate the Indian group of speculators and it would appear that the great resources of Government are being made available to that end. It is not enough to starve the group as, according to Messrs. Montague, they have lately been starved. Other means as we have seen have been employed to circumvent them, and it is impossible to say whether further irregular measures may not be contemplated. Has this not been carried too far? Even if the Indian speculators were out of the market would Government be any better off? Government would still be at the mercy of speculators as they were before the Indian clique entered the market * * *. In any case it is unseemly for a great Government to allow their resources to be employed to circumvent one set of speculators only that others may gain," etc.

It is further stated there:—

"When the Indian public have been put to the expense of providing immense sums of money to enable Government to do without fresh purchases only to find that purchases have been made at much higher prices than could have been obtained if no delay had taken place in making the purchases, it is of little use to ask the public to believe that any advantage in price has been gained by the transactions now announced."

Q. You see my point. I am putting it as a matter bearing on the banking problem?—
A. If I may say so, the purchase of silver from Chuni Lal has nothing to do with the banking problem.

Q. In one sense; but assume that the Government had purchased from the Indian Specie Bank, is it not likely that the bank would not have come to grief?—A. It is an extremely difficult question for anybody to answer. I am not a hostile witness on this question, but I saw a good deal of what was going on in the Specie Bank, and perhaps some of your colleagues will tell you. I find it extremely difficult to answer that question.

Q. As far as you are aware, did the Government purchase the silver at a higher rate than the rate at which they could have got it from the Indian Specie Bank?—A. I don't know what rate the Specie Bank were prepared to sell it for.

Witness here gave confidential evidence.

President.—Q. If you did guarantee interest, would you not be forced correspondingly to raise your reserves?—A. I don't think necessarily so, because we would then definitely, ascertain our liabilities in the course of the year and would budget for them accordingly, and these would be distributed over the whole period of the year, and we could arrange for payment coming at a time when our balances are able to afford it.

Hon'ble Pandit M. M. Malaviya.—Q. In case of deposits, would you recommend that deposits should be received in banks requiring them but not for a short time?—A. Industrial banks should not receive deposits at call nor at short notice.

Q. You would take long term deposits?—A. Yes.

Q. Or would you prefer the system of issuing bonds, so that they may not be able to make a rush on the bank for payment?—A. I don't follow that.

Q. I mean bonds, share bonds, or debentures?—A. I contemplate this will be a joint stock concern, and whether the capital should be raised in shares or bonds or debentures is really a matter of detail. That is entirely different from the deposit question.

Q. Do you think you will attract long term deposits if Government guaranteed interest?—A. I take it that what would happen would be this. Government can either say, "we will guarantee so much per cent. interest on the capital or we will guarantee a certain rate of interest on the deposits so that your rate for deposits can be higher than those of other banks." Those are two alternatives.

Q. These are somewhat on the lines which obtain in Japan. In Japan the Government have guaranteed interest for 5 years, I think, and that has, I believe, helped to establish such banks?—A. I don't know about the Japanese experiment.

Q. Would you have only one bank for the whole country, with branches in different places, or have provincial industrial banks in different provinces?—A. My personal feeling in regard to banking is that the local banking system is the best. I don't much favour an All-India Bank. I think local conditions vary such a lot, and particularly in the case of industrial banks where success is dependent on the local manager's knowledge of particular people, it seems to me essential that there should not be an Imperial or All-India Bank.

Q. You say in regard to the question of Government purchase of products that "I believe that there has always been a feeling in respect of these latter rules that they unduly favour purchase through the India Office." Is it not one disadvantage of this system that Indian manufacturers receive less consideration than they should?—A. As I said, in answer to

Mr. Low, I believe they are handicapped; the rule operates in such a way that they are handicapped.

Q. For instance, take the railways. Purchases are made for railways for which there is absolutely no justification, and which are entirely against the spirit of the rules laid down by Government to encourage indigenous products. You are aware that Government has laid down that where you can buy indigenous products, you must give them preference. Now take for instance the Tata Works; because the purchases are made through the Secretary of State, the Tata Steel Works cannot get the full benefit of the rules by reason of their articles being produced in this country?—*A.* I don't know about the particular instance you refer to, but while on the Stores Committee I did come across a case similar to that where an Agent of a Railway was ordered by his Home Board to refuse to give evidence before us on the ground that the Government rules were only applicable to their purchase of stores by the courtesy of their Directors. I think, generally speaking, your view is correct. I think the point has been put sufficiently correctly as I have put it in my note.

Q. Have you any suggestion to make to ensure that full effect may be given to the rules laid down by the Government of India?—*A.* I suggest that the form of rules should be amended.

President.—*Q.* The new rules are that if you can get the stuff in this country you do not buy from home?—*A.* That is only applicable to certain articles. The rules were very skilfully amended, so that with regard to certain classes of goods you had to go home. You could only buy in this country if you could buy as cheap and as effectively as if you bought at home. I think I am right in saying that the Department of Commerce and Industry review all these purchases at the end of the year, and ascertain why the rules for local purchase have not been carried out. I think if you had a department which could save the purchaser the trouble and responsibility incidental to the purchase of locally produced articles no doubt there would be considerable improvement in this respect.

Hon'ble Pandit M. M. Malaviya.—On of the witnesses said that firms would not bring this to the notice of the Department of Commerce and Industry, because they would be afraid of offending the Public Works Department with whom they have to deal. The policy laid down by Government is quite clear; they say you must purchase things produced in the country, and there will be no excuse for purchasing goods outside the country, so long as the indigenous articles are fairly good, and the price is not unfavourable. Yet you find the rule is violated over and over again by the person who is supposed to enforce it, namely, the Secretary of State.

President.—*Q.* Don't you think that the trouble is due to the fact that we have got the India Stores Department where orders on a large scale are accumulated, and where they receive orders year by year in sufficient quantities to enable them to make forward contracts; and that until we have a corresponding department in this country, we are bound to be handicapped?—*A.* Yes.

Q. Don't you think from what you know and what you have heard in a reliable way that it is possible that firms are handicapped here by the fact that individual officers can buy under these rules and that they don't want to offend these individual officers?—*A.* I think so.

Q. You are also of the opinion that Indian officers are afraid to undertake the responsibility of buying locally?—*A.* Yes.

Hon'ble Pandit M. M. Malaviya.—*Q.* You say, speaking about trade representatives in London, that "a far more important requirement is to provide manufacturers or capitalists who are interested or likely to be interested in the purchase of, or the development of, Indian products with the facilities of ascertaining the preliminary data without which their operations cannot be begun or extended". In concluding that paragraph you say "We need to introduce some suitable method of attracting attention to these resources, and to the very complete data which many Indian scientific departments have put together as to the possibility of commercially exploiting these resources." Do you think that the Government of India, as a Government, should encourage the exploitation of Indian resources by foreign capitalists?—*A.* I think anything is good which brings capital to this country.

Q. Should it not be the object of Government to encourage Indian capitalists more than they have been encouraged?—*A.* I think Indian capital should be encouraged. My feeling is that India and the Indians are in the position of that of a young man who has come into an enormous property which is undeveloped, and which he cannot develop with the monies which he has inherited. It would be a sorry policy if he was to say that I will not let people develop this portion of my property until I have developed the rest.

Q. On the other hand you will take care that he gets a fair share of the profits of the inheritance he has received?—*A.* I entirely agree.

Q. If you have a trade representative who is to supply information to capitalists in London, or to those who wish to exploit Indian resources, these capitalists with their better organisation, more scientific knowledge, and more capital, would be better able to take advantage of those conditions than Indians would be?—*A.* I think there is room for both, and I am a great believer

in competition for the purpose of stimulating. I don't believe in preserving for a man, who can develop only one corner of the field, the whole of it.

Q. Would you make your proposal so catholic as to include non-British subjects, say Americans or Japanese?—A. I have heard it suggested that we should adopt a tariff which would differentiate between nations according to the degree of neutrality, hostility and assistance displayed by them during the war. I would like to think over such an idea.

When you find the young man you have been speaking of, would you as his guardian, let out his property on a long lease?—A. Oh, no.

Q. And you would see that this young man—your ward—is properly trained to take advantage of the resources which he has inherited?—A. He ought to train himself.

President.—And be beaten if necessary.

Sir D. J. Tata.—He has got to get some of those hard knocks.

Hon'ble Pandit M. M. Malaviya.—Q. Do you think that the capitalists you have in mind have been trained entirely by themselves, without assistance from the State? Let us take an instance. Take the steel trade in America. You know that before the sixties there was no steel trade there worth speaking of. From the sixties onwards they have now established a steel trade which is by no means despicable. That was done by the help of the Government. Don't you think that the young man whom the Government is in charge of should be helped both by knowledge and assistance, and a proper regard for his interests in the resources of the country?—A. I agree that he should be assisted to the extent that he assists himself.

Q. I quite recognise that indigenous capital is shy at present. But it ought to be encouraged. I think there is danger in the proposal you have made that the interests of English capitalists may be promoted at the expense of the legitimate interests of the Indian subjects of His Majesty?—A. I think you have got to take it this way. You have got to either see a property quickly and efficiently developed, or you see it slowly and perhaps not as efficiently developed. I am not in the least afraid of British capital coming to this country, because I think there is room for it.

Q. It is not a question of British capital coming or not coming; the whole question is that of safe-guarding the interests of Indians?—A. I think there is no reason to fear that they will be damaged seriously or at all. It is only a question of administration.

Q. I will give you my reasons for my misgivings, and would like you to solve them. Take this Copper Syndicate at Singhbhum. I don't know who the members or the shareholders of the Syndicate are; but suppose there is a trade representative in England, and suppose he gets information about the possibility of developing copper in that particular district, and the English capitalist comes and develops it entirely with British capital, not offering it to Indians or inviting Indian capital at all. How would you guard against this; what measures would you take to secure that Indians should have a fair share in the development of their country?—A. He has a corresponding department in India who would do the same thing for him as the trade representative is doing for British capital, viz., the Survey, Forest or Industry Department.

Q. How will you ensure that there shall be fair play—absolutely fair play—between Indian and non-Indian subjects of His Majesty?—A. In the first place the fact is that the information which the trade representative will possess will be information collected in India; therefore the distance alone would give the Indian capitalist the earlier chance of working on that information; secondly, the departments concerned are departments located in India. They ought to be—and many of them are—constantly in touch with Indian capitalists.

President.—Q. In the particular case you mention, the information was published here in the records of the Geological Survey in 1904, and again in 1908 when the boring results were obtained; so that the information was published here before it was published at home; in fact during that time there was no trade representative to push it. Of course the Geological Survey was at the disposal of anybody who wished to come?—A. I think the position is that all of us, who know anything of India, are more anxious to see it developed by Indian capital than by anybody else; but we don't want to see such development fail because Indian capital won't come forward. I also think after the war India will be certain to get a certain amount of capital from other countries, and if you say we must not use this capital, I don't see it is much advantage that we should have, as a result of the war, altered for the time being our position from being a debtor to a creditor country.

Hon'ble Pandit M. M. Malaviya.—Q. I am not blind to the advantages of English capital being invested here, and there are other obvious reasons why we should welcome it; but in view of the industrial backwardness of the Indian people, do you think that it will be a fair proposition to suggest that every company that is established in India should offer half its capital to be subscribed by Indians?—A. May I suggest that the present tendency in most enterprises is to have a rupee capital, because of the pitch of taxation at home. There will be a tendency to raise money in this country or to bring money into this country. I don't think you need be alarmed.

Q. Do you think that a proposal like what I have suggested would operate to draw Indian capital, because the European would bring capital, and his capital would

be secured, and Indian capital would come forward all the more readily, because there would also be this feeling that Indians were sharing in the enterprise?—A. If you were to make that limitation that they must raise half the capital, supposing they don't get half their capital?

Q. Fix a reasonable time, lay down reasonable conditions which would give Indians a fair opportunity to subscribe?—A. I am very doubtful about these artificial methods.

Q. I have been led to think of this proposal because I have learned in the course of my tour that some companies would not offer any of their shares to Indians, or would not record transfers of shares in favour of Indians in their concerns?—A. On that point I am very doubtful whether an artificial division in all cases as between India and England of the capital which has to be offered is a practical proposition.

Sir F. H. Stewart.—Q. Could you give us any general opinion about the comparative suitability of methods 3, 4 and 6 of giving Government aid to existing or new industries, in question 5?—A. 3, 4 and 6 are only different forms of the same idea, except that in method 4 loans without interest are contemplated. Such a method would be the same as 1 and 2, except that it implies repayment.

Q. You would say that the loans should certainly bear interest?—A. Yes. I would rather put the matter in the form that I have put it in my note.

Q. I was trying to find out if, in your opinion, one method was preferable to another?—A. I have thought a lot over that and my view is that, from the point of view of administration, it is always better not to lay down a very precise formula, because it grows into a rule and hampers any case which cannot be met on the ordinary lines. What I feel is that there is at present no definite policy in regard to this question of Government assistance. I think the guarantee of purchase the most suitable form in a number of cases, but you could not, if you had a pottery factory, guarantee that Government would buy so much of the supply, or if it were a case of developing a dairy Government could not very well undertake to purchase so many quarts of milk every year.

Q. Who would decide when and how assistance was to be given to the industry?—A. The Industrial Department, who would advise the Government of India.

Q. Would that department be Imperial or Provincial?—A. I do not believe in decentralisation when you are discussing scientific departments. You want an Imperial department who would lend assistance to provincial enterprises. You could not afford to duplicate the scientific staff.

Q. You would not have a provincial department also?—A. I am not very much in favour of Provincial Departments.

Q. Would not the circumstances of the different industries requiring and asking for assistance be better known?—A. The case is different from that of an All-Indian Industrial Bank. A bank manager must know the people who come to him. You could not, if you had an Imperial bank in Calcutta, and an application came from Cawnpore, expect the man in Calcutta to know sufficiently about the Cawnpore applicant. You would have to get local knowledge; whereas in the case of an Imperial Industrial Department, dealing with industrial questions, it is perfectly possible for the head of the Industrial Department to go down to the province and put one of his experts on to work it up. Unless you are prepared to duplicate the whole staff right through, I don't see how you are going to make it effective, and after all, the supply of experts is limited. We have got 11 Local Governments and administrations, and we cannot have 11 chemists, 11 geological departments, 11 tanning experts, etc.

Q. With reference to your answer to question 10, you consider that there is need for Government to take the initiative in providing these banking agencies. Don't you think they will come of themselves?—A. I don't think that Government should collect half a dozen capitalists together and say, "You are to form an industrial bank." I think if half a dozen capitalists came together to form an industrial bank and went to the Government for assistance, I would not object to the Government being prepared to consider a proposal to assist if a satisfactory scheme could be formed.

Q. Supposing the Government wanted a considerable sum of money for the purpose of aiding industries, that would have to be derived either from taxation or from loans?—A. Yes.

Q. Do you think that the proposal to raise a loan for this purpose would appeal to investors?—A. Personally, on principle, I am doubtful as to the advisability of Government raising a special loan (as apart from its general borrowings), for a particular specific local purpose. It seems to me the whole of the assets and credit of Government is at the back of any loan, and you cannot say, we are going to regard this portion of the general assets and credit is at the backing of a loan raised for one, and another portion thereof at the backing of another, particular loan. I think one way is to increase the amount of borrowings which we make in this country. The tendency has been to rely more on Indian capital than on home capital.

Hon'ble Pandit M. M. Malaviya.—Q. For instance, as you have done in the financing of the buildings at Delhi?—A. That is one instance of it.

Sir F. H. Stewart.—Q. With reference to your evidence about the Indian Trade Commission, are you considering that he must always be an official or an ex-official?—A. I said

"if an official." My view is, take the very best man you can get, whether he is official or non-official; a man of the Civil Service or any other service or department.

Q. What term of office would you indicate to prevent his getting out of touch on the one hand, and to prevent too many changes on the other?—A. I think possibly a tenure of 5 to 7 years, with the arrangement for periodical visit to this country in the interval. I think he should arrange to come out here from time to time.

Q. Don't you think that you might starve on small lines, and that it would be difficult to expand later. You might have difficulty to get the Government of India to consider increases afterwards?—A. I have never found the Government of India unreasonable, when a satisfactory proposal comes to them properly prepared and backed by detailed inquiry of a competent person. I don't fear the contingency you contemplate.

Q. With reference to the Director-General of Commercial Intelligence, I gather that even if you have got your Industrial Department, you still think there would be a distinct need for this officer?—A. Oh yes, most certainly.

Q. For the reasons which you give?—A. Yes.

Q. Where would you put him?—A. I have no doubt whatever that he must be in Calcutta. He will have to be supported in Bombay, but the headquarters should be in Calcutta.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. About Government help to industries, what industries should Government help, coal mines or jute mills or other big concerns like that. Will twenty or thirty lakhs be sufficient?—A. On this point my view is that you should attack the really big ones. I think that the resources which Government has for purposes of helping industries are naturally not unlimited, i.e., they are limited, therefore you ought not to dissipate such strength as you have got in attacking small problems which do not spread further. You want something big on which other industries will hang, for instance, heavy chemical industries, and the aluminium industry.

Q. You think that these should be supported by Government, or should Government pioneer such industries?—A. They ought to see it through in any case, but if they can get capitalists to come in with them, on the basis of a share in the risk or of a guarantee of interest, so much the better. You should concentrate your powers on the big things.

Q. And about the smaller industries, the cottage industries?—A. These don't appeal to me. I think the system of loans on takavi lines might be developed.

Q. You think that Government guaranteeing the interest is more preferable to their giving the money?—A. I think on the whole it is probably better.

Q. About the Indian trade representative, I suppose you are aware that feeling on Bombay side is very keen that Indian Attachés ought to be at every Consulate to have Indian trade encouraged. Don't you think that Indian industrial products can be pushed if there are Indian Attachés at different Consulates?—A. I don't know. The British Consular Service has not been very successful from the point of view of assistance to trade.

Q. As you know, the Japanese Consular Service has been very effective in Bombay?—A. They, I think, are called by some other name.

Q. About industrial banks and your scheme; do you think that the Government should guarantee some interest on the capital?—A. I think that is one way.

Q. Don't you think that capital would be forthcoming if Government guaranteed a reasonable rate of interest?—A. I hope so.

Q. What rate of interest would tempt the capitalist; can you tell us?—A. The competition at the present time of other industries is so severe that any remarks one would make at the present time would be inapplicable to other conditions. I should say a little more than that the rate at which Government loans are floated.

Q. About these museums; it was suggested to us by some of the witnesses that as most of the manufactured articles from Indian raw material samples of the imported foreign articles exhibited that would be a great advantage; people would see them and try to initiate their manufacture locally?—A. As an educative arrangement, that probably has its points. But I don't see any value in it commercially. I don't see that the sight of a bale of cotton or piecegoods would tempt anybody to put money into the business.

Q. But how would you think of this proposition commercially?—A. Not as a commercial proposition.

Q. Then you want an Imperial Department of Industries?—A. Yes, I should like to see that.

Q. And you want the Provincial Director of Industries too?—A. I am not very keen on Provincial Directors of Industries, except that you want somebody with local knowledge to sift the information that would come from different parts of a province. Personally I feel that the experts should be Imperial. There must be an Imperial Director, who would be able to place the assistance of his experts at the disposal temporarily of the local people.

Q. Can I suggest a hypothetical scheme that I am thinking of? Suppose you have an Imperial Department of Industries, with all the experts Imperial, and then suppose there is a Board of Industries in every province consisting of local business men, some nominated by Government and some by the local bodies, with a Director of Industries, and that they have the help of the experts, and suppose an industry proves successful; and the Government of India think that in a particular province it can be much better helped by Government than if financed by the industrial bank, don't you think that in that way the industries can be encouraged?—A. I attach very little importance to a constituted Board of Advisers, because I believe—and my own experience has been—that advice is more often asked by non-officials when there is no definite relation. Where there is a definite relation it immediately sets up points of difficulty. A provincial Director of Industries would have absolutely no difficulty in getting hold of the leading men of his place if he was competent.

Q. Do you know anything of the Indigenous Committee we have in Bombay?—A. I know very little about them. I talked to your Secretary in Bombay when I was down there recently, and have had communications from him about it, but I am not enamoured of that sort of organisation. The best information is obtained by talking informally and without a regular set of meeting hours, and where a lot of administrative routine comes up to be discussed, instead of propositions of particular moment.

Q. In the Imperial department you don't want an Advisory Board?—A. No, I am not in favour of that.

Q. And about the Director of Industries, do you think he ought to be a service man or a business man?—A. The Director of Industries should be the very best man that you can get.

Q. And should the local Director be recruited from the Imperial Service?—A. If you have a local Director, you must also pick your best man.

Q. And he must be under the Imperial department and not under the Local Government?—A. Provincial Directors will be provincial officers.

Q. His recommendations also will go to the Government of India?—A. I take it that his position would be exactly the same as the Director of Agriculture. He would deal with problems, that came up in the province and if he wanted assistance, he would ask the Imperial Department for the assistance of experts.

Q. What about the industries in the meanwhile? It will take two or three years before the Government of India's reply can come. It will go into somebody else's hands. It is the delay that I am afraid of. Don't you think if the department was local it would be better. If there is a local Director, he will send to his Local Government; he will see the industrial people get their advice and send to the Government of India, who will think over it?—A. Then eliminate the local directors altogether. You have got your Imperial department with the experts and can go direct to the Imperial department.

(The Commission adjourned at this point and resumed after an interval.)

Hon'ble Sir Fazulbhai Currimbhoy.—Q. If the industrial bank could lend on machines and the buildings and other things, don't you think that Government can do away with the direct help to industries if they help through this bank?—A. I am a little doubtful whether the industrial banks could be developed very fully on that basis.

Q. Then supposing that Government gives some concessions or guarantees interest, don't you think that at the time the prospectus is issued they should lay down that half the capital should be subscribed by the Indians. Indians will be able to start big industries if English firms do not come in, and that will be beneficial to the country?—A. I do not contemplate we should give any special concession to British capital coming into this country.

Q. If Government is going to take up this chemical industry it must guarantee interest for a certain period or give some other concession. Then don't you think that the Government ought to compel that nearly half the capital must be offered to Indians when they issue the prospectus?—A. Do you mean then that I should be debarred?

Q. I am thinking of the inhabitants of the country?—A. Supposing an Indian subscribed to the capital at the start and subsequently proceeded to sell his share?

Q. Supposing a syndicate is formed in England and they take up the whole of the capital then India has not the advantage?—A. I cannot see how you are going to make the shares attractive if you attach that particular disability.

Q. The other shareholders also will sell it?—A. Why is any differentiation necessary? I cannot conceive that the raising of capital will be easy if you attach disability of this kind.

Q. About these Swadeshi stores do you think that Government ought also to have these like the museums?—A. I should like to see some sort of organisation where Government would provide the means of putting before a would-be-purchaser the products of certain manufacturers leaving him to make his own arrangements with the manufacturer he selects.

Q. Supposing some department of Government have published a list of the articles every year, that are purchased at home with their different prices, would it not help the local

manufacturers here to know what goods they can supply?—A. I think there is a good deal in that. That was one of the recommendations of the Stores Committee.

Dr. E. Hopkinson.—Q. With regard to Government assistance to industries I understand that you have in mind three quite distinct forms of undertakings to which the Government might give financial aid. You have already explained in answer to one of the members that in answering question 4, paragraph 1, you had in mind large industries involving large capital sums and you quoted instances of the chemical industry and aluminium industry. That makes one distinct compartment. In your paragraph 2 you deal with another matter. You speak of small individual industrialists who do not appeal to the public for subscriptions but who want financial aid. You speak of the model of the system by which Government places loans at the disposal of the agriculturists. I do not know exactly what model you are referring to?—A. There are two classes of cases. My experience dates back in this connection to 1901, but my recollection is that there were two classes of cases in which Government assisted. They lent money out at 6½ per cent. for the purpose of assisting cultivators to purchase seed and there is another class of cases where the money is given for the purchase of agricultural plant. These advances are recoverable by the District officer. In my own experience I have given considerable sums, just after a famine to re-establish agriculturists who had suffered from the famine. In another district in which I served we made advances for the digging of wells. We fixed the time of repayment according to the time when the well would be finished and the man could bring the land under cultivation. We had never any difficulty in recovering the loans.

Q. Who provided the loans?—A. The Government of India places at the disposal of the Local Government a certain sum of money every year.

Q. The funds are provided by the Government of India whereas the loans are given through the Local Governments?—A. Yes. The advances are made by the District officer on the spot. I remember in one district having at my disposal a sum of Rs30,000 to distribute to agriculturists in this way. They generally gave security in the form of personal security I cannot remember whether other security was generally required.

Mr. C. E. Low.—Q. In many provinces we give out agricultural loans for seed and cattle on the joint answerable responsibility of all the people in the village who take loans. I understand that you recommend that the system as it exists should be continued, that it is useful and that so far as it goes it is useful and you consider it should be continued?—A. Undoubtedly it must continue and I would like to see it applied if necessary to the small industrialist.

Dr. E. Hopkinson.—Q. I want now to ask you as to the third category of undertakings to which Government financial aid should be given. In answering question 10, you suggest the assistance in these cases should be through new banking agencies. What sort of enterprises do you think such industrial banks should assist?—A. I am thinking of an industrial concern which is half way between the very big ones and which cannot be called minor industries. For instance the pottery industry. I understand that assistance is required from Government. It is not big enough to go into the first category and it is too big to come under the second.

Q. That is sufficient to indicate what you have in mind. Returning to the big industries, you suggest that the Government should not take the whole of the risk. I understand from that that you want Government to take some portion of the risk. Before financial aid to any industry is considered the first business of Government is to ascertain that the proposition is financially sound?—A. Quite so.

Q. And if the risk is a material one the Government would not deal with it at all?—A. There is a certain amount of risk in the early years of the operations of an adventure of that kind. For example the output may not come to a certain desired standard.

Q. The risk should be ascertained beforehand, so far as human foresight can and if a venture can be described as risky the Government ought to hold aloof?—A. If it is to be labelled as a risky one I agree with you that the Government should not undertake it. My view was rather that in the initial stages all ventures are more or less in the manner of experiments.

Q. That I grant. But you admit that risk as far as possible should be eliminated?—A. I entirely agree with you there.

Q. From the way in which you have worded your answer I think your idea is that the object of Government assistance is to take some part of the risk. Now as far as I can see that is not what is wanted. It is not the question of risk. It is the question of finding the actual money to start the undertaking in such large matters as we are speaking of. It is the question of obtaining the necessary capital. Is that a correct view?—A. I think that if you are going to break new ground surely there is a certain amount of uncertainty attached. One might take the example of the iron and steel venture in regard to which at the time it was started there existed a certain amount of risk as to whether the output would be of the quality required.

Q. Take as an example the question of growing long staple cotton. Now I assume that the scientific departments of Government have shown it can be grown successfully. But that is a small part of the matter. There are other considerations. It must be grown within a

limited irrigated area with proper arrangements for ginning and marketing all of which require much capital. It may not be so attractive financially as the steel proposition. But is not that the sort of thing that Government ought to assist. I only give that as a casually chosen example of what I mean. It indicates the sort of thing I have in mind?—A. I did not quite contemplate a case of that kind. That particular instance is one which Government has already had to consider and has passed on the inquiries to the Agricultural department. I do not know very precisely what they do at Pusa. I understand that they conduct experiments in the improvement of crops and they demonstrate the value of their experiments by actual trial on the spot and then they get the people interested (either the cotton mill owner or the exporter) to put the trial sample on to the market. I thought that that kind of case would be sufficiently provided for by the methods now in existence in the Agricultural department. I was rather thinking of the class of cases which are not embraced by the Agricultural Department. I think my definitions do not cover the whole ground. I entirely agree that there is a hiatus between all the necessities of the country and my suggestions for meeting them. I have never contemplated the agricultural side of the thing for one thing. There is a difference between the agricultural and industrial problems because the risk in the two cases is of quite different character.

Q. Do you agree with me to some extent at least that it is not a question of taking risk but of finding the capital?—A. That is undoubtedly the whole trouble, the provision of capital.

Q. Does it not follow from that as a necessary deduction that capital should be provided in a form that is best secured, say, in the form of debentures?—A. I agree with that as a general proposition.

Q. And not in the form of shares?—A. Not in the form of shares.

Q. For two reasons; first in order to minimise as far as possible the risk undertaken by Government and secondly because Government can always find money more cheaply than any other agency. So that you would add that Government assistance to large undertakings should as far as possible be in a form of loans secured either by debenture or otherwise, so as to diminish as far as possible any risk to Government?—A. Yes.

Q. Now further in connection with this matter will you tell us whether your paragraph 3 in answer to question 4 as to management and Government Directors refers to large undertakings or only to the smaller industries?—A. That was in direct reply to one of the questions as to how Government control was to be provided in cases where Government gives financial assistance. My objection to the suggestion that there should be a Government director with well defined powers simply arose from the fact that the Government director cannot be in more than one place at a time; it would be impossible for the director to move about attending these small meetings.

Q. If there is a Director of Industries in a particular province why should he not be the director of the company?—A. I did not contemplate there should be a provincial Director of Industries. I contemplated that there should be an Imperial department.

Q. You do not contemplate a Director of Industries in each province?—A. I personally prefer to see an Imperial department which would deal with all questions coming up from the provinces and which would send an expert down to enquire into cases. There are as many as 11 provinces and I feel doubtful whether we would be able to get 11 competent men who could be of use in dealing with questions arising in connection with these companies. I should be very doubtful about that.

Q. You suggest that in place of the Government director the minutes of the directors should be subject to Government approval?—A. Government should have access to the minutes. They will have to keep a close control. They will have to watch the proceedings.

Q. Is that a feasible arrangement? Can the affairs of any company be properly directed, if the decisions of the directors are to be sent to Government for approval or disapproval before being acted upon?—A. The proceedings of the directors should be open to inspection. There will be no point in having access to them if you have no right to disapprove of them. That is undoubtedly what I suggest.

Q. And you still maintain it? From my experience in these matters I should say it is impossible in practice.—A. Your experience in these matters carries greater weight than mine. I am probably arguing from the limited cases in this country.

Q. Do you not think that you want to be able to guide the policy from the very start and that the only way to do so is to have a Government director who will be able to have an eye on the policy at its initiation and when it has been more or less developed?—A. I thought that the Government Director might be more hampering than useful. The Government official, I take it, would always rely on his powers and assume a rather different position to his co-directors and the tendency might then be if he was a man of forceful personality that he might run the whole thing and impose his personality on the other directors.

Q. Would that not be a good thing if he was a man of forceful personality?—A. I do not see much value in making the whole thing a Government show.

Q. Perhaps it might have an educational value upon the other directors?—A. You are more confident of the possibility of finding suitable directors from among Government officials than I am.

Sir P. H. Stewart.—Q. Where would this Imperial Director of Industries be, in Delhi or Simla?—A. I contemplate his being in Calcutta. I contemplate a case which I myself come into daily touch with. The Controller of Currency is not a Director on the Presidency Bank but he is in daily touch with what is going on and with what the bank is doing and the lack of any definite relationships makes for greater confidence between the Government officer and the non-Government bank official.

Dr. B. H. Harrison.—Q. Let me ask you now as to the third form of Government assistance. It is said that the existing banks provide all that is necessary for conducting the commerce of India. That is admitted, but you say that the creation of new banking agencies to give assistance to industrial undertakings is a pressing problem. Do you speak from personal experience?—A. I speak from the number of cases which often pass through one's hands of small concerns coming up for Government assistance, sums which are not sufficient or big enough to attract the well known capitalists. Such cases, as I am referring to, are sufficiently frequent to justify the remark that the problem is a pressing one.

My experience of Indian industries is admittedly limited but I have listened for six weeks to the evidence and I have not heard a single case made out which indicated that a definite system of industrial banks seemed desirable or necessary. That is the impression made upon me so far?—I was thinking of the match factories for example.

Q. That we have heard of and I think the evidence shows that the match factory has no business to exist in India at all under present conditions, and that Government assistance there would have been a retrograde step. I understand you to say that in the course of your official experience you have had many cases where Government assistance would have been of use?—A. There are cases in which Government has been applied to for small sums which indicate that there is a demand for an agency or a bank which should supply capital for such cases. I offer no opinion as to whether assistance would have been effective or not because the cases came up usually unexamined, without the presentation of the salient facts on which an opinion could be passed and it seemed to me that the transfer to an agency of the duties which are at present thrown on the Government departments, namely, to examine the proposition would help the deserving cases. It cannot be said that the whole lot of these cases are undeserving and in this way it would teach the people the lines on which the bank would end money.

Q.—Do you think that it is fully appreciated that an industrial bank in India means an entirely different thing with entirely different purposes from an industrial bank in the United Kingdom? Have you read the report of the Farrington Committee?—A. I have read a summary of the report. I quite agree. I have been told that there was no doubt that German banks would lend money on the strength of an order placed with the German manufacturer, say, by a purchaser in England. Money would, on the strength of this order, be placed at the disposal of the manufacturer to enable him to purchase his material. When the goods are shipped, they still were so to speak the property of the bank who could practically dictate to the manufacturer as to the line by which the goods should be shipped and as to how the money recovered from the purchaser should be remitted to Germany. Such a system would become almost a danger in India. That is not the system that I have in view. My experience of English manufacturers is limited to the short time that I was in the Board of Trade and I heard then that the German banks were rather in financial difficulties.

Q. You still think there is need for an industrial bank to finance Indian undertakings?—A. There are three classes of banks in India. You have got the Presidency Banks, the Exchange Banks, and the Indian Banks. The Presidency Banks finance produce down to the port, the Exchange Banks arrange for the finance required to place the goods on the European markets. That is a fairly rough division.

Q. Do not the Exchange Banks also finance imported goods?—A. Imports are financed by the Exchange Banks to a large extent.

Q. So that the Exchange Banks do finance export and import?—A. Yes. There are the banks which are established up country. Many of them lend, or used to lend, on property. There are also of course the shroffs who finance a lot of the external trade. I do not think that any of these financing agencies are prepared to do anything in which there is a possibility of a long lock up of capital. That is why I think that there is a necessity for a financial organisation out here.

Q. It is then up to us to decide whether there is really a need for such a bank and whether the existing organisations can be made use of or not?—A. The existing organisations are naturally anxious to continue working which pay them.

Q. You would not like the Exchange Banks financing export and import?—A. It seems to me that this would curtail the resources of these banks in other directions. We must supplement the existing organisations and not divert their resources from one channel to another. That will not give us new money.

Q. Assuming then that industrial banks are set up, a witness the other day said the problem was quite simple. He said that all that was required was that the bank should receive deposits from the public on which four per cent. interest would be allowed and which should be guaranteed by Government and that the bank should lend at 6 or 7 or 10 per cent. to the industrial concern. Do you regard that as a sound banking proposition, which Government may properly back?—A. I do not think that is going to solve the problem. I think it is a most complicated problem. The personnel is likely to give a considerable amount of difficulty.

Q. I could not quite clearly understand the answer you gave to Sir Fazulbhoy regarding the raising of capital partially in India and partially in England. Would it not be possible to reserve a certain portion of the capital to Indian undertakings and a certain portion elsewhere?—A. Yes. I understood that it was to be reserved in India for subscription by Indians. You can say that a particular sum should be raised in such an area but you could not say that only a particular class should subscribe to a portion of the capital. You can make a distribution geographically but I do not think you can do anything more.

Q. I understand you to suggest that in addition to the scientific departments there should be a technical department competent to investigate and deal and direct technical undertakings, both to be co-ordinated?—A. Yes.

Q. You say that the constitution of such an Imperial department should be created on the analogy of the Geological Survey or the Forest or the Agricultural department. In what respect should it be analogous?—A. These departments have a staff of economic enquirers attached to them as well as scientific men who would devote themselves to the scientific aspects. It struck me that we should have not only that economic enquiry but also something more than that and that is to make the preliminary examination before the economic aspect can begin to be considered.

Q. Then you are not specially referring to the organisation?—A. No. What I had in view was that the activities should follow the model of those departments.

Q. Would you go further and suggest an organisation like the Geological Survey?—A. The Geological Survey has to my mind this advantage over the Forest and Agriculture departments in that it is an Imperial department and the others are divided between provincial and Imperial. I had rather pinned my faith to the model of the single Imperial department which would place its experts at the disposal of the Local Governments whenever they wanted to enquire into any subject.

Q. Then you want centralisation and you are not in favour of the appointment of a Director of Industries in each province?—A. I am not much in favour of it personally.

Q. If there is no such provincial officer how is a particular thing to be brought before the Imperial department?—A. I should think that there should be no difficulty in bringing the matter to the notice of the Imperial department on the part of people who are interested.

Q. Would a small manufacturer be willing to enter upon what may be a long enquiry and a long discussion with an Imperial department. Would he not prefer to confide his troubles to a local Director of Industries?—A. I think he would, the small man especially.

Q. It would be a distinct advantage to have a local man who would be sympathetic to the people of his own province and who would know at the same time how to bring the matter into proper form?—A. His functions will have to be very limited then.

Q. There are other matters which might come under his direction, such as industrial schools?—A. I do not think there should be any tendency to duplicate on the provincial the same department as we are contemplating on the Imperial side.

Q. I do not want to suggest that, but I do want to ask whether it is altogether wise to turn down the idea of a Director of Industries in each province?—A. Then it might be considered whether they should not be part of the Imperial department located in the province. But one has always to consider how things come up for consideration from Local Government. They are often submitted with very scanty materials for a decision and often without full preparation.

Q. You mean that local Governments should send in their proposals to the Imperial Government and the advice of their local directors and that then a decision will be made by the Imperial Government?—A. Yes. The question really is one of communication. If there is a provincial officer, it is easier to make it if he has a proper opportunity to deal with a case with success and he can refer it to the Government of India through the Local Government then, if the recommendation is not accepted by the Government of India, the Local Government will feel that it is a case of communication and a case of communication. To my mind that is the difficulty. I suggest that if the Imperial Government could be available to any Local Government.

President.—Q. There is a great deal of work to be done in the smaller provinces and you want to have some man in the provinces to whom the local men could go for information. Would not the provincial Director of Industries be a useful switchboard, that is to say a man to whom enquirers will go and who will send the proposals on to the Imperial department?—A. Yes.

Q. He could give the Local Government advice and instructions on matters on which he could do so. Don't you think he would be useful in that way?—A. Yes.

Q. Then the question arises, supposing you made this Director of Industries independent of the Government of India is there not a danger of the Director imagining in his ignorance, as he will be ignorant in all except one or two subjects, that he will be able to follow up all subjects himself and even do research work and give advice?—A. I think that is a danger to be guarded against.

Q. The danger might become a very serious one. It might lead people astray. Is it possible to combine the functions of the local Director of Industries with those of an appointment which we may call now the Director-General of Industries in such a way that the Director of Industries will be a member of the Imperial department, liable to transfer, but not frequent transfer, from one province to another, and having the prospect of promotion as Director-General? Would that be an advantage?—A. That does not bring him under the Local Government.

Q. The relations of a local Director of Industries to the Local Government is a rather difficult point. This is not the case with the Geological Survey in which an officer, wherever he may be, in Burma or Madras, is absolutely under the orders of the Director. In some other departments the case is different, their officers are either partly or wholly under the Local Government. Would it not be possible for the local Director of Industries, who is a member of the Imperial department, to be lent to the different Local Governments for, say, a period of five years and to be placed under the orders of the Local Government for executive purposes subject at the same time to the Director-General?—A. I think that is conceivable and could be carried out.

Q. Would that not satisfy local susceptibilities?—A. There is an exact analogy in the Customs Department where the Government of India selects the Collectors of Customs. It is true that the Local Governments very rarely take an interest in what he does, but this will not occur in the case of industrial development. I think that of all the forms the one suggested by you is the most practicable.

Q. Supposing a Director of Industries is transferred from one province to another for officiating purposes or on promotion he would have to adjust himself to the new provincial atmosphere. Would it be an advantage for him to have a small Advisory Board of Industries?—A. I have my doubts about Advisory Boards.

Q. Supposing we start with three?—A. I do not see that it will be of very great assistance. He could always get the help of non-officials if he is the right type of man.

Q. You think then that it is practicable to have an organisation of the kind I have described, namely, a Director-General with local Directors of Industries under him?—A. Yes.

Q. And you are absolutely against the provincial industrial officer being associated in any way with a Board, either Advisory or Executive?—A. There may be some advantages of a general character in associating him with a Board but I do not look to any definite result from the Board.

Q. I have been keeping one or two matters in view during my recent rush through India. For example, in the matter of weaving there have been very great local variations and some of the variations are due to the fact that weaving experts have totally different methods in trying to teach the people. In one province you have one kind of loom and another kind in another province. Each province does not know what is being done in the other provinces. In a case of this kind would not a small Advisory Board be useful to the new Director of Industries in a province?—A. Would the Advisory Board be a permanent body with a tradition and an accumulated fund of experience?

Q. That is rather a difficult point. You think that the local Director of Industries would get all the advice from local men if he is the right kind of man?—A. If you get the right type of man he will gather round him a certain number of non-officials. If he is not the right kind of man then the Board will not help him.

Q. If you had an Imperial Service then the recommendations that such and such an industry should be helped would go from the local Director to the Director-General?—A. You could also have a provincial budget for this purpose. The question will eventually have to be faced as to whether the Local Governments should not have certain grants for industrial development.

Q. Is there any provincial Board of Agriculture anywhere?—A. I do not know. I have very little experience of agricultural matters.

NAGPUR.

WITNESS No. 137.

*Rao Bahadur D. V. Bhagwant, Shri Lakshmi Oil Mill Co., Limited,
Aklola, Berar.*

Written Evidence.

I have been the managing director of the Shri Lakshmi Oil Mill Co., Ltd., since 1905, when it was established. Its paid up capital is Rs. 1,05,000. The company owns an oil-mill at Akola in Berar which at first crushed linseed only. Subsequently in 1910, it was extended and equipped for crushing sesame, groundnuts, castor seeds and similar oil-seeds. In 1914-15 a cotton seed department, including a refinery, was added.

There are eight oil-mills between Shegaon and Nagpur on the Great Indian Peninsula line. All of them are operated by steam power and use hydraulic presses for expressing oil. Most of them crush linseed and have been prosperous mills. The oldest among them is, I believe, of about 45 years' standing. The oil seed industry.

In the following answers I will confine myself chiefly to the consideration whether cotton-seed oil-mills can be successfully established in India. I will assume that it is eminently desirable that cotton-seed, which in recent years has been exported to Europe in very large quantities, should be worked in this country, thus affording food for men, cattle, animals and plants.

There is this peculiar advantage about cotton seed oil-mills that they can be established and worked by small capitalists. Cotton seed is a bulky material, which costs much to convey to a distance; and is apt to get heated when stored in large quantities. The best results are obtained when it is crushed on the spot, and as fast as produced by the ginneries. There is however this disadvantage about these mills. They can be worked most economically and with the best results during the cotton-ginning season only, which lasts about six months. During the remaining six months the machinery must remain idle or crush stored seed or other oil-seeds.

Several cotton-seed oil-mills have been recently established in British India and Berar; but, so far as I know, none of them has yet proved successful. The reasons for this, in my opinion, are mainly two—

- (1) want of skill in operation, particularly in the operation of refining the crude oil,
- (2) want of remunerative markets for the products of the mills.

Both these desiderata can, I think, be supplied.

The former want can be supplied by having for instruction, for the whole country, one cotton-seed oil-mill, including a refinery fitted with the best and most up-to-date appliances, and operated by skilled workmen under the supervision of a competent chemist.

The mill will be on a railway line in a district where seed can be had fresh and in abundance. The mill should provide instruction to all those who desire to learn the trade. A substantial fee might be charged to the students. Subject to regulations, the students should have full and free access to every department of the mill and the refinery, as well as to the accounts of operation, and also opportunity to practise the various processes themselves. The students should be men with long and practical experience of mechanical engineering, who hold second or first class certificates under the Boiler Acts, and who preferably have had a full course in engineering, in a technical school like the Victoria Technical Institute at Bombay; or they should be men who have taken the B. Sc. course or higher degree in science and have subsequently studied in the laboratories of the Tata Institute at Bangalore or other laboratories for at least two years. These last can learn, at the mill, the art of refining only. The former can learn both, the manufacturing of crude oil as well as its refining. My opinion is that a six months' attendance would be ample.

If possible, the mill should not be owned and managed by the Government. Government supervision and management is likely to be very expensive and should be resorted to only as a last resource. The supervision and the management should preferably belong to private persons who are already in the business and known to possess superior experience and skill in manufacturing and refining cotton-seed oil. A liberal subsidy or grant-in-aid should be made to them, so that they might have little reason to neglect instruction of students, which is the object of the subsidy or grant-in-aid. At the same time, the grant should not

be so large that it would have the effect of discouraging competition. I am unable to say whether the mill should be placed under the control of the Education Department or of the Department of Industries ; nor am I in a position to define the extent and nature of the control which these departments should possess. I repeat, however, what I have said, that every effort should be made to provide the instruction at a private mill. It is only when all efforts in this direction fail, that I am willing to advise that Government should step in and establish their own mill, and I advise such an expensive measure, involving risk of waste, because I feel that the interests of a future prosperous industry for which India possesses peculiar advantages are at stake.

Can a central refinery supply the needed skill in refining?

The most difficult operation in a cotton-seed oil-mill is that of refining the crude oil. The few cotton seed oil-mills which have been recently established in British India have each their own small refinery. The refining is done by persons who, in most cases, did not possess previous experience and skill. This is necessarily so ; for a small refinery cannot afford to employ an expert refiner from a foreign country and there are, as far as I know, no expert refiners in India itself who would be willing to accept employment for a modest salary. As a consequence, the refined oil which is produced is inferior to other competitive oils made from groundnuts, sesame, safflower and other seeds. One remedy to improve the refining is to establish a refinery in a central situation to which local mills will send their crude oil, instead of trying, as at present, to refine it themselves. The large central refinery will be in a better position to employ an expert refiner and produce a really edible oil. In the United States of America, where there are the largest number of cotton-seed oil-mills in the world, the practice is not for each separate cotton-seed oil-mill to try to refine its own crude oil. There, the mills sell their crude oil to large and centrally situated refineries. This solution of the difficulty, however, is not practicable at present ; for a large and central refinery cannot be established until we have first a number of cotton-seed oil-mills producing crude oil. Moreover, it is to be feared that the central refinery people, in the absence of competition, would compel the cotton-seed oil-mills to sell their crude oil at an unfairly low price.

As soon as a number of cotton-seed oil-mills are well established and have begun to pay, the *All-India* cotton-seed oil-mill, private or Government owned, for the practical instruction of students, which I am advocating, will become unnecessary and the grant for it should be withdrawn.

In the absence of a mill, either private or Government owned, which I am recommending, I have little hope that a private owner of a cotton-seed oil-mill will be willing to give to students or intending competitors free access to his works and full facilities to learn the trade and its secrets, and it will take a very long time for an extensive oil mill industry to build itself in this country. This is not all. In the endeavour to build such mills, there will be many failures, waste of energy, loss of capital and disappointments. All these evils may be to a great extent avoided by the provision of an *All-India mill* for imparting practical instruction on a commercial scale.

In explanation of the second desideratum, which I have mentioned, I have to say that the chief difficulty which cotton-seed oil-mills have to face at present has regard to markets for their products. There is frequently no immediate or large market for these products in up-country districts, that is, in places where the seed is produced and where the mills ought to be established.

The oil, cake, lint, hulls and soap-stock bring prices which are not, so far as I know, ordinarily remunerative. At times, when other oils and feeding stuffs are dear, the cotton oil and cake, which are the most important products, may bring prices which cover all expenses or even leave a profit. But there is an uncertainty, if for some years to come, they will ordinarily do so. It is a wellknown fact that oil produced from the Indian seed is very inferior, so much so, that in the United Kingdom, where it is most produced, it is considered fit only for the soap kettle. It is rarely, if ever, prepared for use as an edible oil in that country. Added to this inherent disadvantage, there is the fact that the art of refining is at present very backward in India. In addition to the loss in refining being very high, the refined oil smells foul when heated and is not always neutral, clear and of a brilliant yellow colour as it should be. Moreover, owing to the difficulty of disposing of hulls at a good price, the seed is frequently crushed whole, without decortication, and consequently yields a grade of oil which is inferior to what it would otherwise do. It cannot be denied that on account of its unfamiliarity and inferior quality, the people have frequently a prejudice against it. Fortunately, the taste of the mass of the people in India is not fastidious. Provided the oil is appreciably cheaper than other oils, it finds a sale in up-country places in small quantities and to a limited extent. In large cities like Bombay, the oil finds, at cheap prices, an immediate and large market. But the expense of sending oil to distant cities amounts to so much that it seldom pays to do so. It is far more difficult to market the cake. The press-made cake, unlike that

produced by the country *ghanis*, is very hard and seems in appearance to be devoid of all oil. The farmer and peasant require a cake which is soft and oily. Even when the cake is cracked and broken and ground into meal it is difficult to find purchasers for it at remunerative prices. Not that cattle which are long used to be fed with whole cotton seed will not take kindly to the cake. Nor is the practice of feeding cattle with oil-cake uncommon.

There seems little difficulty on these accounts. The difficulty is about the prices which the people are willing to pay for the cake. It is argued that if cotton seed itself sells at so much per maund, the cake, from which all nutritive oil is taken away and is left as dry as a wooden board, must sell very much cheaper. That the cake is more clean, that it is free from dirt and lint, and that it contains just the quantity of oil which the animal can well digest, are arguments which do not appeal to the common man. Experiments made at cattle-feeding stations, the practice followed at Government farms and dairies, and at Commissariat stations and the publications in agricultural bulletins do not ordinarily reach him and in rare cases when they do, they have little influence with him. To one argument, however, he is always open, and that is *cheapness*. He is poor and all his prejudices vanish when he can buy very cheap. The hulls present the most difficulty in Berar. They get heated when stored, are apt to catch fire, and are so bulky that large buildings are necessary to store them. It is most desirable therefore to dispose of them as fast as they are produced. They do find buyers, but only if sold at nominal prices. We made hulls in 1914 before the war, but a hundred pounds of them could with difficulty bring from three to four annas. A hundred pounds ought to sell at about 12 annas to one rupee. We could not use them in the boiler as fuel, for coal was found cheaper for this purpose. I have, however, every confidence that if placed on the market with perseverance, they will, in a few years, come into increased favour and bring remunerative prices. They are already reported to do so in Gujrat. Similarly, with the oil. It will gradually become more popular and command better prices, especially so when the refining comes to be better practised than it is at present. In the meantime, very great care must be exercised that the production of the oil and the hulls does not exceed the limited demand in the mofussil. Only so much should be produced as the markets will absorb. At the same time, care must be taken to keep persistently the oil and the hulls and also the cake on the market to supply regularly and without failure such demand as exists and to meet further and increased demand. Such a control and regulation of production is only possible, in my opinion, in the case of a mill which does not depend solely on cotton seed for its raw material, but is equipped for crushing other oil seeds. This state of things, however, is only a temporary one, and will not last for many years. Once the oil and the hulls and the cake come into general vogue and begin to bring remunerative prices, mills can be erected which are devoted entirely to the crushing of cotton seed.

The lint from the linters can find already a ready and remunerative sale in Berar. It is used for making rugs and carpets, which is an ancient industry in this province. The soap-stock also is finding sale at Rs. 42 per ton but not at remunerative prices. These two, however, are minor products, which do not affect the question of cotton-seed mills in a very vital degree.

To bring cotton seed products into vogue in this country they must be sold for some years at very cheap and tempting prices. No manufacturer, however, particularly a small one, can afford to sell his products for any long time at unremunerative prices, to help the establishment of a new industry, however convinced he may be about the ultimate greatness of that industry. He will be the more unwilling to do so because there is no guarantee that other competing mills will not come to be built, once the industry is shown to be profitable. If the products of the mill must be sold at a loss for some years, this loss ought in fairness to be shared, in part at least, by the public revenues, because the successful establishment of the new industry means a great increase in the wealth and prosperity of the people, and an increased revenue to the Government, as has been strikingly shown in the case of the United States of America, and to a smaller extent in the case of Central Asia and Egypt. To form an adequate estimate of the possibilities to India from the new industry, we should remember that India is the second largest cotton seed-producing country in the world.

Another plan of assisting the new industry would be for the Government to guarantee the purchase of the products of the mills, in whole or in part, for a term of years.

A way to create a demand for cotton-seed oil would be to promote the allied industry of soap-making. This industry is capable of consuming enormous quantities of oil. Thus all the refined oil made from the Indian seed in the United Kingdom is used up in the manufacture of soap. There is this disadvantage, however, about cotton oil that it cannot produce a hard soap. For this purpose tallow or cocoanut oil is required to be mixed with cotton oil. I recommend, therefore, that a soap factory should be made

available for the instruction of students in the same way as a 'cotton-seed' oil-mill. This factory may with advantage be located in the same place as the *All-India* cotton seed oil-mill, as the latter can supply the former with its raw material. All oil which cannot be sold for edible purposes can then be used for making soap, as also all soap stock which will be produced by the cotton seed oil mill. The Presidency of Bengal, I have read, possesses some very good soap factories. It will not be difficult therefore to procure expert soap makers for the soap factory. The soap factory for the instruction of students should be, if possible, a private owned one. It is only when a private factory cannot be secured that Government itself should establish their own factory.

As soon as a number of soap factories are established with success and the knowledge of soap manufacture becomes general, the necessity for maintaining or subsidising a soap factory will cease to exist.

I have been informed that the principle of providing for the instruction of students in particular arts at a private factory has been already adopted by the Government in the Bombay Presidency, and that students holding Government of India scholarships are provided with facilities to learn and practise the art of refining castor seed oil at the well-known works of the Sabarmatti Mills which belong to the Bombay, Baroda and Central India Railway Company.

Up-to-now I have not mentioned the foreign markets which exist for cotton seed cake, both of the undecorticated and the decorticated kind. At Liverpool these cakes fetch good prices. My esteemed friend, Mr. B. N. Mudholkar, Managing Director of the Berar Oil Works, Limited (this is another and larger oil mill in my town which is equipped to produce both the kinds of cotton seed cake), has kindly furnished me with figures in respect of thirty-one consignments of undecorticated and two of decorticated cotton-seed cake which his mill sent to England in 1912-13 and 1913-14, before the war broke out. The average price which he obtained for the undecorticated kind was Rs. 63-2-0 and for the decorticated kind was Rs. 93-12-0. The proportions, however, of these amounts which went to defray the expenses to Liverpool were 59 per cent in the case of the undecorticated and 42 per cent in the case of the decorticated cake. It may be mentioned that the amount of expenses remains the same whether the cake is the decorticated or the undecorticated kind. From the smaller proportion of expenses to the gross total price in the case of decorticated cake one might be led to think that it must be more profitable to send decorticated than undecorticated cake to England. But it may not be really so.

The secret of the prosperity of the cotton seed oil industry lies *chiefly* in the ability of the manufacturer to dispose of his cake at remunerative prices. In the figures about the 33 (31 *plus* 2) consignments to Liverpool which my friend, Mr. Mudholkar, made in 1912-13 and 1913-14, the undecorticated cake brought to his hand an average price per ton of Rs. 27-3-0 only and the decorticated cake Rs. 54-3-0 only. These are not such prices as to make the industry a profitable one. The table given below will make this clear.

Table showing average products and values obtained from one ton of seed crushed whole without decortication in the years 1912-13 and 1913-14:—

	Rs.	a.	p.
Refined oil, 269 lbs. at Rs. 7 per 38 lbs. calculated on the basis of a yield of 12½ per cent refined oil per 100 lbs. of seed	50	0	0
Undecorticated cake, 1,881 lbs. at Rs. 27-3-0 per ton, on the assumption that the dirt, sand, &c., amount to lbs. 90 per ton	22	13	3
Lint, 16 lbs. at Rs. 2-8-0 per 28 lbs.	1	6	9
Soap stock	0	12	0
Total	75	0	0
Less—			
Cost of one ton of seed at Rs. 56 per ton	56	0	0
Cost—manufacturing and selling, including all over-head charges at Rs. 30 per ton	30	0	0
Total	86	0	0
Loss per ton	11	0	0

I am unable to give a similar table in respect of seed decorticated prior to being pressed because the quantity of seed so treated was small.

The cost of Rs. 30 per ton might be objected to as too high, but it is established by several years' experience. It must be noted that it is not merely the manufacturing cost. It is calculated as follows:—At the end of the year when the accounts are balanced and the final figure of total expenditure arrived at, this figure is divided by the total weight of seed crushed in tons. The result obtained is taken as the cost per ton. I know many people have come to grief because they under-estimated the cost. In this connection I take the liberty of giving an extract from the book of Professor W. D. Ennis entitled "Linseed Oil", page 158. "With the mill 'working cost' of 4 to 8 cents per bushel, the actual cost of operation has only begun. Thus, in one example, the monthly cost of barrelling exceeded the entire working cost, freight and drayage amounted to half the working cost, executive and selling expenses equalled the working cost. It is these items, which must all be considered in arriving at the cost of oil, that lead manufacturers to speak of the working cost as from 15 to 30 cents per bushel, rather than from 4 to 6 cents per bushel."

The cost of Rs. 30 per ton includes depreciation on plant, buildings, bags, stores, reserve parts, furniture and live-stock, insurance, interest, all kinds of losses such as missing bags, fuel, press cloth, and all kinds of stores, repairs, wages, salaries, taxes, all overhead charges such as the commission paid to the directors, and all kinds of miscellaneous expenditure including selling expenses.

To revert to a consideration of the form of Government aid to the cotton-seed oil industry, the plan of making a grant-in-aid to the manufacturer to recoup a portion at least of the loss he suffered appears to me to be difficult to carry out, for the questions would arise:—(1) How is the amount of the grant to each manufacturer to be fixed with justice and impartiality to all? (2) How are the interests of the general tax-payer to be safe-guarded? These questions are so difficult that I confess I cannot answer them satisfactorily. The second plan which I have suggested, *viz.*, that the Government should guarantee the purchase of the products of the mill, in whole or in part, for a term of years does not seem to me difficult to adopt. In respect of this plan the chief question to answer is to what use the Government can put the goods it would purchase under the plan. Government cannot manifestly buy the oil or the linters or the soap stock. It has no use for these. But to a small extent it has use for the oil cake and perhaps the hulls. The Government can order these for its farms, dairies and military establishments. Perhaps it can advise local bodies to buy them for their cattle. But the aid given in these ways would be quite insufficient. Moreover, the action of the Government is not likely to bring the cake and the hulls into more favour with the agriculturists. I would suggest therefore that every year the Government should purchase quantities of cake and hulls at prices which would be reasonable to the manufacturer and then distribute the goods so bought either gratis or at nominal prices among the agriculturists. Such an action on the part of the Government will, in my opinion, bring the cake and the hulls more and more into fashion and its benefits will be enjoyed equally by all cotton seed millers. Agricultural co-operative credit societies may be treated with special favour in the distribution, as thus the membership of the societies will be made more attractive. No other form of Government aid is, in my opinion, more suitable under the circumstances.

In the table given above (paragraph 22) the average price of undecorticated cake in 1912-13 and 1913-14 is shown as Rs. 27-3-0. This price was obtained by sales made in Liverpool. Had the price obtained been Rs. 40 per ton there would have been no loss in crushing cotton seed. Now, while most of the cake made by our friends of the Berar Oil Works, Ltd., was sent to Liverpool and sold there, some small quantities were sold by retail sale locally at Rs. 32 per ton *ex-mill*, thus showing that, provided the output of cake is such that the local market will absorb it completely, the loss per ton of seed need not be so high as Rs. 11. Had the oil sold at Rs. 7-10-0 per maund of 38 lbs. and all the cake at Rs. 32 per ton, there would have been no loss, although there would have been no profit. Thus it is all a question of local markets at a little better prices than at present.

I have long and earnestly thought whether the District Boards and Municipalities cannot give help in promoting industries. The cry has been that Government should start technical schools, undertake research work, establish pioneer and demonstration factories, hold industrial fairs and exhibitions, finance industries and encourage and help trade in other ways. Cannot the local bodies take a share in this good work? I think they can and ought to.

Assistance
Local Boards
Municipalities, by and

I know that the means of the up-country local bodies are small. I admit also that the promotion of industries cannot rank as high as sanitation and the other duties which they at present perform, and which generally absorb all the funds at their disposal. Yet, I contend, that the duty of promoting industries should be expressly added to their other duties. Local bodies will have to obtain more money by taxation to be able to establish and maintain technical or industrial schools, and to promote industries. The power to levy this increased taxation should be conferred on them. The money thus

raised will ordinarily be spent on technical and industrial education. In those cases in which it is wished to assist an industry, like that of cotton-seed oil-mills, the local bodies should be able to do so only in co-operation with or with the approval of the Government. A restriction of this kind would be beneficial to them as thereby they would have the advice and guidance of Government. It will also prevent abuses.

I am strongly of opinion that an alteration of the laws for the purpose of expressly giving local bodies liberty to raise and spend taxes on the encouragement and promotion of industries will do much good by enlisting the co-operation of the people and making them more self-reliant and self-respecting.

Railway freights.

We are dissatisfied with railway freights. One would naturally expect them to be, in respect of long distances, proportionately less for less mileage. But they are not so. Take for instance the grain rate from Pipariya (a station from which we bring seed for our mill) to Akola, a distance of 316 miles. The rate is Re. 0-9-5 per maund. But this is also the rate for 505 miles from Pipariya to Bombay. This is typical of numerous other cases.

We have had several extraordinary cases of disparities in railway freights. Kirkee is a railway station 411 miles from Akola. Poona, the next railway station after Kirkee, is 414 miles, that is, 3 miles more distant from Akola. Now, 20 tons of oil cake sent to Kirkee are charged Rs. 399-8-0 and 20 tons sent to Poona are charged Rs. 172-11-9, that is Rs. 226-12-3 less for three miles more. We have this experience several times every year for we send oil cake to Kirkee and Poona.

We are much handicapped in our business owing to the high rates for grain. Our supplies are often drawn from Pipariya, Itarsi, Banapura, Harda, Chanda and Warora—all distant stations from Akola on the Great Indian Peninsula Railway. A special concession rate from the above stations to Akola for seeds to be used for crushing would be a great help to our industry.

Another cause for complaint is the refusal of the use of sheds for *perishable goods* waiting to be loaded. Oil cake is justly classed as "perishable goods" because the least exposure to moisture will damage it and make it mouldy and unfit for cattle food. It has often happened that we had to forward goods while it was raining and there was plenty of empty room in the goods sheds at our station. But permission to deposit our cake in these sheds while waiting to be loaded was refused on the ground that the sheds were intended for storing unloaded goods. No sheds have been provided for protecting *perishable goods* from rain while they are awaiting to be loaded. This is a great hardship.

Another complaint we have is that no specially favourable rates can be obtained for conveying the products of cotton-seed oil-mills. These mills, as shown above, have not become paying and therefore require to be fostered. But the railway people seem to be indifferent. They do not appear to have long views. They are not inclined to take into consideration the very large and increased traffic which a flourishing cotton-seed oil-mill industry would bring to them. Perhaps they are not convinced that this industry would ever flourish.

Training of labour and supervision.

I am of opinion that, if trained, Maratha Brahmins will make good managers and superintendents. I am a Maratha Brahmin. My community is noted for its intelligence, but its members are generally poor. Our ambition has hitherto been to shine in all those departments of life which require intellectual but not manual labour. No boy in the community is illiterate. It is the boys of my community who form the greater majority in the high schools. They form also a considerably large number of students in colleges. The superior students prepare for the Bar and a considerable number of them take up the medical profession and a few civil engineering. But few enter the commercial line and fewer still wish to become manufacturers. The prevailing opinion is that we are not adapted by nature for commercial or manufacturing work. Our ablest thinkers have very much deplored the existence of this opinion and have desired that the present universal tendency to follow the professions should be corrected. The basic idea of our oil-mill has been to show by example, on however small a scale, that by honest work even Maratha Brahmins can hold their own as merchants and manufacturers. Our mill is entirely managed by Maratha Brahmins. All the directors, the secretary, who takes care of the erection and manufacturing side of our work, and the assistant secretary, who does all the buying and selling, are Maratha Brahmins.

In order to develop industries in India, manual training must be made compulsory in the high schools, the students being required to attend classes in carpentry and smithy work for a certain number of hours every week. It may be objected to this suggestion that the high school course is already overcrowded with too many subjects. To this my reply is that the course might be extended by one or two years. At present, from the time a boy begins to learn English it takes him seven years to

become ready to appear for the matriculation examination. In future, the time should be eight or nine years. This will give the students ample time to do manual, side by side with literary, studies. If compulsion is considered too drastic a measure, then I propose that the students should be induced to attend the manual work classes by special privileges such as remission of half their fees.

By introducing manual training in the high schools we shall secure a supply of proper students for the Victoria Technical Institute at Bombay and other similar institutions which are intended to produce managers and superintendents for manufacturing and industrial works. The receipt of a little manual training will be no disadvantage to students who desire to prepare for the professions, only they will have to remain at school a little longer. I am convinced, that in no other way can immediate and appreciable results be obtained in creating a liking for manual work among Brahmins. It is from Brahmins who have received industrial training that we shall be able to draw our future supply of managers, superintendents, and foremen. For besides their intelligence, resourcefulness and self-discipline, they possess the advantage of superior social standing which will enable them to command obedience from subordinates.

The linseed cake produced in the Central Provinces and Berar is generally all sent to Liverpool for sale. It is considered to possess peculiar virtues, and commands there a price which is higher than what its protein and fat contents alone would call for. In India, however, it hardly finds purchasers who are willing to pay the price that can be obtained by its sale in England.

Technical aid to industries.

Assistance in marketing products.

Indian linseed cake is almost always so imperfectly pressed that it generally contains from 9 to 12 per cent of oil, as against 6 per cent which the cake from North America as a rule contains. Now, it is the case with English farmers, and stock feeders, that the more oil they get in their cake the more pleased they are. The same is the case with the compound feed manufacturers in England. They prefer the more oily cake. Yet, notwithstanding these facts, and the additional one that Indian cake is made from seed which is more mature than the American, the price which Indian cake can fetch in the Liverpool market is equal or a little less than the American. According to its character and oil contents, the Indian cake should bring a better price than it does at present.

Several reasons may account for the discrepancy. Firstly, cake which is sold on a guaranteed analysis fetches a better price than one which is sold without such a guarantee. Indian cake, in the absence of facilities for obtaining correct analysis, is often forwarded without any guaranteed analysis. On the other hand, all American cake is offered for sale with a guaranteed analysis. This may explain the reason why Indian cake fails to fetch its proper value. Facilities therefore should be given to Indian oil millers to have analysis made at responsible Government institutions. I use the word *responsible* advisedly; because it has happened within my experience that a series of analyses at one Government institution were all wrong. To give one instance: on one occasion the whole seed was reported to contain 32.01 per cent oil, and the cake made from it 8.50 per cent oil. This was manifestly wrong, for the actual yield of oil from that seed at our mill was 34 per cent, i. e., 7.61 per cent more than was demanded by the above analysis. If the analysis is wrong, the guarantee given on its faith makes the exporter liable to pay compensation. The result may even be worse; for the buyer may refuse to accept the goods in a falling market.

Another reason which may account for the discrepancy in the prices may be that while there are probably American representatives of trade on the spot at Liverpool, to take care of their countrymen's business, there is no Indian representative to watch the interests of Indian exporters. I have had inquiries made on one occasion through a European friend about the reputation in which our cake was held in the Liverpool market, the price it usually fetched, and other matters relating to the trade in linseed cake at Liverpool. My informant, who was practising as a broker in grains and seeds in the Liverpool market, sent me a reply in which, among other things, he said that Indian shippers of linseed cake were *victimised* in the Liverpool market. This may or may not be true. The circumstances, however, are manifestly such that there is need of a Government representative to look after the interests of Indian trade at Liverpool, to explain to Indian traders the requirements of the market, its likes and dislikes and to advise each individual exporter, if he makes the request, as to the point or points in which his goods require improvement.

Trade representatives.

I will give another illustration to show the desirability of having trade representatives. Our sesame cake was formerly all sent to Liverpool. Sesame seed is dear: but our cake used always to bring disappointingly low prices. After years, I read in an official report made by a representative of the Government of the United States of America, who had been sent to the European countries specially for the purpose of reporting on the trade in each country in oil cake, that "hardly any sesame seed was crushed by English

oil millers, and that sesame cake was not much appreciated by English farmers, and stock feeders. On the other hand, sesame was much crushed on the Continent, especially in France, in the Low Countries, and in Germany. Being the produce of home manufacture, every effort was made in these countries to bring its true value to the notice of feeders and consequently the cake was much appreciated." This may serve to show the desirability of having a Government representative not only in England but on the Continent to look after the interests of and to give advice to Indian traders.

Every province should have one full-time Director of Industries. He should be a business man and, if possible, possess experience of one of the industries, or at least a knowledge of engineering or chemistry or one of the sciences. Indian industries cannot develop properly without the help and advice of such an officer. The Central Provinces and Berar have effected important improvements in agriculture because in the commencement this Department was presided over by two eminent officers in succession. I appreciate very much the efforts and useful work which the Directors of Industries have been doing in the United Provinces, in Madras, and in the State of Mysore. Under the guidance of such officers there is every hope of saving what is left of old industries and of establishing new industries.

In a central place Government should permanently exhibit (1) labour saving and (2) safety appliances. Labour is getting exceedingly dear. Every manufacturer, therefore, is anxious to have as little labour employed in lifting, conveying, and handling things and material as possible. He is always on the look-out to see and study appliances which can save labour. An exhibition, therefore, in which the latest and the most varied devices for saving labour are shown will be of great service to him. Every manufacturer, moreover, is anxious to guard his employes from injuries. But often he does not know how best to do it. If he can know how other people have constructed safety guards in situations which he has considered awkward, he will be glad to follow their example. Devices for removing dust, smoke, and noxious gases, for admitting light, ventilators and all similar appliances which can conduce to the health, comfort and safety of the employes should find a place in the permanent central exhibition. As soon as a new device is on the market, it should be placed in the exhibition and brought to the notice of manufacturers.

Commercial
Intelligence.

One of the largest and most important oil seeds in India is safflower. It is not exported to Europe probably because no machinery has yet been devised which can successfully decorticate it. The seed is decorticated in stone mills and pressed in country *ghanees* in this country, and yields a good edible oil and cake. Oil millers in India would be much benefited in their commercial operations if they had forecasts of the safflower crop, and I would suggest that such forecasts be prepared and published in future.

Government
publications.

Speaking about the oil mill trade alone, I would suggest that bulletins, reports, periodicals and other literature concerning the vegetable oil industry, which may be published in future, should be supplied at a reasonable charge *directly* to oil millers and persons engaged in the oil trade who may register their names with the publishing department. At present we cannot easily know what literature is issued about the oil industry.

"The Indian Trade Journal" is becoming more useful. It contains now the valuable reports of the Directors of Industries. It can be made useful to those who are concerned with the Indian Companies Act, the Factory Act, and the Boiler Inspection Act, if the Reports of the Registrars and Inspectors under these Acts, and the Government Resolutions thereon, and the Rules and Regulations that are issued from time to time under the Acts all find a place regularly in the journal.

At present people have to be on the watch to see if any notifications affecting them are published in the Local Gazette—a publication to which up-country factory owners, as a general rule, do not subscribe. By insisting that all notifications shall regularly appear in the journal, factory owners will derive much convenience and benefit. They will also be able to know what notifications are intended to be issued or are issued under the above Acts in the other provinces. The journal may also usefully publish reports of the important trials under the above Acts, in whatever province they are held.

It would do a great deal of good if the journal could arrange to publish every week a full report in respect of the trade in oil-cake at Liverpool. Indian oil-cake, especially that made with hydraulic presses, is almost all sent to the Liverpool market for sale. Indian shippers of oil-cake therefore are naturally very anxious to have full knowledge about that market. The journal would be doing a valuable service by appointing its own special correspondent in Liverpool, and publishing his reports regularly every

week. The journal, until lately, gave the rates of vegetable oils prevailing at Hull by publishing extracts from the "Oil Colour and Trades Journal of London."

I am aware that commercial people in cities like Bombay consider the "Indian Trade Journal" of little use. This is probably because they have better and more quick sources of information. But factory owners and commercial men living up-country who have not such sources must depend upon the journal, which, with a little more enterprise and attention to the requirements of up-country manufacturers, factory owners, and commercial people, can, I am convinced, be made far more useful than at present.

Oral Evidence, 15th December 1916.

President.—Q. You say that there is difficulty in getting a central refinery because it would require a large expert and costly establishment. Could not the owners of oil-mills co-operate to own one central refinery?—*A.* There are only five mills in the whole of India at present, and with one exception, *vis.*, the mill at Navsari, they are not crushing cotton-seed only, but other seeds, and there is not enough crude cotton-seed oil produced to go to the central refinery.

Q. There is no use of starting a refinery until you have enough crude oil?—*A.* Quite so.

Q. Do you wish Government to start a central refinery?—*A.* Without the oil mills, how could they? There are not enough oil mills and, moreover, it is not enough to have one central refinery, because then it will compel the acceptance of its own terms.

Q. But if it were controlled by Government, or if it were a co-operative institution, then the owners would co-operate about the price? Do you think that in your district there would be a sufficient number of mills established to justify the foundation of one refinery?—*A.* There are only two oil mills in my district. There is room for more. In my town 23,000 tons of seed are produced.

Q. Possibly the absence of a refinery prevents the growth of further mills?—*A.* That is not so. The products of a cotton-seed oil mill do not get proper prices.

Q. A refinery would not be sufficient?—*A.* No.

Q. You recommend the improvement of your market for cake and other bye-products?—*A.* Yes.

Q. Coming to the question of railway freights, have you communicated with the agent of the Great Indian Peninsula Railway?—*A.* Several times. I have gone to the Commissioner, I have gone to the railway authorities, but my complaints have been ignored.

Q. Have they given you any reasons as to the apparent discrepancy in the rates?—*A.* No.

Q. Then you do not know the reasons?—*A.* No. In the case of Poona, I know there is a special rate for that city.

Q. Is the industry likely to be a large one to warrant the railway offering special rates?—*A.* Yes. We have the example of America before us.

Q. You say there are only five mills in India?—*A.* Yes. They are situated as follows: One at Lahore, one at Cawnpore, one at Navsari (Bombay Presidency) and two at Akola (Berar). The mills are so scattered and so distant that it would be very expensive to send their crude oil to a central refinery. The railway freight, the packing and other expenses, besides the loss of oil due to leakage on the long journeys would amount to so much that it would not pay to have their oil refined at a central refinery.

Q. You have suggested here that manual training must be made compulsory and if necessary the term of training should be lengthened?—*A.* Yes. Manual training should be introduced in the high schools from the bottom class to the top.

Q. If you concentrate your training in the earlier years, don't you think that you would produce a better class of boys?—*A.* Yes.

Q. They could not go on to the University without putting in a longer time in this way?—*A.* No.

Q. In other words, would you make it more difficult for them to get to the University?—

Q. You have made out a case for trade representatives at home to look after the interests of those who are selling oil cake. You think with reference to trade journals that it would be better if the Government issued journals dealing with particular subjects or groups of subjects so that when anything was published, for instance with reference to oil, it might not be buried in the Gazette with a large number of other notifications?—*A.* Yes.

Mr. A. Chatterton.—Q. You have a linseed oil mill at Akola?—*A.* Yes.

Q. Can you tell me why linseed oil is imported into India and why it is not all manufactured in this country?—*A.* I do not know. Linseed oil is eaten in Berar and the Central Provinces. There are mills which crush linseed but the oil is eaten.

Q. You boil the oil?—*A.* One mill boils a portion of its oil.

Q. Can you tell me why when a large market exists in India for boiled linseed oil, it is not made by the mills in the Central Provinces?—*A.* They do not make boiled linseed oil because without any additional cost or labour they can get good prices for raw linseed oil. They restrict their business to producing oil for eating.

Q. Have you tried boiling linseed oil?—*A.* No.

Q. You say that cotton seed oil mills can be established and worked by small capitalists?—*A.* Yes.

Q. What do you consider would be the output of a mill of the smallest size?—*A.* The capacity for decorticated cake would be 15 tons per day, and undecorticated cake 10 tons.

Q. You say you have extended your mill for the crushing of sesame, ground nuts and castor seeds, how often do you change from one kind of oil to another?—*A.* If there is a demand for linseed oil we go on crushing linseed for weeks together and if there is a demand for other kinds of oil, we make these.

Q. You have large godowns attached to your mills?—*A.* Very large and expensive godowns, because in my place all the seed has to be purchased at the harvest time. It cannot be purchased all the year round and so we have to store the seeds in godowns for the whole year.

Q. Have you asked for advances for stocking seed?—*A.* I have never asked for advances. We have had our own money and I have never experienced any difficulty. We have a branch of the Bombay Bank; but it is very troublesome to get advances from the Bank of Bombay.

Q. You are in the fortunate position of having enough capital to conduct your business?—*A.* Yes.

Q. You say a Government mill should be established for the training of mill superintendents and mill managers?—*A.* Yes.

Q. And I gather from your note that you consider that it is more important that the manager of the mill should be a chemist than that he should be an engineer?—*A.* The manager should be a chemist and engineer. He must have knowledge of both.

Q. Chemical knowledge is more important?—*A.* In the refinery.

Q. You say that the mill you recommend should not be managed by Government, but that it should belong to private persons who are already in the business and known to possess superior experience and skill in manufacturing and refining cotton-seed oil. Do you think that any one who has this superior knowledge and experience of oil milling would be willing to impart this information to persons who may become rivals in the manufacture?—*A.* I know from reports that the mill at Navsari (Bombay Presidency) is managed by a young American gentleman and produces the best oil. Whether the mill will receive students or not I do not know. If they won't the other course is that the Government should have a factory on a commercial scale for training managers.

Q. Do you think it would be possible to have a small mill and complete refining plant at an institution like the Institute of Science, Bangalore, where these people could be trained?—*A.* Yes. In London there is a Polytechnic in which students are taught the manufacture of varnishes on a commercial scale.

Q. Do you think that it could be done at a scientific institute like the one at Bangalore?—*A.* Provided they have the plant.

Q. You say in your note that all the Indian cotton seed which is sent to England is considered only fit for production of oil.

Q. Do you think that you would be able to produce edible oil here if it is only fit for soap manufacture in other countries?—*A.* We are not so fastidious. We can sell the oil and it is used for cooking. Our tastes are not so fastidious as those of people in the West.

Q. Where do you get your market for the cotton seed oil that you produce now?—*A.* The chief market is Bombay for large quantities and small quantities we sell locally in our province.

Q. What do you do with the cake?—*A.* Whether it is decorticated or not it is mostly exported to England. Small quantities are sold locally for cattle food to Government farms and other private owners. But most of the cake is exported to England.

Q. Is any cake used for manure?—*A.* I know only one case in which the cake was used for manure, and a small quantity was used. It would be wasteful to use it as manure.

Q. What are you doing with soap stock?—*A.* We sell it to soap factories in the Bombay Presidency on the west coast.

Q. And you think that it would be better if you had soap factories established in connection with the cotton mills?—*A.* Yes.

Will you tell us how you refine your cotton seed oil at the present time?—*A.* By means of caustic soda. We mix the oil with a solution of caustic soda.

Q. Do you use a filter press?—*A.* Yes. For all oils.

Q. Have you a separate press for each kind of oil?—*A.* For cotton seed oil we have a separate filter press; but for other oils we have only one press.

Q. Is the machinery that you are using German or English?—*A.* The cotton seed department machinery is from America, and machinery of the other departments is from England.

Q. Have you had any trouble about decortivating machinery from America?—*A.* We have a knife decorticator. Once the knives broke and we could not get them in India, and so we bought a disc huller. We have no trouble, now we can use both the hullers—the knife huller and the disc huller.

Q. The delinting machinery is American?—*A.* Yes.

Q. You say that there is plenty of scope for the establishment of oil mills in your province?—*A.* Yes.

Q. What would, in your opinion, determine the sites on which cotton-seed oil mills should be erected?—*A.* Mills should be established where the seed is produced, i. e., where ginneries exist.

Q. You would not have a mill at a place like Navsari?—*A.* They have to import their seed from Bombay which is very expensive.

Q. Are you aware that that mill is making a profit or not?—*A.* They say that they do make a profit, but there are other people who say that they do not make a profit.

Q. They publish balance sheets?—*A.* Balance sheets can be produced to say anything. I say this, however, without in any way questioning the correctness of their balance sheets.

Q. Do you mind telling us whether in your experience a cotton-seed oil mill is profitable?—*A.* Our cotton seed oil mill does not pay us. We abandoned cotton-seed crushing, because we lost money.

Q. Do you know whether the American machinery which you have in your mill is similar to that at Navsari?—*A.* I was told that their machinery is like ours.

Q. Will you tell us how you manage your mill?—*A.* I am the manager, and my son is an engineer and a nephew of mine is a chemist.

Q. So that you have a complete control both on the engineering side and the chemical side?—*A.* Yes. Our company has 11 shareholders.

Q. It is a manageable body?—*A.* Yes.

Q. Do you produce a very highly refined class of oil, or deodorise it?—*A.* We do not deodorise or deoiling at the mill, but simply produce yellow oil. Indian people do not like to use it.

Q. What about the odour?—*A.* The oil gives a bad odour when it is heated, but afterwards it does not give a bad smell. It is used for sweetmeats.

Q. Have you made any attempts to produce an equivalent to vegetable ghee?—*A.* No.

Q. Is there any market in this part of the world for vegetable ghee?—*A.* There will be a market, but the difficulty is you must have a plant. It is very difficult and expensive to make ghee. I do not know much about it.

Q. Is there any scarcity of ghee in this part of the world?—*A.* What we Brahmins get in the bazar is ghee mixed with tallow. In Bombay there is a regular trade in this line. They import tallow from the United Provinces and mix it with ghee and sell it as pure ghee.

Q. Would you like some chemical or scientific institute to take up the question of the manufacture of vegetable ghee?—*A.* Yes.

Q. And work out the process which could be adopted in this country?—*A.* Yes.

Q. Do you think that there would be a large market for it?—*A.* Yes.

Q. The reasons why you have not taken it up is the fact that there is not a sufficiently worked out process?—*A.* It is beyond my capacity to think about these schemes. I am a small man. I have read about these schemes, but I have never given any serious attention to them.

Q. Do the ryots in your neighbourhood use cotton-seed as food for cattle?—*A.* All the agriculturists feed their cattle with cotton-seed.

Q. What is the prejudice against using cotton-seed cake?—*A.* Because the cake is very hard, and they say that all oil is taken out and the cake is devoid of oil. There is one omission that I have to supply. I have not stated in my statement the capacity of my mill and the hours of work. I have said that the cost of working is Rs. 30 a ton but that is an insufficient statement. The capacity of our mill is 10 tons for undecorticated and 15 for decorticated cake and the hours of work are between 12 and 15. We do not work day and night. If the capacity were more the cost would be less.

Hon'ble Sir R. N. Mookerjee.—*Q.* You propose a new tax giving local bodies liberty to raise and spend taxes on the encouragement and promotion of industries?—*A.* Yes. They may levy it if they like. There is a strong feeling among the leading people that they should encourage industries and they may be persuaded to levy a tax.

Q. Will you make that optional or compulsory to each Local Board?—*A.* Optional.

Q. Do you think they will levy?—*A.* I know many members of the municipalities and District Boards are willing to assist industries and for that purpose my idea is to give them an option.

Sir D. J. Tata.—*Q.* Do you decorticate the cotton-seed first always, or do you press the whole seed?—*A.* We only worked for a few weeks and we found we made a loss and we abandoned working. We decorticated the seed.

Q. You say that the machinery you have is the same as the one at Navsari?—*A.* The makers may be different.

Q. I understand that the Navsari people claim that they have machinery for decorticating which is giving complete satisfaction?—*A.* There are only two decorticators in America, the knife decorticator, and the disc decorticator. There is no third type.

Q. Do you know of any English decorticating machinery?—*A.* No.

Q. Is your statement correct that the cake is left as dry as a wooden board?—*A.* It appears so. It contains, however, nine to ten per cent of oil.

Q. I understand that 5 to 10 per cent of oil is left in the cake?—*A.* In America they reduce the percentage of oil from 6 to 7. But in our mills the percentage left is 9 to 10.

Q. The cake is not left as dry as a wooden board?—*A.* It looks like that. If you analyse the cake, however, you find it contains 9 to 10 per cent of oil.

Hon'ble Pandit M. M. Malaviya.—*Q.* Can you make any suggestion as to the place where this All-India Cotton-seed Mill should be situated?—*A.* It should be in a central place on a railway where there are gineries. You must be able to get the seed and it should be on a railway in a central place.

Q. There is a great deal of cotton-seed produced in the Central Provinces and also in Bombay and there is also a great portion produced in the United Provinces. In view of these facts, have you any particular place which you think would be central for the purpose?—A. I cannot choose. The seed produced in Berar contains a larger percentage of oil and that in Bombay less oil. The cotton seed in the United Provinces contains a large percentage of oil but all places are equally good for a cotton-seed mill.

Q. Have you any idea as to what it would cost to equip a refinery?—A. I have not made any estimate. It would not cost much. The refinery consists only of tanks, and a few pumps and an engine.

Q. You have not thought out the cost?—A. It would not cost much. At the outset the highest cost would be Rs. 50,000.

Q. What about the recurring expenditure?—A. I cannot give you an estimate.

Q. Don't you think that a few of the proprietors could raise this small sum and start a central refinery?—A. There are only 5 mills at present in the whole of India. Only the Navsari mill confines itself to cotton-seed. The other mills work other seeds and there is not an enough number of mills to co-operate and think of a central refinery.

Q. You are opposed to the Government owning and managing this suggested mill. But do you think that if the Government deputed one of its officers to investigate the whole question and to place the result before the public, the people will be coming forward to find money to start such a mill?—A. We are not any longer in that stage. This industry is carried on on a large scale in several places in Egypt, Central Asia, and America, and there is no need of investigation. The only need is for training managers.

Q. By investigation I only mean putting together the facts which bear upon the question as to how much it would cost, the recurring expenditure and equipment, and whether it would be profitable?—A. The makers in America and England furnish a complete estimate to you for the smallest plant as well as for the largest plant, from 15 tons to 500 tons.

Q. You say, "In those cases in which it is wished to assist an industry like that of cotton-seed oil mills, the local bodies should be able to do so only in co-operation with or with the approval of the Government." Why do you want to limit their discretion?—A. For this reason, that a small municipality may abuse powers. They might assist a friend and abuse their powers, whereas if they were required to co-operate with Government, they would get Government advice and there would be no abuse of their powers.

Q. What you mean is approval of Government and not co-operation in any other sense?—A. No. The Government when they ask the local bodies to assist with money, will come forward with a grant themselves and so both will give money.

Q. You say, "I am of opinion that trained Maratha Brahmins will make good managers and Superintendents." Don't you think that others besides Brahmins will also make good managers and Superintendents if they receive training?—A. Others will also make good managers. But our people are after literary pursuits and therefore I say that they should be weaned from the literary pursuits and taught manual labour.

Q. It is not your object that Brahmins alone should be trained?—A. No.

Q. You suggest that manual training should be made compulsory in the high schools, and you mention the opening of classes in carpentry and smithy work. Suppose it is considered to be too strong a measure to make carpentry and smithy compulsory, would you make drawing a compulsory subject beyond the primary stage?—A. Drawing is a compulsory subject in the high schools in our provinces. Drawing is taught to all the boys.

Q. At what stage is it started?—A. From the first English standard they learn drawing & up to the matriculation class.

Q. Both in boys' schools and girls' schools?—A. Not in girls' schools.

Q. You have expressed your opinion as to the usefulness of the "Indian Trade Journal." Do you think the advantages available to a larger circle of industrial people would be lost if the journal were published in the vernacular of each province?—A. I think it would be a great advantage if the journal were published in the vernacular of each province. I have not seen it, but I have heard that it is a very good journal.

Q. Assume that it is brought up to the standard which you think it should keep up, then don't you think it will be an advantage to the public, to the Bhatias, Marwaries, and other people who do trade, to have commercial information supplied to them in the principal vernaculars of the province?—*A.* I must know in what form it is going to be published. The present form is very imperfect.

Mr. C. E. Low.—Q. Can you tell me whether the Agricultural department has been able to give you any practical assistance in selling your cake as cattle fodder or as manure?—*A.* I look to them for assistance, but we must go beyond this. The people do not know what experiments are carried on in the experimental farms. What we need is that intelligent people should feed their cattle with this cake and should show the results to their neighbours.

Q. On the same lines as ordinary agricultural demonstration in other subjects?—*A.* Yes.

Q. Has any practical result arisen from the demonstration work done by the Agricultural department?—*A.* Yes.

Q. You speak of the desirability of trade representatives in the United Kingdom and elsewhere. The instances you give appear to me to relate to nascent industries or infant industries. You give two instances where trade representatives would be useful to an infant industry, or growing industries, but not so much to an established industry?—*A.* There are oil mills which have been established and it would be even useful for them if there was a trade representative in England.

Q. I quite agree, but do you think that a trade representative in England or in other countries would be useful to India after these industries have become established?—*A.* Yes. After the industries are established trade representatives will still be useful.

Q. You speak of the desirability of getting guaranteed analyses, that is authoritative analyses for the cake. How do you propose that it should be done?—*A.* I get my analyses done at Nagpur, but facilities should be given to all.

Q. How will the purchasers know that that analysis was done on a fair sample?—*A.* If the manufacture of the cake does not give a fair sample it is his own mistake. Everything depends upon giving an average sample.

Q. In guaranteed analyses in other countries, is it not the case that the fair sample is taken by some authoritative department?—*A.* No. It is the look-out of each oil mill owner. He takes care to see that the analysis is correct, because if the analysis is not correct the purchaser will not buy the cake.

Q. You think that the responsibility of taking up a fair sample might in India be left to the manufacturer?—*A.* Yes.

Q. Would you recommend a central authority for giving such an analysis or do you think it might be left to provincial agencies?—*A.* It might be left to provincial authorities.

Q. The President wants to know whether you think that provincial authorities would command the same respect for their analysis outside India as a central authority would?—*A.* If the analysis is guaranteed the purchaser makes his bargain on the basis of that analysis. If he has any doubts he might get the cake analysed in Liverpool or other places and if the guaranteed analysis is found to be incorrect there might be an arbitration. But the certificate of the guaranteed analysis itself will have no value. We will sell on the basis of that certificate. If there are any doubts about the analysis they will have a second analysis made.

Q. If by the second analysis the first analysis is found to be incorrect there would be an arbitration?—*A.* Yes.

WITNESS NO. 138.

Mr. Amritlal Howsa, Proprietor, Match Factory, Kota, Bilaspur District.

Written Evidence.

Q. 1.— Indian capital is generally shy. It may be possible to command capital for industries which have taken root and flourished. But when a new enterprise has to be launched, it is almost impracticable to obtain money from the public. When I started my match factory, I had the desire to raise the necessary capital by the public.

principle, but as many other similar concerns which were formerly started had not proved successful, it was found altogether impossible to raise the money from the public by making my business a joint-stock concern. I had to invest every pie that I had at my disposal in building, machinery and initial experiments. Consequently I had to experience great difficulties on account of the lack of sufficient working capital. It is therefore completely essential for the Government to support new industries by assistance of every description. When a new business has to be brought into existence, the Government may guarantee the dividends for a limited period of time. The Government may advance loans at a reasonable rate of interest on proper security. The presidency banks and co-operative societies can be induced to help new industries by lending money to honest persons. The rate of interest must not be very high. I myself am put to great inconvenience for obtaining my working capital. If I can get a loan of twenty-five to thirty thousand rupees at four or five per cent, I can work my factory with greater ease and show better results.

Q. 3.—As far as my industry is concerned, there is no fear of having more concerns than can be maintained by India.

Q. 6.—When the Government has given assistance in some form, they must see that the money granted to the agent is not diverted to objects other than those for which the assistance has been given. The Government should not interfere in the internal management of the concern. Their control should be external. Government assistance.

Q. 15.—I have suffered much owing to want of technical and expert advice. In the beginning, I had to conduct various experiments in connection with match-making on a small and large scale. I lost much time and money in this procedure. If there was an expert to guide me in my work, my factory would have been much more successful than it has otherwise been. Technical aid.

Q. 19.—If the Government establish a model match factory, the existing factories would be greatly benefited. They might learn much from the Government concern.

Q. 22.—If the research work in connection with various new industries is conducted in India, business managers can personally see with their own eyes the work done by experts. It would be highly advantageous if we have a place which we can refer to for the solution of various difficulties which often come in our way and mar our progress. Experts should be supplied by the Government without charging anything. A reasonable charge should be made only after the business has been firmly established on a profitable basis. Demonstration factories.

Q. 38.—The Government should give preference to articles of Indian manufacture while buying their stores. The Government and railway companies can buy Indian matches if they are good and practicable. Government patronage.

Q. 40.—The Government should make facilities for the starting of new industries by free grants of land. Land policy.

Q. 44.—In India labour is unskilful, inefficient, and unsteady. It is very difficult to train them in a new kind of work. I experienced great difficulties in obtaining men who would work in the factory for a long period of time. In the match industry the machinery is very intricate. After a labourer becomes expert in some kind of work, he naturally gets good wages. As soon as he earns a small sum of money, he runs back to agriculture. I established a school for educating my labourers, but nobody attended, with the result that the masters, being disgusted with their task, left service. Training of labour.

Q. 54.—There is a difference of standard in the examinations of mechanical engineers in various provinces. A mechanical engineer of one province is not recognised in another. If there is uniform standard for certifying mechanical engineers throughout India, many difficulties would be removed. Mechanical engineers.

Q. 56.—There should be an advising Board in each province. Expert and technical advice is absolutely essential at every step in a new enterprise. Official organisation.

Q. 87.—For the convenience of match and pencil industries and similar other concerns which require suitable wood for their success, the Government should publish, through the Forest Department, pamphlets giving information about the places where suitable wood can be obtained. The Government should supply wood to manufacturers by charging only nominal royalty. Government publications.

Q. 91.—The Government should not give match-wood by public auction. The Forest Department contracts for wood at a very high rate for wood suitable for the manufacture of matches. The Government should supply wood to manufacturers at a low rate.

for any price that he would demand. The Government should, therefore, supply match-wood direct to the manufacturers. Also they must issue such regulations that small trees may not be destroyed. The trees that give suitable match-wood should be taken care of and should be allowed to grow into big trees. The Government can induce the Native States to give match-wood to manufacturers at a nominal rate.

As the match industry has to contend with the well-established and long-standing Japanese factories, and as Indian wood is not as white as Japanese wood, the business of match manufacture will not be able to stand in Japanese competition if the railways do not grant exceptionally concessional rates. The success of a new enterprise depends upon the facility with which the products are carried to the consumer. If the railway freight is heavy, it is impossible to work with profit. Up to the present the railways do not afford the convenience of concession rates as liberally as they ought to. For making new business successful, it is quite necessary that the railways should grant special rates more liberally to Indian products.

Oral Evidence, the 15th December 1916.

President.—Q. Can you tell me how long this factory of yours has been in existence?
A. 16 years.

Q. Was the match factory a paying concern?—*A.* It is a paying concern. I was a share-holder in a match factory at Ahmedabad. I came to understand that they were making good profits and then I brought machinery and set up a factory myself.

Q. What sort of technical expert did you have for a manager?—*A.* I had one London man and also one German.

Q. How long?—*A.* Former about six months. The German was only 15 days.

Q. You have had no regular continuous manager?—*A.* No.

Q. Then why do you expect the factory to be a paying concern?—*A.* It is a paying business now.

Q. In your accounts do you distinguish between the things that you buy in this country and the things that are imported?—*A.* I purchase the chemicals from Germany and from England and also the papers, labels and other things. I tried printing of labels here. They were printed but not properly cut.

Q. Can you tell us which cost more in the match factory, the materials obtained in this country or those that are imported?—*A.* The imported goods cost more.

Q. What would be the proportion before the war?—*A.* Including labour, it would be 60 per cent foreign and 40 per cent swadeshi.

Q. During the war the foreign material costs more?—*A.* More than 10 times.

Q. Is it a private factory or a public joint-stock company?—*A.* It is my private company.

Q. What does the labour cost?—*A.* About 10 to 12 per cent.

Q. How much capital have you invested?—*A.* Rs. 1,15,000.

Q. What return did you get on this?—*A.* Three to four thousand rupees.

Q. Is that net profit?—*A.* It covers only the interest. My factory is not going properly on account of some difficulties in getting things in proper time.

Q. Do you allow for depreciation?—*A.* I am deducting one thousand a year for depreciation on machinery. I got some of the machinery second hand and at present I cannot get some of the parts for wear and tear.

Q. If 60 per cent of the articles are imported and 40 per cent indigenous, what advantage is it to the country to make matches here?—*A.* This is a swadeshi concern. I started it simply from the business point of view in order to make profits. If the things that are imported can be produced here, for example zinc oxide, manganese and glue, etc., then we can do this industry successfully here. I would only have to import phosphorus.

Q. You want Government to supply wood. At present I cannot find any satisfactory reason for making matches in this country. Is there any real necessity for this wood for building, etc.?—*A.* The simool wood is not used for any other purpose except matches.

Q. You want most of these things to be manufactured here. For doing this you want a much larger market than merely the match industry. Nobody is going to start the manufacture of these chemicals for the match industry alone. The match industry must await the development of other industries?—*A.* That is no doubt true, but if we look at the total quantity of chemicals imported into the country you would find that it is very large.

Q. How many match factories would be needed in India to meet the demand?—*A.* Hundred. I had been producing 1,000 gross per day, but owing to many difficulties I am producing only 300 to 350 gross at present.

Q. Where did you get your labels?—*A.* The machines here do not cut it nicely. I had therefore to get it done in other countries. I used to get labels from Germany and also from London.

Q. How do the Japanese and your matches compare in quality and colour?—*A.* My factory was closed for eight months because the steamer that was to come from Liverpool or London bringing me the goods I wanted did not arrive. It is now working for the past three months. The Japanese matches are no doubt whiter, but they break more easily and you have to light many sticks before one is ignited. In appearance the Japanese match is better but in quality mine is superior to the Japanese product.

Hon'ble Pandit M. M. Malaviya.—Q. Do you know if the Japanese Government is helping its manufactures?—*A.* I hear they are helping the industry to a great extent. I have spoken to people who went to Japan and they told me about it.

Q. You say that the presidency banks and co-operative societies can be induced to help industries by lending money to honest persons. The presidency banks as they are at present constituted cannot help industrial enterprises. In your opinion there ought to be a bank which would specially help industrial enterprises?—*A.* Yes.

Mr. C. E. Low.—Q. Where are you getting your wood? How much is good and how much useless?—*A.* I get it both from zamindaris and from Government. 50 per cent becomes useless.

Q. Where do you sell your matches?—*A.* From Madras to Cawnpore.

Q. What brand is it?—*A.* Sword brand.

Q. Have you got a sample of your match box?—*A.* Yes. Witness handed in a sample.

Dr. E. Hopkinson.—Q. What security would you offer for the loan which you desire?—*A.* The security will be my property. I am not indebted to anybody.

Q. What property?—*A.* The factory machinery and plant and building.

Q. To what extent should the loan be covered by the security?—*A.* If the Government advances 25 per cent of the security the work will go on well. I want Rs. 25,000.

Q. At what interest?—*A.* Not more than 5 per cent.

Q. Have you ever applied to the Department of Forestry for advice?—*A.* I have written to the department. They help but not to a sufficient extent. Owing to the coupe system sometimes we get an abundant supply and sometimes we get a very poor supply.

Q. Have you ever applied to the department for advice as to suitable kinds of wood?—*A.* The Forest Economist at Dehra Dun visited my factory. We also find out from the publications of the department.

Q. Did the Economist come at your request?—*A.* He came of his own will. He was touring and in the course of the tour he visited the factory.

President.—Q. What kind of manager have you got now?—*A.* I have got my own manager. Myself and my son-in-law are working at the factory. It is my opinion that it is only profitable if we work the factory on a large scale. If we do that then I can say that we can keep out Japanese matches to a great extent.

Q. Are you working every day?—*A.* Yes. I live very near the factory, almost in the factory, I may say, and we (I and my son-in-law) work 16 hours a day.

Q. Where are you getting your chemicals from now?—*A.* Wherever I can get it in the market.

Q. If only 40 per cent is swadeshi how can the thing be done here without first having the chemicals?—*A.* If more factories are started then the chemical manufacturers will surely come in.

Q. What sort of royalty are you paying for the wood?—*A.* 4 annas royalty per cart-load.

Q. How far is the factory from the wood?—*A.* 40 miles.

Q. What would it cost per cubic foot at the factory?—*A.* I shall work out the figures and send them.

Witness subsequently forwarded the following note.—Below is a list of the chemicals and raw materials showing the rates before the war and at present.

The cost of the wood is the same before the war and at present, *i. e.*, I pay Re. 0-4-0 per cart-load of fresh cut wood that it comes to nearly Re. 0-3-0 per cubic foot. The chief objection of pushing the match-making industry is the keen competition of Japan matches. If import duty on Japan matches, 25 per cent of the cost be laid, the Indian match-making industry will surely be successful.

List of the chemicals and raw materials showing the rates before the war and at present.

Name of the articles.	Approximate rate before the war.	Approximate present rates.	Rates per
	Rs. a. p.	Rs. a. p.	
Potash Chlorate	0 5 0	2 8 0	Lb.
Potash Bichromate	0 5 0	1 8 0	"
Caput Mortum	0 1 9	0 5 0	"
Zinc Oxide	0 4 0	0 10 0	"
Sulphur	0 1 0	0 2 6	"
Amorphous red Phosphorus	1 8 0	5 0 0	"
Antimony Sulphide	0 5 0	0 10 0	"
Strantia Nitrate	0 4 6	2 0 0	"
Barayta Nitrate	0 2 6	1 8 0	"
Glue of best quality	0 6 0	0 10 0	"
Gum Senegal	0 3 6	0 8 0	"
Paraffine wax of 123	0 2 6	0 5 6	"
Potato Starch	0 2 0	0 4 0	"
Blue paper in reels	0 1 6	0 8 0	"
Labels on yellow paper in black and red printing	0 1 6	0 6 0	1,000
Tin sheets of size 20 x 14"	9 0 0	35 0 0	112 sheets.
Dark packing paper	3 0 0	9 0 0	Ream.
Wire nails of various sizes	9 0 0	25 0 0	Cwt.

Q. How do you get your machinery repaired?—*A.* I have got my mechanic shop and engineers and fitters.

Q. Where did you bring them from?—*A.* From Ahmedabad.

Q. How many hands altogether do you employ?—*A.* Formerly there were 300 when the factory was working fully. Now there are only 100.

Q. What wages do you give them?—*A.* They are paid for piece work.

Q. Where did you get your machinery?—*A.* I bought some in an auction and many I bought new from Germany and some shortly worked by the Bombay factory that failed. They are the machines of the firm of Mr. A. Roller in Germany.

WITNESS NO. 139.

*Hon'ble Rao Bahadur N. K. Kelkar, Pleader, and Honorary Secretary,
Co-operative Bank, Balaghat.*

Written Evidence.

My main profession till about six months ago was that of a pleader. I have not so far been directly connected with any industrial concern, large or small, such as a mill or a factory, and I am not therefore sure if I can be regarded as experienced within the meaning of the summons I have received from this Commission. I have, however, suffered some loss from some of these concerns and gained profits from others. This led me to make enquiries into the causes of failures or success, and I desire to place my views before the Commission. I am not prepared to go so far as to suggest that the failures were due to dishonesty on the part of the management. I am strongly inclined to think that in many cases they were mainly due to lack of adequate knowledge of the business.

The educated people have begun to think of industries, or revival of them, but along with this proportionate progress has not yet been made in industrial education. The result is that, in their well meant desire to promote the industries of the country, people having little or no practical experience or knowledge of the business and with little or no training start industries or undertake the management thereof. Such men, though sound lawyers, or medical practitioners, or experienced Government servants, are not necessarily competent to manage industrial or commercial concerns. The failure of some of the important concerns in these provinces was, in my opinion, due to the management under such men. The failures of others might be due to other causes also. My own view is that industrial and commercial prosperity of this country will depend entirely upon men well trained in the business and such men to start with must have adequate openings.

The present tendency, even on the part of those who think or talk about industries, is to go in for the bar, or medicine, or for Government service, and those who have money generally invest it either in land or in money-lending. In the latter I include investments in co-operative banks. A few of those who invest in land do so not necessarily with the intention of promoting the agricultural industry. There has been some awakening now in mill and mining industries, but those who own these industries depend largely upon foreign expert advice.

Either in the matter of profession or occupation or in the matter of investment the existing general tendency is due to the impression which prevails in many quarters that commerce and industries are monopolised by Government for the benefit of their kinsmen in Great Britain, and that Indians have got no chance or prospect of material gain in them. Before going to other points I may say a word with regard to the accusation that is made against Indian capitalists. The timidity on the part of the Indian capitalists is due, I believe, to some of the aforesaid causes. The industrial regeneration of the country will depend entirely upon Government initiative. Unless Government comes to the rescue no good is likely to be achieved. Government aid may be in various ways. First of all the educational policy must be revised. Till recently in these provinces there was no school of handicrafts. Manual training was neglected and drawing is not yet a compulsory subject. Principally education is confined to literary training. It is mainly on account of this educational policy that there is growing tendency in the minds of the people to go in for Government service, or for the bar, or for some such profession. In other words the education we receive in our schools or colleges makes us fit for that kind of profession or occupation only. Indeed it was mainly on this account that the industrial association started by us in Balaghat in or about the year 1909 has not so far succeeded in achieving the main object with which it was started. The objects of the association are:—

- (1) to push the cause of industrial education amongst all classes of people,
- (2) to impart technical, industrial, mechanical and special craft education to boys by placing them as apprentices with some firms with a view to train them as master mechanics and craftsmen,
- (3) to help the boys with funds or otherwise to establish themselves in business

The association was started under most favourable circumstances. The Chief Commissioner became its patron. Some firms in these provinces agreed to take up apprentices on most favourable conditions. Still we found considerable difficulty in recruiting boys as apprentices. It was very difficult to make people believe in the dignity of labour. I am inclined to think that our association has not been successful because we confined its benefits to boys in the high school classes. If we had commenced with the primary school boys perhaps the result would have been different.

Having regard to the temptations of easy life in Government service, or otherwise, and having regard to the fact that the boys themselves were given to home-loving habits, or not accustomed to labour in their early age, it was difficult, indeed impossible, to induce the parents or guardians to believe that manual labour has got a dignity of its own. I don't think it necessary to enter into the discussion whether elementary education should be made compulsory or not. It must of course be general, but in any case drawing and manual work should be made compulsory in primary schools. No time should be lost in making a beginning in this direction on as large a scale as possible. The application of this rule to boys from their early age would assist in getting trained labour and students better fitted for technical education. Boys accustomed to manual labour in this manner may be sent to work as apprentices in mills, mines or factories or in the Government School of Handicrafts. I would not confine this kind of training to any particular class. All who have an inclination for it or are likely to be fit for it may have it. Government should use its influence over mill or factory owners to take up and train apprentices.

The next step to promote industries would be to open industrial schools. The industrial schools, and the number of Government technical scholarships to Indians may be increased. At present

the general policy is to bring experts from outside to investigate the possibilities of industries. This policy may be replaced by training Indians either in this country or elsewhere to qualify themselves as experts to undertake investigations.

I have got no pronounced views whether the proposed industrial schools should be subordinate to the Director of Industries or to the Education Department. All I want is schools. The other detail (after all it is a detail) as to whether they should be subordinate to the one or the other may be settled in consultation with those who are best competent to decide it. My main point is that unless a sufficient amount of technical and expert knowledge is created in the country itself it is useless to think of industries. So long as our industries depend or are made to depend upon external advice or outside initiative local or national industries are not likely to succeed. This leads me to another question which deserves consideration on the part of the Commission. Some of my aforesaid remarks may be construed to indicate that at present there is a general disinclination or aversion against industrial training or manual labour. The disinclination is due to causes which can be removed by Government. Instances have occurred in which men with requisite technical knowledge failed to secure suitable job or for want of employment in the line had to seek employment in a different line for the sake of their livelihood. The general belief is that owing to Government tariff policy or otherwise Indian industries have got a limited field, and men with technical or industrial knowledge have got little scope in that field for their livelihood. It was probably on this account that recently in Bombay a suggestion was made that commerce and industry graduates should be eligible for law. The B.Sc. and the agricultural graduates go in for law because the complaint is that there is no prospect for them except perhaps in the educational line.

I might suggest the following amongst the other remedies to remove this difficulty.

A separate department of industries, like that of agriculture and co-operation, may be opened, the different cadres of this department should be filled not by amateurs but by experts or trained men. Civilians may be good administrators, but for want of technical knowledge a department under their control is not likely to be useful. The appointments in this department should be open to all alike without distinction of race and colour, or of provincial and imperial service. Needless to say that prospects must be sufficiently alluring. The primary functions of this department should be research work, collection of statistics, and the investigation as to the possibility of success of new industries.

Speaking, not as an expert but as a layman I believe that concerns investigated, financed and for some time even managed by Government would have considerable educative value, and would, in addition to the Government department, throw a wider scope for employment to a large number of Indians. I may not be understood to say that such concerns should be monopolized by Government for ever. This may, after some time, be transferred to deserving private individuals who know local conditions well and whose business habits are beyond question.

It is thus that interest in industries may be stimulated and men competent to manage them may be available in sufficient number.

Government assistance. As a rule Government assistance to any industry, old or new, should be on business principles, but in times of financial crisis or when, owing to war or otherwise, money market is tight that principle may be relaxed. In such cases money grants-in-aid, loans without interest or with moderate or nominal rates of interest, or loans for machinery or for plant may be very useful.

For some of the reasons indicated above local capital is timid. There is want of mutual faith. Guaranteed dividends or contribution of part of share capital will create faith and carry the conviction of economic soundness to the public. That will attract large capital which otherwise would not be forthcoming. I draw this inference from my experience of the working of the co-operative movement in these provinces. Many people are found willing to invest their savings in co-operative banks simply because only with Government control and supervision they feel that the investment is sufficiently safe. Guaranteed dividends or contribution of share capital would add considerably to that sense of security. I have stated above that the Government assistance should be on business principles and should continue until the industries can stand alone. But after they become earning concerns there is no reason why the general tax-payers should not be reimbursed for the expenditure incurred in paying guaranteed dividends.

Having regard to the backward condition of industries abstention and aloofness on the part of the Government won't do. Mere goodwill is not enough, there must be material assistance of a practical nature. I do not grudge Government control and supervision, provided it is reasonable and is educative and instructive. Whatever may be the form of

help so long as the existence of any industry depends upon Government support it is but reasonable that Government control should be indispensable. Indeed as trustees of public money Government would be failing in their duty if they were to remove all control. It is not quite easy to lay down hard-and-fast rules specifying the nature of the control, that must depend upon circumstances, and upon the qualifications, capacity, and business habits of the management. As at present advised I am inclined to think that generally the control must be from outside and the appointments of Government directors with definite powers may be made when such a course is dictated by the exceptional circumstances of the case.

Closely connected with the above is the question how far the Government should guarantee the purchase of products. In my opinion the time has not come, and may not come for long, to lay down any limit to this form of Government aid. In my opinion the Government should patronize local products in preference to imported articles in spite of some additional cost. Government, local bodies and semi-public departments or concerns patronized by Government may be advised to follow this rule strictly. I am led to make this remark, as I am told that some of the existing rules which require purchases from local concerns are not strictly followed.

Government patronage.

Publication of lists of imported articles used in Government departments or their exhibition in commercial museums may be useful, but such publication or exhibition won't have the desired effect until preference to local products is strictly insisted upon.

Agriculture, weaving and brass work are the three industries which, to my personal knowledge, have been assisted by the co-operative movement in these provinces.

Sympathetic and active co-operation between the officials and non-officials has, with personal visitation from village to village, instilled the principles of co-operative credit into the hearts of the people which has resulted in the rapid expansion of the movement.

A list of industries which can be developed by means of co-operative societies is given in the Hon'ble Mr. Low's report on the industrial survey of these provinces, 1908-09. I have nothing to add to that list. I think all such societies must, like agricultural societies, be with unlimited liability. Their special object should be to preserve and improve the industry with the minimum of labour and expense and the maximum of output of superior quality. With the aid of improved machinery and adequate capital these may be converted into small local factories. I am not sure if the hand industry can compete with the machine industry, at least so long as the hand industry is not considerably improved. In co-operative societies, if we clear off old debts carrying exorbitant rates of interest and advance sufficient money for all legitimate purposes, I think we ought to be able to make substantial improvement in agriculture. So far in these provinces we have had no difficulty in securing money for business. Land tenures in these provinces do not afford sufficient security to the investing public. If the recommendations made by the MacLagan Committee are accepted that difficulty would disappear. Our present experience is that in these provinces agriculture is perhaps the only industry which can be helped and developed by means of co-operation. With regard to the assistance to and development of other industries, such as weaving, by means of co-operation, we are rather becoming pessimistic, though we have not yet lost heart or abandoned them altogether.

Co-operative societies.

The local law of these provinces, *viz.*, the Land Revenue Act, allows acquisition of land required for purposes connected with mining operations by lessees from Government. Such acquisitions are made very nearly in accordance with the provisions of the Land Acquisition Act. Government is interested as much in mining as in other industry as revenue derived from all industries goes to public treasury. There is, in my opinion, no difference in principle, and the concession may be extended to other industries also.

Land policy.

Local or Indian industries are already suffering from competition. At trade centres in these provinces the market value of the land has increased. Instances have occurred in which private enterprises had to pay fabulous or prohibitive prices, far in excess of the reasonable values. These competition prices have their effect on the industry. Acquisition under the Land Acquisition Act would be an advantageous concession. The provisions may be extended to private individuals even though they have not constituted themselves into companies proper.

So far industrial developments of the provinces do not appear to have been directly affected by the land policy. But efforts are being made to introduce such checks which, if enforced, might impede the development of the industries. The policy of revising the assessment of land revenue during the currency of the term of settlement if the land is diverted from agricultural to non-agricultural purposes, or of taking premium on such conversion, may be very sparingly used or not used at all. Generally the settlement of such land should be for a much longer period than the one of land used for agricultural purposes.

In these provinces the assessment of land revenue is made on land used for all purposes. This practice is now codified into law. The assessment on land revenue on income derived from land otherwise than by agriculture causes great hardship, and if the practice is not considerably modified, I am afraid people will cease to grow materials which are commercial commodity. Such income is at present classed as miscellaneous income though the revenue derived therefrom is comparatively large. Lac, harra (myrobalam) and bamboos are some of the articles grown in malguzar forests which, commercially and industrially, are very important. Considerable hardship is experienced in connection with the first article. Owing to the methods adopted in assessing land revenue on this income some people cut the palsa trees on which lac is generally propagated and convert the land to agricultural purposes.

There is no statute law in these provinces to regulate the rights of the landlords and tenants with regard to the produce of the trees standing on tenants' holdings. So far as fruits and flowers of trees are concerned no difficulty has so far arisen. But with regard to lac the highest tribunal in these provinces has held that it is neither fruit nor flower, and therefore it belongs to the malguzars, on the analogy that the property in the trees in which lac is propagated belongs to them.

If this ruling has correctly interpreted the law, in my opinion, in the interest of the industry, it ought to be repealed at once by an express provision in the statute. The practical effect of this ruling is that tenants cannot allow palsa trees to grow or to stand on their lands, and consequently the malguzar cannot propagate any lac thereon. There are large areas of tenants holdings on which palsa trees for propagation of lac can be most advantageously used. But in consequence of the above ruling it is found impossible to do so.

In making assessment of land revenue the Chief Commissioner issues instructions for the guidance of the Settlement Officers. Such instructions, so far as one can judge, are issued mainly with a view to safeguard or increase public revenue. As far as one can judge in all these instructions due regard does not appear to have been given to the development of the industries. In my opinion the Provincial Board of Industries, of which the Director of Industries is the President, should be consulted with regard to the principles of assessment of land revenue on products useful for industrial development and the recommendations made by the Board should be duly considered.

Official organisation.

A Director of Industries is appointed. A Board of Industries for C. P. and Berar was constituted in 1914.

The activities of this department are summarized in the Director's note, dated the 22nd August 1916, which, I believe, is before the Commission.

In these provinces we have got both a Director of Industries as well as a Board of Industries. In another part of my note I have pointed out that if the department is to be of any practical use the Director must be an expert with adequate knowledge of the industries. If administrative control is essential one from the Secretariat would be enough.

The Board of Industries consists of officials and non-officials nominated by the Local Government. Its functions are at present advisory. In my opinion the time has not yet come to make any changes in the present arrangement. Time may come, when I can't say, when the Board of Industries may require executive powers and funds. The present arrangement is working satisfactorily, and if it continues to do so, the question of extending the powers of the Board and of defining the relation between the Board and the Director and the Administration may be considered. Under the present circumstances I don't feel competent to pronounce any definite views. I may suggest that in the meanwhile individual members, if they so choose, may be given facilities to inspect any works or may be helped with information which might lead to the development of the industries. I beg to take the liberty to suggest that the usefulness of the department and the activities of the Board may be enhanced if subsidiary committees in the districts are organised to help the Provincial Board.

The Provincial Board consists of 3 or 4 officials and about 5 non-officials. The officials have an organised machinery at their disposal to collect information. The non-officials have not. Five or six non-officials from the combined province won't be able to deal with industrial problems concerning the province. The object of the district committees is to widen the sphere of popular interest in industries. The organization of the district committees will create opportunities for many more people to think of industries and possibly to assist them. Now, when there is some awakening in industrial matters organization of district committees would be easy.

In these provinces associations, named agricultural and technical, were formed years ago. These associations seem to have forgotten or kept in abeyance the industrial side of their activity. If district associations throughout the province are not considered advisable

they may at least be started at places where some cottage or other industry of considerable local importance is to be found. My proposals on this subject are before the Local Government, and any advice or recommendation from the Commission would be very helpful.

In my note dated the 28th September 1916 (copy below) to the Director of Industries, Central Provinces, I have mentioned supplies of some raw materials for which there is a good case for investigation. With regard to harra (myrabolam) I might say that the Balaghat District alone produces tons of harra every year. I have reason to believe that a large portion of it is not picked and exported. I am told that tannic acid can be extracted from harra. General.

The Balaghat and surrounding jungles produce large quantities of creepers (*bukkels*) from which very strong ropes can be made with the aid, I am told, of special machinery.

Bauxite from which aluminium can be extracted, is available in the Balaghat District above the ghat, but this is not yet exploited for want of railways and electric power. The surveys for the former are, I am told, made and for the latter there are natural advantages in the Nahara and Uskal rivers. Owing to want of railway the manganese mines near Ukwa in this district cannot export any ore from there.

Letter, dated Balaghat, the 28th September 1916.

From—The Hon'ble Rao Bahadur N. K. KELKAR, Plender, Honorary Secretary, Co-operative Bank, Balaghat,

To—The Hon'ble Mr. C. G. LEFRWICH, I.C.S., Director of Agriculture and Industries, Pachmarhi.

I am in receipt of yours of the 24th instant. Before the receipt of this letter I visited Gondia to see the lac refining factories there. Only one out of the 4 factories is working there now. The remaining 3 are closed for reason the accuracy of which I am not in a position to vouchsafe. The one that is working now formerly belonged to a Marwari's firm at Gondia, but is now taken over by a firm from Mirzapur. The expert labour is imported from Mirzapur, and is supplemented by unskilled local labour. The concern is worked by manual labour. It is a small one. From what I saw I am inclined to think that there is scope for expansion of the lac refining industry in these provinces. In the course of my enquiry I learnt that the work of any of the factories at Gondia (defunct or existing) was never stopped for want of supply of lac. Gondia is one of the largest centres whence thousands of maunds of stick or unrefined lac, both Palsadi and Kosam, are exported generally to Mirzapur in United Provinces and to Calcutta or Cossipur in Bengal. Even if all the 4 factories were working, I was told, they would not consume even half the export of lac from Gondia itself. Some of the Satpura forests produce large quantities of lac, and if, for any reason, Gondia is considered to be an unsuitable place either for refining or for any other industry out of lac some other place on the Satpura Railway line may be selected for the purpose.

Lac propagation or cultivation is not expensive. The propagation or cultivation is done generally in an unscientific manner. On that account or otherwise the expenses are comparatively large in proportion either to the yield or its value in money given at fluctuating rates. As stated before several maunds of lac are annually exported from these provinces to some other provinces, such as United Provinces or Bengal, and thence in a retained form exported to other countries. Lac is one of the raw materials in these provinces to which the Industrial Commission's attention may be usefully drawn. The method of propagating or cultivating the lac can be considerably improved. I am informed that in Central India scientific method for propagating lac is adopted. If that is done in these provinces it is possible that it would considerably increase the annual yield. Before leaving the subject I would suggest that the Commission or its Sub-Committee may visit Gondia to see the refining factory there. It is a small factory and probably bears no comparison to any in Mirzapur or other places. Local inspection or local enquiry may satisfy the Commission that there is a clear ground for further investigation into the development of the lac industry in these provinces in all its stages.

Harra is another forest produce which is exported in large quantities from some of the districts in these provinces, and similarly bones and hides. Manganese is too well known to need any mention.

Kindly let me know what has been done with my suggestion for starting a factory somewhere in these provinces for preparing ink powder. I have already mentioned to you bamboos which can be used for paper pulp. At one time a gentleman from Jubbulpore was very keen in having a paper factory at Balaghat. He told me that the Balaghat jungles might supply bamboos to the factory for at least 20 years at the rate of some tons a day. I don't remember the exact quantity.

Oral Evidence, 15th December 1916.

President.—Q. Can you tell us more about this industrial association at Balaghat; what you have done since 1909, and what the results have been?—*A.* We started an industrial association in 1909. We sent some boys to the coal fields, and some apprentices to work in the mills. We succeeded in inducing about 10 boys in the first instance to go there, but one by one every boy came back, and there is now only one boy working in the mills at Badnera.

Q. Why did they come back?—*A.* For two reasons; first, because they were not accustomed to hard labour in the fields, and, secondly, they wanted some instruction in the English language. As no arrangements were made to give them technical education, and as they were made to work as coolies, they were not satisfied.

Q. What mill was that?—*A.* So far as the mill is concerned, we did not hear any complaint, but the complaints came from the boys who were sent to the coal fields in the Pench Valley.

Q. You said they were made to work as coolies?—*A.* Yes.

Q. How are you going to learn mining otherwise? I had to work like that myself?—*A.* We all know that, but the boys here are not accustomed to that sort of work.

Q. Is it not good for them to get accustomed to hard work?—*A.* Yes, it is quite good for them.

Q. You think that the experiment you made was a worthy one; that you did seek to benefit the boys, but they did not appreciate the good work you did for them?—*A.* No.

Q. You say there is one boy now who has stuck to work?—*A.* He is at Badnera, working as an apprentice in the cotton mills.

Q. Has no boy stuck to the mines?—*A.* No.

Q. Perhaps that was an exceptional case; would it be possible to send the boys to some other mines where they would be likely to get more suitable treatment, and where they have evening classes for boys?—*A.* That is what we want to do, but many proprietors refuse to make arrangements of that kind. They say that the boys must be made to work as coolies for two or three years, and afterwards some arrangements might be made to give them instruction in classes; whereas the boys' parents and guardians want arrangements made immediately. That was the cause of dissatisfaction.

Hon'ble Sir R. N. Mookerjee.—Q. Did you try the Bengal Coal Company's fields?—*A.* No, we only tried the Pench Valley and Ballarpore.

President.—Q. There was no chance there of boys getting any technical training?—*A.* Not at that time. It was a Government mine. We asked the manager, but he refused to make any arrangements.

Q. I suppose where there is a small number, and only one mine, it is difficult to make arrangements like that; but where you have several mines and evening classes, it would be easier for the boys. You could not expect boys to do work where they were not going to get any kind of technical assistance. It was entirely the fault of the boys you think?—*A.* Not entirely the fault of the boys.

Q. You have never tried that experiment since?—*A.* We never got any boys afterwards. We tried to recruit boys, but did not succeed. Once the experiment failed, it was very difficult to get the boys.

Q. Then your industrial association has not got very satisfactory results so far?—*A.* Not so far.

Q. What is your proposed line of continuing this association?—*A.* My present line is to induce the boys and parents, and if some arrangement is made in the coal fields or mines for giving them some technical instruction, I think some boys would come, but not till then. If they are made to work as coolies, I don't think we shall succeed in getting any boys.

Q. It may not be possible for a small field like the Pench Valley to arrange for this technical training, but it is already established in the Bengal Coal Fields?—*A.* I don't know that boys from these provinces will be willing to go so far as the Bengal Coal Fields, but it was quite possible to make some arrangement in the Pench Valley. The manager was very sympathetic but had his own notions about it. He did not want to give them technical education, until the boys had worked for two years as coolies.

Hon'ble Sir N. R. Mookerjee.—*Q.* What was their education when they went there?—*A.* Middle school class, i. e., 4th or 5th standard.

Q. What was their age?—*A.* Between 14 and 16; 18 at most.

President.—*Q.* Had they any knowledge of science or mathematics?—*A.* They had a knowledge of mathematics, but I don't know if they had any knowledge of science.

Q. That would be a drawback; you could not get the manager to teach them all these subjects?—*A.* No.

Q. Had you any high school in Balaghat?—*A.* Yes, we had then in 1909; in fact that association was started by the High School Committee.

Q. Have you tried any other industry but mining, and this one boy who is at a cotton mill?—*A.* No. I beg your pardon, we sent one or two boys to work as apprentices in the carpenters' shop, Biramjee's shop.

Q. Have you sent any of them to the School of Handicrafts at Nagpur?—*A.* No.

Q. Is there any reason why you should not do that?—*A.* I am trying for it.

Q. I suppose you will send more than one class of boy; what about the village carpenter?—*A.* The village carpenters are not so advanced yet. Speaking for my district, the people are not willing to come as far as this town. They have their own prejudices.

Q. They would not like to go so far away from their homes?—*A.* No.

Q. I have found boys from the Nagpur School at Seoni carrying on the carpentering business successfully. You cannot persuade anybody to come from Balaghat?—*A.* We are trying to persuade them, but have not yet succeeded.

Q. Can you form any idea as to whether it is advisable to send a boy from a place like Balaghat to a place like Nagpur for training in a school of the kind you have here. Would it break up the boy's home associations and do him harm?—*A.* I don't think so.

Q. You think there is no reason why he should not come and be trained in school here?—*A.* No.

Q. You have never succeeded in sending a boy from Balaghat to a school here?—*A.* No, only two boys to Byramjee's factory, and since then we did not succeed. There again we were unfortunate, because both boys died of plague. That was in 1911.

Q. That would produce a local prejudice again?—*A.* That is our difficulty in getting boys.

Q. You mention, besides agriculture, weaving and brasswork as industries that have been assisted by co-operation, and afterwards you say, "Our present experience is that in these provinces agriculture is perhaps the only industry which can be helped and developed by means of co-operation." In what way have the weaving societies and brassworkers failed to co-operate?—*A.* We have two or three weaving societies not working well. We find that all these weavers are very heavily indebted, and from my experience found that they have been carrying on their trade mostly on borrowed capital, at a heavy rate of interest, something like 25 per cent a month. Their whole indebtedness, however, is very large. Unless our co-operative societies are willing to take up their whole indebtedness, I don't think that weaving by co-operation has any chance. The co-operative society is not willing to lend them any large sum of money, as the security offered is not considered to be sound by the investing public. Another thing is that the weavers have to depend upon others for very many things. We have to make arrangements for purchasing yarn for them; for selling their cloth; and one famine or bad year or a year like this, when war is going on, prevents us from making any arrangements for them. Everything is dear: the yarn is very dear, dyes very dear, and they cannot compete with foreign industries.

Q. You have two difficulties: first, the weavers are hopelessly in debt; secondly, co-operation is not of much use unless you can co-operate for the sale and purchase of the materials?—*A.* Yes.

Q. Then you fear that it is a hopeless venture?—*A.* I am not yet hopeless; that is our present experience. Perhaps times are not very good on account of the war. It is only after the war that we have begun to experience this difficulty.

Q. But the war has not affected them very greatly; it has raised the price of yarn to a certain extent?—*A.* Dyes are very dear.

Q. But what are the weavers doing; what becomes of them?—A. They do some business but they are not prospering.

Q. How are they going to meet their debts?—A. They are in arrears.

Q. What happens when they become hopelessly in debt?—A. They are, as a matter of fact, hopelessly in debt at present. We are not willing to advance them sufficient sums of money on account of their past heavy indebtedness.

Q. Who do you mean by "we," the district co-operative bank?—A. Yes.

Q. Are you permitted to go outside agriculture and take up weaving too?—A. Yes.

Q. What about the brass workers; what is the difficulty with them?—A. They are also dependent upon others. They do not prepare parts of the utensils themselves. That is the difficulty with them. If they prepared the utensils themselves, I think there is some chance for them.

Q. They don't make the utensils themselves?—A. No.

Q. Who makes them?—A. We brought some men from other places to make utensils for them. They used to purchase the utensils from them and sell them.

Q. They are not brass workers then; they are brass-work dealers?—A. Yes.

Q. Don't you want to help them in any way?—A. Our idea was that they should learn to assist themselves in making the utensils.

Q. You would rather help the brass work direct?—A. Yes, it was with that intention that the society was started.

Q. Is there any chance of inducing any kind of co-operation among brass-workers?—A. Co-operation in what way?

Q. If you can get co-operation among the brass workers direct, you can get rid of these people who are brasswork sellers?—A. Yes.

Q. Who does any missionary work among these people; what steps do you think of taking to make these people better themselves?—A. In the first place a lead was taken by officials in the Balaghat district.

Q. I suppose they have no time to go into cases of this kind and foster industries?—A. No, they have no time.

Q. Does your industrial association undertake work of that kind?—A. Rather the directors of the district bank.

Q. Another case of the work falling back on one man?—A. Yes, there are not sufficient number of workers, missionaries, I mean.

Q. Work of this kind is commonly done in England on an enormous scale. Is there no way of infusing a better spirit into the leading people of the district?—A. I think so. Some people are coming forward. Now the work does not fall on one man only.

Q. We have had a lot of advice as to what the Government ought to do, but very little as to what the better class of people ought to do in helping their poorer neighbours?—A. They must do their share; that is what I have stated.

Q. This Provincial Board that you refer to, consisting of 3 or 4 officials and about 5 non-officials: you say that "5 or 6 non-officials from the combined province won't be able to deal with industrial problems concerning the province." If you had a larger Board I suppose it would be difficult to get that Board together frequently; but would you not obtain just the same kind of result if you allowed the Director of Industries a free hand, and then gathered together, not a Board, but something of the nature of a Conference, say 40 or 50 leading people from different parts of the province, at the end of the year, to discuss the Director's Report, and to consider with him the way in which he might have done the work, and put before him suggestions for the following year? Don't you think that would be better than having a large Board of Industries which would be representative of the province, but could not work efficiently because of its size?—A. That is not my point. Even if the Board were to consist of, say, 40 or 50 members, I don't think any useful purpose could be served. What is wanted are local

committees. The Provincial Board might consist of a select few, but it is impossible for them to go round the whole province and collect information. My point is that they must be assisted by a number of district committees. In that way we might get a larger number of people.

Q. Still if you had a large number of district committees they would all be able to send in suggestions to the Director of Industries to act on, and at the end of the year would it not be a good thing to gather together representatives, so that each could help the other with suggestions?—*A.* Yes.

Q. You would prefer then a Director of Industries acting alone at head-quarters, but at the same time a number of district committees to be formed also. Do you think that any advantage would be gained if these district committees met together in general committee? Or at least their representatives might meet together.—*A.* It would certainly be an advantage.

Q. You would like me to put that proposal before Mr. Leftwich for consideration when he comes before us?—*A.* That suggestion is already before him, forwarded by the Local Government.

Q. In what form is it before the Local Government; in the form of district committees?—*A.* Yes.

Q. And nothing else? You did not make any suggestions as to how these district committees should be linked up?—*A.* The district committees should be formed in districts themselves and should send their representatives to work on Provincial Boards.

Q. These two rivers you refer to, in the Balaghat District, which can give a certain amount of hydro-electric power, are they in full flow throughout the whole year, or in flood only during the monsoons?—*A.* They flood through the monsoons, but their flow is throughout the year.

Q. Their dry-weather streams are comparatively small?—*A.* Not of the Nahara, but the Uskal.

Q. Would there be any suitable place for damming the water and forming reservoirs?—*A.* Some enquiry was made on that point.

Mr. C. E. Low.—*Q.* How many industrial co-operative societies have you in Balaghat?—*A.* Three, one at Hatta and two in the Katangi circle.

Q. Do you find that, so far as the work went, there was any tangible benefit to these men by getting cheap credits and getting cheap yarn?—*A.* In the beginning it was and they made some profit out of it.

Q. As things went on, they apparently got slack about their payments?—*A.* Yes.

Q. Have you any knowledge of what is happening in the adjoining district of Bhandara?—*A.* Yes, there also the complaint is the same as in Balaghat; they are not doing well. They are in arrears; payments have to be suspended. They could not get a market in Berar.

Q. It is the case, isn't it, that at the outbreak of war, and just before, there was an extraordinary difficulty in selling goods?—*A.* Yes.

Q. Do you think that affected the societies at that time giving them a wrong turn; do you think it led them to get slack in payment?—*A.* They did not become slack, but they could not pull on with the business. They could not pay. They were working all right, but had no custom for their cloth. There was no demand for their materials.

Q. Your view seems to be that unless you can arrange to finance their goods and stock and sell them for them, these societies could never be a real success?—*A.* You must make one more arrangement; you must clear off all their old debts, otherwise it would be impossible to help these people.

Q. Your experience in that direction was in the first instance, with agricultural societies; how did you help them, by meeting their current necessities, or by paying their old debts?—*A.* Now I have made it a point, when I want to organise societies, I recommend that all old debts must be wiped off at once, otherwise I don't organise or recommend societies for registration.

Q. You were afraid to do it at first?—*A.* Yes.

Q. What difference do you find it makes to the working of the society, and to the condition of the men; do you find they are more truly co-operative, more punctual in

payment?—A. Yes, they are. I will tell you one or two cases—we advanced them money at low rates of interest. They prepare some yarn or cloth, and that is attached by another creditor.

President.—Q. It makes a difference to the man's spirit if he feels he is out of debt?—A. Yes.

Mr. C. E. Low.—Q. Have you any idea on the subject of technical assistance to weavers; have you seen anything of the work of the textile experts?—A. Yes, some looms were sent to Kamptee and brought to the Nagpur Exhibition.

Q. With what results?—A. They took to it; they liked it very much.

Q. You are speaking of the weavers in the Katangi society?—A. Yes.

Q. Have any of them come back using the fly-shuttle?—A. No. The Katangi people are not using it. They are Mahars by caste.

Q. The Bhandara people are using it?—A. Yes.

Q. You are a member of the Central Provinces Board of Industries I am told so, but I don't know. Since when?—A. About a month ago.

Q. Were you recently elected?—A. Recently nominated; at least I was told that I would be nominated.

Q. You say that the district association, which you originally formed, was started with the object of pushing the cause of industrial education, imparting technical, industrial, mechanical and special craft education, and to help the boys with funds. Don't you think it is a mistake to have the same society doing such entirely different things?—A. I think for technical purposes there must be a separate society.

Q. Is it not your experience that the more you narrow down the problems the greater the interest taken by members?—A. Yes.

Q. Have you an agricultural association in Balaghat?—A. Yes, two, one in each tahsil now.

Q. They are concentrating their attention on certain definite problems?—A. Yes, agricultural problems.

Hon'ble Pandit M. M. Malaviya.—Q. You say that the essential thing needed for the development of industries is that a sufficient amount of technical and expert knowledge should be created in the country. Towards that end you recommend that there should be industrial schools established. You also say that "at present the general policy is to bring experts from outside to investigate the possibilities of industries. This policy may be replaced by training Indians either in this country or elsewhere to qualify themselves as experts to undertake investigations." You are aware of the system of scholarships which is in vogue. Have you any special recommendations to make as to how these may be utilised?—A. They must be put on some work. They get the scholarship all right, but as soon as they come back, they do not find any employment here. They must be put on to some work.

Q. You recommend that "Government should use its influence over mill or factory owners to take up and train apprentices." What kind of influence? Do you mean to say that when Government patronises any firm or industry or factory, it should insist upon some student receiving training there?—A. Not necessarily that; even if Government does not patronise any factory, if Government uses its moral influence it would be enough. In our Balaghat association a recommendation from the Commissioner of the Division was quite sufficient to induce mill-owners to take up our apprentices.

Q. You mean the moral influence of the Government should be exercised?—A. Yes, that I think would be quite enough.

Q. You have a science college here at present?—A. Yes.

Q. Does it teach only theoretical science or applied science also?—A. I don't know much about that.

Q. You are not familiar with the syllabus prescribed?—A. No.

Q. If applied science were made one of the subjects in the syllabus, do you think it will attract many students at present?—A. I don't know if it would attract many students, but it will attract some students.

Q. You have no college of engineering here; you draw your engineers from Roorkee?—
A. Yes, from the higher grade.

Q. But you have got a school of engineering?—*A.* Yes.

Q. How far does it teach?—*A.* I think up to the sub-overseer's class.

Q. Have you got many men here who have returned from England after receiving technical education there?—*A.* Not many; about five or six that I know of.

Q. Are they busy with some industries?—*A.* Independent industries you mean? I don't think they have taken up independent industries.

Q. Have they found work as technically trained men?—*A.* They have found work, but not to their satisfaction.

Q. What is the complaint?—*A.* They have been working in some subordinate position in some of the mills here.

Q. They have not risen to the higher appointments?—*A.* No.

Q. Would this not come after they have gained a little more experience and proved their worth better?—*A.* Provided they are given opportunities for learning the higher kind of work.

Q. Is it their complaint that they do not get opportunities for qualifying themselves for the higher kind of work?—*A.* Yes, that is their complaint.

President.—Q. What mill are you referring to?—*A.* One is at Bullub Das's Cotton Mill, and one is working at the Balasher Coal Fields.

Hon'ble Pandit M. M. Malaviya.—Q. Did both these gentlemen receive their technical education in England?—*A.* Yes, for some time, they were working here, and got Government of India scholarships, and on their return were employed in the above business.

Q. Was the gentleman, who is working at Jubbulpore, trained as a weaving expert?—*A.* Yes.

Q. And the other gentleman?—*A.* He was a mining engineer.

Q. What is the present position?—*A.* Assistant manager.

Q. How long has he been there?—*A.* On his return from England; he told me at that time he was there nearly four years.

President.—Q. Do you remember his name?—*A.* I don't remember his name.

Q. I know all these mining students, and would like to know his name?—*A.* He is a local man, a Teli by caste.

Hon'ble Pandit M. M. Malaviya.—Q. You do not know more details about him?—*A.* No.

President.—Q. This is an Indian mill in Jubbulpore, entirely managed and run by Indians?—*A.* Yes. The student's name is Baliram Pandurang.

Hon'ble Pandit M. M. Malaviya.—Q. Who is the manager of the mill at Jubbulpore?—*A.* The present Manager is some European, Mr. Wright, I think.

Q. You think, therefore, that this Industrial Department which you recommend, will find more employment for men who have been technically trained?—*A.* Yes, that is one of the means.

Q. You say that "concerns, if investigated, financed, and for some time even managed by Government, would have considerable educative value, and would, in addition to the Government department, throw a wider scope for employment to a large number of Indians." Supposing the Government or Department of Industries investigated possible commercial problems and published the result, will not that by itself lend a great stimulus to industrial enterprise?—*A.* I don't think it will give the necessary stimulus; it may give some stimulus.

Q. Do you think if banks supported by Government were created to help industrial enterprise, this stimulus, added to that of published information in regard to possible industries, will supply sufficient stimulus?—*A.* Then it will be direct assistance from Government.

Q. A bank supported by Government to lend money to industrial enterprises and a Government department to publish information about possible enterprises and to lend other assistance?—*A.* The two together will certainly supply sufficient stimulus.

Q. Then the Government need not manage any concern itself.—*A.* No, it need not manage it itself.

Q. You say here, with reference to the Government guarantee of purchase of products, "In my opinion the time has not come and may not come for long, to lay down any limit to this form of Government aid. In my opinion the Government should patronise local products in preference to imported articles, in spite of some additional cost." You know the present rules lay down that local products should be patronised if they are fairly good and their price is reasonable. You think it is necessary, in view of present industrial conditions in India, that Government should give preference to articles produced in the country, even if the cost is somewhat higher than that of the articles imported?—*A.* Yes.

Q. How would the public be benefited by it?—*A.* They won't be benefited immediately, but in the end.

Q. You think it would promote the general object for which the Government exists, namely, the prosperity of the people?—*A.* Yes.

President.—Q. What limit are you going to put in the way of sponging? You cannot possibly put that on record unless you have some definite rule to assist Government. The actual rule is that all articles produced in India, in the form of raw materials, or manufactured in India from materials produced in India, should, by preference be purchased, provided the quality is good and the price not unfavourable. If you go beyond that, we must have something very definite to go on, as to what allowance we are going to make?—*A.* (No answer).

Hon'ble Pandit M. M. Malaviya.—Q. Will you help us with your opinion on this point? Suppose you find that an article produced in India costs the Government a little more than a similar article imported from Japan or America, could you indicate any definite percentage of difference?—*A.* It is very difficult to lay down a hard-and-fast rule.

President.—Q. If you cannot lay down any hard-and-fast rule, then no rule can be laid down at all?—*A.* (No answer.)

Hon'ble Pandit M. M. Malaviya.—Q. The Government have laid down a sound liberal policy that preference should be given to local products, but we know that, in spite of it and in spite of the presence of valuable sound material produced in the country, preference is given to articles produced outside; what would you suggest to ensure that the spirit of the rule shall be respected and not infringed?—*A.* The strict orders of the Local Government and every contract must be checked by the Director of Industries or some such officer. For instance, if the Public Works Department require any glasses or tumblers for their inspection bungalows, a large order is given to one firm. Such orders should be given to the Director of Industries, who would then advise, "here is a local industry, say the Jubbulpore factory; give preference to that factory; send all your orders to that factory."

President.—I would not like to be a candidate for your job of Director of Industries!

Hon'ble Pandit M. M. Malaviya.—Q. Please confine yourself to the rule which the Government have already laid down, that preference shall be given to indigenous products when the quality is sufficiently good for the purpose and the price not unfavourable?—*A.* Yes as far as I understand that rule it must be divided into two parts; first of all, it must be interpreted to give preference to local products. For instance, if there is competition between Madras and the Central Provinces products, that rule should be interpreted in favour of the Central Provinces product, but if there is competition between an Indian and a foreign product, then preference must be given to the Indian product. That is how I should interpret that rule.

President.—Q. You suggested just now that we should give a higher price for an Indian article; what rule would you lay down; would you lay down the percentage of price?—*A.* It is very difficult to lay down a hard-and-fast rule fixing the percentage.

Hon'ble Sir R. N. Mookerjee.—Q. Can you cite any instance where Government has not upheld that rule?—*A.* (No answer).

Hon'ble Pandit M. M. Malaviya.—Q. Have you any case within your knowledge where this rule laid down by Government has not been followed?—*A.* Yes, I know of one case, where all these tumblers and glasses required by inspection bungalows and all bungalows are not taken from the glass factory at Jubbulpore.

Hon'ble Sir R. N. Mookerjee.—Q. Where were they taken from?—*A.* From Madras.

That is local.

President.—Q. You give instances of the first category. Have you any knowledge of cases of the second category?—*A.* No.

*Hon'ble Sir R. N. Mookerjee.—*That complaint then vanishes.

President.—Q. This rule bears on India *versus* the rest of the world; not one province against another. This rule does not recognise any provincial patronage?—*A.* Personally I would like to interpret it in that way.

Hon'ble Pandit M. M. Malaviya.—Q. Now in fixing the price, in considering whether, in spite of some additional cost, the Government should or should not give preference to indigenous articles, the first thing the Government will have to bear in mind is that the cost of the indigenous article should not be very high, in view of the interests of the general tax-payer; will you recommend that officers of Government should bear in mind that manufacturers outside have had a longer innings, have had a long-established organisation and are able, therefore, to produce articles at a comparatively cheaper cost than Indian and also that possibly by reason of the profits they have made for a long time, they are able to reduce their prices for the time, if there is any indigenous product to compete with it. Would you recommend that Government officers should take these factors into consideration in determining to what extent they should show preference to goods of higher price?—*A.* I think so, because foreign articles should not be allowed to kill indigenous industries.

Q. You think then that more of Government patronage is essential in order to protect nascent industries in India against foreign competition?—*A.* I think so.

Hon'ble Sir R. N. Mookerjee.—Q. For a number of years or everlastingly?—*A.* I could not say that.

Hon'ble Pandit M. M. Malaviya.—Q. I have used the word "nascent." I take it that that should be shown only for a certain number of years, in order to give a fair chance to industries of establishing themselves, if an industry is not established within a reasonable period, you would wish Government to withdraw its patronage?—*A.* (No answer)

President.—Q. This discussion is quite theoretical. We know the rule is not carried out, for very good reasons. One is that the responsible officer does not wish to take upon himself the responsibility of purchasing when you have the Stores Department who will take that responsibility. If you are buying a big piece of plant, and have only one year to run in office, your successor may say that you have purchased a bad piece of plant. You have the Stores Department upon whom responsibility rests. Another reason is that the responsible officer does not always know where to get these materials in India, and does not know if they will be of the right quality. He is already overloaded with work, and it would be easier for him to send the indent home, where the work will be inspected. It is no use our harping on this rule if we cannot get the rule carried out?—*A.* Every officer of Government should be supplied with a list of goods to be found locally.

Q. Do you think that we might have a list of articles published each year? In practice that has been found impracticable. It takes a long time to publish this list, and it comes out too late. We have had suggested to us another proposal, that in India should be formed a Stores Department similar to the Stores Department of the India Office, and that these orders should go into the Central Stores Department so as to get the benefit of contract prices. They would have a staff who would make it their duty to find out where goods are to be obtained, inspect the goods and take the responsibility. Does that appeal to you?—*A.* It appeals to me, but I cannot say about its practicability. It seems to be a very good suggestion.

Hon'ble Pandit M. M. Malaviya.—Q. If a Stores Department, like what has been suggested to you, is established, would you wish to have one for every province, or one for the whole of India, in view of the problems that have to be tackled?—*A.* I have not thought out this problem.

Q. You say here, "The policy of revising the assessment of land revenue during the currency of the term of settlement, if the land is diverted from agricultural to non-agricultural purposes, or of taking premium on such conversion, may be very sparingly used, or not used at all. Generally the settlement of such land should be for a much longer period than the one of land used for agricultural purposes." Is that the regular practice here at present, that if land which was purchased for agricultural purposes

is diverted to non-agricultural purposes, then there is a revision of the settlement during the period of the previous settlement?—A. I have stated in my evidence that under the law as it now stands, it is not possible to do it, but under the law under amendment, it will be possible.

Q. Then from your point of view it is a wrong departure from a good policy?—A. Yes.

Q. If the law is passed?—A. Yes.

Q. If land is diverted from agricultural to non-agricultural purposes, i. e., let us confine ourselves to industrial enterprises, then the industry that might grow thereon would probably contribute a tax in the shape of income tax, and you think that would be sufficient reason for not revising the land assessment during the period of settlement?—A. Yes.

Q. You say, with regard to the instructions for the guidance of Settlement Officers, that "such instructions, so far as one can judge, are issued mainly with a view to safeguard or increase public revenue, and that as far as one can judge in all these instructions, due regard does not appear to have been given to the development of the industries." That may be due to the fact that the Government of India had not decided what policy to pursue in regard to the development of industries? I understood from another witness that drawing was compulsory in your schools; here you say "drawing is not yet a compulsory subject."—A. Not in the Central Provinces to my knowledge.

Q. You are firmly of opinion that drawing and manual work should be compulsory?—A. Yes.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. About these district committees how many men do you want on these committees; do you want them from different villages or from a central district town?—A. If you get men from villages that would be an ideal district committee.

Q. What do you think ought to be the number of the committee?—A. As many workers as there are. I would not lay down any number.—If you can get 20 men it would work.

Q. Meeting every month?—A. Not necessarily; once in three or four months.

Q. Who are these people to consist of; businessmen or men who have got experience?—A. Businessmen and men of the district who have experience.

Q. And they may be subordinate to the Provincial Board?—A. Yes, or they may be co-operators of the Provincial Board, if they do not like the word "subordinate" to be used.

Q. But they would work under the advice of the Provincial Board?—A. Yes.

Q. At present this Board of Industries is under the Director of Industries, or under Government?—A. It is nominated by Government.

Q. And so it is under Government?—A. I don't understand what you mean by "under Government".

Q. Or under the Director of Industries. Suppose there is a problem brought before him; should they advise Government or can they only advise the Director of Industries?—A. Advise Government through the Director of Industries.

Q. Are their opinions laid before Government or before the Director of Industries?—A. Before the Director of Industries. They are placed before a meeting which is presided over by the Director of Industries, and all the proceedings are forwarded to the Government. He is one of the members of the Board.

Q. Then about the land acquisition, suppose if the land is required for a bamboo plantation for the wood pulp industry, and suppose that 5,000 acres of land are needed by Government for this purpose in one plot not divided up, so that they can do it economically, do you think that Government should acquire these 5,000 acres of land through the Land Acquisition Act; do you mean that?—A. Yes.

Sir D. F. Tata.—Q. With reference to this complaint about the young men who have returned from England, and who, you say, cannot get sufficient opportunities, do you think it is a real grievance? Does the fault lie entirely with the employers? Do you think that the young men themselves are everything that they should be?—A. I cannot say, but the fact remains that they don't get employment.

Q. You have just now told us that some of these men, whom your association has refused to do manual work in the mines because they were expected to work as labourers for two years, and that they left because they were not taught the theoretical

work at once. A good many of these young men—very estimable young men no doubt—who leave their country to try and learn new industries, go out, but don't you think they only acquire the theoretical knowledge required for that purpose, and that their practical knowledge is actually nil, and if when they return from Europe they expect to be employed as you say in managerial positions, how could any concern employ them as such when they have no faith in their ability to do practical work?—A. I am told they get some practical training, and even then find difficulty to get employment on their return.

Q. Is the practical training of such a nature as to satisfy the employer in this country?—A. I am not in a position to give an opinion on that just now.

Q. You will find, on enquiry, that nearly every man who occupies a high post in industrial concerns, however great may be his theoretical knowledge of the subject, has always worked practically as a labourer for a long time before he can be fitted to do any work. Don't you think, therefore, that if our young men reconciled themselves to this idea more, they would do themselves and the country more good?—A. I quite agree with you there.

Q. You said something about these men not getting opportunities; but don't you think that a man who is really serious should make his own opportunities, and should not wait for them?—A. The theory may sound well.

Q. Naturally in practice what happens is this. A young man goes out to Europe either, with a scholarship or with money borrowed, or on a small allowance his people may make. He spends sometime in Europe to acquire the knowledge of an industry or trade, and he expects to begin to earn as soon as he returns. That is the real grievance, because the people are too poor. But at the same time, if, after he returns to the country, and goes into an industry, he devotes the first two or three years to beginning at the bottom of the ladder, don't you think he will arrive at the top quicker than if he went straight off to jump into management?—A. I don't say he should be appointed manager at once.

Q. You said that some of the people who returned complained that they had not got into high posts; how long have they been in this country?—A. I have cited two instances. I know they have been in the country five or six years after returning from England.

Q. Do you expect that in any industry, after he has begun his work, anyone could rise to high posts in five or six years?—A. At least he must have hope of rising.

Q. Personally I should say it would be 15 or 20 years before a man can be head of an industry?—A. Personally I think you cannot expect so much patience from an Indian.

Q. Then you expect them to rise?—A. That is what I say; there must be some limit to it.

Hon'ble Sir R. N. Mookerjee.—Q. Is this association at Balaghat a registered association?—A. No.

Q. What is the qualification of the members of the association; do they subscribe any money?—A. Yes.

Q. What is the number of the members?—A. I could not tell you just now.

Q. What is the fund available to the hands of the association?—A. Some thousands, I think, I don't remember the exact amount just now.

Q. You don't know what is the qualification; is there any limit of subscription?—A. Persons who pay Rs. 200 are called patrons, and those who pay monthly subscriptions are called donors. We have got funds and have expended some money out of that.

Q. Can you give us any idea of how much you have expended?—A. We built hovels for the boys in the Pench fields. I have not got the details here.

Q. It is not registered?—A. No.

Q. Don't you think that, as you have public funds, it would give more confidence to the public if you had it registered?—A. Yes.

Mr. A. Chatterton.—Q. You say you have had no difficulty in securing money for business, and that land tenures in these provinces do not afford sufficient security to the investing public. Then you go on to say, "If the recommendations made by the

MacLagan Committee are accepted, that difficulty would disappear." What difficulty are you referring to?—A. The co-operative banks, I think. The recommendations made by the MacLagan Committee are that land transfers should be made in favour of co-operative societies.

Q. What I understand from this is that the land at present does not afford sufficient security to the investing public, and that if these recommendations are carried out, land would have a greater value, and therefore people would invest their money in land instead of business propositions?—A. Nine-tenths of the members we have dealing with have no transferable interests in the land they hold.

Q. You want their land as security for the money advanced?—A. Yes.

Q. Why do you say that the land tenures do not afford sufficient security; simply because they are not transferable, or because of the short-time settlements?—A. Because they are not transferable. The short-time question has not got anything to do with it.

Q. On the same point of land policy, I understand there is a good deal of discussion. It is proposed to review the settlement. If the land is transferred from agricultural to the non-agricultural purposes, is that with the view to securing the unearned increments?—A. Yes.

President.—Q. Can you tell us, approximately, what your annual turnover is in connection with the co-operative societies in the Balaghat district?—A. About 7 lakhs. More than nine-tenths is in respect to agriculture.

Q. At what rate of interest is your money with the co-operative bank for industrial purposes?—A. We have only one rate of interest, 12 per cent. We get money from deposits at 6 per cent to 6½ per cent, according to the term of notice. When we have occasionally to borrow money from the Provincial Bank, we get loans at 7 per cent.

Q. Hon'ble Sir Fazulbhoy Currimbhoy.—And you give at 12 per cent?—A. We don't deal with individual members; we deal with societies.

Q. Hon'ble Sir R. N. Mookerjee.—What is your present capital?—A.—Our working capital is about Rs. 3,80,000.

WITNESS NO. 140.

Rao Sahab G. N. Sahasrabudhe, Pleader, Ellichpur, Berar.

Written Evidence.

Industrial
research institutes.

At present I am interesting myself in the manufacture of paper and pulp from green cotton stalks which are abundant in the Central Provinces and Berar. I am indebted to Mr. Leftwich, Director of Agriculture and Industries, and Mr. Plymen, the Agricultural Chemist, for investigations on the raw material. A bundle of stalks was sent by me for investigation and demonstrating the manufacture of paper from them. The report of the Agricultural Chemist has been published. I wish to take the matter further and see whether the enterprise will be commercially successful. Mr. Plymen has promised to enlighten me further and give me the opinions of firms regarding its use on a commercial scale. He has already sent me a letter giving the estimates of the capital required to produce 300 tons per week of unbleached pulp made by Messrs. Bertrams, Ltd., of Edinburgh. Further enquiries are being made by me. But before the industry is started it must be satisfactorily proved that the concern will be profitable. The idea is to start a pulp factory to begin with. If the enterprise proves commercially successful and feasible, a company in the Central Provinces and Berar will be ready to undertake the manufacture of pulp with Government help and to learn the process of manufacture. We shall have therefore to see whether there are facilities provided in the country (1) for learning the process of manufacture of pulp and paper from cotton stalks, (2) for investigating on the raw material and proving that paper and pulp can be manufactured, and (3) for demonstrating to the public the feasibility of the concern on a commercial scale.

There is a small research institute and laboratory at Nagpur, but it will be occupied with agricultural experiments and will be unable to experiment upon industrial products. The research institute at Pusa will also be occupied with agricultural research work. The research institute at Dehra Dun experiments upon forest products, and I doubt whether it will find time to do the industrial research work. Provision under this head seems therefore necessary. There is also no institute in the country to train the apprentices in the various processes of manufacture of various articles and to demonstrate the practicability of the enterprise on a commercial scale. I am experiencing a practical difficulty at present in this respect.

I had a considerable correspondence on the subject with research institutes and Government departments in the country and with private paper mills in India and from the replies received it seems that no provision is made to train apprentices in the process

of manufacture of various industries. The country is in need of experts and scientists and skilled labourers, and, unless they are produced, there is not much hope of advancing the industrial development of India.

As for my experience of Ellichpur Match Factory, I beg to state that we had to face many difficulties. A note on the Ellichpur Match Factory is annexed. The causes of the failure of the concern are many and varied, but chief amongst them are:—

- (1) unsuitability and insufficiency of the raw material *salai*;
- (2) want of expert knowledge;
- (3) want of expert aid;
- (4) insufficiency of capital for working expenses;
- (5) want of skilled labour.

In the light of the above experience I submit the following suggestions for the consideration of the Commission.

I would suggest the establishment of a separate Imperial industrial scientific and technical department at Allahabad or Cawnpore, controlled by a Board of Industry, on the lines on which Boards of Forestry and Agriculture are established. The Board should consist of officials and non-officials nominated by the Government of India. A new officer, named "Director-General of Industries," should be appointed on an attractive salary, helped by the above Board and also by a qualified Indian secretary having sufficient knowledge of industries and their organization, also appointed on a good salary. An industrial research institute and industrial laboratory should be attached to the department, manned with a competent staff of experts and investigators who should be able to experiment upon raw products and to demonstrate the practicability of the concern. Imperial scientific and technical departments.

Investigation of major problems should also be made in the research institute. The Board should co-operate with the department in England and should carry on correspondence or personally go to England and utilise the research institute and Advisory Board of Scientists in England when it is absolutely necessary to do so.

The Board should have executive power with budgeted funds at their disposal. A provision should be made in the Indian Imperial Budget under the head "Development of Industries." Provincial Directors of Industries should receive advice from this Imperial Industrial Board. Annual meetings of the Board should be held, when all Provincial Directors and Industrial Chemists should attend and the Director-General of Industries should preside at the meetings. A triennial programme of work should be discussed and sanctioned just as is done in the case of Boards of Forestry and Agriculture, the questions being decided by a majority of votes. The proceedings of the meetings should be published for the information of the public concerned. The Government of India should have controlling and revisionary powers over the Board, and their orders should be final.

The industrial research institute would demonstrate the utility of certain raw material for a market product used by people in their ordinary course of business. A further stage is to see whether the experience will be successful on a commercial scale, and I humbly think it forms part of Government duty to get an investigation made as to the probability of the success of new industries. To meet this want I would suggest that the Government should establish pioneer or model factories for manufacturing a certain article—say paper pulp from green cotton stalks—on a commercial scale (in which I am interested) in a place where the raw material is abundant: in my case, say, at Wardha in the Central Provinces or Murtizapur in Berar. The Government should run the factory, say, for one or two years, and when it is proved that the concern is successful and profitable, any company in Central Provinces and Berar may—and in my case a company will be ready—purchase the concern at a cash price and run the factory on the lines demonstrated by Government. This model factory will be a training school to learn the actual process of manufacture as well as to train labourers and thus create a competent class of skilled workmen in a particular industry. I also venture to suggest that when handing over the concern to a new company, or when any financial assistance is given by Government to a company, a condition should be attached to the effect that the promoters of the company should undertake to teach one or two apprentices the actual process of manufacture. Apprentices will thus have some facility provided to learn the actual process of manufacture either in the Government model factory or in the factory purchased by a company. The details of the scheme may be worked out later on. I know that it will be next to impossible to start model factories for numerous industries. But I suggest that such a model factory may be established only when the demand for a particular industry arises, or when the initiation comes from the people themselves, as in my case of paper manufacture, the initiation will come from the people. This scheme is feasible and there should be no difficulty in sanctioning it. Model factories.

Official organization.

As regards the official organization of the Central Provinces and Berar, I beg to state that there should be a Board of Industry (not advisory) consisting of officials and non-officials nominated by Government with executive powers and with budgeted funds at their disposal. A provision should be made in the provincial budget under the head "Development of Industries." The Board should be helped by a qualified Indian secretary possessing practical knowledge of industries and their organization and business abilities appointed on an attractive salary. There should be a small industrial laboratory and research institute attached to the Board equipped with a good industrial chemist and a staff. Small and major problems of the province should be investigated in the laboratory. Annual meetings of the Board should be held at which the Director of Industries and Agriculture should preside. Questions should be decided by a majority of votes, the President having a casting vote. The proceedings of the meeting should be published for the information of the public concerned, along with the annual report showing the progress made during the year. The Board should carry out the problems and orders of the Imperial Industrial Board and should co-operate with the latter. The Board should also look after the development of small industries as well as big industries in the province and carry out the scheme that will be sanctioned by the Commission and by Local Government. The orders and resolutions of the Board should be subject to the revision and control of the Local Government, whose orders will be final.

Institute of Science, Bangalore.

The Institute should be fully developed, unless it is completely specialized, say, for iron and steel. Research and laboratory work should be carried on here in connection with industries, the raw materials of which are abundant in southern India. It should be an Imperial institute. It should be general in activities and interests for the present. The scientific and technical experts of Government and this institute may be encouraged to study methods in foreign countries. The Government of India should exercise control over the Bangalore Institute and see that it actually serves the purpose for which it was intended by the donor. The results of the Research Institute at Cawnpore and Bangalore should be published by Government for general information along with the annual reports summarising the work done during the year. No restrictions or conditions should be placed in the matter.

Technical aid.

The Government should entertain a good staff of experts in various industries, as demand arises, such as (1) match, (2) sugar, (3) paper, (4) tanning, (5) oil-refining, etc., etc. The experts may be given on loan to private firms or deputed on applications, on conditions which will not act harshly on promoters of a company. The periods of loan may be extended if necessary. In the case of the Ellichpur match concern such expert aid would have been a boon to the company. Chemical treatment of match-heads was found defective and the matches would not ignite in the rainy season, with the result that the matches and the match boxes were simply lying idle for want of custom, which partially accounts for the failure of the concern.

The salai wood was found useless, as it could not be split evenly. The result was that heaps of broken splints were lying in the compound of the factory unutilised for want of expert knowledge. Now it is said that these waste splints could have been used and turned into bricks for flooring. What is really wanted is that the Government should have at their disposal various expert advisers for advice in various industries. The object is to build up an industry at an early stage by Government help, leaving further development with managers.

Government assistance.

Government aid to industrial concerns can take one or more of the following forms:—(1) direct financial aid in the form of bounty or subsidy for a specific or general purpose; (2) indirect financial aid in the form of commissions as regards railway freights; (3) supply of raw materials from Government without charging royalty or any other tax; (4) experimentation with a view to testing or improving certain processes of manufacture from various points of view, and especially chemical or economical view point. Looking to the backward state of the country, all methods are welcome. But (1) guaranteeing payment of interest without subsequent refund of expenditure incurred for paying dividend, (2) loans with interest at a cheap rate, just like *tagai* system, (3) supply of machinery and plant on hire-purchase system, (4) guaranteed Government purchase of products permanently or at least for a certain period until credit is established, (5) assistance through State banks, (6) State patronage and facilities of transport, and (7) finding markets for indigenous products, are methods which will most appeal to people. Money grants, bounties, and subsidies may be given in the case of some industries with great scrutiny. The matter should be decided on the merits of each case.

My experience is that Government control is absolutely necessary for the satisfactory working of a factory; when any direct or indirect aid is given by Government, Government control should, in my opinion, be confined to a general audit of accounts, keeping a strict watch over the monthly statement of profit and loss. Any defects in the accounts should be at once brought to the notice of directors and should be removed immediately.

Pioneer factories.

Pioneered concerns should be treated and managed just like other departments of Government. A balance sheet and statement of profit and loss should be published at the end of the year. If the concern is a profitable one, people will come forward and purchase it.

I am against the principle of converting pioneer factories into permanent Government institutions. It is something like Government interference with trade and commerce of the people. In war times and in the case of concerns on the largest scale only Government may pioneer industries; for instance, munition factories in war times.

I think it is necessary to establish industrial banks supported and financed by Government in a central place in the country, the branches of which shall be opened in each presidency or provincial town of India. They should be supplied with expert managers, who should be in a position to work on both the industrial and the commercial side of the institute. Advance of loans at a cheap rate of interest will be welcomed by proprietors of small and big industries in the country, many of which will be saved by timely help from these banks. In the case of the Ellichpur Match Factory we wanted money for working capital and we had to borrow it at a rate of interest not lower than one per cent per month.

I have got no experience of co-operative societies helping any industrial concerns. But there are some societies in the Central Provinces and in the Bombay Presidency which assist small industrialists and cotton and silk weavers.

I have got a bitter experience of unskilled labour in the Ellichpur Match Factory. The match industry is already an intricate industry, and skilled labour is absolutely necessary for the successful working of the factory. To work on the machines requires training. We had to suffer a considerable loss for want of skilled workmen. We had to import experienced labourers from Ahmedabad at a considerable cost. The work of filling boxes with matches is generally done by female labourers; on this side of India there are no skilled male and female labourers at all. Whereas in Japan a female labourer can fill up 2,000 boxes in a day, the Indian woman can scarcely fill up 500 boxes in a day. If my memory is correct, there were only one or two girls in the lot who filled up 1,200 boxes in a day of 10 hours. In consequence the factory had to suffer considerable losses.

Training of labour
and supervision.

An Indian workman is intelligent, but he requires training and good prospects before him. He does not take interest in his work and is unmindful of its details, probably for want of encouragement and facilities in many directions. The proprietors of factories and even the promoters of the big cotton mills of Bombay have not yet provided full facilities for the comforts and education of the mill hands. The pressure of commercial competition forces managers to pay close attention to the market, and to a careful study of the machinery and plant. But no heed is paid to labourers, who are admitted to the factory as they come. But the time has now come and the business-world is now realising that, whether they desire it or not, the labour side of a big industrial concern calls for a large and continuous expenditure of brain-power on the part of some officer of a factory. It cannot be left to subordinates.

Labourers are human beings and they should be treated as human beings and not as imperfect machines. The managers should respect the industrial independence of the work-people. They should be treated not as mere work-people, but as citizens with their human hopes and aspirations and their own part to play in the life of a nation. The main spring of the policy of a factory manager should be a sense of social duty. The test of any scheme of factory organization is the extent to which it creates and fosters the atmosphere and spirit of co-operation and good-will among the work-people. The efficiency of the employes shows itself in many ways, the most striking being the elimination of waste and reduction of cost in various departments. The care for the physical efficiency of the worker forms an important factor in the industrial organization of a concern. It results in a decreased sickness rate and the higher physical fitness of work-people. To accomplish this purpose, the manager should adopt (1) a careful method of selection of the employes, (2) a scheme for educating them, (3) carefully thought-out methods of promotion, (4) just and fair discipline, (5) healthy and orderly house surroundings, (6) a system of bonuses, (7) recreation and sports clubs, (8) good, airy and decent houses, (9) kind and sympathetic treatment, (10) system of medical aid, (11) system of life insurance, and (12) opportunities for the development of the organizing ability and initiative of the workers.

The science of industrial organization is as yet in its infancy in India. The establishment of model factories by Government, organized on the system of the Bournville Works, will have a most encouraging effect on the people of the country. This should be the ideal of the Indian industrialists; and it is capable of attainment with Government assistance.

The Government departments should publish list of imported articles which are used by them and also exhibit them in commercial museums. The people of the country will then be in a position to know the nature of the articles purchased by them, their prices, and the make and finish of these articles. An Indian manufacturer will thus be in a position to manufacture similar articles in his factory and offer them for sale to the public and the Government.

Assistance in
marketing products.

Trade representatives should be appointed in foreign countries on behalf of India. They should be men of business and commercial instinct, and should try to create a demand for Indian articles in foreign countries and as well as study the taste of people and report on new methods and articles manufactured in Europe and America.

The demand for factory products is one of the main factors in the success of an industrial undertaking, and trade representatives or agents in India itself would be of much value if they will try to advertise and create custom for articles manufactured in factories.

Emporiums and museums, exhibitions in presidency towns and at local fairs, and establishment of sales agencies are the most important factors in the development of Indian industries.

Railway freights.

Several witnesses have advocated a reduction of railway freights in India. I fully agree with them. I cite a particular instance of hardship entailed upon a big and distinguished firm at Bombay.

The complaint from the Alembic Chemical Works Company is as follows:—"We are liquor contractors to the Baroda Government and manufacturers of spirits, foreign liquor, etc., etc. We cannot receive proper supplies of mohada and coal in season due to shortage of wagons. We have tried many times in different directions; but we are neither given siding facilities, of which we are in great urgent need, nor does the railway company give us any concession in rates, although we are paying on an average about Rs. 10,000 per month in the shape of railway freights." The grievance complained of is worthy of relief. The only remedy, in my humble opinion, lies in the transfer of company management of railways to State management. There are many grievances of this nature in the country, and I earnestly request that the railway grievances should be removed as soon as possible. The correspondence will be shown at the time of examination.

Cottage industries.

A considerable portion of the population of Central Provinces and Berar is engaged in carrying on small or cottage industries. Hundreds of thousands of people maintain themselves on the profits earned in these industries. Small industries play not an unimportant part in the industrial organization in the country, not only in India but even in England, France, Belgium, Switzerland and Holland and other countries. It has been conclusively proved with reference to small industries of the work that they can hold their own in competition with foreign-made articles manufactured by steam or electric power. These industries therefore deserve encouragement both from the Government and people.

The Hon'ble Mr. C. E. Low, I.C.S., has made good suggestions in his lucid report on the "Industrial Survey of Central Provinces and Berar," published in 1910. The Central Provinces Administration has approved the recommendations, which are being carried out gradually. Experts should be appointed to instruct apprentices in some of the small industries, *vis.*, (1) cotton and silk weaving, (2) dyeing, (3) toys, (4) brick and tile-making, (5) glazed pottery, (6) oil-pressing, (7) brass, (8) embroidery, (9) bangle-making, (10) furniture-making, (11) carpentry and blacksmithy.

(2) A superintendent for each district should be appointed on a handsome salary, who should try to establish societies of co-operative credit and advance money to industrialists at a cheap rate of interest.

(3) Modern machine tools and plant should be supplied on the hire-purchase system and demonstration workshops should be opened in the head-quarters of a district or province.

(4) Sales agencies should be established, which should dispose of the goods prepared by the owners of the small industries.

(5) More industrial and handicrafts schools should be opened in the provinces in the Central Provinces and Berar, such as Jubbulpore, Wardha, Yeotmal, Akola and Ellichpur. Demonstration classes and workshops should be attached to them, wherein specialized instruction by experts should be given in the process of manufacture of various articles. People trained in these schools will be available to work in factories carried on by oil and steam engines, to make general repairs of machinery, etc., when required.

**Match industry,
Ellichpur.**

This is an industry of which I have got bitter experience. We had started, at Ellichpur (Berar), a company for manufacturing white phosphorus and safety matches, in 1906, on a share capital of one lakh of rupees. The whole amount was collected by shares and was spent in erecting an imposing building and the purchase of machinery from Germany. There was no working capital. We had to borrow it on interest. The factory went on working for nearly two years but yielded no profits, and at last the business of the company was wound up in 1910. The causes of the failure were, as usual, various and varied. Bad quality of the wood-salai (*boswellia serrata*), lack of expert knowledge and skilled labour, want of capital and want of experience and business

management,—these were the chief causes. I have suggested a scheme of establishing a saw mill and wood-cutting machinery at the foot of the Himalayas which abound in pine tree and other trees suitable for match industry. Logs of wood should then be floated down by water-ways, *via* Ganges river to a central railway station on the banks of the Ganges river. A splints factory should be established near this railway station to manufacture splints from the above logs of wood. These splints should then be imported to the interfluvial plains where the match factories are already established.

This suggestion, if carried out, will be really a great boon to the people. Forest and railway concessions, a little expert advice to factory owners at times,—these are as necessary as the Government help in the matter. There are many small things needed to complete a match box which are required to be imported from foreign countries, and it is a problem how these small things can be manufactured in India. I think it is not possible to make the country self-contained in every respect, and we shall have to depend on foreign countries, especially for chemicals, unless the chemical industry is completely taken up by England.

The problem of finding suitable wood for match manufacture is a difficult one, and can be probably solved—at least partly though not wholly—by the adoption of the scheme proposed above, and by using pine trees which abound in the Himalayas and which is the most suitable wood for match manufacture. My experience shows that the salai wood, which was used by us at Ellichpur, is useless (and insufficient in quantity in the Melghat Forests) as it cannot be split evenly, with the natural result that there was great waste of wood and consequent loss to the company. Heaps of broken splints were lying in the compound, but for want of knowledge the waste could not be utilised to some other purpose. A knowledge of the utilisation of waste is absolutely necessary to the proprietor of an industry, and the Government should help the factory owners in this respect. We also experienced the chemical difficulty attending the treatment of match-heads, especially in the rainy season, which also accounted for the enormous loss sustained by the company. Laboratories and research institutes are absolutely necessary for the practical training of the people. The Forest Department should make suitable arrangement for the supply of wood on reasonable terms. Railway freights should also be reduced to a considerable extent.

Oral Evidence, 15th December 1916.

President.—Q. I understand that you have taken an interest in paper pulp manufacture from cotton stalks. We are not experts in paper and so I expect that you would get more advice by placing your problem before an agricultural chemist or Mr. Leftwich who would put the matter before the right kind of people, or before Mr. Finlow?—*A.* I do not know whether Mr. Finlow has taken up the matter.

Q. Or any paper experts in Bengal? Have you sent any samples to Messrs. Bertrams, Limited, of Edinburgh to take an interest in the matter?—*A.* No. The first difficulty which I place before the Commission is that we want facilities for learning the process of manufacture, in the first place, in the country itself. For that reason I enquired at the Research Institute at Dehra Dun, at Pusa, at Nagpur and at Poona, and the replies which I have got from all these places seem to show that there are no facilities provided for teaching the process of manufacture. What I wish to impress upon the minds of the Commission is that these facilities should be provided in the country itself. Secondly, after having demonstrated that a certain article can be produced from a certain raw material, it remains to demonstrate whether the concern will be successful on a commercial scale or not. If these two points are accomplished, then I believe any company will come forward and take up the concern. As far as I see there is no facility provided in the country itself. If these two facilities are given in the country itself, then I think we shall be able to start an actually new manufacture of paper pulp in the Central Provinces and Berar, and so far as my enquiries with my friends are concerned, I feel sure, that a company will come forward to undertake this new industry of paper pulp from cotton stalks. To demonstrate the practicability of the concern on a commercial scale model factories should be started by Government in a place where there is abundance of this material, either in Wardha in the Central Provinces or Murtizapur in Berar, and after experiments are made for two years by the Government, if it is proved that this factory could be carried on as a profitable concern, the concern would be purchased by a company with a price paid in cash and the matter would go on very easily.

Q. Have you formed a company?—*A.* I have not yet formed one. I have taken the sense of the people and I think they will form a company if it proves a successful concern. My bitter experience of the match factory at Ellichpur shows that I should not advise anybody to come forward in an undertaking of which they have no experience, and which it has not been proved in the country would be a successful concern. We lost Rs. 1,73,000 in the match factory. There is no use going on with any new concern unless one is satisfied that it will be a profitable concern. That is my conviction from experience. I advocate model factories in the Central Provinces and Berar.

Q. What makes you think that the Institute of Science at Bangalore may become specialised in iron and steel? What has that Institute got to do with iron and steel?—A. Because it is Tata's. Sir D. J. Tata may wish to use it for iron and steel.

Q. There is an extraordinary confusion of ideas; because the money was largely subscribed by the Tata family, it is thought that the Institute will have something to do with iron and steel?—A. My impression was wrong, it seems.

Mr. C. E. Low.—A. You speak of the Board of Industries as the provincial controlling authority for the improvement of industries. Will the Board control the ordinary work of the experts?—A. It should contain ordinary businessmen.

Q. You will have experts as well?—A. Yes. I propose an industrial chemist and experts, all attached to this Board.

Q. Experts in what?—A. Experts in the process of manufacture of any material.

Q. You will not be able to get an expert in the manufacture of everything?—A. Not in everything, but in a particular industry. In the Central Provinces and Berar, paper industry.

Q. You propose to start with an industrial chemist and an expert in making paper from cotton stalks?—A. Yes.

Q. Will the Board control the experts?—A. Yes.

Q. Would you find any difficulty in controlling the working of experts through the Board?—A. I have not got experience of that. I cannot say that.

Q. The non-officials would be, you say, businessmen?—A. Some of the officials would be businessmen also. The non-officials will be businessmen, or men interested in industrial concerns, or commercial business.

Q. You propose that annual meetings of the Board should be held. Do you propose that it should not meet more than once a year?—A. There will be a meeting once a year, but if necessary they may meet more often.

Q. They will have constantly to refer to experts for opinions, probably twice or thrice a week? Speaking from my experience as Ex-Director of Agriculture, I used to find that experts were referring to me several times a week?—A. They will not be in a position to meet once or twice a week. A certain period may be fixed at which these questions may be discussed.

Q. Turning to your match factory, there was a good deal of waste of wood in 1905 when I had the pleasure of visiting it then?—A. Yes.

Q. Do you remember how much of your wood you had to waste?—A. Out of one ton, one fourth was utilised and three-fourths were wasted.

Q. You were using salai wood for match heads and match boxes?—A. Yes.

Q. You had to get your salai from a considerable distance?—A. Yes, more than twenty miles. We had a concession from Government in that respect. We paid two annas a cart. The cultivators have to pay eight annas a cart.

Q. Do you think that if there was a Government expert his advice would have been freely available to you?—A. Yes. He would have been of great use.

Q. Do you think, looking back on it, with expert assistance you could have made it a success?—A. With expert assistance and capital we could have.

Q. Leaving the question of capital aside for a moment, do you think that with that wood you could have made matches to pay?—A. Yes.

Q. You had, of course, at that time a ready sale for all your products?—A. Yes.

Q. You sold them locally?—A. Yes.

Q. And you found that within a radius of 50 miles you could knock out any Japanese for other competition?—A. Yes. There was no complaint about the sale at all.

Q. Did you make experiments with any other kinds of wood?—A. There is only salai wood available in that part.

Q. The Maharukha wood is very limited?—*A.* Yes. It grows round Ellichpur.

Q. After a few years' working you would come to the end of it?—*A.* Yes.

Hon'ble Pandit M. M. Malaviya.—Q. You refer to the correspondence on the subject with research institutes. Have you any objection to laying it before us?—*A.* No.

Q. So far as the enquiries have gone on, is it now established by Mr. Plymen's research that the raw material is suitable for producing paper?—*A.* Yes.

Q. You want the matter to be examined to see whether it will be commercially successful?—*A.* Yes. That is the stage at which we have now arrived.

Q. You say that if it is to be proved that it will be commercially successful you want the Government to start a demonstration factory?—*A.* Model factories. Without them capital would not come forward.

Q. Have you found out what capital would be necessary to start one?—*A.* Mr. Plymen referred the matter to Messrs. Bertrams, Limited, Edinburgh, and the estimate amounts to a total capital of £ 230,000 or Rs. 34,50,000. It is on a large scale, so that you may be able to produce 300 tons of pulp every week.

Q. You do not think that so much capital will be raised in the first instance unless the Government has demonstrated by a demonstration factory that the project will be successful?—*A.* No. I am quite sure of that.

Q. You suggest the establishment of a separate Imperial scientific and technical department at Allahabad or Cawnpore. Do you suggest one of these places because they are more central?—*A.* Yes.

Q. You say that there should be a qualified Indian secretary under the Director-General of Industries?—*A.* Yes.

Q. What are the advantages which you have in mind? Do you think he will be able to bring the Indian businessmen into closer touch with the department?—*A.* Yes. He will be the working man in the whole Board. He will take more interest in the matter.

Q. You do not think that it would be sufficient to have an Advisory Board of Industries?—*A.* No. It is no use.

Q. You think that the opinions of the Board should be binding upon the Director of Industries?—*A.* Yes.

Q. Do you think that businessmen are more likely to be attracted to the membership if their opinions are binding upon the Director than otherwise?—*A.* I think so.

Q. As regards your point about the Institute of Science, Bangalore, you think that the Government should take it over under their own control?—*A.* Yes, and give it an Imperial character. It should be developed properly so as to carry out the intentions of the original donor.

Q. What was the machinery that you had in this match factory? Was it German?—*A.* German. The whole thing was German. It cost about Rs. 50,000. It was very nice machinery.

Q. You have enumerated the various causes which led to its non-success. But among these causes which would you select as having contributed more than any other to its non-success?—*A.* Non-suitability of the wood and want of expert knowledge too.

Q. Want of proper knowledge on the part of managers?—*A.* Yes.

Q. You had no difficulty about capital?—*A.* We had to raise money for working capital at a high rate of interest.

Q. Do you mean that if you could raise capital at an easier rate you might not have come to grief?—*A.* Yes.

Q. You say, "The work of filling boxes with matches is generally done by female labourers; on this side of India there are no skilled male and female labourers at all." Are you not finding now that more and more boys and girls are going to some of the schools?—*A.* There might be some improvement. They are still inefficient, though cheaper.

Q. The cheapness is counterbalanced by the inefficiency?—*A.* There is no use of saying that the labour is cheap. In Japan a woman can fill 2,000 boxes a day of ten hours. Our women can only fill boxes up to 500. I saw only one girl who filled 1,200 boxes.

Q. Do you think one of the reasons for it is that girls in Japan are put through a course of schooling for six or eight years?—*A.* Yes.

Ninety-seven or 98 per cent of the girls in Japan receive elementary education?—*A.* Yes.

Q. And under one per cent only get it here?—*A.* Yes. Want of education and training is one of the causes. We had no machinery for filling boxes.

Q. Does education generally increase the efficiency of the labourers because it gives them more interest in their work and invests them with a greater sense of responsibility?—*A.* Yes.

Q. You say that there should be better facilities for the comfort and education of mill hands in order to improve their efficiency?—*A.* Yes.

Q. Are you aware of any mill or factory on your side where provision is made for the education of the mill hands?—*A.* I have not got the experience. There is no mill at Ellichpur which does it. There are no night schools in Berar at all.

Q. Have you any objection to placing the correspondence before the Commission about railway freights of the Alembic Works Company?—*A.* No.

Q. You say that the railway company have not given any attention to your grievance. In your opinion, the remedy is the transfer of the management of railways from the companies to the State. If that were done you think that Government would give proper attention to the needs of the industry more than companies do at present?—*A.* Yes.

Q. About small industries in your province, do you think that a superintendent for each district would find enough work to occupy him in promoting small industries in your province?—*A.* To begin with I do not wish that a superintendent should be appointed for each district. There ought to be one for the Central Provinces and one for Berar, and the staff should be increased as the work increases.

Q. On the whole, the system which you recommend will, in your opinion, promote the small industries in your province?—*A.* Yes. That is my opinion.

Hon'ble Sir R. N. Moskerjee.—*Q.* You say, "labourers are human beings and they should be treated as human beings and not as imperfect machines." Have you got any experience?—*A.* I have not got any experience. I have not examined the mills. I think sufficient attention is not paid to the labourers.

Q. You cannot say from your experience or personal knowledge?—*A.* I cannot cite any particular instances. That is the ideal which I think should be followed.

President.—*Q.* Do you mean that you do not get proper housing accommodation?—*A.* There is no housing accommodation. There is want of schools. I have not seen the mills at Bombay or Nagpur. As far as my knowledge of Berar goes, work is taken and wages are paid and nobody cares to see what the real state of affairs in the houses of the labourers is.

Hon'ble Pandit M. M. Malaviya.—*Q.* You mean to say that except during the hours that the mill hands work, the managers do not concern themselves with their welfare generally?—*A.* That is what I think. That is my impression so far as Berar is concerned.

Q. You do not think, so far as you are aware, that there is any care taken for the social life they lead after mill hours?—*A.* No.

Q. Nor is there provision made for innocent amusements which will enable them to avoid temptation and lead a healthy life?—*A.* No.

Q. What kind of factories are you referring to in Ellichpur?—*A.* I am referring to my own match factory. There are three ginning factories at Ellichpur. I have seen operatives there. They are managed by Indians and still they do not take any interest.

Q. Each of them is a small undertaking?—*A.* Yes.

Q. What number of persons do these factories generally employ?—*A.* 50 or 60 a day, and 50 or 60 in the night.

Q. Do they work for about 4 or 5 months only in the year?—*A.* Yes, only in the cotton season. The labourers live either in Ellichpur or in the city.

Nagpur.

Rao Sahib
G. N. Sahasrabudhe.

Q. But do a good portion live near enough the mills to be able to attend a school if it were started?—*A.* I have seen some huts near the mills, that is, for those that have come down from the North-West Provinces.

Hon. Rao Bahadur
R. N. Mudholkar.

President.—Q. If they had primary education they would look after themselves?—*A.* They should have primary education. All people are quite ignorant now.

Sir D. F. Tata.—Q. We leased out a land from Government and tried to house our operatives, in Nagpur, but they preferred to live in their own surroundings rather than in the superior surroundings provided for them. They wanted to live with people of their own caste in their own original native place and did not care to avail themselves of the superior accommodation that we tried to find for them?—*A.* If the people are properly educated they will appreciate these things.

WITNESS NO. 141.

Hon'ble Rao Bahadur R. N. Mudholkar, C.I.E., General Secretary,
Indian Industrial Conference, Amraoti.

Written Evidence.

I.—Financial aid to industrial enterprises.

Qs. 1, 2 and 5.—I have been taking practical interest according to my capacities and opportunities in the development of trade and industry in India since the last 35 years. The first joint stock company formed in Berar by Indians—the Berar Trading Company—was established at my house when I was living at Akola in 1881 and I was its secretary for the first two years. I also bore a leading part in the establishment of the first factory in Berar in which Brahmins and educated men occupied prominent and responsible positions. I was also one of the founders of the Akola Cotton Ginning and Oil Manufacturing Company which has now developed into the Berar Oil Works, Limited. In this latter concern more than half the paid-up shares are held by my family and more than a third are owned by me. I have been the chairman and chief partner of the Agents' firm of the company and the main task of arranging for the financing of the company and conducting its affairs during the most anxious period of its existence has devolved upon me. I have been chairman since its foundation and also managing director since 1904 of the Amraoti Cotton Manufacturing Company, Limited, which owns a ginning and pressing factory. I own 7-8ths of a spinning factory at Shirala near Amraoti. I am also chairman of the National Financing and Commission Corporation of Bombay. I have put my money in several other industrial concerns, three of which the Agra Stewart Tannery, the Poona Cotton and Silk Manufacturing Company and the Central Provinces Swadeshi Spinning and Weaving Mills are no longer in existence.

I have thus had fair practical experience of the financial difficulties which industrial concerns outside the great commercial cities and industrial centres like Bombay, Calcutta, Cawnpore, Ahmedabad, etc., have to meet, and some knowledge of the causes of the success and failure of industrial enterprise in the mofussil, and have a sufficiently accurate conception of facts to distinguish between the personal element—knowledge and experience—and the element of surroundings, *i. e.*, situation and financial facilities. While not ignoring the great—the supreme—importance of knowledge, skill and experience I wish to draw special attention to the fact that in the mofussil and particularly in these provinces industrial development is greatly hampered by want of sufficient financial facilities. In Berar excepting the two Branches of the Bombay Bank at Amraoti and Akola there is no banking institution to speak of. The Sahukars in our towns and villages concern themselves mostly with lending money to agriculturists and private individuals at pretty high rates of interest. There is a certain amount of capital employed in seasonal factories (ginning and pressing) and in the purchase and sale of cotton and agricultural produce. But there is with a few exceptions practical absence of interest among the capitalists in regard to the development of existing manufacturing industries, the creation of new ones or the resuscitation of those which have gone out of existence. The expression of oil from seeds and the utilisation of the products for preparing articles of commerce, the tanning and leather manufacturing industry, the preparation of glass, the spinning and weaving industry, the utilisation of forest produce and several other things afford a great scope. But these do not attract the money-lending and capitalist class as a class. In another part of my note I am dealing with the special case of the oil seed crushing industry in Berar and elsewhere. The point to note here in regard to manufacturing industries generally is that the desire to stimulate industrial enterprise in Berar is not manifested by the capitalist class properly so called. The impetus towards this movement comes and has come to a very large extent from what, for want of a more convenient expression, is called the educated class, the majority coming from the legal profession.

Actuated by a desire to stimulate the industrial and commercial progress of the country these persons, after a more or less study of the literature on the particular industry they wish to see established, start companies in which some men belonging to the capitalist class and men of moderate means from the middle classes are also induced to join. It happens in some cases—I would say in very many cases—that the original calculations are exceeded either on account of expansion of the original plan of operations or an inadequate appreciation of the real requirements of the concern proposed to be started. And then commences their real period of difficulties. Even where an industrial concern is proved to be based on sound principles, financial assistance is unavailable though sufficient security by way of mortgage is offered. The Presidency Banks cannot and do not lend money on mortgage of immoveable property and machinery. The big joint stock banks in the Presidency towns and elsewhere—European and Indian—follow the methods of the Presidency Banks and refuse to entertain applications for loans on mortgages. Further they say plainly that they do not care to go outside their particular towns. The local capitalists adopt the same attitude; and even the capitalists among the shareholders refuse to come to the rescue. I am, as I have already said above, referring not to hopeless concerns or those based on wrong principles, but those in regard to which such objection cannot justly be taken. The result is that the concern leads a sickly existence or entirely succumbs. The loss in a case of this kind is not only to the shareholders concerned but to the country. An entirely erroneous impression is created in regard to the particular industry which the concern represented and a notion gets about that that industry cannot be conducted with profit in India, or at any rate in that province. Nay a more serious result follows. The disappointment of the particular shareholders has a depressing effect not only on them, but demoralises the whole community, and the cause of industrialism suffers.

This is difficulty No. 1 and a very serious difficulty it is.

Capital is wanted not only for the initial expenditure of putting up a proper and efficient factory, but also for working it fully, and for this also there are hardly any facilities in Berar. In the first place except at Akola and Amraoti no assistance can be expected from the Bank of Bombay; and secondly the regulations under which financial help for working can be obtained from these banks are so rigid and severe that the assistance cannot become available to a company which has substantial security to offer in the way of immoveable property but suffers from a deficiency of cash. As to accommodation from other persons possessing money, the attitude of doubt towards new industrial enterprises, which is characteristic of them, is only accentuated when they are told that the new company wants a loan; and little help is forthcoming from them. Besides as they get interest at high rates on the mortgage of villages, fields and houses they see little inducement in the terms which a business concern can offer.

This is difficulty No. 2.

I shall indicate another obstacle to obtaining capital and that is the restrictions put in the way of obtaining capital or loans from Indian States or Ruling Princes or their near relations. The restrictions in my view are unnecessary and undesirable. In the first place it is not at all easy to obtain a sympathetic hearing from these States. But even when such co-operation is promised, the restrictions imposed by the policy of the Government of India are regarded as serious impediments diminishing the value of the security.

This is difficulty No. 3.

Another difficulty in the way of obtaining capital for new industrial enterprises is that in this country even among men of education and knowledge of the world the expectation is very widely entertained that an industrial concern ought to yield dividends in the very first year of its working. If these dividends are not forthcoming, as they cannot be in very many cases (or rather in the majority of cases), there are whispers and insinuations freely indulged in which seriously affect the position, credit and future prospects of the new enterprise. So widespread and unfair is this impatience that even the most scientifically organised and soundly conducted concern in the country could not escape its shafts. It is by no means rare to see both educated men and capitalists in these outlying provinces naively asking the promoters of an industry as to whether it would not yield dividends from the first year of operations. Where the promoters honestly state that this should not be expected the springs of co-operation become dried.

This is difficulty No. 4.

One more difficulty I shall mention. There are ups and downs in every trade and every industry. People have got accustomed to the vicissitudes of trade and the failures of seasons; and not much is said against the merchant or the agriculturist who is the victim of these vicissitudes or failures. But the same consideration, the same tolerance and charity are not extended to the industrialist whose industry suffers from unforeseen and abnormal circumstances. To him is not extended the helping hand on business terms that is done to the merchant or the agriculturist; nay not even bare sympathy. On the top of all these unfavourable influences have come the bank failures and the dislocation of finances and trade due to the war; and Indian capital always shy has become ten times so since 1913.

These are some of the great difficulties which industrialism has to contend against; and yet if India is to have her place among the nations of the world, if her masses are to lead a decent existence, her industries have to be developed. Situated as we are Government assistance is absolutely necessary in one or the other of the modes indicated in question 5 for supplying the deficiency of capital for an industrial concern which is useful to the country and which is essentially sound.

In some cases the assistance might take the form of subscribing for shares, in others of guaranteeing a minimum profit for a short period of 5 or 7 years from the commencement of actual working, in yet a third kind of cases loans at reasonable (and in very special cases without) interest on due security might be granted. In some cases Government might themselves start an industrial factory (for example dyes). In other words the principles adopted and the methods followed in regard to railways, canals, agricultural development and improvement should be adopted and followed in the case of industries.

In regard to loans in particular a very liberal policy and a very generous attitude should be adopted with of course the essential condition that proper security is forthcoming. The mere fact that Government after carefully examining the condition of the concern is prepared to advance a loan might in many a case create such a feeling of confidence in the investing public, that persons who would otherwise have refrained from giving any loan might come forward to assist. The simple countenance of Government would in some cases effect salvation.

In addition to supplying or facilitating the supply of capital Government assistance should be given in the other methods (1), (2), (5) and (7) set out in question 5.

There is no reason why method (7) should not be always followed in regard to products which Government wants for its purposes.

This assistance should be confined to concerns which fulfil the following conditions:—

- (a) The head office and directorate is located in India.
- (b) At least two-thirds the capital is held by "Natives of India" as defined by the Government of India Statute of 1870.

In what I have submitted above I have mentioned the case of Berar; but what I have said in regard to Berar applies also to the Central Provinces districts and in fact to the major part of India.

Q. 3.—There are more ginning and pressing factories in Berar especially in big centres like Amraoti, Akola and Khamgaon than are required for coping with the work. They were, some of them, dumped in simply for obtaining shares when the system of pools existed. With the disappearance of pools many of these have been silent for years.

Q. 4.—I have no experience of such financial aid.

Q. 6.—Government control will have to be exercised when Government subscribes to the share capital or guarantees dividend or gives a loan. In these cases there should be a Government Director, who would watch the working. Control should be exercised in regard to inspection and audit; but every care should be taken not to throw obstacles in the way of honest working.

Q. 7.—There have been no Government pioneer factories in the Central Provinces and Berar. I have seen, however, the aluminium factory and the chrome tanning factory at Madras. I doubt if but for the pioneering by Government there would have been any aluminium factory till now. The chrome tanning pioneer factory was working satisfactorily under Mr. Chatterton and it is a matter of regret that the Secretary of State should have ordered it to be closed.

Q. 8.—The method of pioneering should be adopted in the case of those industries which are necessary or desirable and are pronounced to be promising by experts, but which require considerable capital, and such capital is not forthcoming owing to absence of experience about their turning out remunerative commercially. Expert direction and guidance as well as capital should be provided by Government and the factory should be conducted as a Government concern under the Department of Industries. The trial should extend ordinarily over a period of five years, and if its commercial feasibility is proved, the factory should be handed over to private capitalists or companies. If at the end of five years it becomes clear that under existing circumstances the industry cannot be successfully carried on, the factory should be closed. But if there is partial success and it appears that with further trials the commercially paying character of the industry can be established, then there should be a further period of three years for carrying on the work or experiment.

Q. 10.—I would strongly urge the establishment of industrial banks in each province, half the capital of which should be subscribed by Government. These banks should be of a different character from the existing banks which are mostly of the usual English

type. Their main purpose should be the supply of financial aid to promising industrial concerns which are carrying on manufacturing work but are hampered in their operations by deficiency of capital whether on initial outlay or in regard to working; they should also help new enterprises, sound and promising, but hampered for want of capital. The loan should be obtainable not merely on security of "liquid assets" but on that of land, buildings and machinery also. The rate of interest should be reasonable and the repayment should be spread over a reasonable period. The industrial concerns to which financial help should be allowable should be those in which not less than two-thirds of the capital is held by persons having their domicile in India, and the head office of which is located in India.

Qs. 11 and 12.—The co-operative societies movement should take in hand the resuscitation and development of cottage industries.

Q. 13.—Where there is a well established industry carried on in several factories by private individuals or joint stock companies, there is, in my opinion, no occasion for money grants in aid, bounties and subsidies, guaranteed dividends, or provision of part of share capital. But if for instance there are in one province some factories manufacturing woollen articles and there is a movement in another province for starting the industry there, it would be proper to give some initial help in the way of loan or supply of machinery and plant on the hire-purchase system or guaranteed purchase by the Local Government for its purposes. But the number of large established industries is so small that all the forms of Government assistance can well be drawn upon without objection.

As to discouragement of fresh private enterprise there is one further thing I would mention. Unless the private enterprise is entirely or mainly Indian (*i. e.*, Statutory Indian) it has no claims upon the Government. There should be no exclusion of aliens, much less of residents of other parts of British Empire; but there ought not to be any restrictions put in the way of granting of facilities for the development of India by the people resident therein, out of deference to doctrinaire principles, or consideration for the residents of other countries. In regard to the mining industry it is high time that some safeguards are enacted to prevent the bulk of mines becoming the property of outsiders. Similar restrictions are necessary in regard to the ownership of land.

Q. 14.—Government assistance ought on no account to be withheld or subjected to limitations on the ground that a new enterprise competes with an established external trade. If such a rule is laid down then there would be absolutely no scope for Government assistance and no possibility of moving it, for no industry can be started or developed in India without competing with an established external trade. Such a limitation would produce the most serious discontent in every part of India and in every community.

11.—Technical aid to industries.

The only occasions on which any of the concerns with which I have connection had any help from Government experts was when we subjected the products of our oil mill—oils and cakes—to the examination of Dr. Harold Mann, Principal of the Agricultural College, Poona, and Agricultural Chemist in the Bombay Presidency, when we sent samples of our linseed and cotton seed cakes to Messrs. Clouston and Plymen of Nagpur and samples of our double boiled linseed oil to officers of the Engineering Department—Executive Engineers and Assistant Engineers.

Our main object was to have the quality of the products tested and to have their position determined with reference to English oils and cakes of these two seeds, and in the case of provincial officers to secure the custom of Government in regard to cakes and boiled linseed oil.

I do not refer here to what I have seen of the work of the Agricultural Department.

It is eminently desirable that there should be highly qualified experts kept by Government to conduct investigations and researches in regard to different industries, to give advice to private persons about the feasibility and paying character of the enterprises they may have in contemplation, to give advice and direction when these are confronted with difficulties, to help them in improving the quality of the products and turning out new ones. As to the publication of the results that would depend upon circumstances and the agreement between Government and factory owners. But some general principles would have to be laid down. Where a process or preparation of an article is carried out successfully by the Government in a laboratory, and the only use that is made of a factory and its own expert is to carry out the working on a larger scale, there is no reason why the results should not be made public. On the other hand if the initiative, the greater amount of the previous working, the entire new experimentations, the testing of the feasibility of the process or the possibility of producing the article were all done at the expense of the factory owner, and the only aid that Government gave was the loan of its experts to advise in some matters, a different line will have to be adopted. A total prohibition of publication is of course out of question when the help of a public officer is

taken. But those who would like to be admitted into the secret might well be put upon terms and required to give reasonable compensation to the person who got experiments and trials made at his cost.

The universities and colleges should be kept in touch with research work. In fact the great aim of scientific education should be to train the mind to handle science in its practical application.

III.—Assistance in marketing products.

I doubt if in the present state of India much benefit will result from establishing more commercial museums. At one time I thought that substantial increase of industrial activity will result from the exhibitions held in the decade between 1901 and 1910, but no advantage commensurate with the money and the energy spent has accrued.

In my opinion it is well worth trying to have sales agencies for the sale as well as display of minor and unorganised cottage industries.

I am very strongly of the view that there should be trade representatives of India in Great Britain, the colonies and foreign countries. These should be Indians who have a knowledge of their country, its state, and its needs and have commercial and industrial experience.

Q. 35.—Yes.

Q. 36.—I see no necessity.

Q. 37.—The principal Government departments which use imported articles should publish lists of these articles and also exhibit them in commercial museums where these exist and in provinces where there are none in a room of the office of the Director of Industries open to the public.

Q. 38.—The rules are not sufficiently liberal. The wording is such that it would be easy for a department to give preference to imported things and discountenance indigenous ones without laying itself open to censure or even criticism.

More than that the rules have not been sympathetically worked. I have heard bitter complaints about this.

Q. 39.—The scope of the industrial banks proposed in dealing with question 10 should be so extended as to include facilities for marketing indigenous products.

V.—Training of labour and supervision.

At least primary education is necessary for every worker, even the so-called unskilled worker. Instruction in the three R's, essential for the every day purposes of life, is indispensable to those who have to apply their facilities to manufacturing work. Where the work involves some exercise of intelligence the training of the intellect is demanded in the interest of the worker and the work. The first basis of all social life is universal education. It has to be free and compulsory. Over and above this there must be drawing for the training of the eye, and for the training of the hand and introduction to his work there should be the particular type of manual training which is suitable to the boy's contemplated avocation. For persons whose circumstances demand that they should earn their bread from their boyhood or early youth, there should be instruction in the industrial school in which practice should be the main feature. The instruction received in the class room and workshop of the industrial school should be developed and rendered still more subservient to actual work by a system of apprenticeship in the factory or shop. This system has yet to be established and followed.

For the more skilled workmen there should be more advanced general education and higher special industrial instruction, with an inculcation of the principles of the particular craft. For supervisors and controllers there should be general middle education or higher education and more advanced instruction in the principles underlying the industry and inculcation in the higher grades of practice.

Q. 54.—It is a fact that there is no uniformity in the standard of the examinations for mechanical engineers held in the various provinces where engineers in charge of prime-movers have to be certified. It is eminently desirable that there should be uniformity.

VI.—General official administration and organisation.

If the suggestions made by me under section I are accepted and Government decide to give financial assistance in the manner indicated in question 5 and provide the necessary funds for giving such assistance, then all that is needed in the way of general official administration and organisation is to have a Director of Industries for each province assisted by an Advisory Board. The Director should, if possible, be a person with considerable commercial and industrial knowledge and experience. But if no such person is available then it will be necessary to be content with one who has a high class general education and has devoted time and energy to the study of industrial and commercial matters.

The members of the Advisory Board should be persons taking actual part in the conduct of industrial or commercial concerns.

VII.—Organisation of technical and scientific departments of Government.

Q. 64.—There should be an Imperial Scientific and Technical department consisting of a number of highly qualified experts capable by their study of principles and practical experience to conduct experiments, investigations, and researches in the different branches of industries, and to give advice and directions calculated to assist in the creation of new industries and the improvement of the existing ones. Mechanical engineering, electrical engineering, textile manufacture, the chemical industries, mining and metallurgy have all to be represented. It should be their duty to examine all schemes submitted to them, and to give advice thereon, to conduct experiments and carry on investigations and research in their various departments of applied science. They should be recruited from among men eminent in the respective branches of applied science to which they have devoted themselves and should combine mastery of principles with fairly long practical experience.

If such an Imperial department is constituted on the lines indicated and properly equipped, there would in general be no need of provincial departments.

Q. 71.—Technological research institutions should be so established as to fit in with a general development scheme for the whole of India. A time may come when each province may have its own fully developed and equipped scheme of institutions for research in every one of the main departments of applied science. But that time is far off.

These institutions should be under Government control and the control should be Imperial. But every one of such institutions should be under the obligation to conduct investigation into schemes sent to them by provincial Governments, make experiments in regard to them and give advice to them or to persons coming through them.

Q. 74.—Co-ordination between the different institutions is necessary.

Q. 77.—By grant of leave, payment of expenses and allowances.

IX.—Other forms of Government action and organisation.

Q. 97.—My province had long to complain of inadequacy of transport facilities in regard to railways and roads; and it has fallen to my lot to draw attention in the Imperial and Provincial Legislative Councils to the disadvantages it is suffering from. Railway lines pronounced to be necessary two decades and more ago, and which were set down as sanctioned projects and were for several years and even now are so mentioned, yet remain to be constructed, while lines the need of which was not obvious to the general public and which after construction have not worked satisfactorily have received preference. Berar wants roads badly for its trade.

Q. 98.—I have in another part of this note dealt with the curious system of railway freight which obtains in this country. The railway tariff seems to be drawn up more for giving encouragement and facilities to the transport of articles of exports to the main ports and the conveyance inland of articles imported abroad. The rates of freight for transport from one inland town to another are as compared to those very high and throw great obstacles in the way of inter-provincial trade.

Q. 99.—We want in Berar the following railway lines :—

- (1) The Hingoli-Basim-Akola-Akot-Khandwa line.
- (2) The taking of the main line of the Bhusawal-Nagpur Section of the G. I. P. Ry. through Amraoti.
- (3) The Amraoti-Chandur-Bazar Ellichpur line.
- (4) The Amraoti-Morsi-Narkher line.
- (5) The Khamgaon-Jalna line.
- (6) The Dhamangaon-Yeotmal line.

Q. 101.—The very serious effects on the trade of the country produced by the tremendous increase since the outbreak of the war in shipping freights (from 20 shillings to 210 and 220 shillings a shipping ton of 17 cwts.) is dealt with so far as one trade is concerned in my answer to question 110.

I see no reason why Government should not step in to regulate this. It seems unjust that one trade should amass wealth at the expense of all others.

Q. 104.—Yes. The industries mentioned in brackets at the end of the question.

Q. 110.—The industries in which I am specially interested at present are the linseed crushing and cotton seed crushing industries. For both these industries Berar possesses great facilities, both these can be developed with advantage to the province and the country generally and both have a very promising future if only sympathetic help is given.

In the manufacture of linseed the main-products obtained are (1) the cake and (2) the oil. Various articles of commercial value are evolved by manipulating these.

- (1) The lincake is one of the best foods for live-stock, especially for dairy cattle. As to its intrinsic feeding value it is surpassed only by the decorticated cotton cake carefully manufactured. After grinding cake meal is made from it. Also balanced foods are made from it under established brands mixing the meal with oats, hay, etc., to suit particular species of cattle.
- (2) The lin-oil when fresh is used for edible purposes in the Central Provinces and Berar. Cold pressed oil is the ideal varnish oil. Paints and pigments, boiled oils, refined and special oils, printers' inks, lithographers' oils, linoleum, rubber substitute and special soft soaps are made from this oil by the addition of various chemicals in the treatment of the oil.

The products from cotton seed are :—

- (1) Linters which are used in carpet manufacture.
- (2) Hulls which are used as (a) cattle food by itself, (b) fuel, the resulting ashes being very rich in phosphoric acid and potash is highly prized by tobacco growers as manure, or (c) as material for paper making.
- (3) Meats, from which are obtained (a) cake and meal which is a highly concentrated cattle food as well as a rich fertilizer containing about 7 per cent. of nitrogen and (b) crude oil which on refining yields the ordinary summer yellow oil which can be rendered almost waterwhite by bleaching. By subjecting this oil to a very low temperature and then straining it through press a quality known as "Winter Oil" is obtained. The remaining substance resembling ghee is used in America for making butter substitute. The soap stock left on refining the crude oil is mainly used for making soap powder.

Linseed is crushed in the factory of the Berar Oil Works for obtaining raw oil, preparing double boiled linseed oil therefrom and utilising the cake for export to Europe. The raw oil is all taken up for culinary purposes in Eastern and North-Eastern Berar, and the Nagpur Division. The boiled linseed oil is mostly sold in the Bombay market where it has obtained some footing and often fetches a higher price than any other India-made double boiled linseed oil. It has been examined and tried by Government Engineering Officers and large contractors and pronounced equal to superior European articles of the kind. The cake has been subjected to tests on different occasions and found equal to the European products, both as cattle food and manure. The main obstacle to the disposal of the cake has since 1914 been the difficulty—at times impossibility—of obtaining shipping and the tremendous rise in freights. In the early part of August 1914 a consignment of my company which had been shipped had to be taken out because the steamer was requisitioned by Government on the outbreak of the war and for months no cake could be shipped. The same thing has happened again twice. Prior to the war the rate of freight was 20 to 22 shillings per shipping ton. Since then rates have not gone down below 50 shillings, for a considerable part of the last year stood at 150 and 160 and now stand at 210 and 220 shillings. The price of lincake in the Liverpool, Hull and London markets has, it is true, gone up greatly. But even then the rise in freights is not fully covered and there is still a great difficulty of securing freights. Now linseed cake is a superior cattle food and is used for horses and for stock cattle in Europe. Government departments purchase this cake. By making purchases in England the Government have to bear the charges of the up-country, the Bombay and the English middlemen—the agents, the brokers and sellers. If they buy direct from the producers Government would be saved the avoidable charges of middlemen, while giving a fair price to the producers. Further the shipping charges to Government by the requisitioned steamers would be much less than what they have to bear from making their purchases in England. To the producers the custom of Government would afford a sure market for at least a fair part of their cake. In every respect both Government and the producers would be gainers by the establishment of direct relations.

This would be in regard to purchases for use in the United Kingdom and other parts of Europe. If Government use lincake instead of gram for their Artillery and Cavalry horses in India, they would be obtaining a superior cattle food at a lower price. Gram now sells at the rate of 9 seers per rupee (at to-day's wholesale rates), whereas we can at our mill premises give 11½ to 12 of lincake, a gain of more than 25 to 33 per cent. Further the gram purchased has impurities which have to be eliminated, whereas the lincake is a pure food from which earth, sand, pebbles and other impurities have been removed.

To the debit side of these gains might be put the railway charges. But if the vagaries and inequalities of the Indian Railway tariff are removed and cake as cattle food is carried at the same rate as cake as manure, and the waggon rate concession that is given to consignments to Calcutta or Bombay is extended to inter-provincial consignments, the

railway freight charges will cease to be the heavy drags on indigenous industry that they are. How unfairly the present system works will appear from the following facts:—

The railway freight on oil cake from Amraoti to Bombay, a distance of 418 miles, is Rs. 9 per ton and from Akola to Bombay, a distance of 363 miles, is Rs. 8. For the same cake sent from Akola to Amraoti, a distance of 56 miles, the charge is Rs. 5 per ton and from Akola to Nagpur, a distance of about 157 miles, is Rs. 9 per ton. The charge for 157 miles is more than for 363 miles. The rate itself on consignments within the country is extraordinarily high. The rate per maund from Akola to Nagpur is 5 annas 1 pie, that is roughly speaking the railway charges amount to nearly one-third the price of the articles itself. What is therefore necessary is (a) that the rate per maund should not be so disproportionately high as compared to the price of the article, (b) that concession rates for waggon consignments may be given, (c) and that the inter-provincial consignments should not be subjected to heavier charges than those to ports.

In regard to the boiled linseed oil if the Government purchases the superior indigenous article direct from the producers in place of the imported article it will make a gain of from 4 to 5 rupees per drum of 45 lbs. Hundreds of thousands of drums are required every year on railways and in the dockyards by the Government and by companies. A systematic and proper carrying out of the existing Stores purchase rules even would be a great help to the indigenous industry.

The third respect in which Government help is wanted is in the matter of financing. As urged above loans at reasonable interest should be advanced on the security of lands, buildings and machinery to sound concerns to meet part of the initial outlay or working capital.

For the further development of the industry, for the production of other articles—especially paints and varnishes—Government aid should be given first by the research and scientific advice department conducting experiments and trial, and by rendering such assistance as is referred to in question 5 as may be settled by agreement between the Government and the different concerns. The period of the preliminary experiments is one of expenditure with hardly any return. The further trial after the demonstration of feasibility equally involves losses. And even after the commencement of operations on a commercial scale years must elapse before the market is caught and the price yields a fair profit. To throw the whole burden, the whole responsibility combined with anxiety, on private individuals is unfair and not conducive to the progress of the country and is the cause of the retardation of industrial development. The whole country—that is the Government—is under the obligation to bear at least a fair share of the burden and the loss and to give active assistance in every way.

Cotton Seed Oil Industry.

The potentialities of the cotton-seed oil industry are very great in this province. The statement given above showing the products obtainable by crushing cotton seed show how many articles of necessity and convenience can under suitable working be procured. By the ordinary refining process used in the factory of the Berar Oil Works, Ltd., an oil is obtained which for ordinary culinary purposes of middle class and even high class Indian families takes the place of good "Til" or "Kardi" oil and is moreover cheaper than Til or Kardi oil. With further refinement the oil obtained serves the purpose of frying as well as ghee. Certain experiments made show that with still further refining the product can by being mixed in the proportion of 1 to 2 with good ghee, supply a fair substitute for ghee to be served during meals. Prices of butter and ghee have in recent years risen immensely. Two pounds for a rupee is now regarded as a fair rate for butter. Often only 1½ lbs. of butter can be obtained for a rupee. That is only a pound and a half of good ghee can be obtained for a rupee in fair seasons and at times one pound only. This has put ghee almost out of the reach of not only the poorer classes but of the lower middle classes also. The place of ghee in the Hindu dietary is well known. One of the main reasons why the Berar Oil Works went in for the cotton-seed oil industry was to produce an article which would alleviate the lot of these classes, who form the bulk of the population. Another advantage to the people from this industry is it can give a cattle food which for draught-cattle is better, purer, more strengthening and cheaper than cotton seed, which is so universally used as cattle food in these provinces. The value as cattle food of the undecorticated and decorticated cotton cake is set out at page 220 of Lamborne, page 295 of Ennis and page 408 of Encyclopædia Britannica Vol. I, 11th edition. As cattle food decorticated cotton cake is shown to be first and undecorticated cotton seed cake is mentioned as next to it. Undecorticated cotton seed cake can be sold 25 to 30 per cent cheaper than the cotton seed itself. In cotton seed as ordinarily given there are several impurities and indigestible and possibly deleterious substances, which have all been eliminated from the cake. It is thus advantageous to all owners of cattle from both points of view to use cotton seed cake decorticated with a due mixture of hulls or the undecorticated one as food for their cattle.

The production of stearine, the manufacture of soap and candle are connected by-industries. Preparation of cotton-seed butter like oleo-margarine but with a vegetable fat basis deserves to be attempted and carried out. There is scope also for the meal of the decorticated cotton-seed being turned into flour.

Placing aside the developments which have to be tried in this country, what has been carried out is still at a stage when Government assistance is needed. In the factory of the Berar Oil Works the products obtained by the processes employed are—(a) refined oil, (b) decorticated cake, (c) undecorticated cake, (d) lint, (e) soapstock, (f) hulls. The refining processes used not only render the quality of the oil equal to that of good Til and Kardi oil but make it capable of being used for frying Puris and even Jilebis. It has been tested by Dr. Harold Mann and pronounced to be fit for being advantageously used for culinary purposes. Several Halwais have been using it for frying Puris and Jilebis which are ordinarily fried in ghee. But owing to conservatism the local consumption has not increased as satisfactorily as it should have been among the bulk of the people; and Bombay and Gujraht have mainly to be looked to as the fields for sale. Owing to the distance which has to be traversed, the high railway rates and the large proportion of leakage the Bombay and Gujraht markets are not very profitable—and at times not at all profitable. To combat conservatism the article must be offered at cheaper rates than other oil: and this means loss. So this obstacle has to be got over.

In regard to cake also there is a difficulty. Though admitted by highly qualified persons to be an excellent cattle food and better and more free from faults than cotton seed the local demand still continues to be very weak. Before the war the bulk of our cotton seed cake was exported to Europe. Since the war it was found possible to send only one consignment to England without loss. As the rates of freight have been so unprecedentedly high and the price of cotton seed cake is always lower than that of linseed, it did not pay to export it. Both for this reason and more than that for carrying out one of the chief objects of the undertaking it is most desirable to develop the home market. This cannot be done unless there is the patronage of Government and the active co-operation of the Government departments and quasi-Government agencies like municipalities and District Boards. There should be (i) the guaranteed purchase by Government of the cotton seed cake produced at rates which are fair, just and equitable to all, (2) the use by the Government of the cake in its agricultural and stock breeding farms, Government dairies, for the animals in the military and other Government departments, and of the municipalities and other quasi-official bodies, (3) employment of the agency of the village officials, and agricultural associations in taking the product to the people, explaining the advantage of the same and the publication of results. Along with this the Government should through the Railway Board lay down the same special rates for oil cake when used as cattle food as are laid down for cake when taken for manuring purposes and to extend the concession of favourable rates on waggon consignments to inter-provincial trade.

My friend Rao Bahadur D. V. Bhagwat has shown me his note and though, in regard to some facts our experiences do not tally and some of his figures have to be modified, we are entirely at one on the necessity of Government help if this industry has to be developed. As stated above, the refined cotton seed oil prepared in the Berar Oil Works has been tested and pronounced good by Dr. Mann; has been used and found satisfactory by consumers and has been sold by hundreds of tons in Bombay, Nagpur, Akola and elsewhere. But owing to the facts mentioned above the rates obtained are not as remunerative as they should be. The second thing I would wish to correct is that owing to adventitious causes and unfortunate accidents there were losses on some of the consignments of our cotton seed cakes and these have affected the average price: in many of the consignments and especially latterly we have realised after payment of all transit, agency and other charges from 40 to 45 rupees per ton on undecorticated cake when cotton seed stood at Rs. 10 to Rs. 10-8-0 per khandi of 440 lbs. Then as to the expenses to be charged per ton there is a difference of from 3 to 5 rupees per ton between us. We are in agreement as to the mode of calculation. But his deduction of the figure 30 is not correct. I place the figure at Rs. 25 per ton. Making the corrections consequential on these considerations and on the other hand leaving a margin for fluctuations and accidents, I would say that the realisations from sale of cotton seed oil and cake *under the present circumstances* (with the load of experimenting and pioneering burden upon us) would just meet the cost of production and other charges or leave a small margin of profit from 2 to 3 rupees per ton—a very poor recompense for the heavy sacrifices made. I therefore support his suggestion that Government should for some reasonable period—not less than 5, not more than 10 years—take over the undecorticated or decorticated cotton seed cake and hulls at a reasonable price calculated on the basis mentioned above.

I, however, submit the further request and that is that in view of the fact that the work done by the Berar Oil Works being pioneer enterprise, and the expenses incurred and burdens borne by it in regard to this being heavy, the Government should advance to it a loan of 3 lakhs at 6 per cent per annum secured on its lands, buildings and machinery and plant.

Oral Evidence, 16th December 1916.

Mr. C. E. Low.—Q. Can you tell me to what extent the gins, presses and factories in Berar are capitalised by local capital?—A. I cannot give you the exact proportion, but excepting the old companies, Messrs. Ralli, Volkarts, the New Mofussil Company and Harvey and Subapathy & Co., most of them are local people.

Q. And those companies which you mentioned, run about 40 or 50 gins and 9 or 10 presses or something like that?—A. I do not think they represent more than 20 per cent of the total gins and presses in Berar.

Q. And they are concerns which take their origin from the time when the exploitation of cotton on a modern style was first started in Berar?—A. Yes. The New Mofussil Company is practically an Indian concern, and its head office is in Bombay. Similarly Harvey and Sabapathy & Co. is also an Indian concern. West Patent Press Co. is an English concern, I understand.

Q. They are not very extensive?—A. The only press of theirs in Berar is at Amraoti. They have only got a pressing factory. There are in Amraoti two Calcutta firms, one has only a pressing factory and the other has got a ginning and pressing factory. These are Indian firms of Marwari gentlemen. As I have said the majority of the new accretions are mostly from Berar.

Q. With the exception of Rallis, Velkarts and the Wests, the whole of the capital in gins, presses and factories is Indian?—A. Yes.

Q. The cotton crop in an ordinary year from my experience is valued between 7 and 11 crores of rupees from Berar?—A. Yes.

Q. How much is that financed by the Bank of Bombay, about one-third?—A. I do not think as much. Less than one-third.

Q. How is the rest financed?—A. By local capitalists, or the purchasers borrow in Bombay or elsewhere.

Q. Does most of the money come locally or from Bombay?—A. I should think the bulk of the money comes locally.

Q. Then there is a great deal of local capital—very large sums invested either permanently in industries, or temporarily in the seasonal financing of the cotton trade?—A. Yes.

Q. And yet you say that there is difficulty about getting local capital to engage in an industry like oil mills?—A. Yes.

Q. Do you consider that Berar people are less enterprising than the average Indian people?—A. I do not think that the Berar people are less enterprising. I have been careful to point out that they are not yet convinced of the immediate success of manufacturing industries. I make a distinction. I do not consider ginning and pressing as manufacturing industries. They only prepare raw materials for manufacture.

Q. You speak of the difficulty experienced in obtaining finance from banks. Did you approach any European or Indian joint stock bank?—A. I approached in some cases the banks themselves and in some other cases the leading members of the banks. The proposition which was put before them was whether they would make advances on the security of the lands, buildings and machinery to make up the deficiency in capital and in regard to that the answer from every one was that it was not at all possible. That was in regard to the initial outlay. Then in regard to working, they required from 20 to 25 per cent as margin, and in regard to two or three factories about which I had to sound them they insisted upon cash or Government paper or liquid assets coming up to 20 or 25 per cent being given to them.

Q. You found the same in the case of both the Indian and European banks?—A. Yes.

Q. What do you consider to be the reason of this?—A. The reason is that they do not wish to lock up their capital in advances which would take some years to return. That was the main reason which they advanced. They say they advance to persons who would give them immediately marketable commodities as securities.

Q. They draw a very large portion of their working capital from deposits of money which they have to pay back?—A. Yes.

Q. The reason then would lie in the nature of their own resources?—A. Yes. They say that their business has been started mainly for the purpose of giving loans for short periods and not for long periods.

Q. I want to ask you one or two questions regarding assistance by Government to industries. Supposing Government gave a loan to the industry, they would, of course, retain a prior charge on the industry by way of mortgage?—A. Yes.

Q. Would that not frighten the money-lender if the concern wanted to borrow from anybody else? You say that the grant of a loan by Government would help the concern and encourage other people to help it, but don't you think that the existence of a prior Government charge would rather frighten the ordinary money-lender?—A. No.

Q. My experience is that such is the case where land improvement loans have been given and if there is Government's prior charge on account of the improvement loan the ordinary

local man is frightened?—*A.* Because in that case the agriculturist requires the money for his own private purposes, and the lenders say that there is hardly any security. Here in this case if there is Government assistance given, let us say for the sake of meeting a deficiency in regard to the initial outlay, the people would say, here is a concern the success of which is felt as highly probable by Government, and so there will be no harm in lending it money on the security of equivalent liquid assets without insisting upon a margin.

Q. You think that if Government investigated through a really competent agency and thought the concern good enough to advance money to it, that would give the people confidence?—*A.* Yes.

Q. One suggestion made by you and by your friend Mr. Bhagwat was that Government should undertake to purchase for a certain length of time the whole or some portion of the output of the oil mills?—*A.* Yes. My suggestion and his was in regard to cotton seed cake.

Q. Let us take this particular case of cotton seed cake. How much cake would Government have to take to help?—*A.* Suppose I work my factory for 24 hours, the output of cotton cake would be about 80 per cent roughly speaking, and so it would be about 20 tons a day. For a month it would be 500 tons. Cotton seed cake is considered to be the best food for cattle. That is what eminent authorities say. Decorticated cotton seed cake is mentioned both by Ennis and Lamborne as the best food and next to it is placed undecorticated cotton seed cake and below that is placed linseed cake. We have thus the best food, the food value of which is much higher than that of cotton seed itself. All our cattle in Berar and the Central Provinces are fed on cotton seed. Instead of that if they would only take cotton seed cake, it would be given to them 25 to 33 per cent cheaper than cotton seed. That is one advantage to the persons owning cattle. Then apart from the experience of men like Dr. Harold Mann and other gentlemen belonging to these provinces whom I have consulted, there is the experience of men who have actually fed their cattle on cotton seed cake, and that is that cotton seed cake is more nutritious than cotton seed itself. What we say is this. The point requires to be more fully developed. The Government agency that is, the agency of the village officials and others, should be enlisted for the purpose of popularising for a time this cake. The more adventurous, more enterprising among the owners of cattle and owners of land have tried it and they are taking to it, but the progress is very slow and mills cannot afford to work and wait for years and years in the mere expectation of finding an ultimate market. It was in this respect that my friend Mr. Bhagwat and myself suggested that Government should take it and see that it was sold and taken up by the villagers. For that purpose the village agency and taluka agency should be employed.

Q. The Government could not undertake it unless they have the machinery. They could not buy it and then hold it unless they could see a way to sell it, and they have to make arrangements beforehand?—*A.* In that way, there is already the village agency which is a highly developed agency in Berar.

Q. Your idea is that the responsibility for selling some portion of the output of your cake should be thrown on Government which should definitely assume responsibility for selling that cake?—*A.* Only for a short time.

Q. It does not matter whether it is long or short. They will have to make arrangements—I do not say that it is necessarily impossible, but it takes sometime to see their way to do such a thing. I suppose you consider the advantage you would gain that if Government definitely assumed responsibility for doing so their help would be more certain and the Government would exert themselves more in the matter?—*A.* The example of Government would have a most highly favourable effect. Then the people would learn that Government are satisfied about the advantages of this cake and that they are prepared to push on its sale, and then many more people would be coming voluntarily for it without any effort on the part of the Government.

Q. At the present time the Agricultural Department is trying to popularise the sale of cake by demonstration?—*A.* Yes, to some extent.

Q. What has been the practical result of that demonstration?—*A.* They have been taking it only on their farm at Akola. I have explained in another part of my note how difficult it is, on account of the very high tariffs imposed by the railways, to send the cake to distant places.

Q. My point is this. What is the Agricultural Department doing in other parts of Berar to popularise the sale of this cake?—*A.* Nothing beyond taking it on their farm.

Q. They are not demonstrating it as they do their other processes?—*A.* No.

Q. Have the agricultural associations been asked to help?—*A.* No.

Q. The delivery would be by cart?—*A.* Yes.

Q. Most of your deliveries in Berar would be by cart?—*A.* Yes.

Q. Putting aside the question of Government taking the responsibility for the money what do you think that the Agricultural Department should do over and above what they are doing to popularise the sale of cotton seed cake?—A. First of all, they should help in the dissemination of information in regard to the value of the cake and its cheapness.

Q. That, of course, is rather a general sort of idea. Do you think that they might distribute small quantities at fairs and exhibitions?—A. Yes. The next thing which they might do is this, to utilise their agency to distribute this kind of cake among the people. In the beginning the mills would be prepared to send samples at their own expense without charging anything for it. First of all, popularising it by exhortations to the people and secondly by distributing the product to the different villages.

Q. Supposing the Government took the responsibility for selling this cake for, say, two years and they found that they could not sell it except at a very cheap rate which did not pay you, then, after the two years was over, you would find that the market for cake would be no better?—A. By the end of the two years the people would have a fairly good experience of the value of the cake and of its cheapness as compared to the cotton seed. Supposing Government was selling 35 or 40 per cent cheaper than cotton seed itself and at the end of that period if we offered to sell for 30 per cent cheaper, that would be sufficient temptation for people to buy it.

Q. My point is this, that where Government themselves were large consumers for military purposes as well as for Government farms, it would, of course, be pretty easy for them to take over a certain amount of cake. But if you simply wish to throw on them the responsibility of selling, I do not know whether Government will be an efficient agency, and their action might land you in difficulties?—A. Purchase by Government for their departments, the Military Department and the Agricultural Department would go a certain way to take off our cotton seed cake, but still I beg to say that it would not be at all difficult for Government to carry on the distribution with the aid of the village agency which is very highly developed in Berar.

Q. It is a definite and practical proposal which you and Mr. Bhagwat have made and I should like to examine it in some detail and perhaps you will put in a note showing, so far as you know, how much the Government departments could actually take without coming into competition with other factories making cotton seed cake?—A. I do not at all wish that there should be any discrimination between the different factories. They should be treated equally.

Q. Have you supplied any cake to the Government Military Departments in Kirkee or elsewhere?—A. Only one consignment was taken, but after that there was no second order. The order was for a dairy.

Q. And not for Supply and Transport Corps?—A. No.

Q. You talk of Military Departments buying cake from England?—A. Yes.

Q. Do the Military authorities out here buy their feeding cakes from England?—A. The Military authorities in England buy cake in England,—I mention that with reference to linseed which I was told by our importers was being used to a large extent in feeding the horses of the Military Department.

Q. You say that pools, and combines have stopped. They have not stopped everywhere?—A. Not everywhere. There was not any pool to speak of in Nagpur. There were pools in Amraoti, Akola, Khamgaon and Shegaon. In Akola they ceased eight or nine years ago, in Amraoti three years ago so far as pressing was concerned, and in regard to ginning about six or seven years ago.

Q. Why did they stop?—A. The difficulty in regard to the pressing was they said that if a certain leading firm was also willing to join in the combination then alone they would go in for it, that is,—Messrs. Ralli. They were in the combine for a long time in Amraoti and Akola, but afterwards they considered that joining the combine would not be helpful and would not be a matter of advantage to them.

Q. I understand that joining your combine meant dearer cotton?—A. Yes.

Q. And it was not to their interest to join in a movement which meant dearer cotton?—A. No. Even when they orally said that they would give an undertaking that they would not press cotton for other people or buyers, some of the other people considered that that was not sufficient and one of the firms, after the whole thing was settled and a preliminary agreement was drawn up, said, that unless there was an agreement in due legal form executed by Ralli's they would not go in for the pool arrangement and that was what broke the combination in Amraoti.

Q. A combination means that there are more gins. The people do not get enough cotton for ginning?—A. The ginning factories except one or two are all working. There are two factories which are not very efficiently worked and they are silent in Amraoti. The others are working night and day during the season.

Q. So far, the stopping of combinations is a good thing?—*A.* Yes, from the point of view of the buyer. But in that case the competition among factory owners is so great that beyond working expenses many of them do not make any profit whatever, nay not even margin for meeting the depreciation charges.

Q. The result of that in the past was that it led to the formation of fresh combinations?—*A.* Yes, but I do not know if there is any likelihood of a combination again coming into existence.

Q. So long as Messrs. Ralli stand out?—*A.* Yes. What has happened in this year particularly is that the persons who went on competing at very low rates saw the unwisdom of their course and most of them now have joined in asking rates which leave some margin of profit, though not enough margin.

Q. When having a definite combination, two or three gins work day and night and the other gins stand aside and draw their share of the profit?—*A.* Permit me to make one slight correction in what you say. So far as the ginning factories went, excepting two or at the most three factories in Amraoti, the others had to work even when there was a combine almost night and day, certainly for 12, and often 15 or 16 hours a day. The result of the cessation of the combine has been this that competition was carried on at almost non-paying rates. Now that process is being corrected and people are now asking rates which will leave some fair margin of profit.

Q. I think I have heard of cases which have come to my notice either officially or otherwise of combines—whether in the Central Provinces or Berar I do not recollect—in which the gins did positively stand idle as the result of the combine and draw profits?—*A.* There have been such cases. In Akola and Amraoti there are very few gins which have not any work.

Q. You suggest that the forms of what may be called artificial assistance should be confined to companies which are registered in India and two-thirds of whose capital are owned by statutory Indians?—*A.* Yes. I only meant to say this thing, that this assistance is to be given for certain definite reasons, namely, to draw Indians more and more to industries.

Q. It is to give help to the class of people who are left behind and want such assistance, whereas other people are quite capable of looking after themselves?—*A.* That is my point.

Q. My difficulty is not in regard to the principle, but in regard to the means of making it effective? There may be devices by which description of this sort may be complied with in the letter but not in the spirit?—*A.* This is a thing which is not determined upon the composition of the company at the start. Every year when the question of continuing the assistance has to be considered the Government would have to be satisfied that two-thirds of the capital (or some such portion) is owned by Indians.

Q. You make a suggestion regarding the restriction of transfer of ownership in certain circumstances to non-Indians. Would you do that in the case of nations which do not impose any corresponding restrictions against Indians in their own countries?—*A.* I did not consider the thing when I wrote it in that aspect. My main object was this, that in view of the fact that, for instance, certain foreigners who at one time were friendly are now enemies and they obtain concessions in regard to lands and mines and others which have created very great difficulties: it is eminently desirable that there should be restrictions about granting rights over land to foreigners who do not belong to the Empire.

Q. You only mean the people outside the Empire?—*A.* Yes. And in regard to the Empire there would be the principle of reciprocity. If there is a part of the Empire which makes a discrimination against India, then I believe in sheer self-interest it would not be improper for us to say that we should also be permitted to make a discrimination against them.

Q. That is to say, you would treat them as they do you?—*A.* Yes.

Q. You say that the Stores Rules are not sufficiently liberal. Would you explain in what respects?—*A.* It was, I believe, in 1906 that the Government of India appointed a committee to investigate this question of the purchase of stores. That committee made recommendations, and if I remember correctly, the recommendation was that preference should be given to country-made articles wherever these could be had at reasonable rates. I do not profess to reproduce the exact wording of the recommendation, but I believe it was very much to this effect. The rules made in 1909 laid down rather stringent conditions and then came the rule of 1913. When I say that the rules must be more liberal I mean that Indian goods should be purchased even if they involve a small sacrifice on the part of the Government.

Q. Costing more money?—*A.* Yes, I would not put the limit beyond 5 or 7 per cent.

President.—It would be a bounty?

Mr. C. E. Low.—*Q.* You want Government assistance in the manufacture of cotton seed oil as well?—*A.* On the question of the manufacture of cotton seed oil, what I meant to say was that by the ordinary refining process which we adopt we produce an article which is as

good as til oil. That does not involve very high cost, and there is a good market for it and provided there is an enough market for the cake, the company will be more than self-supporting and a certain amount of profit will be left behind. When we want to carry on double refining process or treble refining process, first of all, certain trials have to be made and more expenditure has to be incurred and it is in regard to this that I suggested that there should be Government assistance in the way, first of all, of expert advice, and secondly in the way of purchase of article produced.

Q. If you want to use it as a substitute for ghee is double refining necessary?—*A.* It was only tried once, and a gentleman whom you know took the oil and mixed it in the proportion of one-third to two-thirds, and served out to hundreds of people and they could not make any difference between the ordinary ghee and that ghee.

Q. In that process there is a good deal of waste?—*A.* Yes, and there is also additional cost.

Q. In the process of ordinary refining, there is not so much waste and do you think it is good enough in your experience as a crude oil among the poorer classes?—*A.* Yes.

Hon'ble Pandit M. M. Malaviya.—*Q.* You say there is another obstacle in raising capital, namely, restrictions put in the way of obtaining capital or loans from Indian States or Ruling Princes or their near relations. Do you know what the rules are exactly?—*A.* There are no rules. There are departmental orders or directions of the Government of India. I have got personal experience of this.

Q. Do they require that any transaction which is entered into by a Ruling Prince or his near relation shall be approved of beforehand by the Government of India?—*A.* According to the directions of the Political Department, it must be obtained beforehand, and if it is not obtained beforehand, I know of instances where relations of Ruling Princes were required to divest themselves of the immoveable property which they had purchased in British India as early as possible and pressure was brought to bear on them.

Q. Does a similar provision exist in regard to loans which are not secured on immoveable property?—*A.* In regard to that there is only the general clause in the Civil Procedure Code.

Q. Is the law which prevails on this point in force in Berar different?—*A.* The same principle is followed.

Q. Have you the Transfer of Property Act in force in Berar?—*A.* It has been extended from 1907.

Hon'ble Sir R. N. Mookerjee.—*Q.* There is no restriction on their buying shares in any company?—*A.* They may take shares, but if they want to take debentures on immoveable property, the same question arises, because that is interest in immoveable property.

Hon'ble Pandit M. M. Malaviya.—*Q.* In the case of Tata's works has not most of the capital been invested by the Native States?—*A.* I am speaking of a transaction carried out openly in the name of the State and for the benefit of the State, and I know of more than one instance where it has been said that Indian Princes and relations of Indian Princes should as far as possible be discouraged from obtaining interest in immoveable property in British India.

Q. Does a similar restriction apply to foreigners like the Americans, the Japanese or the French?—*A.* No.

Q. Then an American company or a Japanese company can lend you money and can sue you?—*A.* Yes. The restriction applies only to the case of Ruling Princes of India.

Q. You think that this restriction should be entirely removed?—*A.* Yes.

Q. Do you expect that our Ruling Princes would then be willing to invest in industrial enterprises in British India?—*A.* I mean to say that they might be induced more easily.

Q. You say that in your opinion in order to develop Indian enterprise it is absolutely necessary that Government assistance should be given in one or more of the forms which you have indicated?—*A.* Yes.

Q. You are not particular about what the exact form of assistance should be? That might be determined, but you think that some assistance should be given?—*A.* Yes.

Q. You have suggested that industrial banks should be started and in answer to Mr. Low you stated that an industrial bank with Government assistance if necessary would serve the purpose of providing financial assistance to business enterprise?—*A.* Yes.

Q. You say in your note that half the capital of such a bank should be subscribed by Government?—*A.* Yes.

Q. Suppose, instead of doing that, the Government guaranteed five per cent interest or such interest as they thought reasonable, would not the object be attained?—*A.* I suggested Government's taking a direct share.

* *Q.* I am not opposed to it. I am only putting forward a second suggestion. I am not disputing the correctness of the other. I want to know, if the Government intended it

subscribing a part of the capital, guaranteed five per cent interest, for, say ten years, do you think that would give sufficient stimulus and encouragement to the public?—A. In that case in the constitution of the bank it will be necessary to impose a condition similar to what I have suggested in regard to Government help to Indian concerns, which are the concerns to which the help is to be given.

Q. Assume that these conditions are laid down. Then you think that if Government guarantee interest on those lines, it will secure what you wish to provide for by the Government being requested to subscribe a share of the capital?—A. Yes.

Q. You think that these banks should lend money on the security of land, buildings, and machinery and plant?—A. Yes.

Q. Do you know of the constitution of the Industrial Bank of Japan? It is very much on the same lines?—A. If my recollection is clear, I believe it is.

Q. It makes its loans on the security of lands, buildings, belonging to factories?—A. I also believe that if there is a project, the project is examined and without the factory coming into existence, on the security of the factory itself, loans are advanced.

Q. Confining ourselves to the first portion of your recommendation that it should advance money on the security of land, and buildings belonging to the factory, and of course, on goods belonging to the factory, what do you think should be the debenture of such a bank, in order to attract capital from the public? In Japan they have 50 yen, that is, Rs. 75 or more. Do you think debentures of the face value of Rs. 50 would attract a good deal of capital?—A. Shares of Rs. 50 or Rs. 100. They should not exceed Rs. 100.

Q. Do you think that a subsidy for payment of interest at 5 per cent for ten years will be sufficient to encourage the public to invest in it?—A. Yes.

Q. You have suggested that preference should be shown to indigenous products and that their cost should not exceed the cost of the imported articles by more than 5 or 7 per cent?—A. Yes.

Q. Have you any particular reason to support this suggestion that it should be 5 or 7 per cent?—A. At one time I know a condition was laid down in regard to certain articles that, first of all, the article should be shown to be as good as the one which is imported, and secondly that the indigenous article should be sold five per cent cheaper than the imported article. We raised the question in the Council in 1911 about it and then this five per cent disappeared.

Q. Till then, the rule was that not only should the indigenous article be good or nearly as good, as the imported article, but that it should be five per cent lower in price?—A. Yes.

Q. Do I understand you to mean that in as much as a difference in price of five per cent was fixed in favour of imported articles, till 1911, you should have a five per cent preference in favour of indigenous articles for, say, ten years?—A. Yes. That will quite suffice.

Q. In answer to question 13, you say, "Where there is a well established industry carried on in several factories by private individuals or joint stock companies, there is, in my opinion, no occasion for money grants-in-aid by Government, ... But if, for instance, there are in one province, some factories manufacturing woollen articles and there is a movement in another province for starting the industry there, it would be proper to give some initial help in the way of loans or supply of machinery and plant"?—A. Yes.

Q. Do you know how many woollen mills there are at present in India?—A. Five. The value of the woollen imports was over 70 lakhs.

Q. And you think that this industry may well be supported by Government in spite of the fact that there are a few well established woollen mills in the country?—A. And also in view of the fact that a very large quantity of wool is exported.

Q. You are strongly in favour of elementary education being made free and compulsory?—A. Yes.

Q. Do you think that drawing and other kinds of manual training should form an essential part of the elementary school course?—A. Yes.

Q. Would you also introduce a little elementary science in the upper primary classes?—A. Yes.

Q. Do you think that that will make our workmen more efficient and more likely to be able to deal with machinery of various kinds that may be used in future in this country?—A. Yes.

Q. You suggest that there should be an Advisory Board to assist the Director of Industries?—A. Yes.

Q. Would you make it merely advisory or would you make its advice binding upon the Director of Industries?—A. It is merely an Advisory Board, the Director being free either to

accept its recommendations or not to accept it, an apprehension is entertained in some quarters that capable men may not be drawn towards the Board?—A. I can only go by the experience I have, and I have no cause to complain of the non-receptivity of our Director of Industries.

Q. I have put the case without any reference to any individual directors. We have in more than one place very good directors at present, but I am speaking of the system. Would men of business ability be willing to give their time and attention to advising in the matter of industries, if they found that they were only recommendations which the Director might accept or not?—A. In spite of this danger, for the present I would just try the present system because as I have proposed, there is to be an Imperial institute of experimental investigation and research.

There is nothing certain about it yet. That is a matter which is being considered.

President.—Q. You would like to consider the other side of this proposition? If the advice given by the Board were binding on the Director, would you ever be able to get a good business man to be Director?—A. That is also another aspect which has to be considered. If really good suggestions are made by business men the likelihood is that the Director would agree to them. If the Director does not agree to them, there is nothing to prevent the Advisory Board putting their views before the Local Government. For the present, I would be content with having an Advisory Board and not tie the hands of the Director, nor at the same time, so to say, increase the responsibility of the members of the Board, because if the views of the members of the Board are to be given effect to, we ought to have some guarantee that the recommendations which they make are really practicable and can be carried out with due economy.

Hon'ble Pandit M. M. Malaviya.—Q. You say that the Department of Industries is necessary if it is to give assistance to industries?—A. Yes.

Q. With whom would the decision to give or refuse financial assistance to any enterprise rest? Entirely with the Director of Industries or with the Director of Industries and the Board which advised him?—A. The Director of Industries, and he has to take the advice of the Advisory Board.

Q. Supposing he does not agree in a particular instance with the advice of the Board, would you make it a condition that he should report the matter for the orders of the Government before taking action?—A. In this matter, I believe it is the Local Government which has ultimately to decide. Even the Director of Industries is not empowered to carry out any scheme which appears desirable to him. The whole thing has to be submitted to the Local Government, because the financial power is in the hands of the Local Government.

Q. Whether it is a proposal of the Director or the Board, the Local Government would be called upon to examine the whole thing and pass final orders? You do not contemplate that the Director of Industries should have any power to spend any money without going up to Government?—A. Money to be advanced for the purpose of helping an industry is distinguishable from money which has to be spent for the purpose of investigation or experiment.

Q. In the matter of investigation you would give the Director power to spend the necessary amount out of the budget sanctioned?—A. Yes.

Q. In the matter of affording financial help you would recommend that his proposals or recommendations should go before the Government for final orders?—A. Yes.

Q. You say in answer to question 64, "If such an Imperial department is constituted on the lines indicated and properly equipped there would in general be no need of provincial departments"?—A. Yes. The reason why I have felt it necessary to curtail the provincial programme is the need to prevent the unnecessary duplication of machinery, and also because if you have a department like that in each province, it will be necessary to have several experts for each. Without a properly equipped department supplied with suitable and sufficient experts it would be of no use merely constituting a department. Then, again, most of the questions to be dealt with have application to more than one province. Provided there is a properly equipped institution for the whole country where investigation, research and experiment are carried on, I think there would be no immediate need, at any rate, for a separate provincial department for each of the provinces.

Q. Do you think that the Imperial scientific and technical department will be sufficiently easily available to those who may wish to embark on industries, to meet the industrial requirements of the provinces?—A. It ought to be.

Q. Don't you think that distance will be a disadvantage?—A. No.

Q. You say, in answer to question 97, "Railway lines pronounced to be necessary two decades and more ago and which were set down as sanctioned projects and which for several years and even now are so mentioned, yet remain to be constructed." Could you name some?—A. Yes. The Hingoli-Basim-Akola Railway appeared more than 25 years ago as one of the sanctioned projects. In the famine of 1896-1899 earth work was constructed, and yet all that has been allowed to be washed away. I raised the question in

Council in 1911 and again in 1912 and an assurance was given to me by the President of the Railway Board that this was one of the projects which were intended to be taken very early in hand.

Q. And there is no visible sign yet of this project receiving any attention?—*A.* Yes, it is so. Apart from the war, there have been projects of questionable character which have been carried out.

Q. You say, "Lines the need of which was not obvious to the general public and which after construction have not worked satisfactorily have received preference?"—*A.* It is very well known in this province what I am referring to. There are lines in this province which cannot pay their expenses and in which only one train is run during the 24 hours. That line is in connection with the Bengal-Nagpur Railway. I forget the name just now. I shall send the name to the Commission.*

Q. You make a very justifiable complaint about the inequalities of railway freights in regard to industries. Have you any definite proposal to make to remedy or obviate such inequalities?—*A.* In regard to this, I have first of all, stated that there should be no differentiation in rates in regard to consignments to port and consignments from ports on the one hand, and consignments from one inland station to another inland station on the other hand on the same kind of goods. Cake sent from Akola to Nagpur is charged Rs. 9 per ton. From Akola to Bombay it is Rs. 8 a ton. The distance from Akola to Bombay is 363 miles. The distance from Akola to Nagpur is only 158 miles and the charge is Rs. 9. I can give numerous such cases.

Q. Do you think that this arises partly at least from the fact that railways are managed by companies? If the State took over the management of the railways it would certainly lay down equal and equitable rates?—*A.* Yes.

President.—Q. What is the reason of these rates?—*A.* They allow what they call waggon rate from Akola to Bombay, but it is not allowed from Akola to Nagpur, even though you may send hundreds of waggons.

Q. Can you give any explanation for it?—*A.* Unfortunately the policy on which these tariffs are based is not published in India, as it is done in America, I understand.

Q. This question has been discussed at the Railway Conference and there must be good reasons for it?—*A.* The fact is there.

Q. Have you had any actual explanation from the Railway Company?—*A.* We had a communication from Mr. McWatters, and I in reply pointed out the unequal and differential treatment meted out to inland trade. In reply we were told that that was a matter which could not be remedied, and beyond that there was no explanation vouchsafed.

Q. Is it because the returning truck will not be able to get any business and will have to come back empty?—*A.* Considering what a large export trade exists in the case of Nagpur, I do not see why there should be any fear.

Q. The waggon has got to come back to Akola empty?—*A.* In that case there is considerable trade also between Akola and Bombay. If Akola was a place which was doing only one kind of business there would be some ground to think that there might be loss. I believe after Bombay, Akola is the fifth or the sixth place on the Great Indian Peninsula Railway which has a very large traffic. We were prepared even to tell them beforehand how many waggons we would require and on what dates, and even that has not been considered as a sufficient thing. But the fact stands out prominently that there are facilities given for articles which have to go to port and they are not given for articles sent to inland towns.

Q. That, of course, one knows in a general way, and the usual reason given is that there is a big continuous trade with the port and waggons are loaded bothways, but for inland journeys it is not so. One is wholesale trade and the other is retail trade? Would not that vary with different places?—*A.* If it is shown that there are places between which there is considerable traffic this argument would vanish.

You think in the interests of trade, in order to remove this impression of inequality of treatment the railway should, in every case where representation is made, either give reasons for the rule that exists or modify it?—*A.* Yes.

Hon'ble Sir Fasalbhoy Currimbhoy.—Q. About these cotton ginning pools, don't you think that wherever in a chief centre pools exist, they start gins in the interior and gradually the pool breaks?—*A.* The breaking of the pools is not quite so much by factories being established in villages and places where there exists no combination. To my knowledge, they have come to an end more on account of one of the big factory owners looking only to his own interest—of course, he is justified in doing so—and refusing to join the combination.

Q. Because people who have got their own ginning factories trade by it and they do not want to enter into the combination as they do not benefit by it and have to give their share of profits to others?—*A.* Yes. But many of them are now learning another kind of lesson.

Q. Suppose there is an industrial bank started to help industries, do you think it ought to have branches?—A. Yes. In centres of considerable trade and industrial activity.

Q. Can you mention any in your own place?—A. Yeotmal, Ellichpur, Murtizapur, Khamgaon, Mulkapur.

Q. Do you think that Government help ought to be given through the industrial bank or that the Government also should give assistance directly?—A. If the Government are going to establish a provincial industrial bank, in which the Government supplies one-third or a half of the capital, or else guarantees interest on capital, in that case the management and examination of projects and so on, should be left to the Industrial Bank, managed as it would presumably be by persons who themselves are good commercial men and who would have experts to advise them.

Q. And these experts you ought to have from the Government of India?—A. Yes.

Q. You think that if an industry is started with less capital than what is needed, the other capital should be provided by the industrial bank?—A. Yes.

Q. You do not start with full capital?—A. No, that is not what I mean. We should examine what was the reason of the deficiency of capital. The first thing which I postulate is that it is a sound concern and that it is a scheme which if properly financed will be beneficial. I do not ask assistance for concerns which are tottering or founded on wrong basis. I only ask help to be given to those which are really sound.

Q. Then you say that this assistance should be confined to concerns two-thirds of the capital of which is held by persons having their domicile in India, and the head office of which is located in India. Suppose there is a big industry like the chemical industry which requires millions for capital, and suppose a foreign company comes in would you still maintain that the concern should have its head office in India and the directors in India?—A. No. It is only a question of Government granting help to them.

Q. Suppose the Government give subsidies or guarantees interest. Would you object to it?—A. You say, a chemical industry the capital for which is mainly supplied by foreigners?

Q. Say a British company?—A. In that case there should be a condition that half of the capital at least should be raised in India.

Q. How could that be done?—A. If there is Government guarantee I am sure that people of India would be forthcoming to make investment in that company.

Q. If you say that half of the capital should be subscribed by the Indians, how can that be feasible?—A. If Government help is required, Government scrutiny and Government examination will become necessary and Government can easily ascertain if half the capital is Indian.

Q. Should Government allot the capital?—A. As I say, if Government help is to be given, the country might well say, that half of the capital should be raised in this country and from Indians and that on that condition alone the grant or subsidy should be given.

Q. As regards commercial museums, it has been suggested to us by some of the witnesses that in the commercial museums if you have samples of articles which are made in foreign countries from the raw products of India then that would be a great help to the people and it will give an impetus to the people and show them how raw material is taken from this country, manufactured in a foreign country and brought back into the country as a manufactured article?—A. I do not discourage the establishment of commercial museums, but considering the demands we are making upon Government, considering the demands that already exist upon the Government, I doubt whether commercial museums are of such an absolutely necessary character that they should be established everywhere.

Q. You are afraid about the cost?—A. Yes. There are more important things to be done. I believe by this time a good deal is known, for instance, as to where your iron ore is taken away, what are the various things which are prepared from it, where cotton is taken, what are the various things that are prepared from it. To that extent there is considerable knowledge not only among the educated classes but among half educated classes also. I have seen the Swadeshi stores of Bombay.

Q. Don't you think that Government should establish some stores like that?—A. That is a store for sale. I am at present only speaking of commercial museums.

Q. I come to sales agency. If the Government have a swadeshi stores like that, do you think it will encourage the people to sell their products?—A. Yes.

Q. Are you one of the members of the Board of Industries in the Central Provinces?—A. Yes.

Q. I want to know whether the Director of Industries should be under the Provincial Government or under the Imperial Department of Industries?—A. I should see him get under the Imperial Department of Industries.

Q. And should the Board be an Advisory Board?—*A.* Yes.

Q. About the technological research institute, you think that a time might come when each province might have its own fully developed institute?—*A.* Yes.

Q. Don't you think that if every province is to have its institute, there might be overlapping of work?—*A.* I have said that at present we should have only one Imperial research and investigation department, but if the work from a particular province is so much that it requires an organisation of another office either at the centre or in the province itself, then the best course will be to have it in that province. It all depends upon the expansion of industrial activity in that province.

Q. You don't think that in the beginning there ought to be a provincial institute?—*A.* No. Not in the beginning.

Q. About the technical and commercial colleges, don't you think that every province ought to have a technical college and a commercial college?—*A.* In regard to that, you know my humble suggestion before the Imperial Council was that we should have one polytechnic institute for the country in which every department of industry, take for instance marine engineering, railway engineering, mechanical engineering, electrical engineering, hydraulic engineering, should be provided for. The college need not necessarily be established in one place. You may have it in different places, Bombay taking up one part, Cawnpore another part, and so on. I say that provision should be made for higher instruction in the various applied sciences throughout the country.

Q. That is the central one. Don't you want provincial ones?—*A.* Below, in the provinces should come institutions where instruction for training up persons for the work of master supervisors is given, and below that comes the scheme of industrial and craft schools.

Sir D. J. Tata.—*Q.* The Industrial Conference has been in existence for over 11 years. Can you submit to the Commission a note as to the work you have so far succeeded in accomplishing in connection with that conference, about the influence which it exercises, and the results that you have obtained from it?—*A.* Yes, I shall send it to the Secretary.*

Hon'ble Sir R. N. Mookerjee.—*Q.* Following the question of Sir Fazulbhoy, do you think that your purpose would be better served if in the articles of association it was stated that preference should be given to Indians at the time of allotment?—*A.* The method which you suggest would meet the purpose as well. The point under reference is that Government aid is to be given to persons resident in India, whatever their race or creed may be, to develop the resources of India. That is the main object. I am one of those who think that even if you have to wait for 12 or 24 years for the development of a particular thing, it is better that it should be developed by Indians rather than it should become the property of private capitalists who are foreigners.

Q. Instead of making that hard-and-fast rule that two-thirds of the capital must be subscribed by Indians before Government gives any help, would it not be better, practicable and expedient that Government help should be sought and the discretion of allotting shares should be left to the directors, saying that preference should be given to Indians?—*A.* In regard to that the difficulty would be that Indians in parts of the country separated by long distances from the place where a company is started who may be willing to take shares, might not know the fact that Government is prepared to give assistance to that industry.

Q. How will you know in the other case?—*A.* Government help will be given if two-thirds of the capital is taken by persons resident in the country.

Q. If Indians are willing to do that, there would not be this Industrial Commission?—*A.* I beg to differ from you. What you suggest would not be sufficient.

President.—*Q.* I do not adhere to two-thirds and one-third?—*A.* I am prepared to put it half and half.

Hon'ble Pandit M. M. Malaviya.—*Q.* Your difficulty is that sufficient publicity may not be given. But assume that sufficient publicity is given by means of publication in the gazettes and newspapers, then the suggestion of Sir R. N. Mookerjee would, I take it, meet your object that preference shall be given to Indians?—*A.* There should be two things done. In the first place the scheme should not be blocked, and in the second place, every encouragement should be given to Indians to subscribe by their being entitled to preference. Don't you think that that would be a great stimulus sufficient to draw forth Indian capital?—*A.* The question of foreigners arises. Supposing there are five persons who are foreigners and five who are Indians, the Indians will receive preference. Supposing there are no Indians coming forward, my difficulty is this, whether Government aid should be given to a company consisting entirely of foreigners with foreign capital and whether it is to the benefit of the country.

Q. You make it a rule like the Japanese that none but a Japanese shall have a share in the Bank of Japan. You want to exclude Indians and you include in that Europeans domiciled in Japan and others who come within the definition. So it would not exclude.

Europeans from it? You only want persons who have a permanent interest in the country should be given a preferential opportunity to invest in the business of the country? That is your whole object?—A. Yes.

Q. Will not that object be attained by the suggestion of Sir R. N. Mookerjee?—A. In reference to that, may I put forward this thing. Supposing there is a large sugar industry to be established in the United Provinces, and supposing an American company takes up the project and says that they are willing to supply the capital and asks for concession from Government, the question is whether the Government concession in the way of bounty or otherwise should be given to that company if there is not a single Indian in it. That is the question and in regard to that my humble suggestion is that Government aid should not be given unless there is a substantial portion of the capital taken up by Indians.

Q. We quite understand your position that Europeans do not require any special fostering in the matter of enterprise. Your object in suggesting that two-thirds shall be reserved to Indians is to draw forth Indian capital. That is your object?—A. Yes.

Q. Will that object be secured by the chances of the success of an enterprise being increased? If you say that preference shall be given to Indians that will only mean that others may subscribe if Indians do not want to subscribe the whole capital. Suppose you have a big project requiring a capital of five crores, and you say that Indians may subscribe three crores and two crores by the people outside India. We require immense capital. That will ensure that preference shall be given to Indians and it will also ensure that if we cannot raise the necessary capital the capital might come from outside?—A. My scheme contemplated this. The concession which I asked to be given was in the way of Government taking shares or giving bounties or grants-in-aid, or specially guaranteeing interest and such things. It was in regard to these that Government help would come, and this not before the formation of the company, but after the formation of the company.

President.—Q. Supposing you started a company with two-thirds of Indian capital, if some of the Indians sold their shares afterwards to foreigners, would Government withdraw their help?—A. To the extent of the proportion being two-thirds there may be a modification. I have already said that I do not adhere to the proportion of two-thirds and one-third. I am prepared to its being half and half. The main point is that the country's making sacrifice ought to be made dependent upon a substantial portion of the capital being taken up by its people.

Dr. E. Hopkinson.—Q. Suppose an English gentleman comes forward and asks an Indian to take up shares in his name and then the Indian transfers the share to him?—A. If the *benami* character of the transaction is established, it is voidable and at times void.

Hon'ble Pandit M. M. Malaviya.—Q. And there must be a legislation for it and there should be a provision that transfers like that ought to be recognised by the directors before it would be valid?—A. That is almost in every articles of association.

Hon'ble Sir R. N. Mookerjee.—Q. You in your position as Secretary of the Industrial Conference, as a member of the Local Council and the Imperial Council, have thought it fit to bring prominently before the eyes of the world the weakness of Indians, that they do not do this, and do not do that, but you suggest no remedy for it?—A. You are not right there. Have I not suggested a remedy for it?

Q. You say they do not trust you. What remedy have you suggested?—A. Indian capital is shy in regard to manufacturing industries. That is a fact which we ought to recognise. That is what you yourself have stated in your address in 1910 that Indian capital is proverbially shy and that Indians expect almost immediate returns for their money. That is one great difficulty which industries have to face in India. What I have said is only the same thing in other words. We are not, in that way, differing on principle. As to remedying this my plan is the only true remedy.

President.—Q. In case of further capital being called up for one of those companies, would you suggest that preference should be given to Indians, because if the company had been a success the Indians would naturally apply for capital?—A. Yes.

Q. Will you drop then this one-third to two-thirds proportion?—A. After all that (*vis.*, two-thirds) is a suggestion. The underlying principle is there that Government aid should be granted only on condition that the industry is essentially Indian. That is the principle that I wish to emphasise and that is the principle I wish the Government to accept. As to the detailed manner in which that principle is to be worked, that might vary under different circumstances.

Q. As a matter of fact, you would not find Government aiding any industry that was promoted by anybody except the Indians?—A. I hope so. Foreigners have no claim for special concessions intended only for Indians.

Sir D. F. Tata.—Q. Is it not your meaning that before the promoters of a company go to Government and ask for aid in the shape of guarantee of purchase and other things, they must have made some sort of arrangement as to finding that capital and they must know where they are going to get their capital and how much. Then you suggest that they

would go to Government and tell them "We propose to do such and such a thing. Will you give us concessions?" Then if the Government are satisfied that there is a fair amount of Indian capital forthcoming, they would give concessions?—A. Yes.

Q. Is that what you mean?—A. Yes. I still think that I do not differ from Sir R. N. Mookerjee on essentials.

Dr. E. Hopkinson.—Q. You suggest that an industrial bank should have a large share capital?—A. Yes.

Q. And should make advances from their capital?—A. Yes.

Q. Do you suggest that the bank should take deposits?—A. I do not think they can take deposits, because deposits are generally for short periods. There might be long term deposits with it. If the bank is of a substantial character, there may be people who will keep deposits with it for long periods, the men who wish to live on interest. Such a bank as the one I propose cannot take short period deposits.

Q. You consider that the best way of Government retaining any control over an industry which it assists is by the appointment of a director?—A. Yes. But the supervision should, as far as possible, be confined to seeing that the management is efficient and honest, that is to say, the submission of monthly statements and audit.

Q. Do you suggest that such a director should be an official of the Government or should be nominated by the Government from the business community?—A. That I would leave to the Government. There are officials who combine official experience with a considerable experience of business methods. It should choose a good man.

Q. With regard to manual training you lay emphasis on drawing?—A. Yes.

Q. And I think that in reply to the Hon'ble Pandit you said some elementary science teaching would be necessary?—A. Yes. Drawing is the training of the eye and manual training is the training of the hand. I mean by manual training, carpenter's work, smith's work, etc., and what we do on paper with pencil or pen I call drawing.

Q. Don't you think that it is important to train the observational faculties as well?—A. I fully recognise it.

Q. How would you do that?—A. I would have drawing even in primary education. I see the difficulty of insisting upon the development of the faculty of observation in elementary education. I should be very glad if it could be done. I have worked out a complete scheme in detail and I have given due place to the development of the faculty of observation and of making experiments. My paper is in the report of the first Indian Industrial Conference.

Mr. A. Chatterton.—Q. You are interested in the question of boiled linseed oil?—A. Yes.

Q. Can you tell us why there are such large imports of this particular commodity into India?—A. Because the imported article still holds the market, and the indigenous article is not yet receiving its due meed of recognition.

Q. Is the indigenous article as good as the imported?—A. I have got the testimony of qualified men who have tested the two and said that ours is as good as the imported article.

Q. Who are the principal consumers of boiled linseed oil?—A. Railways, dockyards, engineering departments, private contractors and private persons.

Q. Have you approached the railway companies to try your oil?—A. We have tried with some companies. Railway companies call for tenders and so on, and on one occasion a tender was sent but it was not accepted and I do not know the reason of it.

Q. Has the Director of Industries assisted you in this matter?—A. No.

Q. Have you applied to him for any help?—A. No.

Q. You say that the hulls of cotton seed are used for paper making?—A. Yes. I found that out from Lamborne, Ennis and Encyclopædia Britannica. I indicate it only as a possible industry, and not as an industry which I have tried.

Q. Have you sent samples to the paper makers in Calcutta?—A. No. I have not yet gone for that industry. I only indicate the possibilities of cotton seed industry.

President.—Q. As regards the restrictions imposed by the policy of the Government on Ruling Princes investing in immoveable property, I suppose you are aware that Ruling Princes cannot be sued in a British Court?—A. Yes. The sanction of the Governor-General is necessary. But that is not the obstacle that is objected to. What is pointed out is that if on failure to pay the debt the property mortgaged is sold by public auction even then the State or its Ruler or his relation may not purchase it even if it is being sold for far less than its value and the amount of the debt secured. That is the serious difficulty I have mentioned in my note.

WITNESS NO. 142.

Mr. F. G. Westmorland, Engineer to Messrs. Ralli Brothers, Shergaon, Berar.

Written Evidence.

Training of labour and supervision.

Apprenticeship system and industrial and other schools.

My experience of Indian tradesman, extending over 15 years, is that the best workers are those that have been trained up in engineering works, such as Messrs Richardson & Cruddas, Bombay, or men having natural mechanical instincts, like the Assari caste in Southern India, who have been taught by practical experience in small native works or factories where they have to work for their living. Next I place those taught in Government schools of handicraft or at similar institutions, and lastly those trained in Mission schools. These latter, I have always found, very much spoiled and never know their trade properly. Those fresh from Government schools have a tendency to think themselves far superior to other tradesmen, demand absurd wages and seem to have been too much petted whilst being trained. Yet on testing their abilities I have generally found that they have not acquired a proper knowledge of their trade, are unable to do an ordinary fair day's work, and at the best can only be engaged at improver's wages. I have heard similar opinions expressed by many other employers of labour, and I think the faults in the training at these schools are due, in the first place, to want of a good practical man to teach up-to-date methods, and in the second to too short a period for the training. The Central Provinces School of Handicrafts at Nagpur have remedied the former by having an excellent European expert in charge, but are shortening the course of instructions to two years, which, I think, is rather a mistake.

In England it is considered necessary for every lad, working 54 hours a week, to work at least a five-year apprenticeship at all trades, and any time lost has to be made up afterwards before he is considered a properly trained journeyman. It is true that the Board of Trade will accept a three-year course of apprenticeship and one year at sea in charge of a watch to allow an engineer to be examined for a 2nd class certificate, but no respectable steamship company will accept less than a five years' apprenticeship before allowing an engineer to take charge of a watch, so really a five years' apprenticeship is required for all engineers. Yet in India, I find, technical schools for training lads give only a three years' or at the most a four years' course for teaching students to pass the 2nd class examination under the Boiler Act. If a five years' apprenticeship is necessary in England to teach a lad his trade, I quite fail to understand how it is expected to turn out good tradesmen in two, three or four years in India, especially as technical schools work much less hours than apprentices do at home.

The aim, I consider, of all such schools should be quality, rather than quantity, so as to turn out expert tradesmen as near as possible in efficiency, for both skill and quickness of labour, to the British workmen, so, if it is impossible to provide a full five years' apprenticeship at these schools, arrangements should be always made with outside firms of good standing to take the students on as improvers to complete their apprenticeship under practical foremen. Lads trained only for two or three years are bound to revert to old careless ways of working if they are not given the opportunity of such further improvement.

Mechanical engⁿ near.

In the Presidency of Bombay, the United Provinces and the Central Provinces with Berar, no engine driving a factory can be worked by steam without having in charge a duly qualified engineer, holding a certificate of competency under their respective Acts, according to the size and power of the engine. But in other parts of India, such as the Madras and Bengal provinces, no such laws are enforced, and in these latter districts frequently engines of over 2,000 B.H.P., driven by several large boilers at high pressures, work, day after day, mills where there are large numbers of hands employed, without having a certificated engineer on the premises. Also large factories are now working in India driven by highly complicated machinery, having their motive power other than steam but equally as dangerous, such as gas, water power generating electricity, etc., without a certificated engineer being in charge, and of this the law takes no notice.

Yet if certificated engineers are necessary to be in charge of steam-driven machinery in one province they are equally necessary elsewhere, and not only in charge of steam-driven plants, but also where other motive power is employed, for the protection of life and property.

The provinces which require engines to be in charge of certificated engineers hold examinations at their respective centres and issue certificates of competency, but there is no uniformity at all in these examinations. The Bombay Board of Examiners will not recognise certificates issued under the Central Provinces Act, or accept students who have passed through a three years' course at the Amraoti Technical Institute, or a four years' course at the Nagpur Engineering School. The Central Provinces Board accept the Bombay certificates, but require an engineer to go to Nagpur and pay a fee, upon which they give him a certificate under their Act, without examination. There is no uniformity either with regard to the nature of the examinations, which vary according to the Board of Examiners who set the papers, with the result that candidates have to study up at least 6 different text-books and must be coached in all sorts of questions in

order to get through the verbal examinations, as it is not infrequent that these examiners put questions to candidates, not with a view of ascertaining their practical knowledge of engineering, but with the idea of failing them if it possibly can be done; therefore a 1st class certificate obtained under one Boiler Act may not at all bear the same value as one under another Act. It often happens that a man failing to pass at Nagpur goes to Bombay and gets his certificate there, then by paying his fee at Nagpur can get a Central Provinces certificate without further examination, or if he fails at Bombay he goes to Cawnpore and gets a United Provinces certificate, which both the Bombay and Nagpur Boards, I believe, will recognize, although as a matter of fact the examinations at Cawnpore are noted for being considerably easier to pass than those at the other places. But an engineer holding a Central Provinces certificate cannot be employed in the Bombay Presidency in charge of engines and must be re-examined there if he happens to get transferred to a factory in that province. A mechanic in another province, such as Southern India, where there is no Board of Examiners and working with owners who require a certificated engineer to be in charge of machinery, although this is not required by law, has to go to Bombay as the nearest centre to qualify.

Examinations for certificates under these various Boiler Acts are held in the vernacular as well as in the English language, and interpreters are generally employed to translate the necessary questions into the native language for the candidates and retranslate the answers for the examiners. This, in my opinion, is open to considerable fraud and should be done away with, especially for the oral examinations, at least for 1st and 2nd classes, as I have personally found men holding certificates whose knowledge of engineering certainly did not justify their passing the qualifying examinations and on inquiry ascertained that they had passed in the vernacular only.

A remedy for this unsatisfactory state of affairs is to be found by following the lines of the Board of Trade, which examines engineers and grants certificates of competency not only in England but in a good many sea-port towns in the British possession. They have sets of examination papers printed on arithmetic, elementaries and drawing, which are revised and added to from time to time from the head office in London, and a candidate knows that no matter whether he is examined in London, Glasgow, Bombay, Hongkong, or Sydney, he will have one of these papers on each subject given him to answer, therefore he has not to study six or seven different text books but only one which gives these papers, such as Reed's Engineers' Hand Book. He is therefore able to go direct from the engine room of his ship to the examination room with a fair amount of confidence, if he has been studying at sea in his spare time, that he will pass his examinations. The only part in which the examiners have at all a free hand is in the verbals, but even then a certain line of questioning is always followed with the view of ascertaining the candidates' practical abilities. So I consider all these examinations under the Provincial Boiler Acts should be standardized on these lines, as engineers in charge of out-of-way factories have very little time at their disposal to study for the higher qualifications and often remain content with their 2nd class certificate rather than incur heavy expenses in paying a coach or buying a lot of text books which they can ill afford, with the hopes of being lucky enough to hit upon the right ones, when in the examination room of these various Boards.

The Board of Trade examiners in all British Possessions are practical marine engineers holding Chief or Extra Chief Engineer's certificates issued by that Board and therefore are fully competent to examine candidates for such certificates. The Board of Examiners under the Bombay Boiler Act has always at least two marine engineers holding Board of Trade Chief Engineer's certificates, and the other members are generally Indian marine officers, or hold 1st class certificates under their own Act, but the other inland Boards, who probably are not so fortunately situated to secure the services of such engineers, consist chiefly of civil, railway and public works department engineers, who, in most cases, do not hold any certificate under their own Acts. Therefore, if the examinations were standardized throughout India on Board of Trade lines and made more independent of the actual examiners, the certificates resulting from these examinations would become of equal value and readily be made available throughout India.

I would therefore advocate reforms on the following lines:—

- (a) There should be a uniform law throughout India requiring properly certificated engineers to be in charge of all engines driving factories which come under the Indian Factory Act independent of their motive power and according to the B. H. P. of such engines.
- (b) The present examining boards should be done away with and a Head Board of Examiners established for the whole of India which would draw up examination papers on the lines of the Board of Trade and appoint two or more local examiners, who must be practical, suitable and certificated engineers (engineers holding Board of Trade certificate being given the preference), at various centres to hold examinations and on their reports the Head Office would issue the certificates of competency. This Head

Board should also have full powers, like the Board of Trade, to withdraw or suspend such certificates if, after proper enquiry, they found that serious accidents had occurred through incompetency or carelessness of a certificated engineer. The Head office should also have power to deal with false certificates, misuse of certificates, etc.

- (c) All technical schools throughout India for training students to qualify for the examinations under the Boiler Act be recognized by this Head Board, which would have them inspected from time to time, receive annual reports of results of the work, and, if necessary, revise the courses of study so that the passing-out certificates given to the students on leaving the school would be available at any centre of examination throughout India.
- (d) Examinations for certificates of competency should be held only in the English language.

Oral Evidence, 16th December 1916.

President.—*Q.* You say, "Those fresh from Government schools have a tendency to think themselves far superior to other tradesmen, demand absurd wages and seem to have been too much petted whilst being trained." What schools have you had men from?—*A.* I have had men from the technical colleges in the Bombay Province. That was some years ago when I was down there in the P. & O. Dockyard; and a few up here. I found very much the same sort of thing.

Q. Have you had any recent experience of that kind?—*A.* Yes.

Q. You think that the men who are now turned out of the Victoria Jubilee Institute are any better?—*A.* I have not had any recent experience of the Victoria Jubilee Institute.

Q. Have you not had any men from the Victoria Jubilee Institute?—*A.* Not very lately; some time ago I had some, fresh from that school. After they knock about the world they lose that tendency to superiority.

Q. We are all like that when we leave college?—*A.* Yes.

Q. Do you think there has been any improvement lately?—*A.* I don't think from my recent experience there has been very much; at least not noticeable.

Q. The School of Handicrafts here has had a too short existence for you to judge?—*A.* Yes, you cannot judge from that.

Q. We were told in Bengal that there was no real call for these certificates of competency on the part of mechanical engineers and those in charge of boilers. The number of accidents had been so small that anything in the form of a certificate would not remove any real danger and that there was on the part of the people in Bengal no real grievance?—*A.* Very likely. If you have no certificated engineers, how can you tell about accidents?

Q. The Chief Inspector of Explosives thinks that the number of accidents is so small that there is no real call for certificates?—*A.* Why do the other provinces insist upon it?

Q. That is what we want to know from you?—*A.* The other provinces insist upon it, not only on account of life but on account of the damage to valuable property. An industry requiring an outlay of capital for machinery will not pay unless that machinery is kept in proper working order to give its maximum outturn at minimum working cost. To attain this object properly trained and certificated engineers are required to be in charge of it.

Q. You have a recognised standard?—*A.* Our firm would not have an engineer, unless he was certificated, in charge of a factory. They have something then to go on.

Q. You think the examination ought to be made more uniform and controlled through the whole of India, i. e., a uniform standard?—*A.* That is my idea.

Q. You have pointed out certain occasions on which the actual regulations can be dodged?—*A.* It is ridiculous. I would have the whole on a uniform standard.

Q. Do you get many accidents due to the inefficiency of the man in charge of the boiler or engine?—*A.* We don't, because we have certificated engineers always looking after them; but I have heard of many accidents in the case of engineers without certificates.

Q. It is rather significant that where they have no certificated engineers, the number of accidents is negligible?—*A.* I cannot say about Bengal. My experience some years ago in Southern India was that there were constant accidents happening to machinery and boilers on account of not having certificated engineers in charge. There were no accidents reported to Factory Inspectors, but they were nevertheless there.

Q. Apart from accidents, there is a certain amount of degeneration of the machinery?—*A.* Yes.

Q. Does this standard of examination result in the men working up their profession in such a way that they would become of greater value to you?—*A.* Naturally they get educated, as they would have to learn a certain amount of technical things, and are better men for having learned it, unless they learned it off like parrots.

Q. You look upon Madras and Bengal as the two backward provinces?—*A.* I do.

Q. They have engines of over 2000 H.P. driven by men without certificates?—*A.* I have seen that very often.

Dr. E. Hopkinson.—Q. Is it the practice in India to insure boilers against accident?—*A.* Against accident? No, I don't think they do, not as a rule. I don't think any insurance company would take it up. It is not like it is at home where they insure against accident and insist upon the engineer being properly certificated.

Q. The home companies do not extend their operations to India?—*A.* They certainly do not to my knowledge.

Q. Would you suggest that it would be a desirable thing if the Government of India set up some machinery for examining the boilers themselves?—*A.* They do examine the boilers themselves every year. The Senior Inspector of Boilers and the Junior Inspector of Boilers do that throughout India, including Madras and Bengal.

Q. What officers of Government carry this out?—*A.* Inspectors of Boilers they call them.

Q. You say Bengal and Madras are exceptions?—*A.* They have Inspectors of Boilers, but not certificated engineers in charge. They only put half the Act in force.

Q. Do you consider the Government Inspectors efficient?—*A.* I don't trust them myself, and generally go and see to things myself; but still I think them generally efficient.

Q. In case a boiler explodes, is there a Government enquiry?—*A.* Yes, always.

Q. And if there is any fault attributable to the owners, how is that brought home to them?—*A.* It would be brought home if they had certificated engineers, by suspending their certificates, *i. e.*, if an engineer had a first class certificate, they would give him a 2nd class. If he had a 2nd class they would take it away for six months, as they do at sea.

President.—Q. Is it brought home to nobody?—*A.* How can you bring it home to the owner? He pays for the expenses of the enquiry, and that is all. At home they are fined.

Dr. E. Hopkinson.—Q. You are acquainted with the work of the Manchester Steam Users' Association, which is an association which does not exist for profit, but for promoting the proper inspection of boilers. Do you think there is need for such an association in India?—*A.* I don't think so, because they don't make boilers in India. They get them out from home. You get the Leeds or Manchester certificate which is accepted out here.

Q. Do you consider that the inspection here in India is done efficiently by Government?—*A.* Yes; at home it is not done by Government; it is done by the insurance company.

Q. The examination which you refer to applies only to the men who are attending boilers; it does not apply to men who are attending steam engines?—*A.* It applies to both. It depends on the size of your engine, what class of engineer you require. Up to a 60 H.P. engine you want a 2nd class, over 60 a first class.

Q. Is that a rule in the Central Provinces?—*A.* Yes, and in most of the other provinces.

Q. Do you consider the system ought to be extended to other classes of machinery?—*A.* I think it ought to be extended to gas and other power plants which are just as dangerous as steam or more so. There are a good many gas plants in India, but I would restrict it to prime movers.

Hon'ble Sir R. N. Mookerjee.—Q. With reference to sub-paragraph (d) at the end of your written evidence "Examinations for certificates of competency should be held only in the English language"; do you include all the common native Tindals who work boilers; should they be compelled to pass an examination in English?—A. Not to work the boiler, but the man in charge, he must be a certificated engineer.

Q. In Bengal lots of the big steamers are plied by Indians from Goalundo to Assam. They get Rs. 100 and Rs. 150 pay, but they don't know English?—A. Then they don't pass any examination.

Q. Oh yes, they pass examinations, and are competent men. They are captains; only because they don't know English they are called something else?—A. They must have a special arrangement by which they are given a special examination under one language. We have a dozen different languages; how can you expect these men to pass.

Q. On these light railways all the drivers are Indians. They don't understand English, but they drive their engines all right. They are certificated?—A. Then you must have special arrangements for examining them.

Q. Then you don't make it compulsory that every man must pass in English?—A. Every man who passes these present examinations.

Q. But how about these light railways?—A. They must make special arrangements. There is no special examination; it is only this examination which every one must pass.

Q. I know of light railways over thousand miles, but have never heard of an accident for want of the driver not knowing English?—A. You must have special arrangements for examining these men.

Mr. C. E. Low.—Q. How many hands have you got in your Shegaon workshop?—A. About 18 to 20.

Q. Do you take any apprentices in?—A. Yes.

Q. Where do you get them from?—A. They are generally sons of some of our old men, our old foremen.

Q. What education do they get before they come in?—A. Some get a better education than others. Some of them have passed, and others have only studied up to the 4th and 5th standard; others the 3rd standard.

Q. Most of them have got a vernacular education?—A. Yes.

Q. Do any of them know English?—A. A few.

Q. Have they had any previous technical training at all?—A. No, they just come to me straight from school.

President.—Q. If they don't know English, they could not qualify for this certificate of yours?—A. No, they certainly could not. I am taking them as mechanics, not as engineers.

Q. You are not taking up men of the kind that you contemplate who would take this first class certificate?—A. I don't give them any theoretical knowledge. I only take them up as mechanics, to become turners and fitters.

Q. Are there any facilities at Shegaon for them to get training?—A. No, they would have to go to Amraoti. I generally recommend one or two to go to Amraoti.

Q. Are you on the Board of the Amraoti institution yourself?—A. Yes, I am.

Q. Do you send on any of your apprentices for training?—A. I have not so far. I have it in mind.

Q. Your apprentices don't pay a premium?—A. No, we pay them; we start them on Rs. 7 a month.

Q. They are not exactly apprentices?—A. No, we don't bind them. We call them apprentices and give them Rs. 7 a month. We keep them for four or five years, if they stay and turn them into workmen.

Mr. C. E. Low.—Q. Can you tell me what kind of men are coming to the Amraoti Institute?—A. They are very well educated. They know their theory very well. We have three engineers now whom I have taken on lately from Amraoti Institute.

Q. They have nothing, but their Amraoti training?—*A.* Yes, and a year afterwards *Mr. H. D. Coggan*, practical training.

Q. How long have you been on the Committee?—*A.* About 4 years.

Q. Previous to that, there were no technical men on the Committee?—*A.* No, there were only the Public Works Department engineers.

Q. Do you think the appointment on the Committee of technical men will have a good result?—*A.* They seem to think I am a benefit.

Q. What share do your Committee take in making the training more practical?—*A.* We are taking in outside work, repairing for the surrounding factories. They are now getting a good deal of outside work.

Q. Have you a good number of Brahmin boys?—*A.* Yes.

Q. Do they shape all right?—*A.* Yes, I have got two of them as engineers. With a little practice they will make quite good engineers.

WITNESS NO. 143.

Mr. H. D. Coggan, Chairman of the Central Provinces and Berar Mining Association, Kamptee.

Written Evidence.

I have the honour, as the selected representative of the Central Provinces and Berar Mining Association, to give my opinion on such matters referred to in the list of questions as concern the manganese mining industry of the Central Provinces.

These rules as applying to the manganese mining industry have as a whole worked satisfactorily, and such suggestions as I now make are with a view to the enlargement of their scope as regards exploration and the encouragement of prospecting on a larger scale than appears to be possible under the rules in their present form. Mining and Prospecting Rules, 1913.

I would suggest that the old form of exploring license should be restored, with modifications, giving the holder the exclusive right to a prospecting license or a mining lease over any portion covered by the license. Exploring licenses.

Although under the existing rules there is no limit to the area which may be granted under a prospecting license, it is stated that it will be restricted to such an extent of land as may be reasonably required for *bonâ fide* prospecting purposes. Under the old rules it is laid down that in the case of manganese ore no concessionaire will ordinarily be granted an area of more than 5 square miles on a prospecting license in any one district, so that in determining the area to be granted under the existing rules the procedure would probably be influenced by this principle, and it is scarcely likely that more than say ten times the originally specified area would be granted. Even this would not be sufficient for the object in view, which is to afford greater facilities for prospecting on a larger and more scientific basis, for no capitalist would embark on operations necessitating the employment of a highly paid staff necessary to thoroughly explore a large area unless they were assured of protection against the fruits of their enterprise being reaped by others who may be watching their operations.

I have suggested above that an area of even 50 square miles would not be sufficient encouragement for prospecting on a large and scientific basis, and this applies not only to the wilder and hitherto unexplored parts of the country, but to those in the vicinity of well-known deposits, for it must be remembered in connection with the latter areas that all outcropping deposits have already been taken up, and the discovery of any that may lie below the surface would entail boring with skilled labour and scientific knowledge to direct it. In view of the expense involved in such operations, I do not think that concessions extending over 100 to 500 square miles would be unreasonable, and even were it possible to grant such areas under a prospecting license, the surface fee leviable, and which varies from 1 anna to Re. 1 per acre per annum, would be prohibitive.

It may be contended that the adoption of my suggestion would mean the degeneration of an exploring license into a prospecting license, but I do not propose that the former should carry with it the same privileges as the latter, *vis.*, the liberty to remove ore up to a quantity which may, at the discretion of the Commissioner, extend to 10,000 tons with the resultant surface disturbance, but that an exploring license should restrict operations to

purely exploring work such as the chipping of the surface of rock with a hammer and boring, which does not involve any serious surface disturbance, and to the removal of only such quantities of mineral as may be necessary for specimens, or samples for analysis, at the discretion of the local authority.

As regards the fees to be charged for such licenses, I think that they should be as moderate as possible, but that a substantial security deposit should be demanded to deter unsuitable persons from applying for them.

The length of time for which such licenses should be granted may be governed by the nature of the country to be explored and the probable distribution of minerals therein.

The adoption of the form of license suggested may also be the means of encouraging the search for minerals in Native States, where the need for the grant of larger areas for the purpose is even greater than in British territory, and where, owing to the mining policy being to a great extent modelled on that of the Government of India, concessions for large areas are not always obtainable.

The "pegging out" of claims.

The system of "pegging out," although provided for in the Mining Rules, has not yet been brought into force in the Central Provinces, and I would suggest that this should be done and made applicable to concessions for all minerals to avoid the possible loss of a portion of or even the whole of a valuable deposit through an error in preparing a plan, although the claimant may have gone to great expense and trouble in proving it. Such cases have occurred in these provinces.

Prospecting licenses.

Under the existing rules, a concessionaire who has already held a prospecting license over any particular area for the full period of three years, including the extensions permissible under the rules, cannot be granted a prospecting license over the same area or any part thereof should he apply for it at any subsequent time. This bears hardly on a concessionaire who, having already prospected such an area to the best of his ability in the time allowed him, takes up a portion of it under a mining lease and finds as a result of his subsequent mining operations that the deposit extends beyond his boundaries but not with sufficiently definite indications to justify his applying for an extension of his mining lease. Unless he is prepared to take up a further area under a mining lease and to pay dead rent on land that might eventually turn out to be barren, he is debarred from further prospecting the area surrounding his mine, in the light of the knowledge and experience gained by operations conducted by him under his mining lease. I would, therefore, suggest that the grant of a further prospecting license to a concessionaire over an area that has already been held and relinquished by him should be made possible, provided that he has taken up a mining lease therein, worked it to the satisfaction of the Local Government, that a period of say one year has elapsed since the expiry of the original prospecting license, and that there is no other applicant for it at the time.

Land policy.

Considerable difficulty has been felt in the operation of section 151 of the Central Provinces Land Revenue Act. This section as it stands at present does not confer on Government the power to enforce entry on private land under which no part of the mineral lies and Government therefore are unable to grant extensions of mining leases over land that may subsequently be found to be essential for the proper development and working of a mine, such as the disposal of waste. I understand, however, that the amendment of the law in this connection is under consideration, but I mention the matter as it has an important bearing on mining interests in these Provinces.

Acquisition of land for light railways and tramways.

I venture to suggest that provision should be made for the acquisition, on behalf of private individuals or companies, of land required by them for the construction of light railways or tramways for the transport of mineral to existing railways or waterways, provided that the importance of the mineral and the interests involved justify it.

Railway freights.

The recent enhancement of freight on manganese ore is viewed with considerable anxiety. Under present conditions when there is no competition with foreign sources of supply, exporters are able, as in the case of sea freights, to pass the increase in railway freight on to the consumer, but when normal conditions are restored and foreign competition resumed, it will place exporters of Indian manganese ore, at a serious disadvantage and make impossible the export of the lower grades of ore of which a considerable quantity has been exported in the past, and of which a much larger quantity must in future be exported if the anticipated demand for this mineral is to be met. Although the railway authorities will no doubt follow the course of events and make such adjustments in the rates as may be necessary in order not to hamper the industry, it is a matter of such vital importance that I venture to draw the attention of the Commission to it.

Training of labour and supervision.

As far as the supervision of mining operations is concerned, I do not consider that the need for trained subordinate staff has yet made itself felt. These operations are generally conducted under the supervision of mining engineers trained in England, with the assistance of Anglo-Indian or Indian subordinates who usually receive on the manganese mines themselves the short practical training necessary to qualify them for their duties. Beyond this, so long as the extraction of manganese ore is confined to open cast working and underground mining for this mineral is a remote contingency—no higher class of

training is called for. It is, however, in regard to mechanical labour and supervision that a want has been felt, a want that is likely to grow as the mines get deeper and the adoption of machinery for pumping and haulage becomes more general, and it is in the training of such labour that Government assistance would be valuable.

There is at present a Government School of Engineering at Nagpur under the control of the Department of Education, which has the essentials of great utility provided its scope can be enlarged. Its character at present is, I understand, purely educational, and the opportunities afforded the students for gaining the practical experience necessary to fit them for employment in industrial enterprises are extremely limited. This, it appears to me, might be remedied by giving the school greater facilities for taking in work from mills, mines and other available sources, than it has at present owing to the small number of experienced workmen it employs, thus giving the students greater opportunity for studying practical methods from more experienced workmen. The school should also be able to send students out with experienced workmen to attend to jobs at mills and mines, thus giving them a more intimate and practical knowledge of the requirements of the industries in which they are likely to find employment in future, so that while assisting these industries themselves the income from such work would probably make the institution self-supporting, or in any case assist Government in carrying out the additions in *personnel* and *matériel* that would be necessary to increase the scope and efficiency of the school.

I venture to suggest that the interests of an institution conducted on the semi-commercial lines indicated would be better served if it were placed under the control of the Department of Industries, which is in closer touch with the industries of the province than the Department of Education can be expected to be, and which has a more intimate and practical knowledge of their requirements. At the same time I would advocate nothing that would deprive the institution of its educational value.

Oral Evidence, 16th December 1916.

President.—*Q.* You say 'under the existing rules a concessionaire who has already held a prospecting license over any particular area for the full period of three years including the extensions permissible under the rules cannot be granted a prospecting license over the same area or any part thereof should he apply for it at any subsequent time.' What rule are you quoting? It cannot be the Government of India rules?—*A.* It is one of the rules provided for the grant of prospecting licenses according to which a license is granted for one year by the Collector in the first instance and renewed at his discretion for a further maximum period of two years.

Q. That rule does not prevent anybody from applying for the same land again unless you put into it a meaning that was never intended. As I see the rule there is nothing excluding the man from applying at a subsequent period?—*A.* It does not seem so from the wording of the rule but in practice that is not the case.

Q. A case of that kind ought to be brought to the notice of the Government. You suggest that provision should be made for the acquisition of land for individuals or companies for the construction of light railways and tramways. In a case of that kind would you make these light railways a public thoroughfare or only for the use of the company itself?—*A.* I should make them public thoroughfares as far as the carriage of the minerals they were originally intended for are concerned.

Q. Or anything which is appropriate?—*A.* It is a question of rolling stock, as stock suitable for minerals would not be suitable for such commodities as grain or timber. In the case of a tramway my company constructed about 10 years ago, Government could only let us have the sides of the public road and Government Forest land free. They could not help us to acquire land for diversions from the public road where they were necessary through privately owned land. We had very great difficulty in obtaining land for this line.

Q. Would that line have been of any use to the public in carrying from other mines for instance?—*A.* It was actually used for carrying manganese ore from all the mines in the Bhandara District and some in the Balaghat District.

Q. That would be a case where the Local Government could have exercised its power under the Land Acquisition Act?—*A.* It was regarded as a private tramway from the beginning and Government said they could not help us. It made Tumsar Road Station on the Bengal-Nagpur Railway the largest manganese exporting station in India and perhaps in the world. We carried nearly two-hundred thousand tons of ore per annum. The line eventually turned out to be of great public utility and it has now been purchased by the Bengal-Nagpur Railway.

Q. It has now become a public line?—A. Yes.

Q. One can understand the objections that may be raised in the case of the Land Acquisition Act being used to acquire land for one private company but if the line is serving other companies and is of obvious public utility the Local Government would interpret the rules generously?—A. We stated in our original application that we were prepared to carry ore for other companies on the same terms as our own, but Government did not apply the Land Acquisition Act.

Q. Regarding your point about the freight of manganese—is it only a war measure?—A. We hope so, but the reasons given by the Bengal-Nagpur Railway were that the existing rates did not pay their railway for the trouble involved in this traffic, on account of the short leads over their own railway. The Railway Board, however, gave us the assurance, when we protested, that the railway would no doubt follow the course of events and make such re-adjustments in freight as may be necessary in order not to discourage the traffic.

Q. You are a little happier over that vague promise. Do you know why the pegging out system has not been adopted in the Central Provinces?—A. Since sending in my written evidence I have found a letter from the Secretariat giving the Chief Commissioner's reasons for not adopting the pegging out system. This letter appears to have been lost sight of in the records of the Mining Association. Had I been aware of its existence I would have referred to the reasons given.

Q. Does that letter give fairly substantial reasons to the satisfaction of the Association?—A. I think the difficulties anticipated there might be overcome.

Q. What were the difficulties anticipated?—A. The principal difficulty was that pegs or other marks might be altered or obliterated by a rival prospector and that such an act could not in the present state of the law be made a penal offence.

Q. Could not the prospector have his certificate of approval cancelled? The certificate of approval is better than any legislation that could be devised. Any defaulter would have his name struck off in the next year's list?—A. Yes. I think that would be a sufficient deterrent.

Q. Do you think then that the time has arrived when the Local Government ought to declare in respect of any specified area the system of pegging out claims. Do you think it would be an advantage to the mining community in the Central Provinces?—A. Undoubtedly it would be.

Q. Is that the view of your Association?—A. Yes.

Q. You want the areas that are usually given out for prospecting to be increased. Don't you think that people will take up more areas than they can manage and that they should be made to pay a corresponding rate, to act as a deterrent in the case of persons who do not intend to really prospect?—A. A heavy security deposit would have the effect of keeping out any but *bona fide* prospectors.

Q. If any area is taken up for prospecting there is nobody in the world who can say whether that is a justifiable prospecting proposition or not until it is actually prospected and that cannot be under one year plus two extensions. The land might be held up against the honest worker for something like three years?—A. It is certainly a danger that has to be reckoned with, but if Government would use more discrimination as to the persons to whom such licenses should be granted I think that danger would be removed.

Q. Discrimination of that kind means the discrimination of the District Officer. That will introduce a difficulty; if discrimination is exercised very carefully it will mean considerable delay in obtaining licenses, and as you know the principal complaints made against the old rules were practically due to the inordinate delay in obtaining licenses. If you increase the machinery for investigating the man's *bona fides* you introduce an opportunity for delay. Do you think there is a compensating advantage in your proposal?—A. I do not think that there would be any serious delay if this discretion is given to the District Officer. In any case a very large area would be necessary before any one would undertake the boring operations that would be necessary on a large and expensive scale to ascertain whether any deposits existed in the areas I have in view.

Q. In a case of that kind, which is exceptional, the Local Government has power to extend the area to anything it likes?—A. Yes, but under the existing rules a surface fee ranging from one anna to one rupee an acre per annum is chargeable and in the case of a large area this would be prohibitive.

Q. Don't you think that by a levy of this kind you prevent the speculator and keep him aloof. A rent of this kind would force the man to discriminate between good and useless ground, that is to say, it would be taken up only by professional men and not speculators?—A. In the case of certain areas it would be very difficult to exercise such discrimination and considering the large area over which mineral is distributed in the Central Provinces I think it would be a heavy tax, in the case of manganese ore especially.

Q. Don't you think there will be a danger that one particular company might get the practical monopoly of all the minerals?—A. In considering the grant of such concessions due regard may be had to the distribution of mineral in the area applied for and they should apply only to areas where deposits are probably at a considerable depth below the surface.

Q. Will you send us for confidential consideration the description of the particular ground that you have in mind?—A. Yes. (*Witness subsequently sent a communication on the subject which is confidential.*)

Q. We quite understand your difficulty in giving any more particulars just now because that would affect the objects which the Association has in view. Speculators may come in and take up the land and sit upon it?—A. I do not think speculators would want to take up the land if there was a very heavy security deposit. That will have a deterrent effect.

Q. Security deposit is the cheapest thing in the world. You have only to hand in Government paper and you are earning interest all the time?—A. It might be stipulated that the deposit should be in cash.

Q. That would be very hard?—A. That is where the deterrent effect comes in.

Q. You say that it is very difficult to pay from one anna to one rupee an acre and yet you want a deposit in cash?—A. A prospecting license for three years over 100 square miles would, if only two annas per acre were charged, mean a surface fee of Rs. 24,000. That would prevent people from prospecting at all.

Q. If a company wants one hundred square miles to prospect for one mineral it must be a fairly gluttonous company. It is probably keeping some body out?—A. It is only reputable people that should be granted such a concession, but if it means payment of Rs. 24,000 as a premium merely to be allowed to prospect an area, no one would think of paying that sum. There are areas without any surface indications which might pay to prospect and I think ought to be prospected.

Q. By expensive boring?—A. Yes.

Q. Do you mean to say that after the boring is done at the expense of the company and there is an indication of the nature of the land then other people would come in and reap the advantage?—A. Yes. I mean that a sufficiently large area would be necessary to secure to the prospector the fruits of his enterprise and prevent others who may have been merely watching his operations from coming in and reaping the benefits.

Mr. C. E. Low.—Q. I understand that what you have in mind is that over fairly extensive areas all visible deposits are being worked, but there are probably others on other parts of the same horizon which are below the surface and so it requires deep boring to find out the ore. In that case you would not require a mining lease for the whole 500 square miles or whatever it is but only for a reasonable number of propositions?—A. That is my idea. Manganese ore is distributed over a wide area. It is not in continuous bands for any great distance.

Q. Do you think that this is a case in which Government itself should put down the borings?—A. I see no reason why they should not.

Q. And then who would have the benefit?—A. They might give it to the highest bidder.

Q. Do you admit Indian members into your Association?—A. Yes.

Q. How many?—A. About half the members are Indians.

Q. You think it is an advantage to your Association to have Indian members?—A. I think it is a decided advantage.

WITNESS NO. 144.

*Mr. W. Wight, Textile Expert, Central Provinces, Kamptee.**Written Evidence.*Financial aid to
industrial enter-
prises.

Q. 1.—While employed by the Congested Districts Board for Ireland as a weaving instructor in congested districts I had an opportunity of noting how the fishermen were enabled to become shareholders in fishing luggars, value £300 each or so. Each boat had a crew of six, one being a nominee of the Congested Districts Board.

The six had each one share in the boat, as regards division of profits from sale of each catch, after all expenses had been met, such as repairing boat, barking nets, interest on capital, etc.

The Congested Districts Board for Ireland, however, did not pay the profits from sale of catch to the crew at once, in the proportion of $\frac{1}{6}$ each, but divided the total value into eight parts, paying each man $\frac{1}{8}$ and withholding two shares to redeem the capital.

In this way many crews became joint owners of the boats after a season or two of good herring-fishing.

The boats remained the property of the Congested Districts Board until total cost of each boat was paid up by the 25 per cent of profits accumulating in the hands of the Congested Districts Board; when the boat was clear it was handed over to the crew.

Government control.

Q. 6.—So long as the boats were the Congested Districts Board's property the crews were treated as employed crews, being under direct control of a Congested Districts Board's Fishing Inspector, as a fleet of herring fishing boats. The fleet moved to the various fishing grounds under his orders. This Inspector also saw that boats and fishing gear were kept in a proper state of repair, stores being issued such as paint, etc., as required and charged to each individual boat.

Technical aid to
industries.

Q. 15.—When I was employed by the Congested Districts Board for Ireland as a weaving instructor in congested districts, my duties were to train weavers in the use of improved hand-loom, producing Donegal tweeds. This work was done by erecting improved looms in different districts and teaching young men how to work them, then moving on to other districts as required.

The cloth woven by weavers in Donegal was all sold at fairs held in different centres (once a month in each centre).

The Congested Districts Board measured all the cloth displayed for sale at each fair to save friction between buyer and seller, and I had full charge of a staff employed for that purpose. While employed in different districts I had opportunities of noting the methods employed in teaching carpentry by the Congested Districts Board. An instructor moved about from district to district forming classes of young men and giving instruction how to use tools, making ordinary farm appliances, also tables, chairs, stools and other things used in cottages.

There were lace and knitting instructors also. The lace instructors formed classes in their different districts, gave instruction in lace-making and were expected to dispose of work done in classes by either calling on and showing the work to wholesale houses in Belfast and Dublin, or sending samples by post all over the United Kingdom. The pupils were paid a scale of rates for the different articles made, and instructors were expected to make their classes self-supporting from profits on sales made.

The knitting industry was not done in this way, as this industry was in the hands of merchants in various districts in Donegal, who distributed to the cottars yarn to be knitted into hand knit, sports coats, etc.

When a merchant wanted to open up a new district he applied to the Congested Districts Board for a knitting instructor to be placed in that district. The Congested Districts Board invariably complied with such requests, as it enabled the women in the district to become wage earners, thus raising the standard of comfort in the district.

Sales agencies.

Q. 30.—My experience of sales agencies is that they are not a success, as compared with any business having a whole-time paid representative. The reason is that sales agencies have many firms or businesses which they represent on a commission basis, and they are

apt to neglect any one whose goods do not sell readily and follow the line of least resistance by paying attention only to the ready selling article, as it means good commission with little trouble or expense. A whole-time representative paid by salary and commission must sell to justify his holding his position and earning his salary.

Q. 44.—I am at present employed by Government as a textile expert in the Central Provinces. My duties are to try and improve the efficiency and skill of hand-loom weavers in the Central Provinces by suggesting any improved methods or appliances whereby better work can be produced. Training of labour and supervision.

On arrival in the Central Provinces two years ago to take up my work I found that the weavers in no case used fly-shuttles and I at once saw that this was the first thing to devote my attention to, as the use of the fly-shuttle would enable the weavers to double their output as compared with their obsolete method of pushing shuttle through by hand. Before deciding on what form of improved sley to adopt, I visited Madras where the Industrial Department have been attacking this problem successfully for over twelve years. I found an excellent fly-shuttle sley in use there, of which they have introduced over 12,000 in twelve years. I decided, judging from my experience of looms, that I could not do better than introduce this sley in the Central Provinces, as it was cheap (cost Rs. 5) and could be placed on a native loom without any trouble.

I also found dobbies for working silk borders in use in Madras, without which fly-shuttle sleys cannot be adopted where fancy pattern borders are woven. I bought samples of sleys and dobby and engaged a weaving master familiar with their working, to come to the Central Provinces.

I have introduced over 50 sleys in the Central Provinces, instructing the weavers in their use. This may seem a small number, but there has been a lot of prejudice to overcome, also there has been some difficulty in getting sleys made in the Central Provinces to withstand the great changes of temperature as compared with Madras; these changes cause the wood in shuttle race to warp or twist. I have had trouble also in getting sleys made, as the price must be cheap, but have now got a contractor to supply on a fixed rate of six rupees each.

Dobbies.—I have introduced eight Buggri Kuttari dobbies so far, and they are giving every satisfaction; but have not yet got a good working model of Ruifull dobby in work. This pattern of border is very popular in the Central Provinces, but the arrangement of the pattern makes it mechanically more difficult in working.

I am still working to get a suitable design, and meantime I am pushing on the introduction of sleys amongst weavers of coarse material, who do not require dobbies.

There are various other improvements such as a warp beam, warping machine, etc., which also can be introduced; but as these do not apply so much to increased output, I am leaving them meantime until the weavers have become thoroughly satisfied with the advantages of the fly-shuttle sley, when they will be more willing to adopt other suggestions offered by me.

Q. 110.—I have been trained as a designer of woollen goods, and since coming to the Central Provinces, after seeing samples of wool grown here, I am satisfied that a good paying woollen industry could be started in the Central Provinces. General.

Under instructions of the Director of Agriculture and Industries I ordered a hand loom, suitable to weave woollen goods. I bought warp yarn from Cawnpore Mills, United Provinces, and have had local wool handspun into welt yarn by villagers, near Nagpur. I have woven samples of cloth from these yarns, and obtained a cloth similar to Donegal tweeds. This cloth could be sold as a handspun, handwoven tweed, suitable for sports coats, caps, ladies' skirts, etc.; as no dye is used, the colour would not fade under the Indian sun.

The cloth could be sold as cloth, or another industry could be introduced by engaging a cutter and dhurries and taking up the making of sports coats, caps, ladies' skirts, etc. I am sure there is a trade opening in this respect, if one considers the enormous number of Norfolk sports coats worn by the students and educated classes in India, many of which are a very cheap mixture of cotton and shoddy. The price paid for them is high, and the cloth I suggest making would be cheaper and with better wearing qualities.

I have been in touch with many firms in Scotland who have started making high-class ready-made sports garments from the same type of cloth with great success.

Oral Evidence, 16th December 1916.

President.—Q. You have only been out a couple of years?—*A.* Yes, two years.

Q. So far as you are able to say, have you got any grounds for hoping that you can improve the weaving school?—*A.* Yes, I have.

Q. Have you seen any signs of improvement?—*A.* Yes, all the people who have taken up the improvements I have suggested, have stuck to them.

Q. Do you find among the people that there is a sort of ambition to take up improvements?—*A.* You find different classes of weavers. Some don't have much ambition. We take a lot of trouble to get them to try these things, but they are prejudiced against them. Other weavers seem to be quite anxious and have taken to them, but not very readily.

Q. Does their indebtedness, in any way, stand in their way?—*A.* I have never heard of that, because I give them the improvements on payment by instalments, and they have always been able to pay their instalments.

Q. What is your complete outfit valued at?—*A.* At the present time the complete outfit never goes above Rs. 12 or 14. The fly-shuttle sley costs Rs. 6, the shuttle 1 and the bobbies vary in price, the cheapest being Rs. 3-8-0, which makes it Rs. 10-8-0 for the cheapest outfit. The more expensive bobbies bring it up a little more.

Q. They frequently introduce a few minor improvements on their own account?—*A.* Oh, yes; and some want more improvements than we are willing to give.

Q. Have they got any sort of association for marketing their goods. Do they make a piece of cloth and hawk it about for the rest of the week?—*A.* They take it into the bazar and sell it. I am not so well acquainted with the marketing of the stuff.

Q. The weaver spends a lot of time in the bazar?—*A.* Oh, yes; time is no object when it is a case of making a bargain.

Q. The bargain might be done by somebody else; if there was some co-operative system of buying and selling?—*A.* That is so, if it could be managed. It is a very difficult thing to get the different weavers to get a uniform idea of value.

Q. You have not come across any attempt at co-operation among weavers?—*A.* Not among the weavers. There are some co-operative members in Bhandara, but I have had nothing to do with the co-operative society. I have been working for them to take the improvements.

Q. Do you think that co-operative societies would be of any use unless they are helped by technical men, so that they might improve technical methods as well as their financial condition?—*A.* Small co-operative societies would be of great use when they come to take machinery, for instance, in cases where one machine would do for a collection of weavers, say a warping machine. One weaver cannot buy a warping machine as one machine could supply a dozen weavers or more. Then a co-operative society would be useful.

Q. Would Kamptee be a good place for you to start a co-operative society?—*A.* I should say it would.

Q. What are the weavers there, some Mahomedans and some Hindus?—*A.* Yes.

Q. Do they work together?—*A.* As far as I have seen they are quite friendly and would work well together.

Mr. Chatterton.—Q. Have you any weaving school under your charge?—*A.* I have a demonstration place under my charge, where I can bring in a weaver from an outlying district and give him instructions. It is not a large school in the sense schools generally are. My work is to go into the bazar and teach him there. If he is too far out, and wishes to see the working of the loom, I bring him in, give him instructions and allow him something for loss of time, say, 8 annas a day.

Q. How many looms have you?—*A.* Four.

Q. And how long do you keep these outstation weavers?—*A.* Two months. If they are not fit to leave, I keep them as long as they need training. If I got a smart man, he would go out quicker.

Q. You simply teach him the use of the fly-shuttle loom?—*A.* Also the dobbie.

Q. Do they learn to work the dobbie in two or three months?—*A.* Yes, they all know the method of weaving fancy borders. The dobbie is only a mechanical method of doing what they are doing themselves.

Q. How many mistries have you got?—A. I have two teachers for weaving and one mistry carpenter for making the necessary alterations and repairs in sleys.

Q. You get these dobbies made locally?—A. Yes, I brought up one doobby from Madras and have had all the others made locally.

Q. Do you work with the School of Handicrafts?—A. I got some sleys made at the School of Handicrafts.

Q. Are you doing anything besides introducing flyshuttle looms, say, with warping mills?—A. I have one warping mill which I brought up from Madras. When any of the weavers come in, I demonstrate the use of that warping mill.

Q. In regard to woollen goods, are you doing anything yet?—A. I have made samples of woollen goods from the local wool. The local wool is not fine enough or long enough in staple to make warp yarn. I have bought warp yarn from the Cawnpore Mills and have had local wool handspun into weft yarn by the villagers.

Q. Do these local wool spinners work with a very primitive type of spinning wheel?—A. Yes, but still the principle is the same. They have running spindles. It does not matter what type of wheel is used as long as it gives the spindle a high speed.

Q. Do you think there is room here for establishing power supply for wool; is there sufficient power available?—A. There is a good deal of wool exported, and I believe a small plant could be used for carding and spinning.

Q. Do you know anything of the Welsh factories; those small woollen mills in Wales which are employed in making flannels for the miners?—A. I have been employed in Scotland, and also in the north of Ireland, and was managing a small factory which was making these goods. The fishermen used them for underwear.

Q. They have small woollen spinning mills there?—A. Yes, some make their own yarn.

Q. Would it be practicable to introduce something of that sort among the wool spinners or the weavers here?—A. Yes.

Q. Have you made any suggestions to the Department of Industries towards that end?—A. I have.

Q. Have you got any idea as to what it would cost for a demonstration plant of that type?—A. I could not give that off-hand. That is an engineer's problem.

Q. Have you had any estimate prepared?—A. No. I can easily get the information from home, because I have a plant in view that I have seen worked by water power. There is no water power here, but a small oil engine could drive the whole thing. They have a small teaser, a carding machine, a ring spinner and a scouring machine. The owner had a lot of hand weavers. He had a ring spinner to make his warp, and he also carded the wool ready for hand-spinning, and handed it out in the district to be hand-spun.

Q. Have you tried dyeing the wool?—A. Not here; at home.

Q. Would you dye the wool here for making homespuns before you spun it?—A. I am not inclined to do that. You have a very strong sun and the colour would fade. It can be done easily enough. It would be far better, however, if you use the natural brown wool. You could have a variety of designs.

Q. Do you think the weaving of wool in this part of the country is suffering from the fact that there is no machinery for spinning. Do you know how many women are employed to keep a loom going?—A. It will take a good many women to keep one loom going, because spinning is a very much slower process than weaving. A fast weaver in a handloom at home would do 20 yards per day. Twenty yards per day means 10 lbs. of weft, and unless you have a little plant ready for carding, it would take a long time. It takes a woman a long time to do 10 lbs. of handspun yarn. She would take 4 or 5 days.

Q. In reply to the President you said that time was no object to a weaver when he was making a bargain, but time is no object to a weaver even when he is on his loom?—A. He has not the same idea of keeping time when driving a bargain as he has at home when weaving. Every man values his time when it is a case of working.

Q. Do these weavers take full advantage of the improvements?—A. Yes.

Q. Are they making better wages here in the case of the 50 sleys you have introduced?—A. Yes.

Q. If you devoted attention to organised sales of their products, it would benefit them considerably?—*A.* I am a textile expert, and mine is a different sphere.

Q. If a person was deputed to organise a sale department, do you think you could introduce a much larger number of flyshuttles?—*A.* If there was a ready sale for the material.

Q. So that you think your work as a textile expert ought to be supplemented by another man organising a sale department of this weaving branch, either through co-operative credit societies or by the establishment of central agencies for the sale of their goods?—*A.* Through co-operative societies, not through agencies. My experience of agencies is that the same man is agent for several concerns and if your stuff is difficult to sell and he has something cheaper, for which he gets a ready sale, your stuff is neglected.

Hon'ble Sir R. N. Mookerjee.—*Q.* No one appoints agents who sell similar goods from different companies?—*A.* No, but if he has a different class of goods, and is getting an easy sale for it, he is not going to waste his time to try and sell yours.

Mr. A. Chatterton.—*Q.* Supposing you establish as an experiment a Government dépôt for selling the products of an improved loom, and put it in charge of some officer under the Director of Industries?—*A.* That is bolstering the thing up. You try to give them the improvements and put a trade in their hands. Except for introducing co-operation, I would not start to make a lot of agencies. I would rather give them a variety of stuff to make.

Q. Before you start co-operative credit societies to do this work, would it not be desirable to ascertain whether it is possible to establish co-operative societies for the sale of these hand-loom goods?—*A.* Not for the class of goods we are working at present. If it was a class of goods universally used, yes; but when you have localised products, I don't see that it would do much good.

Dr. E. Hopkinson.—*Q.* What method of selling do you recommend?—*A.* Personally I think the co-operative idea is quite good if you had a lot of weavers in small bustees. If you made half a dozen villages into a type of co-operative society, that would be a good idea.

Q. Would this society sell in the bazar?—*A.* The stuff is all sold in the bazar. The people who buy these things go to the bazar to buy them. I know, for instance, there is a bazar in Kamptee every week. All the cloth there is held by the bories. The village men sell to the bories, but that is the place where the public come.

Q. You think that is the best means of selling it?—*A.* That is the only way that I see in order to reach the people in the district, who want the goods.

Q. How is the weft yarn and the warp bought?—*A.* It is bought from these agents in the bazar. There are men in the different bazars who sell the yarn, and each individual weaver buys. In the co-operative movement they have dépôts to sell yarn to members on more favourable terms.

Q. Do they usually pay cash?—*A.* I don't know.

Mr. C. E. Low.—*Q.* I understand that the Government Commercial Agent assists you in the matter of the sales?—*A.* We found that it was very expensive to have a commercial agent who was not an expert in weaving, so latterly I have not had the commercial agent going round.

Q. Then the sales department of the business must have been left to take care of itself?—*A.* The sale comes from demonstration in different villages.

Q. I mean the sale of cloth?—*A.* I don't know anything about the sale of cloth; that does not come in my sphere.

Q. The man is not working in touch with you?—*A.* Not in regard to selling cloth.

Q. Not selling cloth but arranging a market for weavers?—*A.* He may be, but I have not been in touch with the man in regard to that.

Q. That is rather an extraordinary state of things. If you get a man a loom which will make more cloth, he naturally wants more finance to enable him to buy more yarn and hold more cloth?—*A.* As far as I am concerned, if I get them to adopt my improvements and if they are benefiting by them, I am finished. It is technical instruction that I am trying to give.

WITNESS NO. 145.

Mr. E. Cove, Head-master, Government School of Handicrafts, Nagpur.

Written Evidence.

Q. 45.—Long before technical schools were started in England, workmanship standards were good. A boy could, and did, learn his trade thoroughly, by the apprenticeship system. That was because, even then, England was a comparatively advanced country. Technical schools in England were only started to supplement a boy's training, chiefly in the matter of drawing. It is different in this country. Unless a boy attends a technical school or serves an apprenticeship in a railway or other big workshop where Europeans are employed, how is he to become a really skilled artisan? Certainly he cannot learn much in bazar workshops. Technical schools are, therefore, in my opinion, peculiarly necessary in this country. Training of labour and supervision.

Q. 48.—For a school to be a success it is necessary to recruit teachers from the ranks of those who have made the business a success to the extent of getting a good living by it. This is the method followed by the controllers of probably the largest number of industrial schools in the world, namely, the Education Department of the London County Council. They have found that while it is desirable to have teachers who have been trained in the art of teaching craftsmanship, it is necessary to import into the schools ordinary craftsmen from commercial firms, not only to show the latest workshop methods but to give the pupils some idea of working against time. I would bring out European craftsmen as teachers on a five years' agreement. If they renewed the engagement they could be given posts as head-masters of branch schools; if they preferred not to renew, the schools would not suffer by it as fresh men with newer ideas could be drafted into their place. During their five years as teachers, these men would be qualifying for head-masterships and their most skilful and able pupils would become instructors.

To reduce expenditure on scholarships, I would, if I had responsible teachers as suggested above, make the boys work on commercial jobs as apprentices do at home where they are made to be a source of profit. A boy cannot learn a trade without making something, and there is no reason why it should not be of a useful size. It gives a boy more interest in the work of his hands if he knows it is not going to be scrapped as soon as it is made. No idea of working against time can be gained by making miniature articles.

To keep the school workshops busy with plenty of work, Government should stipulate to Executive Engineers that technical schools should be given the option of undertaking the joinery and ironwork of Government buildings. This would be a distinct advantage to Government as well as to the schools, because at present the appearance of some Government buildings is completely marred by the woodwork, which by reason of bad workmanship is quite unsightly. This could not be regarded as competing with private enterprise because profits would go to the pupils in lieu of scholarships. But it would be an effective way of training boys, and the item of scholarships (by no means a small one) would be saved.

Brief history of the School of Handicrafts and Mochi School.

The School of Handicrafts was opened in April 1913 with a capacity for 36 pupils in the workshops, drawing class-room and hostel. The course was for three years. Trades—Smithing, fitting and turning, carpentry, wheel and cartbuilding, painting and polishing. Included in the curriculum were drawing, measuring, calculating: the English names of tools and materials, manufacturing processes of materials and all about oil-engines. Only boys of artisan castes are admitted.

One batch of 14 pupils have as yet finished their course. Two of these have taken charge of a branch school that we have started in Saugor and they are teaching carpentry and drawing: three are working in a similar capacity in our school: one became a teacher in a Mission school on Rs. 25-0-0; two are working in the Gun Carriage Factory, Jubbulpore: one in the railway signal department; two in a cabinet making firm, and the rest, I believe, are working in their villages where the tools that we supply them on leaving, are a source of admiration and education to the villagers. A good proportion of these tools were made in the school.

At the beginning of this year, on the recommendation of Mr. Sly, who expressed himself as very satisfied with the school, the Chief Commissioner passed orders for the capacity of the school to be doubled. At this time I submitted a proposal to admit older boys and to shorten the course to two years, as I felt that we were wasting time and money by training small boys of 13 and 14 years of age who were really too small to hold the tools. This proposal was accepted, and now only boys of 16 years and upwards are admitted, the value of the scholarships being increased by one rupee. Being a two years'

course we require 36 fresh pupils each year. We have now, or will have when the boys return from vacation, given on account of plague, ten third year boys and thirty-six first year boys, made up of twenty-six new and ten 2nd year boys, or 46 in all, which will be increased to 72 next term.

In this school a lot of improved agricultural and industrial tools and implements have been made to my design, from a potter's wheel up to a large eight-tined automatic and adjustable seed-drill which is being used by the Agricultural College and is reported on as satisfactory.

Synopsis of development.

This school is in process of doubling, the extensions being well in hand.

A branch school for 24 boys has been started in Saugor.

Schemes for branch schools at Amraoti and Jubbulpore are under consideration by the Local Administration. It is probable that the Amraoti branch will start from 1st of next April.

Mochi School.

This was started in a hired building in April 1912. It has been housed in the main building since February 1914. Mostly adult pupils are admitted. The course is between one and two years according to the aptitude of the pupil. No scholarships are given, but after deducting the cost of materials from articles sold the balance is handed over to the makers. At first they earn very little, but as they progress they earn anything up to Rs. 25 per mensem. Nineteen mochis have been fully trained and have received the school's certificate. About the same number have come in for short periods, ranging from one to three months. Tools are purchased for each passed pupil out of deferred pay, and with these tools and a small cash balance they start in business. They get together by threes and fours and open a shop. One of these small associations of passed pupils is employing fifteen or more outsiders whom they are teaching. I have obtained for them large contract orders, which I have distributed according to the outturn capacity of each association. I am responsible for the quality of the work and the regular outturn.

Lasts being difficult to obtain we make them in the carpenter's shop and sell them to the passed pupils. Labour-saving devices are also made. In short, anything to help these men and foster their enterprise, that can be done by the school, is done.

Brass hollow-ware making from sheet.

The question of helping this industry has been thoroughly gone into and the details have been worked out. This is briefly the situation. Brass hollow-ware making is at present a cottage industry, the tools required being a pair of shears, a hammer, an iron block and a soldering-iron. Try to increase the worker's outturn and it can no longer remain a cottage industry for the simple reason that the only alternative to hammering the sheet into shape is to press it, and presses cost £ 500 and more. Cannot the matter be compromised by inexpensive hand-power presses? No! Whether you press by hand or by power, you have got to provide an apparatus capable of exerting, for a Goond (water vessel), a pressure of approximately a hundred tons. Such a press with toggle-drawing dies would cost Rs. 1,000 and would give about six operations, that is, six Degchies an hour. A power-press, on the other hand, would cost Rs. 8,000, and would give from 600 to 900 Degchies an hour with the same number of labourers.

The only inexpensive plant we can introduce is a lathe driven by a small oil-engine. Sheet workers can spin Thalis into shape on this. A wooden die is chucked on the headstock and a brass disc is held up to it by a ball-bearing centre in the tailstock; then by means of a wheel-tool held in the slide-rest, the disc is spun into Thali shape. Afterwards, the Thali is given a fine polish, which is a comparatively easy matter when your lathe is being driven by an oil-engine.

We have such a spinning and polishing plant touring the province now, demonstrating at brass and bell-metal working centres. Bell-metal workers would find such a plant particularly useful, as their castings being very hard, make it a slow and laborious work to produce a fine finish and polish, using the primitive Karat revolved by a man pulling a strap. To spin a Thali on this lathe is the work of about three minutes; by hand the same job takes an hour. This small plant will suggest to moneyed men the possibilities of power-presses and spinning-lathes, and it may encourage them to invest in a small factory like the factories of Bombay and Poona. The engineer in charge of this plant is well equipped with all the information necessary, having worked in such a factory. A small disc-cutting machine accompanies the plant.

I suggest that the following demonstration factories could be started.

There is no doubt whatever that unless the brass sheet hollow-ware makers of this province adopt power-presses and spinning-lathes, that is, unless they start factories, the ousting of their trade by aluminium ware is only a matter of time. Already, this ware is found in large quantities in all the bazars of the Central Provinces. I consider that this fact makes out a good case for starting a demonstration factory. I have talked to moneyed men in the brass trade on the subject and have suggested that they start a factory, but being so ignorant, having never been out of the province in their lives, their attitude of mind with regard to power-presses is the same as our attitude was a generation ago with regard to flying. If they saw pressing and spinning demonstrated, I think there is little doubt that they would readily pay the full price for a factory in good working order, so that Government would have no difficulty in disposing of the factory. My opinion is that Indians are ready enough to invest their money in ready-made concerns, but that having no experience and little enterprise, they wish to be saved all the trouble of working out the scheme.

Another demonstration factory that could be started by Government is a sawing and planing mill to which I would add a wheel-making department. It is cheaper to buy ceiling matchboarding that has come all the way from Europe than to buy locally made matchboarding. Hand labour cannot compete against machines. In Nagpur there is no saw mill; every thing has to be cut up and planed by hand. Again, wheels can be better and cheaper made by machinery than by hand. The machine gives precision, by comparison to which the craftsman's work is erratic and unreliable. The following machines would be required:—Spoke lathe; Spoke tenoning machines; Hub boring and mortising machines; Tanging machine; Fellow planer; Rim, dressing machine; Boring and boxing machine. As an alternative to a wheel-making factory I would suggest a peripatetic show consisting of a few hand-power machines for mortising and boring, tanging, tyre-bending and tyre-shrinking.

Lastly, there is a real need for a chrome tanning factory. Chrome leather has caught the popular fancy and nearly every wearer of modern shoes insists on getting chrome. We use nothing else in the school, and our passed pupils are asked for nothing else. A tanner in Kamptee told me that he would willingly employ a man, European if necessary, to teach him chrome tanning and to organize his factory. Government should employ an expert either to go round teaching at the tanneries or to start a demonstration factory. Perhaps, the latter would be the more successful way of introducing chrome tanning because the factory would be open to all to come and learn and to copy from, whereas in the former some factories would have to wait a long time for a visit from the expert.

Oral Evidence, 16th December 1916.

President.—Q. If these factories, which you recommend, became successful the ordinary worker would be knocked out except such as those who come into the factories, and the rest would have to find their living elsewhere. Do you think that there is any real prospect of introducing improved methods in this way and thereby displacing large numbers of hand workers?—*A.* I think the factories are bound to come in for this work—aluminium as well as brassware.

Q. You want the same thing to be done in the case of brassware and copper?—*A.* They prefer brass to aluminium.

Q. The result will be the displacement of some thousands of workers in this part of the country?—*A.* Yes. There are about 22,000 workers in the Central Provinces.

Q. You could not employ 22,000 workers in the factories?—*A.* We can employ at the outside, say, 1,000 workers.

Q. Will this make you a cheaper article and thereby increase the total sale of copper and brass goods?—*A.* Yes.

Q. And the country will have to import more copper and more brass?—*A.* Yes.

Q. The country will not be wealthier for that? In the same way if you had a central factory for the making of wheels, say, at Nagpur and a sales agency organised on business lines at Kamptee, the village wheel wrights would have to go somewhere to get a job?—*A.* Certainly it would knock out a lot of hand labour. But I propose an alternative—a peripatetic show consisting of a few hand-power machines.

Q. If they are not more efficient they will never be accepted. If they are more efficient they will knock out a certain number of workers?—*A.* The wheels will become cheaper.

Q. Actually cheaper than the present wheel?—*A.* They charge Rs. 25 per pair for small kachha things.

Q. You say, "To keep the school workshops busy with plenty of work, Government should stipulate to Executive Engineers that technical schools should be given the option of undertaking the joinery and ironwork of Government buildings"?—*A.* We would only accept sufficient work for our class purposes, for the purposes of the course of training.

We would not keep the whole course on one kind of work. If a boy wants to become a joiner he has to learn to make doors, frames and windows. That is what we want to teach him. By doing this work he learns to work against time.

Hon'ble Sir R. N. Mookerjee.—Q. Suppose there is a building to be constructed and the Executive Engineer asks you to supply all the doors and window frames and the building is to be completed in twenty months, will you be able to make all the things necessary?—*A.* I suggest an option. We can do as much as we can. We are not always building such a large building as this. The idea is to teach a boy to work against time and also to save scholarships.

President.—Q. In Bombay I understand that they have a scheme by which they give marks for the total quantity of work done from the time the students enter the school to the time they leave it after a four years' course. They do not manufacture doors and windows but they have select articles which they make, and they get marks for the quality and quantity of work. Consequently a boy knows that if he loses five minutes he will never be able to make them up in the rest of the four years. It introduces a good spirit?—*A.* What do they do with the work they make?

Q. I do not know?—*A.* If you are going to scrap the article as soon as it is made the boy will be discouraged. I do not think that you can teach a boy to work against time if he has to make miniature articles only to be afterwards scrapped.

Q. My experience is that if you devote the school supplying orders in competition with ordinary private enterprise you think more of producing the articles than of training the students?—*A.* We always put so many boys on one kind of work at the same time, and thus a spirit of competition enters into the work.

Mr. A. Chatterton.—Q. You have been in this school for 3½ years?—*A.* Yes.

Q. Previous to that you had experience elsewhere in India?—*A.* Yes. I was in a Mission school for 12 months.

Q. You say in your note that it is desirable to get plenty of work for the school?—*A.* That they might be taught to work against time.

Q. And also become expert in particular occupations?—*A.* Yes.

Q. You say that in India technical schools are peculiarly necessary?—*A.* Yes. By that, I mean trade schools.

Q. Your school is confined to sons of artisans?—*A.* Yes.

Q. I should like to know from your experience whether there is a real demand for improved artisans in the villages from which you are drawing these students?—*A.* I do not think there is any demand in the villages yet, but it will come, if improved agricultural implements become more popular.

Q. What does the village carpenter do in the village?—*A.* He makes ploughs and wheels.

Q. Does he make any furniture at all?—*A.* They do not have any furniture in the villages.

Q. Do you expect your boys will go back to the villages, or do you think they will be able to find employment in towns?—*A.* A portion of them will have to go back to the villages if they do not find work in the towns. I suppose 75 per cent. will find work in the towns, and the rest will have to go back to the villages to benefit the craft, to educate their fellow craftsmen.

Q. In each village is there more than one carpenter?—*A.* It depends upon the size of the village. Some of our boys come from villages that contain only one family of carpenters, I think.

Q. Take an ordinary village implement—the country plough—do you think that you can make it with improved tools and better methods of construction?—*A.* Of wood? No.

Q. You do not teach your boys how to make the implements which they will have to make when they go back to the villages?—*A.* We give them a general training in order that they may be able to tackle anything of the kind. My opinion is that the next stage of improvement to the wooden plough is the iron plough. These ploughs are tipped with iron.

Q. Do your blacksmiths make these iron-tipped ploughs?—*A.* It is a simple thing. We teach them something superior.

Q. You say, "There is no doubt whatever that unless the brass sheet hollow-ware makers of this province adopt power-presses and spinning-lathes, that is, unless they start factories, the ousting of their trade by aluminium ware is only a matter of time"?—*A.* I do not say that it is desirable.

Q. Would it not be advisable to introduce aluminium?—*A.* Yes. But I think that brass will be more popular for years to come. They prefer brass.

Q. Do they take to aluminium?—A. Yes. It is cheaper, weight for weight. But they do not like it and prefer brass.

Q. If there is a possibility of the manufacture of aluminium in India itself, would it not be an advantage to encourage aluminium so as to create a market for it and help to bring about the establishment of a large factory?—A. Yes, because aluminium has many advantages over brass.

Dr. E. Hopkinson.—Q. Under what department of Government does your school come?—A. Under the Department of Industries.

Q. You make your reports to the Director?—A. Yes.

Mr. C. E. Low.—Q. You say, "During their five years as teachers, these men would be qualifying for head-masterships and their most skilful and able pupils would become instructors." What type of instructors? What degree of responsibility do you suppose they would eventually be able to rise to?—A. To run the practical part entirely, under supervision.

Q. They may become capable of being put in charge of schools of handicrafts?—A. No. I do not think so.

Q. Supposing you had the system of teaching manual work in primary schools, do you think such men would be suitable for the purpose?—A. I think so. We have instances of that. Some of our pupils are already teaching in schools and are doing very well.

Q. You say that you give tools to these boys. Can you give one or two instances where the tools will give the boy an advantage over the ordinary village tool?—A. They cannot make anything smooth with their own plane. Their saws are never straight, they are always a little hollow, and consequently cannot cut anything like so quickly. I saw two men tugging at a little saw like this, and I substituted one of our English saws and the man was able to do more work by himself than by having another man pulling at the other end. As regards shoe makers, there are no improved tools. They have to use the same tools.

Q. Has any of the mochi associations invested in sewing machines?—A. Two of them have.

Q. Have you yet recruited any bigger boys for your two years' course of carpentry and blacksmithing?—A. I have twenty-six of these older boys.

Q. How do you find them pick up work?—A. The big boys get hold of it much more quickly.

Q. Had they been doing any artisan work in their own houses before they came in here?—A. No. They might have helped their fathers, but some of them had never even seen a file.

Q. Do you find that they have forgotten what they learnt in the primary classes?—A. No.

Q. Because ordinarily one finds in the villages that the boy who has been through these primary schools has often forgotten in a few years even to write his name?—A. I have not noticed it. We find that they can write.

Q. In this brass spinning, can you spin anything but thalis?—A. Only Degchje lids. Goonds require three operations of pressing and three operations of spinning.

Q. You told me yesterday that your passed mochi pupils need financial assistance. How do you think that could be arranged?—A. I think the Director of Agriculture and Industries might be given some money for the purpose of helping the mochi boys who form partnerships, but I would not give it to men who, I think, would run away.

Q. That is, the financing agency should have some form of supervision with regard to their honesty and efficiency and so on, and obviously Government cannot do it to an unlimited extent?—A. Not on a large scale.

Q. Have you thought out whether any financial organisation could be started to meet that difficulty?—A. No.

Q. Could you think of any other industries which would need the same kind of financial help?—A. I have not thought of any industry like that. It would not touch the brass workers.

Q. Not as they exist, but if you give them these spinning-lathes?—A. The plant that we have demonstrated will cost Rs. 1,500.

Q. Some of your mochi associations are taking as much as that?—A. Yes.

Q. Would they not want a small advance?—A. When they see the success of the plant they will take it up.

Q. It is more likely to be taken up by the banias at present?—A. Yes.

Q. Do you know whether there is already in India a matchboard making factory or wheel-making factory?—A. I do not know of any in India. Here is a case of the need of sawing mills. (Witness reads the rates from a book.)

Q. As regards matchboarding are there any Indian woods in this province which you have come across, which will be suitable?—A. Only teak.

Q. Deodar would be suitable, I suppose?—A. Yes.

Q. Have you seen anything of the work done in concerns in Assam which make tea boxes?—A. I have not seen it. I had a case to-day. The ordinary dealwood matchboarding which comes from England costs Rs. 19-8-0 for 100 sq. feet. I asked what it would cost to make it at Nagpur, and I was told Rs. 30.

WITNESS NO. 146.

Sir Bomanji Dadabhoy Mehta, Kt., Manager, Central India Spinning, Weaving & Manufacturing Co., Ltd., Empress Mills, Nagpur.

Written Evidence

With no desire to appear as a witness, I beg to submit for the consideration of the Industrial Commission, for what they may be worth, the following suggestions without any claim to their being original or novel.

**Mercantile marine
and ship-building.**

It is essential for the progress and development of Indian industries and commerce that India should possess its own mercantile marine for the transport of at least some portion of its imports and exports by sea. It would enable India to meet in a measure any unfair international competition in commerce. This has been well demonstrated by the Japanese having their own steamship lines. They have not only been able to stamp out the imports of Indian yarn into their own country, but have been most successful in competing with it in the China market; so much so that the latter, once a lucrative monopoly of the Indian mills, is gradually but inexorably slipping off their hands. Already the Indian and Japanese exports of yarn to China about balance each other; and the former are steadily declining. The recent failure of the group of the Greaves Cotton Spinning Mills in Bombay may be said to be largely due to this cause. Having their own shipping, the Japanese importers and exporters can co-operate and combine to import cotton and export manufactures at favourable freight rates. They are even now actually importing into India itself their manufactures and competing not only with the home products, but also with those of Lancashire. I do not say that their mercantile marine is the sole cause of this success; but there is no doubt that it is one of the principal contributory factors. That great far-seeing practical industrialist, the late Mr. Jamsetji Tata, having had some knowledge of a few Bombay merchants having owned ships in olden times and acquired wealth, appreciated so greatly the importance of a nation possessing ships of its own that he endeavoured years ago to interest Bombay capitalists in a scheme for purchasing or building even three or four ships for the China trade which he considered as being much handicapped by foreign companies imposing exorbitant freight rates. When he did not succeed in his laudable object, he turned his attention to another direction. He persuaded a Japanese shipping company to compete with the powerful P. & O. line, undertaking to reimburse such losses as the former might sustain by the latter reducing its own rates just to drive out a rival from the field. Before making himself responsible for such losses, Mr. Tata had obtained assurances from the leading shippers to patronise the new Japanese lines exclusively at a fixed rate. The opulent and powerful P. & O. Co., finding the business to China slipping out of its hands, adopted the bold expedient of reducing its own freights to a nominal figure. The bait, though a short-lived one, of exports to China at almost no cost, was too strong for the shippers to rigidly adhere to their compact. They gradually managed to wriggle out first by shipping their goods in other names and then openly breaking away. Mr. Tata, not very wealthy at the time, was thus forced to admit defeat, having lost Rs. 2 to 3 lakhs himself, and the scheme fell through. I mention this incident especially to show the importance he attached to an indigenous mercantile marine for the protection and development of the overseas trade of India. And its necessity is being more and more accentuated by the growing importance of India in the international markets all over the world, and especially in times like the present. The profits of foreign carrying companies from their Indian business constitute no small economic drain from India. Government would therefore, in my humble opinion, be quite justified in giving what aid it can legitimately do in starting an industry fraught with such immense potentialities for the benefit of the people and the State itself during critical times. This aid might take the form of a guarantee of interest on the capital invested as in the case of the Indian railways when first inaugurated, or subsidies on some such terms as are now being offered by the Japanese Government to joint stock companies formed for the purpose of manufacturing dye-stuffs in Japan.

Again, from the point of view of the country's industrial welfare it is desirable that ships should be built in India. The Government Dockyard at Bombay was once famous for the ships it turned out for merchant princes as well as the Imperial Navy, but those ships were exceedingly simple, compared with the leviathans of the present day, which are the products of the best expert scientific and technical knowledge, skill and calculations. To permit of their construction in India, it would be necessary to import a number of designers and supervisors from England or other countries for some years. The benefit that would be conferred on our artisan classes as well as those aspiring to higher industrial professions would be very great. Accuracy and skill in the use of tools, and the habit of observation as to the smallest details, which are now so wanting in some of our best artisans, would be rigidly enforced and acquired.

It might be objected that the time for an Indian ship-building industry is not yet, but if we wait for a generation, we shall find ourselves then just in the same position as now. It would be a costly commencement certainly, but one fraught with potentialities. If Japan could build both mercantile and warships assisted by imported experts and material at first and be so successful now as to dispense with foreign aid, could not India with its British rule and British connection do the same? Of course the beginnings must be slow, and perhaps an Indian company on its first formation may have to buy foreign-built ships with Government guarantee as to interest, to meet any unfair competition; but in time it must begin building ships if it is really to be prosperous and successful. We have now an iron and steel industry which already is prepared to expand greatly and which even now supplies pig-iron to Japan, and we may confidently hope that most of the material for ship-building could be produced in this country in time.

If Government naval yards could also be established in Indian harbours, there would be much wider opportunities offered to the Indian people of acquiring industrial skill, knowledge and experience, which technical schools or technological institutes, though beneficial in their own way, can scarcely afford. The building of battle-ships in India would be no little gain to the Empire itself. As a well-equipped independent unit of the Empire in crises like the present, which let us hope may never recur, or even in less critical times, India would be of invaluable assistance to the mother-country. In minor matters, it would help to minimise labour troubles in other parts of the Empire. These essential adjuncts to industry may be expected to give no small impetus to India's economic progress and prosperity. I believe, the foundations of Japan's wonderful political and material development were laid when the Japanese took to making their own locomotives and building their own merchant and warships.

In the matter of railway communications, Government is doing what it can so long as its finances will permit in laying down new lines. But one wonders what it could mean when small gaps are left in a large through system which would otherwise lead to direct communication with important parts of India and increase the development of industry and commerce. For instance, the Central Provinces and Berar cannot communicate direct either with the south or the north without making long detours from certain important centres of trade. The south could have been easily reached years ago by a direct route, saving an unnecessary haulage of some 500 miles, if the small gap of about 200 miles between Ballarshah and Warangal could have been bridged. The necessity of this link has been seen and discussed for years, but why no steps have been taken so long is a mystery. The difficulties in the way could not be insurmountable. I enclose copy of a representation made to the Local Government, and I understand the Hon'ble Sir Benjamin Robertson has taken up this important question with the authorities concerned. We may therefore hope that it may not again be shelved, as it has hitherto been done. Then the Nagpur-Itarsi line, which gives the Central Provinces and Berar a shorter and direct route to Northern India, has after years been in an advanced stage of construction, leaving a gap of some 60 miles for want of finance, and thus the object of a very short and direct route is for the time being at least frustrated. Such obstacles must retard the growth and development of traffic.

Besides these two gaps, there are to be noticed some very insignificant, and for that reason all the more irritating, gaps left with what reasonable object it is difficult to understand; but they offer real obstructions to potential traffic. There are two instances in this neighbourhood, *vis.*, at Chhindwara and Chanda, where the termini of the Great Indian Peninsula and the Bengal-Nagpur Railways are only separated by about 6 miles each. If company-managed railways are to remain and work side by side with the State-managed ones—and it is desirable they should—then self-interest should be subordinated to the public good, and the Railway Board, as the chief controlling authority, must have power to brush aside any petty jealousies. I enclose copy of correspondence with the Bengal-Nagpur Railway on the subject of the short gap at Parassia.

The Bengal-Nagpur Railway narrow gauge line, which terminates three miles from Nagpur, if brought up to Nagpur, would also save much vexatious delay and inconvenience to local traffic, besides releasing a number of broad gauge wagons used for haulage between Itwari and Nagpur. Surely there can be no insuperable difficulties in the way, and when once overcome, the advantage both to the public and the railway by the saving of wagons and facilitating traffic will more than compensate the small cost of bringing up such lines to their natural destination.

The doubling of the Great Indian Peninsula line up to Nagpur, though sanctioned years ago, is proceeding very slowly, and the Bhūsawal-Nagpur section therefore suffers severely from congestion during every busy season. With the expansion of traffic in cotton, manganese and other commodities, the situation is growing more and more acute year by year and the railway is frequently compelled to summarily prohibit all bookings at intervals to clear deadlocks along the line or large accumulated stocks at stations. The hardships and financial losses thus caused to trade and industries, great as they were already, have been further accentuated since last year by the unprecedented situation created by the new factor of coal traffic to Bombay, the tonnage crisis caused by the War having suddenly thrown on the railways the burden of handling the whole of this traffic hitherto served by the sea. The resources of this congested section are thus being highly strained, and it seems to me imperative that the construction of the whole of this double line and other connected works, like the remodelling of the yards at Nagpur and other centres, be pushed forward to completion as vigorously and expeditiously as possible.

* The system of sanctioning and even proceeding with open-line or new projects, but not allotting sufficient funds to carry them out continuously to the end, must cause a great and unnecessary waste of energies, materials and interest. It seems an unbusiness-like procedure to make such projects dependent on fortuitous factors like surpluses or other budget arrangements which might vary from year to year. A sound business corporation would in no circumstances consider it prudent to carry out its own projects in this piecemeal fashion. When once, after full consideration, any scheme for the improvement of an existing line or the construction of a new one is sanctioned, it ought not to be starved for funds; but carried through to the final stage at all costs. Surely the advantages expected from all such schemes, when in full working order, must more than counterbalance any temporary financial inconvenience.

The cotton industry.

The cotton industry, though making steady progress, is capable of great expansion. The most serious handicap is want of steady and skilled labour for finer work. Long stapled cotton can be imported, as is done in Europe and elsewhere; but any competition with the finer goods, which constitute the bulk of our imports, connotes concentration in work, skill and agility which are sadly lacking in the mass of the operatives as are found in Indian textile mills. There is a constant cry from every manufacturing centre of irregularity in attendance, and there must be few cotton mills which are not suffering from shortness of labour. The reason is not far to seek. Mill life, as it is understood in India, is one monotonous round of drab, dreary toil. Grinding work for 12 hours a day and 312 days in the year must turn away many an earnest worker. Wages alone, though high enough, cannot compensate for the rigours of such a life. Labour then takes the remedy in its own hands, attends when it suits its purpose and absents itself when it can. The dawdling habits of the operatives are also to be ascribed to the same cause. The true remedies for this state of affairs are shorter hours of work, more holidays, and provision of some rudimentary comforts for work-people. Welfare work in the direction of providing healthy and comfortable dwelling-houses, play-grounds, recreations, education for the children of the operatives, medical aid, hospitals, etc., is becoming an indispensable desideratum of factory life, leading not only to their contentment and happiness, but also to the prosperity of the industrial concerns themselves. But above all, elementary education of work people must be the foundation on which this welfare work could be based. Without it the best dwellings will be turned into hovels; sports might lead to squabbles and recreation rooms to drink-shops. In the eloquent words of the late Mr. Gokhale: "With the diffusion of universal education, the mass of our countrymen will have a better chance in life; with universal education there will be better success for all efforts, official or non-official, for the amelioration of the people, their social progress, their moral improvement, their economic well-being." * Mass education alone will raise the general level of intelligence among the whole community; it will inculcate in them a more refined standard of living and broaden their outlook, thus bringing into play factors which must necessarily react on the industrial efficiency of the worker. This has been the experience of every civilised country in the world. Elementary education was made universal in Japan only forty years ago, and I believe in this lies the secret of the amazing success she has since achieved in all her pursuits, whether of peace or war.

* Though, as I have stated above, the long-staple cotton can be imported, it would accelerate the development of the Indian cotton industry a good deal, if it is successfully grown in large quantities in India. The best indigenous long-staple cotton was once the famous Hinganghats, the whitest, cleanest and strongest staple in the world; but unfortunately owing to its poor yield per acre it has all but died out. Many exotics have been tried by the Agricultural Departments all over India. Some of these have given great promise of success; but in almost every case the results have been disappointing, due in a large measure to the cultivators and dealers not understanding their ultimate interests, and with a view to present gains, mixing the long staple with the short, which is a comparatively abundant yielder. I think Government should devote their attention by every means in their power to increase the yield of the indigenous long staple or Bani, as the exotics seem to deteriorate on account of adulterations, combined no doubt with climatic influences. The average yield of lint per acre in India is not even half that in America, and that of long staple considerably less. Per-

sistent attempts in the direction of intensive cultivation, especially in connection with the long-staple variety, are necessary towards discovering such chemicals or other artificial fertilisers as are best suited to the Indian soil and climatic conditions. A few American expert agriculturists may also be employed as an experimental measure towards this end. In several districts, the rainy season being of short duration, the cotton plants do not get sufficient moisture for the crops to be matured, and irrigation in such cases would help greatly the increase of yield, especially of long-staple cotton.

The local Agricultural Department is doing much useful work in this direction; but it is a fact that it has almost been obliged to give up experiments with the long staple and devotes itself more and more towards encouraging the shorter staple, which is such an abundant yielder. The department is quite justified so long as the cultivator obtains a comparatively more remunerative return for the shorter staple on his farm, but I do not think we should despair and give up further trials with fertilisers of different kinds and with irrigation, where possible, towards improving the yield of the long staple. Even if there is failure in one province, there are no doubt other parts of India more suitable for growing long-staple cotton, and the yield there might be capable of great expansion under the right kind of fertilisers or irrigation or both.

It may be mentioned in passing that if the Agricultural Departments in all parts of India, as in these provinces, looking to the immediate interests of the cultivators, encouraged the growth of the short staple, as it certainly would prove a more abundant yielder under similar circumstances, than the long staple, a time must come when the price of the short staple will fall in relation to the longer one and the former possibly become a drug in the market. It may then take years to revert to the long staple.

If even some approach to the American yield is practicable in India, the problem of the long staple indigenous cotton would be solved, the crop would be enormously increased and thus a powerful stimulus would be imparted to the development of the Indian cotton industry, benefiting growers, spinners and exporters alike. The demand on cotton crops throughout the world is continuously outgrowing the supply, and American cotton prices, even during the present War crisis, have soared to heights which were only reached during the Civil War. It is even feared that in a short time America may utilize the whole of its crop for its own manufactures, and Lancashire will have to look for its raw material elsewhere. It is therefore imperative for the Government of India, and even the Imperial Government, to leave no stone unturned in exploiting the possibilities of the Indian crop.

Knitting and hosiery work would be a suitable cottage industry as an adjunct to hand-loom weaving. The Indian market in these goods is now practically a monopoly of Japan, where the industry is worked mainly as a cottage one. But the machines required are costly and beyond the means of the Indian cottage worker. It is, however, well known that sewing machines, though also beyond the means of the poor, are to be seen working even in villages all over India. This is due to the enterprise of the Singer Sewing Machine Company, whose agencies are studded all over the country and who, by their system of hiring out machines or selling them on the easy-payments system, have succeeded in establishing a vast and lucrative business. It is on the same lines that hosiery and knitting machines can be spread over the country. Government might subsidise one or more machinists to establish agencies for this purpose. If the Singer Sewing Machine Company, with its large number of established agencies, could be induced to undertake the business, it could work it much more cheaply than other machinists who would be new to the country and who would have to incur a large expenditure in establishing and running their agencies.

Cottage industries.

If forests could be made far more accessible than they are, the timber trade could be greatly developed. India, with its variety of climates, is believed to be capable of growing every variety of trees, and yet wood and wood-work is imported from foreign countries, because the cost of transport, etc., of the indigenous article is too high! Government might aid the development of the timber industry by providing wire ropeways, tramways and light railways, and even up-to-date saw mills, in all parts of the forests, so that accessibility to them may be made more easy and cost of transport greatly reduced. Government might even cut down, stock, and season wood ready for use. It might be costly at first, but in the end it would pay. Capitalists could in time see their way to start saw mills and work the timber traffic themselves, provided that every forest is made accessible in every available part, and the railway or transport charges made reasonably low so as to withstand foreign competition.

Forests and wood-working industries.

The textile industry requires large quantities of wood bobbins, tubes, shuttles, sleys, rollers, bowls, etc., for which India could supply suitable timber. We hitherto received these from England, but Japan has also for some time past been successful in exploiting the Indian markets in these lines. There is no reason why this industry should not be started in India; but with its control of forests and its large resources in regard to expert knowledge, etc., the pioneering work must largely rest with Government in the initial stages at all events.

All industrial and commercial activities in India are being seriously handicapped by the periodical stringency in the money market every busy season. Mr. Chamberlain's Commission on Indian Finance and Currency have given it as their opinion that this stringency is in a large measure created by the revenue operations of the Government.

Discount rates.

itself and have strongly favoured State action for its relief by means of temporary loans to presidency banks from the treasury balances or the paper currency reserve. The subject has been fully dealt with in paragraphs 136 to 165 of the Commissioners' Report. I think Government should proceed to give effect to their recommendations under this head year by year as soon as the presidency bank rate for demand loans goes over 6 per cent.

Correspondence No. 1.

The Ballarshah-Warangal Railway Project.

No. 294, dated the 5th August 1914.

From—KHAN BAHADUR SIR BEZONJI DADABHOY MEHTA, Kt., Manager, Empress Mills, Nagpur,

To—C. E. Low, Esq., C.I.E., I.C.S., Director of Agriculture and Industries, Central Provinces and Berar, Nagpur.

I have the honour to address you the following representation, on a matter which vitally affects the trade, industries and social amenities of the Central Provinces and Berar, and shall thank you to bestow favourable consideration thereon, and take such steps as are best calculated to secure the object in view.

2. As you are aware, our Provinces are deprived of a very large proportion of the natural advantages due to their geographical situation, owing to the want of adequate railway facilities. The two trunk lines serve us well, so far as communication with Bengal and Bombay is concerned; but up to only a few years back, we could not boast of even a single direct north-to-south line, the sole means of communication with Upper and Southern India being the very long and circuitous routes *via* Bhusawal and Manmad respectively. Matters have, however, considerably improved of late, so far as connection with the North is concerned. There is already a narrow gauge line between Jubbulpore on the one trunk line and Gondia on the other, extending up to Chanda; and it is satisfactory to note that the Great Indian Peninsula Railway are pushing on vigorously with the construction work of the Nagpur-Itarsi broad gauge line. The first section from Itarsi to Betul is open already, and the whole is expected to be ready in two or three years. This line has certainly come not a day too soon, and places within the reach of the trade and the travelling public of these Provinces a very short and direct means of communication with Northern and Central India, the United Provinces, the Punjab, and above all, the new capital of India.

3. It is, however, much to be regretted that the most important project of a direct connection with the South, in continuation of the Nagpur-Itarsi line, has been allowed to drift for so long. It cannot be denied that, if the Central Provinces and Berar are to have their proper share of trade with His Highness the Nizam's Dominions, as well as the Madras Presidency, which they adjoin, a central and direct north-to-south communication is an imperative necessity.

4. If one looks at any railway map of India, one is at once struck with the vast expanse of railless territory below the Bombay-Nagpur-Calcutta trunk line, right from Manmad at one end to Kharagpur at the other. The large rough triangle formed in the middle of India, by the railway lines connecting Manmad on the Great Indian Peninsula, Bezwada on the Madras and Southern Mahratta, and Kharagpur on the Bengal-Nagpur Railway with each other, has absolutely no means of through communication between the sides; and yet this railless area, the bulk of which comprises our Provinces, contains some of the richest tracts of cotton, coal, rice, timber, etc., with potentialities of no little development and expansion under the impetus of short and rapid means of communication, both north and south. The former will, of course, soon be an accomplished fact, with the Nagpur-Itarsi line in operation; and the map will show that there will then remain only a very small missing link in the south between Ballarshah and Warangal, to convert the whole into one grand trunk line of standard gauge through communication, from Madras in the south to Peshawar in the extreme north, passing through the very heart of our provinces.

5. Thus the Ballarshah-Warangal line is destined to play an important part in the chain of communication north and south; and, to our Provinces, its advantages would be incalculable. It will at once afford an extremely short and direct route to the fertile Nizam's Dominions as well as the Madras Presidency. In fact, the line is likely to revolutionise the conditions of all our trade with these parts of India, which is at present well nigh annihilated, owing to being forced through the long tortuous channel *via* Manmad.

6. As to how far the absence of direct communication with the south hampers commercial development, I should like to give you the instance of our premier industry, with which I am directly connected.

7. South India is a very large market for cotton yarns and piece goods, and we have more than once endeavoured to obtain a share of this trade; but our attempts have always ended in failure, because of the artificially enormous distance the goods have to be carried *via* Manmad, and the heavy freight charges consequent thereon. It will be seen from the map what a tremendous difference it could make, if the missing link—Ballarshah-Warangal—were to be supplied. The following typical figures show how the mileages will be affected:—

Typical large stations for yarn and cloth in South India.	Miles from Nagpur <i>via</i> Manmad.	Miles from Nagpur <i>via</i> Ballarshah.
Madras	1,133	686
Bangalore	1,031	807
Salem	1,255	845
Coimbatore	1,354	944
Madura	1,441	983

8. Again, the Southern Presidency and the adjacent Nizam's territory are famous for their Cambodia, and some other types of long and strong staple cottons, which they grow profusely. As you know, cultivators here are taking more and more to short-staple cotton, and we find it increasingly difficult to secure our supplies of long staple within the limits of the Central Provinces and Berar. We have practically to buy about 75 per cent of our requirements in this line either in America or other parts of India; and here, again, we can do much larger business with the south than at present, were it not for the high railway freights which raise the cost abnormally. With the Ballarshah-Warangal line these cotton centres can also be brought within considerably easier reach, as the following will show:—

Typical large stations for staple cotton in South India.	Miles from Nagpur <i>via</i> Manmad.	Miles from Nagpur <i>via</i> Ballarshah.
<i>Madras Presidency.</i>		
Nandyal	948	661
Tirupur	1,323	913
Dindigul	1,403	989
Virudupati	1,458	1,054
<i>Nizam's Territory.</i>		
Dharmabad	619	494
Umri	602	513

9. Of course, the advantages even to the cotton industry will be reciprocal. The cotton mills in Southern India will be able to buy the Central Provinces short-staple cotton, the best of this type throughout India, and cheaper freight might enable them to cater for our markets effectively in manufactured goods as well.

10. Similarly, the trade in various other commodities is bound to be fostered, by the railway mileage being brought down to a level commensurate with the natural geographical distances. Besides, it is a matter of common knowledge, that new railways planted in fertile tracts, affording direct means of communication with large consuming markets, lead to lines of development and evolve forces of progress in their train, the end of which it is impossible to foresee.

11. Apart from its undoubted commercial advantages for our Provinces, this small link will do away with the present hardships of travel to the Southern Presidency. It takes over two days to reach Madras from Nagpur, even by mail or express trains; but a Madras-Delhi through express *via* Nagpur, which will be a certainty with the Ballarshah-Nagpur line, could accomplish the journey to Nagpur in some twenty hours.

12. The link will, further, be an admirable one from a strategic point of view, as it would at once complete the chain of one-gauge direct communication north to south, traversing the whole length of the country.

13. With all these advantages, and its immense possibilities for good, it is very curious this project of linking up Ballarshah with Warangal, once said to be well on the way, has been practically shelved, for reasons best known to the responsible

advisers of the Government of India. Sir T. R. Wynne, the late President of the Railway Board, recently stated in His Excellency the Viceroy's Council, that the line had been completely surveyed, but he could not say whether it would be constructed at all. In this connection, the well-known Calcutta commercial weekly, *Capital*, makes some pertinent remarks in its issue dated 23rd ultimo. It says:—

"Calcutta will naturally draw all the traffic and business it can, but its capacity of absorption will have some physical limits; and it will be necessary to provide for other outlets. England's prosperity is not dependent on that of a single town or port, but on many. Madras may well agitate for a share in the business. It is evident from a glance at the map of India that it only requires a few missing links to provide a through north and south grand trunk communication on the broad gauge, between the United Provinces in the north and Madras and Colombo in the south

"An obstacle to this is to be met in the Nizam's (Hyderabad) Railway policy, which has been to spend money through the agency of the Nizam's State Railway Company in making the Godavery Valley Railway on the metre gauge, which supplies only a local want. 120 miles of broad gauge between Warangal and Chanda lies wholly in the Hyderabad State. It forms the most important link to be supplied in a north and south trunk line. For some reason, not completely explained, this link is supposed to prejudice the narrow gauge railway, if made. Except for local purposes, the Godavery Valley Railway is at the mercy of the Great Indian Peninsula Railway. By connecting at Chanda, the Nizam's line gets in touch with the Bengal-Nagpur Railway and encourages trade with Madras. It becomes a very important factor in all through traffic, when the developments in course of formation, north and south, are fully matured.

"The Bengal-Nagpur 2' 6" gauges, running north from Chanda to Jubbulpore, have little traffic from want of a north and south objective. Let the Hyderabad State link be made and they may be swamped with traffic to and from Madras, and their conversion rendered imperative. It is evidently Hyderabad that is stopping the way to the North and South Grand Trunk system, with its antiquated Nizam's State Railway contract. If progress is to be made, it will probably require the assistance of an independent company with an up-to-date contract."

14. The above gives one some indication of the difficulties in the way of the new line; and, incidentally, it also shows what decided views people interested in trade and industries hold as to the possibilities of the Warangal-Ballarshah (Chanda) connection, and its necessity for the full development of the existing lines as well. The same writer, in another issue of *Capital*, dated 11th June 1914, considers this connection to be in every respect much more urgent, both from the Madras as well as the Central Provinces point of view, than the Raipur-Vizianagram line which was so much heard of in the past, but work on which is also entirely suspended after the opening of a very small section from the Vizianagram end, some years ago. He writes:—

"As far as Vizagapatam harbour is concerned, we find that a connection with Raipur, however much it must have been pressed on the attention of the Government of India, is still marked on the maps with a dotted line, the funds for it being apparently diverted under the pressure of the agitation for wagons and rolling-stock exercised from Calcutta. It is not clear that this connection demands a first place in the railway programme of construction The interest of Madras, in the main, lies in the connection of Warangal with Chanda and Nagpur If Madras wishes to rise to a real sense of her dignity as an important jewel in the Imperial diadem, she will agitate for the through connection with Upper India by an uninterrupted broad-gauge route."

15. The Railway Board are not likely to spare the large funds required for some 400 miles of the Raipur-Vizianagram Railway for a considerable length of time, and have made it quite clear that this line must await other urgent needs. I submit, this, coupled with the fact that the Ballarshah-Warangal line is a very short length of some 150 miles and is much more necessary for the development of trade between the Central Provinces and the south, as well as south and upper India, makes its immediate construction doubly necessary.

16. I have, therefore, now the honour to request you, as the officer primarily responsible for the fostering and development of agriculture and industries in these Provinces, to move the Local Government to use their influence with the Government of India with a view to have this small link between Ballarshah and Warangal sanctioned, and constructed by one or other of the railways concerned, or by any other agency, as soon as possible. As one who was intimately associated with the trade and commerce of this country, during his official connection with the Government of India for several years, Sir Benjamin Robertson will hardly need any arguments to convince him of the necessity of this line, and all it means for the Provinces under his charge. And, looking to the important interests at stake, any differences with the Nizam's Government are not likely to be incapable of friendly adjustment, especially when it is remembered that the line will benefit His Highness' Territory as well, and that we are fortunate in having at the head of the Government of India a diplomat of diplomats in the person of the present Viceroy.

Trusting you will take up the matter with the Local Government as soon as possible and awaiting an early and favourable reply.

Correspondence No. 2.

Re the short gap between Parassia, the terminus of the Pench Valley branch of the Great Indian Peninsula Railway, and Khirsadoh, on the Bengal-Nagpur (narrow gauge) Railway.

No. 459, dated Nagpur, the 31st August 1915.

From—KHAN BAHADUR SIR BEZONJI DADABHOY MEHTA, Kt., Manager, Empress Mills, Nagpur,

To—A. M. CLARK, Esq., Traffic Manager, Bengal-Nagpur Railway, Calcutta.

As you must be aware, the Pench Valley branch of the Great Indian Peninsula Railway Nagpur-Itarsi extension is to be opened next month for all descriptions of traffic. The terminus of this branch—Parassia—is, I understand, only about $1\frac{1}{2}$ miles from the Bengal-Nagpur Railway narrow gauge station, Khirsadoh, and I trust you will arrange for this small connecting link being made up as early as possible. In fact, looking to the trifling cost at which this tiny link will at once afford a means of direct and considerably shorter through communication to your main line and all the narrow gauges converging at Itwari with the various sections of the Great Indian Peninsula meeting at the important junction of Itarsi, I should be surprised if the project has not already engaged your Agent's attention. A junction of the Great Indian Peninsula and Bengal-Nagpur Railways at Parassia will be mutually advantageous to either line as well as the general public; and I trust the Bengal-Nagpur Railway with its characteristic enterprise will see that it is not long delayed.

No. 12779, dated Calcutta, the 1st November 1915.

From—G. C. GODFREY, Esq., Agent, Bengal-Nagpur Railway,

To—The Manager, Central India Spinning, Weaving and Manufacturing Co., Ltd., "The Empress Mills," Nagpur.

Mr. Clark has handed over to me your letter to him No. 459, dated the 31st August 1915, in which you advocate the linking up of the Bengal-Nagpur Railway narrow gauge line with Parassia station on the Great Indian Peninsula Railway broad gauge line. This matter has already had my attention, and a year ago I expressed my views on it to the Hon'ble the Chief Commissioner; at that time I reported that I did not think the connection would serve any useful purpose as the two railways had their own lines over which to carry coal, and as for through booking in other kinds of traffic I could not foresee any prospects.

In your letter to Mr. Clark you indicate that in your opinion the line will be advantageous to the public and to the railways; I shall be very glad to receive your more detailed views on the matter and your suggestions as to what sort and kind of traffic is likely to benefit from it.

Thanking you in anticipation.

No. 1384, dated Nagpur, the 20th November 1915.

From—KHAN BAHADUR SIR BEZONJI DADABHOY MEHTA, Kt., Manager, Empress Mills, Nagpur,

To—The Agent, Bengal-Nagpur Railway Co., Ltd., Kidderpore, Calcutta.

I beg to thank you for your kind favour No. 12779 of 1st instant regarding the proposed through connection of the Great Indian Peninsula and Bengal Nagpur-Railways at Parassia.

I was not aware that the Hon'ble the Chief Commissioner had approached you on the subject, nor had we had any communication with Government on the subject. This will show you that there are independent opinions as to the desirability, if not quite the necessity, for the linking up both the termini. We believe Messrs. Shaw Wallace Company of the Pench Valley Coal-fields are just as anxious that such a facility would help traffic.

It is difficult to enumerate beforehand what description of traffic and how much of it may be encouraged; but you know development follows the easiest routes.

It struck me that while the Itarsi-Nagpur line is building, the construction of which is now being retarded and may be delayed for years owing to the unrighteous and cruel war now raging, it might be possible for us to book our large traffic for Cawnpore, Delhi and Amritsar by this new route as it would save over 200 miles of haulage, and therefore might well result in relatively cheaper through rates. We might also be able to send

a good part of our goods to Itarsi and several other stations in the neighbourhood. Then there might be grain and other traffic from Chhindwara and Seoni and other stations on your narrow gauge line which may find an outlet by the proposed route.

May I venture to add that it would indeed be a great pity to leave such a short gap between the two termini, offering obstruction to traffic which would in all probability largely develop but for the difficulty of transport by carts over a small distance?

Trusting this may receive your favourable consideration, and thanking you again for your courtesy.

Note on the Empress Cotton Mills, Nagpur.

The Empress Mills, Nagpur, has been the pioneer of the cotton industry in the Central Provinces. It has grown from a small beginning to be the largest cotton manufactory in India with five separate mills comprising in all over a lakh of spindles and 2,200 looms with preparatory, bleaching, dyeing and finishing machinery, and working with a capital, reserve funds, and loans aggregating about 2½ crores of rupees.

The company was formed and registered in Bombay in 1874 with a capital of 15 lakhs divided into 3,000 shares of Rs. 500 each.

The mill started work in 1877 with an equipment of about 30,000 mule and throstle spindles and 500 looms. There were considerable difficulties in regard to labour in the beginning, the mill being the first industrial joint-stock venture on this side of India, but the untiring energy and genius of its founder, the late Mr. Jamsetji Tata, who personally supervised its erection and working during the first few years, overcame every obstacle, and the company was soon in a position to earn large profits. The success since attained is unique in the annals of Indian cotton industry.

In 1912 extra capital to the extent of 50 lakhs was raised by the issue of 10,000 5 per cent cumulative preference shares. This rate is considered the lowest ever paid on this description of shares issued by an industrial corporation in India.

The company has out of its profits added Rs. 31,87,500 to its capital, giving fully paid-up shares free to the shareholders in proportion to their original holdings; and thus raising the capital from Rs. 15,00,000 to Rs. 46,87,500.

It has paid Rs. 2,80,18,131 in dividends to date.

It has further been able to build up entirely from the profits the following reserve

	Rs.
Reserve fund ...	8,05,719
Equalisation of dividend fund ...	5,14,271
Depreciation fund ...	35,51,570
Insurance fund ...	16,33,404
Pension fund ...	2,97,277
Provident fund ...	8,14,644
	<u>70,16,885</u>

Thus, the total profits up to 30th June last, exclusive of Rs. 7,66,875 paid as preference dividend during the last four years, aggregate Rs. 3,82,22,516 or over 25 times the original ordinary capital.

The original shareholder has consequently gained, by being the first fortunate allottee of a share in this company, 205 shares free; and his first investment of Rs. 500 is thus, with these 205 shares given him gratis, worth to him Rs. 7,015 at the present rate of Rs. 2,300 and has brought him Rs. 9,339 in the shape of dividends.

The company possesses about 105 acres of landed property in Nagpur and other places. It has mill buildings, godowns, bleach and dye-houses, ginning factory, residential quarters for staff, etc., covering an area of about 10 lakhs square feet in Nagpur alone. It also possesses seven ginning factories, together with cotton baling presses and land, buildings and godowns appertaining to them, in the cotton districts. The total value of the immovable property is Rs. 31,45,948.

The plant consists of 100,354 spindles and 2,200 looms with all preparatory, dyeing, bleaching and finishing machines of the best type. The dye and bleach works and the latest extension, *vis.*, mill No. 5, are driven electrically. The total value of the movable property is Rs. 66,56,002.

The average number of work-people employed is over 8,000.

During the cotton season about 600 operatives are employed at the ginning factories.

The company has over a dozen agencies for purchasing cotton and over 40 agencies scattered all over the country for the sale of its manufactures.

The average dividend on the paid-up capital since the commencement comes to 21.59 per cent per annum, which works out to 47.89 per cent on the originally subscribed capital.

The company has from the first adopted the principle of setting aside adequate sums for depreciation of property ; and though nearly the whole of the machinery in the older mills is renewed, the best and newest of its kind with all the latest improvements having been set up, and the buildings kept in a thorough state of repair, the depreciation fund still stands at a very satisfactory figure.

The property of the company being extensive the annual premium of insurance comes to a very large sum, and the company contents itself with partly insuring with the insurance companies and carrying the remainder of the rateable premium to its own insurance fund. It is thus to a large extent its own underwriter. The total insurance fund which has been built up entirely out of the net premiums saved on uninsured property now amounts to over 15 lakhs. The company has been most careful in taking every possible precaution against fire risks. The buildings are all shed ones divided into blocks, and the company has provided automatic sprinkler installations all over the mill as well as all other appliances for putting out fires as its own experience and as the fire insurance offices have from time to time suggested.

It has built up a workmen's pension fund partly out of profits and partly out of the amount of unpaid wages, which latter item is wholly credited to this fund. From this fund pensions up to half the average monthly earnings, subject to a maximum of Rs. 7 per month, are ordinarily paid to all the operatives who have served over 25 years and are able to do so no longer. Besides, special pensions are also awarded in cases of exceptionally long and meritorious service. The total number of pensioners on the rolls at present is 49, drawing in the aggregate Rs. 480 per month.

From the pension fund small increments of Rs. 1½ per month in addition to the usual earnings are paid to all operatives who have completed 20 years' service. The total number earning such increments is 142 to-day.

We have also a provident fund for the benefit of all employes whose earnings exceed Rs. 10 per month. Contributions are optional. The members contribute an anna per rupee of monthly earnings ; the company ordinarily contributes a like sum to the credit of members, and allows interest on both at 6 per cent. There are 650 contributors who annually pay in about Rs. 20,000 and the total sum standing to their credit, including the company's contributions with interest, aggregates Rs. 4,12,000. Members leaving service in less than 20 years are not allowed the benefit of the company's contribution, but only the interest on their contributions.

Copies* of the pension and provident fund rules are annexed.

Government have established two factory schools for the elementary education of half-time workers in the neighbourhood of the mills. The company contributes Rs. 50 per month towards the maintenance of these schools besides providing slates, pencils, books, etc., free to every child. Besides, with a view to encourage regular attendance, a bonus of four annas is paid by the company to all children who attend the schools every day during the month. The total number of half-timers receiving instruction in the two schools is 360, of whom about 300 earn the regularity bonus.

The company also maintains an elementary vernacular school teaching up to the Gujarati fifth standard for the benefit of the children of the staff who are charged a nominal fee. This school is attended by 45 pupils.

We have a system of apprenticeships for training up our own men from the start for all positions. All our heads of departments, foremen and other assistants with very rare exceptions have been entirely trained at the mills. Besides, about a hundred men trained here have left us to join other concerns on higher salaries as managers, heads of departments, supervisors, etc. Copies* of apprentice-agreements for different classes are also annexed.

We have recreation and reading rooms for the superior officers and staff who are all provided with decent sanitary quarters round about the mills.

We have also a system of annual prizes for skilled and efficient work and regularity in attendance. These prizes are awarded on the results of competitive trials or on the basis of the highest monthly production or the utmost regularity in attendance, also for general skill and proficiency as suited to the various classes of labour concerned.

Monthly cash bonuses of a rupee or more are also allowed in almost all departments, where fixed wages are paid, to those who regularly attend every working day.

All these incentives to skilled and steady work in the shape of bonuses, prizes, increments, pensions, etc., are being appreciated by the better classes of employes, but the larger proportion are notoriously unsteady in occupation and irregular in attendance.

About 15 to 20 per cent is the daily proportion of absentees. The operatives habitually take a couple or more days off besides periodically going away for months together to their up-country homes, or to other lighter occupations. It was calculated some years back that the entire population of the mills changed, *on an average*, every eighteen months. Hence the very small number of pensioners and increment-earners in spite of the mill being in operation for 40 years. A large proportion of those who are taken on as new men are usually ex-employees who return after an absence of some months or years. With the demand for labour falling habitually short of the supply the men, specially the skilled artisans, are masters of the situation and have to be taken up whenever they choose to come.

We have a grain shop opened for the benefit of the work-people where grain is sold to them at cost price on credit. The monthly purchases are deducted from their wages on pay-day. The shop is very popular, the annual sales therein aggregating about 1½ to 2 lakhs. In famine or scarcity times, the prices charged are below market rates, the company bearing the loss. In one year of exceptionally high grain prices this loss came to about Rs. 55,000.

A plot of land measuring about 4½ acres was leased by us from the municipality some ten years back with a view to build quarters for our work-people. A number of chawls have been built accordingly, but these failed to attract our men and the experiment had to be abandoned. They prefer to build or live in their own huts in different localities and in the neighbourhood of the dwellings of their caste-fellows, friends and relatives.

The company, as stated at the outset, pioneered the way for the cotton industry in these provinces. It was the first in India in adopting and successfully demonstrating, when even the English spinners looked askance and were in doubt, the vast superiority of ring spindles over throstle spindles and for such counts as are ordinarily being spun in India, over even mule spindles. It was also the first in India to provide its mills with sprinklers for automatically extinguishing fires. So has it been the first in India in adopting, in its mills, humidifying and ventilating apparatus of the best kind available. It is the only one so far as is known having a regular pension and provident fund scheme for its operatives.

The following accompaniments to this note are not printed:—

- (1) Provident fund rules.
- (2) Pension rules.
- (3) Agreement form for graduate apprentices (to be trained as managers or heads of departments).
- (4) " " ordinary apprentices.
- (5) " " mechanical engineering apprentices.
- (6) " " technical college textile graduate apprentices.
- (7) " " " " electrical graduate apprentices.

Note on Calico-printing.

This is a promising industry for India. It has already been attempted on a small scale, but in almost all cases has been found a failure. I have only lately seen a small plant working in one of the Bombay mills which is reported to be a success. I doubt, if such comparatively tiny installations as are usually contemplated as appendages to spinning and weaving mills, are at all likely to flourish or contribute to the building up of this industry in India. These will have little chance of successfully competing with a vast and highly-organised European industry. In the first instance, highly-paid European experts would be necessary for working the printing machines, mixing colours and working out and engraving designs on rollers, and, efficient working premises, the cost per unit of output would be disproportionately high for small plants.

The vicinity of the Tata Hydro-Electric Company's Power Station at Khapoli, on the Great Indian Peninsula Railway only a few miles from Bombay, would seem to be an ideal site for the establishment of one or more large bleaching, dyeing and printing works. Land would be very cheap and an unlimited supply of water which practically runs to waste from the turbine outlets would be available. Besides, there are possibilities of building up a large and efficient industrial colony far away from the unhealthy surroundings, temptations, etc., of city life. The industry is certainly worth investigation by the Industrial Commission.

Additional Written Evidence.

We have adopted this system since the mills started work in 1877.

At first, we took up young men who had passed, or in some cases studied, up to the matriculation examination, on Rs. 10 per month for a term of three years with bonuses of Rs. 125 and Rs. 250 for the second and third years, respectively, and an option on the part of the company to retain their services for two years more on Rs. 50 per month.

The present terms for the same classes of apprentices for the spinning, weaving and other departments are Rs. 25 for the first three years, Rs. 35 for the fourth, and Rs. 45 for the fifth year. For mechanical engineering apprentices these are Rs. 25 till the passing of 2nd class engineer's examination and service for five years thereafter, Rs. 50 per month being paid for the first two years and Rs. 70 for the remaining three.

From 1887 we began taking up a few University graduates for being trained up as managers or heads of departments. The terms for this class were Rs. 50 for the first year, Rs. 75 for the second and Rs. 100 for the last three years. These are the same to this day, with the exception that Rs. 125 per month is being paid for the fifth year.

Only recently we have commenced taking up the Bombay Victoria Technical Institute graduates as apprentices on special terms. These are for manufacturing departments Rs. 35 at the start rising to Rs. 75 with annual increments of Rs. 10, and for electrical engineers Rs. 40 in the first, Rs. 50 in the second, Rs. 60 in the third year and till passing the second class mechanical engineer's examination, with service for five years, thereafter, Rs. 80 being paid for the first two years and Rs. 100 for the remaining three.

We prefer to take young men direct from schools or colleges and train them up in our own way. We have experience of only a few technical college youths, who were taken up on our ordinary terms prevalent at the time. Their equipment cannot be compared with that received at the mills, but after being grounded in practical work just like others, they have shaped very well.

The total number of youths who entered into apprenticeship agreements with us for the past forty years aggregates 202, of whom 39 left us owing to ill-health or other causes in less than a year, 5 died in the company's service, and 64 are with us at present as heads of departments, assistants, foremen, etc., or in course of training. The remaining 94 who left us after being trained at the mills are accounted for as follows:—

Managers or heads of departments in other cotton mills.

Managers	...	10	
Spinning masters	...	7	
Weaving "	...	6	
Carding "	...	5	
Engineers	5	
Dyeing and bleaching masters	...	2	
			35
Assistant masters or engineers, etc., in other mills and factories	27
In other occupations	19
In occupations unknown	13
Total	...		94

Of the 23 University graduates taken up-to-date 10 are with us at present, 1 being spinning master, 1 weaving master, 1 dyeing and bleaching master, 1 assistant spinning master, 1 assistant manager, 1 assistant dyeing and bleaching master, 1 assistant engineer, and 3 in course of training. Of the remaining 13 who left us 6 are managers, 2 weaving masters, and 1 spinning master of other cotton mills; 2 are in other occupations and the whereabouts of 1 are unknown.

Our two chief engineers, one of whom has been in our service for forty years and the other one over thirty, both started their career in the ordinary grade of apprentices on Rs. 10 per month.

The 64 men of the apprentice class now in our service are employed as follows:—

Engine Department.

Chief engineers on Rs. 475	...	2	
Assistant engineers on Rs. 70 to Rs. 245	...	9	
Apprentices in training	...	5	
			16

Spinning Department.

Spinning master on Rs. 800	...	1	
Assistant spinning masters on Rs. 250 each	...	2	
Foremen and assistants on Rs. 55 to Rs. 185	...	11	
Apprentices in training	...	6	
			20

Weaving Department.

Weaving master on Rs. 550	...	1	
Assistant weaving masters on Rs. 150 and Rs. 250	...	2	
Foremen and assistants on Rs. 45 to Rs. 120	...	4	
Apprentices in training	...	6	
			13

Dyeing and Bleaching Departments.

Dyeng and bleaching master on Rs. 400	...	1	
Assistant dyeing and bleaching masters on Rs. 150 and Rs. 215.	...	2	
Assistants on Rs. 60 and Rs. 80	...	2	
Apprentices in training	...	3	8
			<hr/>
<i>Office.</i>			
Assistant manager on Rs. 450	...	1	
Assistants on Rs. 95 to Rs. 120	...	5	
Apprentice in training	...	1	7
			<hr/>
Total	...		64
			<hr/>

On Evidence, the 18th December 1916.

President.—We value your advice very much based as it is on experience of a unique kind in India. Your note gives a good deal of material to think over. We shall take every opportunity of discussing this question of shipping and ship-building with other people who can supplement your views. The great difficulty in the way is the absence of anything like steel-plate manufacture in the country. About railway facilities we had a little fight to a finish somewhere about 1906-07 in the matter of the Nagpur-Itarsi line, and Mr. Low will note the suggestions and also the other proposition about the extensions southwards between Warangal and Ballarshah. About the cotton industry we will discuss the matter with the agricultural experts and see if anything can be done. I understand that a certain amount of long staple cotton is already grown in Sind and other places. Regarding the forest question you have struck a point which we have discussed with previous witnesses. It turns almost entirely on the question of extraction of forest materials. There are many difficulties in the way such as the absence of light railways, suitable roads, and these stand in the way of development and marketing. Your note about Calico printing opens up a question about which we shall have to re-adjust our ideas. And then as regards the hydro-electric schemes, we have been accustomed in peninsular India to water-flow in the rivers which is intermittent; there are floods in the monsoon and the rivers are dry in the summer. We have got obviously to recast our notions and look at things from different points of view. If more hydro-electric schemes are developed, of course, we shall have more cases of that kind to consider.

I do not know if any of my colleagues would like to ask you some questions. I suppose you would not mind having an informal talk with us. Some of the members who are away have lost this opportunity. I know they would all like to express to you our congratulations for the success of your enterprise which is opening out a new field in the Central Provinces. You have done a great deal of credit to Mr. J. N. Tata who, if he were alive, would give you credit for your genius and ability which have given such splendid results.

Mr. A. Chatterton.—Q. In the course of the Commission's tour we have had a great many witnesses who are in favour of extending technical education through the agency of the university; that is to say, in some form or other connecting the technical colleges with the universities, but from a glance at the additional note you have sent us it appears that to a large extent your mills are running under the control of men who are mainly drawn from other classes than the university graduates?—*A.* Yes.

Q. Apparently you have established an apprenticeship class and that at any rate a very large number of highly paid managers and assistant managers, not men who are in-charge of the scientific departments of the mill, have not had a university education?—*A.* There are graduates and we have also matriculates. We have two classes. You will find that the higher service is manned by graduates from universities and others are matriculated students. We take them from the colleges and schools directly and train them up to the point that we require.

Q. In the apprenticeship classes how many are graduates?—*A.* Of the 23 graduates 10 are with us at present, one being spinning master and so on as given in the note. There are others who have gone away to take up positions outside the mill and there are 64 men on the apprentice class in our service.

Q. Are not any of these 64 university graduates?—*A.* That is given in the note, 10 out of the 64 are university graduates.

Q. The point I would like to ask is this. Do you find it necessary or even advantageous that the men who are going to be your heads of departments and foremen should have a university education or do you prefer they should begin their training in schools such as the Victoria Jubilee Technical Institute?—*A.* We prefer graduates. We prefer university

men coming direct and being trained at the mills. We find that they grasp things quickly. They have been able to manage things better. We have also tried some technical students. We found that they did not come up to the same level at least immediately.

President.—Q. What subjects should they have taken in graduation and what should be their age?—*A.* All I want is some standard of education and general culture so that they can grasp the theory and practice of any branch and so pick up all the threads thereof quicker. The age should be about 25.

Dr. E. Hopkinson.—Q. Do you want any science degree?—*A.* We would prefer men with science qualifications, but we do not for that reason refuse to take graduates in literature or other subjects.

Mr. A. Chatterton.—Q. Do your managers and technically qualified men train them?—*A.* In fact they begin work at once and they go on learning as they do the work. They begin from the lower grades.

Q. Do you have any training classes?—*A.* We have no training classes. A man when he joins us goes direct to the mechanic shop and learns filing and chipping and so on. A graduate would learn the work of one department and then begin another. The men see the work of their superiors and they learn for themselves.

Q. Do the majority of your men belong to the Parsee community?—*A.* Almost all of them. We found it difficult to take other communities because they would not stand our discipline and our rules.

Q. University education does not do much harm to the Parsee?—*A.* Not as far as I can see. In fact it helps him.

Q. Have your graduates suggested any improved machinery?—*A.* They bring to notice small details. Even unskilled men who have not had any university education do that. There is a man of the working class who was taken up as a child and who has gradually risen higher and higher. He has been able to suggest a good many improvements.

Q. Is he a Parsee?—*A.* He is a Hindu of the lower class. We encourage all such suggestions wherever they come from.

Q. You think that in this matter of giving tips graduates are no better than the ordinary men?—*A.* We have found that many graduates have grasped things and managed better.

Q. The whole of your machinery is standardised. You get the machines from Lancashire?—*A.* We have made many improvements. If after trial we think that any improvements are needed we make suggestions accordingly the next time that we order similar machinery. If you were to look at our orders you will see the number of suggestions and alterations that we have made. That shows that the working men notice these defects in the machines.

Mr. A. Chatterton.—Q. Have you got any system of rewards for the men who notice these defects and suggest improvements?—*A.* If we find a man intelligent we give him bonuses.

Q. About hand-loom weaving, if I remember rightly you were speaking about it in Naini Tal. Have you supplied warps to hand-loom weavers? To trade generally?—*A.* It does not suit them to get the sized beams from us. It would be a good thing if they did that. We supply sized beams to jails and some hand-loom factories.

Q. You supplied me with long warps which I have tried on hand-loom and the difficulty I found was that they were too long. It took the weaver much too long to get through the warps?—*A.* It would not pay us to make small warps. If people wanted short warps we shall have to cut them.

Q. Have you tried any experiments in Nagpur itself in developing a market for the warp?—*A.* We are afraid of doing that. They would fight shy of us and would be afraid that we were going to deprive them of their living.

Q. It has been said that hand-woven cloth is much more durable than the machine-made cloth. Have you any reason to think that it is true?—*A.* Yes. If you size the cloth very heavily the cloth would not be so durable as the hand-woven cloth. Of course otherwise there would be no difference. I do not think the hand-weavers could put on such quantities of size as the power-factories can do.

Q. You would agree that hand-sizing gives you a stronger yarn than slasher sizing?—*A.* I cannot say that. It all depends on the quality and the quantity of the size put on.

Q. Another question in which we are interested is whether the power-loom will drive off the hand-loom. Have you formed any opinion about that?—*A.* Power-looms have not so far been able to drive hand-loom out. Still there is a large number of the latter running. I do not know if there is any reduction. We sell over half the quantity of yarn we produce.

to hand-weavers, export about a fifth to China, and weave the balance ourselves. The quantity sold to hand-weavers is thus a fairly large proportion, and this in spite of the fact that our spindles have increased from 50,000 to 100,000 during the last fifteen years.

Q. As manager of your mills you are as much interested in the development of the hand loom as the power loom?—*A.* In one way certainly.

Q. Another point which you raise in your note is about the cotton-hosiery. Do you spin cotton suitable for this sort of work?—*A.* Only a very small quantity, because there is not a large demand. If there was a good demand we should spin it specially. We make it only in special cases as the demand is so small.

Q. Is there any large demand for the Japanese hosiery?—*A.* It is spreading all over India. It is very cheap, I understand.

Q. You recommend the adoption of the methods of the Singer Sewing Machine Company. Do they sell entirely on the hire-purchase system?—*A.* Both by the hire-purchase system and also outright. They have agents in small villages also. They go out from place to place.

Q. Have they any schools for teaching?—*A.* These agents go out. When they sell a machine, they send a man specially to the customer and he shows him the methods of working the machine.

Dr. E. Hopkinson.—Q. You say that calico printing has been tried in India and has been a failure. Do you know the reasons for this?—*A.* I think the field is very limited at present. There was only one machine which I saw in Bombay. You want experts. These are not available in India. In Bombay there was only one European who was looking after the machine. Engraved rollers would have to be got out and kept in stock in sufficient quantities. Unless you have a large establishment it will not be a paying concern.

Q. Calico printing represents the highest development of the textile industry. It requires very expert knowledge. Supposing you started on a large scale, for many years you would have to import the machinists, the colourists and the engravers. But still in the face of that you advocate it as an industry to be established in India?—*A.* Yes. We had six Englishmen imported when we first started the mill in Nagpur.

Q. How long did they remain?—*A.* They remained three years. We have only one Englishman now on our staff.

Q. As regards long staple cotton you strongly advocate that attention should be given to it not only from your point of view but for Indian mills generally. Do you think that if long staple cotton were produced successfully there will be a distinct tendency towards spinning finer counts?—*A.* It would pay the mills to do that. At present they cannot get the cotton they want.

Q. You yourself are importing American cotton?—*A.* Yes. And Egyptian cotton also.

Q. Would you advocate the growing of long staple cotton even beyond the requirements of India for export?—*A.* Certainly. I think then England would not have to depend on American cotton so much.

Q. Would you endorse this as a general proposition that the higher the quality of production the more profitable it is?—*A.* I am afraid not. It would not pay so well as coarse spinning as circumstances go at present.

Q. I think you hold very strongly that there will be no great improvement in the efficiency of Indian labour except through shorter hours and higher wages?—*A.* With shorter hours we can get steady labour.

Q. Would you advocate any legislative enactment with that end in view?—*A.* There is no other way of doing it. There is a legislative enactment now. The mills are supposed to work 12 hours a day. We used to work 13 hours before this enactment.

Q. You would advocate still further legislation?—*A.* I would. I would propose 11 hours and then after a time 10.

Q. Would you extend legislation to fixing wages?—*A.* No. I think we should be obliged to raise wages. Supposing there is difficulty in obtaining labour, the workmen will demand more, and we shall be obliged to pay them.

Q. That will come about naturally?—*A.* Yes. There is no legislation required in the matter. The thing will adjust itself.

Q. You object to anything of the nature of a minimum wage?—*A.* I do not think I should advocate it.

Q. Would you advocate legislation to ensure better hygienic conditions for the people?—*A.* I think there is sufficient legislation for them. But as regards dwellings, we tried to build houses but we could not attract the people. In the case of Bombay it is quite

different, but in mofussil places people generally like to live with their relatives, friends and caste fellows in houses built by themselves. I do not know if it will be wise to legislate on the matter. It may be necessary in the city, but not in the mofussil.

Q. Have you got half-time in operation here?—*A.* Yes.

Q. I think you would say that the best possible education is based on primary education going on concurrently with the work in the mills?—*A.* I think so. There are Government schools here where the half-timers go for two hours a day.

Q. Do you think it desirable that mill-owners should be compelled by legislative enactment to provide schools for the half-timers?—*A.* I cannot say one way or the other, I think it is the business of the Government to provide schools.

Q. At any rate you agree that it might be a good step forward in the direction of compulsory and universal education?—*A.* I agree in that.

Mr. C. E. Low.—Q. Have you any knowledge of cases where these small hosiery machines have been worked successfully by individuals?—*A.* Not personally. I know a great deal of yarn is ordered by the hosiery people. I think there are some hosiery factories in Calcutta and other places.

Q. Did the same man continue the orders for yarn for any length of time?—*A.* Yes.

Q. Where was he working?—*A.* At Delhi and Cuttack.

Q. You do not know anything of the sort here locally?—*A.* There is a man who works a number of knitting machines here in Nagpur and he also buys yarn from us regularly.

Q. Do you think that an organisation like that of Singer's would be the right way of bringing it in?—*A.* It would be the cheapest and the best.

Q. Do you know what their system is?—*A.* They have agents in different cities and even in villages. When they sell the machine on hire-purchase or otherwise they send a man to the customer or the buyer to show him how to work it. In this way they have introduced it even in remote villages where the tailors can be seen using it.

Q. Supposing long staple cotton is grown on a large scale and a great proportion of it is exported, do you think that any counter-acting measures ought to be taken?—*A.* I do not think so. We are now competing with the exporters. In fact the prices are generally settled by the exporters and not by the mills.

Q. What would be the effect if a larger proportion of long staple cotton were grown and a good deal of it were exported. Do you think it would increase the growing of long staple cotton in India?—*A.* Certainly. It would all depend on whether it pays the cultivator.

Q. Supposing it pays him, do you think it would be a good thing for the country generally, looking at it from the cultivators' point of view and the mill-owners', that there should be an export demand as well as a local demand?—*A.* I think it would be good for everybody.

Q. Supposing there is only a limited quantity grown just sufficient to supply the local mills, do you think that would affect the position?—*A.* It will not be so good for the cultivators. It must be open for all and any market which pays the cultivator the best.

Q. Supposing the mills required 2 million acres of long staple cotton, and the Agricultural Department could not get more than that, do you think that in that case, leaving aside the tariff question, steps ought to be taken to reserve the cotton for the Indian mills?—*A.* I would not do anything of the kind. I would let the exporter compete with the Indian mills in just the same way.

Q. Why do you think it would be undesirable?—*A.* That would be unfair to the cultivators.

Q. That would discourage him from growing the crop if he finds that Government is interfering with him?—*A.* Yes.

Q. Therefore you are in favour of free competition?—*A.* Yes.

Q. Turning to apprentices, are the men employed in your factories all Parsees?—*A.* Nearly all of them. There are one or two other men besides Parsees.

Q. Do you know anything about a young Bengali who was sent home 4 or 5 years ago with a technical scholarship?—*A.* He was apprenticed at our mills. We had some more also but they could not stand the strain and the discipline. This did not suit them for their religious ablutions and other domestic reasons. I do not know what the Bengali gentleman is doing now.

Q. Did he come to you for employment?—*A.* He wanted more than other people. There were other apprentices who did their work very well and we could not place him above them and pay him more than them.

Q. You were satisfied with his work?—A. Yes. He did very well indeed.

Q. He would have good prospects?—A. Certainly.

President.—Q. Had he learnt anything during his stay in England?—A. He said that he could not learn more than what he had learnt here. He was very honest and straightforward.

Q. He had lost three years' experience?—A. He might have gained some experience. But he said that he learnt nothing new.

Q. So those who remained behind had the advantage over him in having gained experience?—A. Yes.

Q. Do you think that that system should be continued of picking out young men and sending them to England with State scholarships?—A. I do not see much use as far as the textile industry is concerned. They could learn here as much as in England.

WITNESS No. 147.

Mr. F. G. Sly, C.I.E., I.C.S., Commissioner, Nagpur Division, Central Provinces.

Note.—Mr. Sly did not submit any written evidence.

Oral Evidence, 18th December 1916.

President.—Q. Practically every scheme that has been put before us so far breaks down for want of suitable technical and scientific advice. We found Local Governments helping enterprises, such as tanning, with all kinds of doles, varying from Rs. 100 to 7 lakhs, and these advances have been made for technical reasons which appear to be little more than guesses; they have been made regardless of the fact that if the Government puts in Rs. 5,000 the unfortunate public imagine that the enterprise is not a mere speculation and they come in with possibly 5 lakhs. Except in agriculture and mining, the Government pioneering of industries, so far, seems to be wasted. In the absence of any system of experimental work they do not seem to learn the lessons that ought to be learned from failures. The failures are buried as decently and as quickly as the local officer can manage, as something to be ashamed of instead of something that ought to be analysed as much as possible in order to obtain a valuable lesson. It is really the result apparently of having no organised scientific services. The man conducting an experiment on proper lines knows perfectly that his failures are as valuable to the country as a success. If we are going to have any real advance, some effective "artillery preparation" in the way of scientific research must be made, extending it and organising it so as to reduce the quantity of "scattered fire" that is now going on. The scientific officers are largely isolated, each doing good work in his own little laboratory; they take up numbers of small problems, work at them for a while, and, when they get results, they are not able to follow them into practice. They go on leave with no one to take up the work on the same lines, and there is an enormous amount of valuable time and material frittered away in this fashion. We are now up against other tropical countries that have been opened up by scientific people. There is no doubt that in future our scientific men will have to be regarded as part of the defence problem. I mean not defence in actual warfare, but the bigger fight that goes on in peace time. One of the most striking cases of waste we have so far come across has been in the matter of chemistry. We find chemists employed by the Agricultural Department, as you know, at Pusa, as well as one each for the larger provinces; under the Forest Department; the Geological Survey; the Superintendent of Local Manufactures; at the Cordite factory are four or five; and the Metallurgical Inspector has one besides himself. Some of these chemists are carrying on researches that overlap; the results are published in isolated reports that the scientific public cannot readily get at. Each little chemist in his own little province is independent: the amount and kind of work that he does is left to his own conscience; but it is not a question of conscience merely, but of pace-making. We want a chemical service organised in such a way that there will be criticism of the work done and of such a size that a good man can satisfy his ambitions, and feel that what he is doing is going to lead to something else, and not merely a local result that might be buried. It should be possible to get more work out of the same staff that we have now in India. You have had a good deal of experience in this matter, because you have organised what has been, so far as we have observed, one of the most successful departments in the country, and we should like to know your views as to how we can arrange to suit the ambitions of a young scientific man who enters the department, to satisfy the susceptibilities of Local Governments who wish to have, as you know, control over their officers, and also to give the officers sufficient local knowledge to transform their scientific research work into results of practical value. One suggestion has been made and it has received a good deal of support, and that is, that we should have our scientific service organised in groups, just as the Forest Department is organised, or possibly as the Geological Survey is organised, that is to say, an Imperial Department for each technical subject or natural group of subjects. Chemistry might be one, and if we stick to our chemical illustration we might have, say, a Chief Chemist to the Government of India who would advise

Government on all chemical problems, would advise the Government too in the matter of promotion and the suitability of articles to appear in the chemical publications, the results being gathered in one journal, except that in some cases they will be repeated in other journals, for instance, chemical results of geological value in the publications of the Geological Survey, chemical results of agricultural value in the agricultural publications. But there would be one central publication that every chemist outside could refer to as a substantial and reliable guide for all chemical research done in the country. We may have this Chief Chemist on a salary of say, Rs. 3,000, with a position and responsibility corresponding to that of the Surveyor-General, and under him there might be three or four Deputy Chief Chemists in charge of technical groups, metallurgical and mineralogical chemistry in one group; organic chemistry, including the chemistry of dyes, colouring materials, drugs and oils, in another group; and another Deputy Chief Chemist in charge of agricultural chemistry. These officers would be partly at head-quarters doing research work and partly in the provinces carrying out detailed investigations for the Provincial Governments. They could be lent to the Provincial Governments as the Public Works officers or Forest officers are; and, as they became senior they could be transferred possibly to the head-quarters for the so-called higher work with better pay, possibly with administrative functions, and finally they would be available for the post of Chief Chemist. That is very shortly one of the schemes that has been put before us, and it has been suggested that the same scheme or a similar scheme might be applied to Zoology and Botany, so that no scientific man is made subordinate to another scientific man except of his own caste. How does that appeal to you? You have looked at these two points of view, and you have managed to get the best advantage of both apparently for the organisation of the Agricultural Department. I suppose you realised that at the time you organised the Agricultural Department, you had to observe economy fairly strictly, and you were limited to a very small number of men; but if we are to tackle this problem of developing India in competition with the rest of the world we have to move forward on a totally different scale?

A. I should like, first of all, to explain that I am in no way a specialist in science, and the questions which you put before me are mainly concerned with science. I was connected with the organisation of the Agricultural Department as an administrative officer, and I will give shortly reasons why the Agricultural Department was organised on its present lines. When I joined the Agricultural Department as its administrative head, one imperial research institution had already been started at Pusa. Then came a further grant of funds, and we had to decide which was the best way of utilising them. It was decided to expand the provincial departments of agriculture within the limit of the available funds, mainly by increasing the scientific staff of specialists. The principal reasons why we started on the lines of a separate staff of specialists for each province instead of a central service, such as is outlined by you, may be briefly stated. In the first place, it was considered essential that there should be thorough local investigation of the agriculture of each more or less distinct agricultural tract. We felt that any central institution, however large its staff, would never be able to undertake a thorough investigation of the conditions of agriculture in such tracts, which investigation must be continuous. Then, in the second place, we felt that the problems connected with the improvement of agriculture differ essentially from those investigated by some other scientific services, in which certain definite problems clearly await decision, and a scientist can be deputed for their investigation. The scientist had himself to make his own local research agricultural conditions, to decide for himself which were the problems requiring survey of and which gave the most prospects of success. To give an illustration from the Geological Service, we could not say that we wanted a particular coal deposit in a particular place investigated to test the possibilities of mining. The agricultural staff had to go round and find out for themselves, in the first place, what were the possible lines of advance, apply research methods to the solution of the problems requiring investigation, and when a solution was found take steps to devise an organisation by which those solutions might be made a part of the general agricultural practice. It was considered that each province should have its own scientific staff, kept in that province for long periods, if not for the whole period of service. My own experience is that the value of an expert in the agricultural department has steadily increased with the length of time that he has been in the province, that any system of deputing experts for short periods would not be anything like so fruitful of results as a system under which the expert is kept for a substantially long period of years, if not for his whole service, investigating the same conditions and acquiring a clear and definite knowledge of the agriculture of the tract. Then, again, I think there is another difficulty in any system of centralised establishment. At least in the agricultural department, for which alone I can speak, if an officer investigates a problem and solves it as the result of his research, he himself is desirous, and rightly desirous, that he should take a practical part in bringing that improvement into actual use among the cultivators of the tract. So far as my experience of agricultural chemistry goes—you have taken chemistry as your example—I do not think that an agricultural chemist would consider it a satisfactory position under which he is sent to a province to solve a particular problem, to put before the local authorities the solution of that problem, and then have no further concern with it. It would be, I think, bad for his work and bad for the Government: if he was

not retained there, if he did not take part in the arrangements for introducing that improvement into the general agricultural practice. Then, another very important factor that influenced us in starting provincial departments of agriculture was that an agricultural problem is always a complex problem. It is not a problem that deals with chemistry alone, it is not a problem that deals with botany alone, it is a problem on which the experts have to work together; the expert agriculturist, the chemist, the botanist, are all bound up together in the solution of almost every problem. You cannot depute a chemist in the agricultural department to do a particular piece of work, and say that that work is finished. He must be on the spot, the agriculturist wishes to refer to him, requires his assistance in the particular work that he is doing, and similarly the botanist's assistance is required by the expert agriculturist, and is required by the chemist. It is a complex problem on which you must have experts all working together. The agricultural service does not deal with problems perhaps so homogeneous as those, for instance, of the Geological Survey or many other departments. These are the principal difficulties that I see in the way of placing the chemist or the botanist into separate watertight compartments instead of having them, as they are at present, one whole in the agricultural department.

A. It is true that many of these scientific officers are considerably isolated in the provinces. For instance, in Nagpur the agricultural chemist is very much isolated from chemical work of other kinds, but you also have to recollect that he has in association with him other scientific officers of his own department, and I hope that in the near future there will be a substantial increase in the number of scientific officers in the provincial departments, with the result that, although the officer may be partially isolated as a chemist, I do not think that he is isolated from all other scientific work. If a stimulus is required there is a stimulus available in the work of the other scientific officers of the department who also have at least some knowledge of agricultural chemistry. There is no man in the department who has not some knowledge of agricultural chemistry, although he may not be a specialist in that particular subject, and as the department extends I think that influence will increase a good deal.

A. Then in regard to the co-ordination of the work of the department, the scheme included a Central Research Institute at Pusa which was intended to be a centre of advanced research dealing with problems of wider scope and of a more purely scientific character than those which would be taken up by the provincial staffs; and we hoped to get at Pusa the best agricultural chemist, the best economic botanist and other experts, who would be able to guide and assist the provincial staff. This part of the scheme has to some extent failed, because hitherto they have not had at Pusa scientists of such outstanding reputation in their particular science that their opinions would be accepted and welcomed by the provincial experts. In order to avoid overlapping in the work of the different provincial departments, for instance in order to secure that the chemist at Nagpur should not be duplicating the work done by the chemist at Lahore, the Board of Agriculture was instituted, to which every branch of each provincial department had to submit a programme of the work they intended to perform; these programmes were subjected to the scrutiny of the Board to see whether they could be improved, and also to see that there was no overlapping so far as it could be avoided between the provincial departments. It was hoped by these means to avoid some of the difficulties that you mention in the organisation of the department. Under your scheme of a separate chemical service, for the reasons which I have given, it seems to me that it would be very difficult to include the agricultural chemist, unless your scheme contemplates that an agricultural chemist should be deputed to a province for a very substantial period.

Q. Not less than ten years?—A. Probably longer than ten years, and in that case I am not quite sure that any very great advantage would result from having these chemists removed from the Agricultural Department and placed in a separate chemical service. One advantage may be that they would have at their head a distinguished chief chemist who would guide their work. Well, as I said, the intention of the Agricultural Department was that this function should be filled by the Agricultural Chemist at Pusa. The heads of the branches of the Central Chemical Department would presumably be men of such outstanding scientific reputation that the majority of the staff would be willing to accept their guidance. But there would also be considerable risk of practical difficulties in the working of the scheme. A chemist belonging to a department which is not agriculture will be deputed to do work in the agricultural department, and it seems to me that in many cases there is the possibility of conflict between the interests of the two departments, that for instance the agricultural department would desire the chemist to take up a particular line of work in chemistry from the point of view of agricultural benefit, whilst the chief chemist might consider that this man could be more profitably employed in other directions of work, with considerable chances of friction in the working of these services. It does not occur in the Geological Service because that department has problems which appear to be much more homogeneous and not concerned so intimately with the other branches of the administration and, therefore, the Local Governments cannot, so far as I can see, come into conflict very much with the views of the Director of Geological Survey. Whether the chemists of other departments can be combined into a general chemical service I hesitate to express an

opinion, because I have not got sufficient scientific knowledge. There are the professors of chemistry in the Education Departments, and I do not know if it is contemplated that they should come into the scheme. Then you have got chemical examiners employed in the medical service, who might be included in the general Chemical Department. There are also some chemists employed in the Assay Department.

Q. The Assay Department would come into the metallurgical and mineralogical group. Chemistry falls into three fairly natural divisions, and they are big departments. The real problem is whether you want the department to be big enough to give a man scope for his ambition. The difficulty that I have noticed at present is that your agricultural chemist or other scientific men have no hope beyond a general promise that they will be considered again when they reach their maximum pay. They may get to Pusa, but they may never be the Agricultural Adviser to Government?—*A.* Hopes for the future may be hopes of material prospects or hopes of future scientific reputation. So far as material prospects are concerned, that has been inquired into by the Public Services Commission, and what is considered a sufficient remedy has been recommended.

Mr. C. E. Low.—*Q.* Is it a fact that the remedy suggested by the Public Services Commission does not offer the prospects suggested by the President? The head of the department would be paid Rs. 3,000 and the Deputy Chief Chemists Rs. 2,000 each. The scale would be parallel to that of the other departments of the first grade in the Imperial cadre?—*A.* I am precluded from saying more than that the Public Services Commission has made recommendations which it is believed will result in adequate pecuniary prospects to the class of men which it is desired to recruit. What will be the conditions after the war, of course, is an entirely different matter.

Q. Of course in the case of agriculture you have to regard the local conditions of soil and climate more scrupulously, and you have established customs to be dealt with. The man must know the ryot as well as the soil?—*A.* Certainly.

Q. Many of the industries that we hope to see taken up will be less affected in this way by soil and climate, and they will be more universal in their application. The raw materials will be more general in character and, of course, more easily transported from one province to another. That is why we want this question to be discussed by you from the agricultural point of view, because we realise that the weakest part of this scheme will be where it touches agriculture. If you could create a better kind of feeling among your agricultural men, a sort of *esprit de corps* as members of the Agricultural Department, whether they are chemists or botanists or mycologists, would not that be an improvement?—*A.* I think there is some *esprit de corps* in the agricultural service as the whole, and there is a strong *esprit de corps* in the staff of some provincial departments, which might be lost in a service of experts transferred from province to province. There is one consideration which I had failed to mention in discussing the material prospects. In a service liable to transfer throughout India and Burma from place to place, a substantially higher rate of pay will be needed than in a service restricted to one province in which the men have their headquarters at the same place throughout their service.

Q. The scheme that has been contemplated is something more than that of the Forest Department, where a man is practically for the whole of his service in one province while being a member of the Indian Forest Department. Any province may yield a man who becomes the Inspector-General, and any province may yield a man who becomes the Chief of the Research Institute at Dehra Dun. In the same way any province might give its best man to be Chief Chemist. There would be no chance of disturbing the men by frequent movements in that way. They would not be thrown about from one province to another. In agriculture there are many problems which may extend well into two or three and sometimes more provinces, and in that case it might be an advantage to have this Imperial department. We came across a case in which the agricultural people in the Punjab did not know what was happening in Sind and *vice versa*?—*A.* This instance seems to suggest that the Board of Agriculture has failed to exercise its function of co-ordination.

Q. The Board of Agriculture is intended to bring these together, but they do not as a matter of fact. They publish their results locally. There was, in fact, as far as one could gather, the development a little too much of individuality. We do not want to have the form of an organisation that is characteristic of German *Kultur*, but we do want to go beyond the present British system of every man going his own way, because we have here in India a clean slate, and we have fewer vested interests to break and we ought to be able to organise in such a way as to steer between the two extremes?—*A.* As regards publications I think that there is a rule that the publications of every provincial department should be sent to every other provincial department.

Q. We have heard this complaint that papers are sent to Pusa for publication, but there is no real authority to say whether they are suitable or not. They have a sort of publication committee, but I do not know whether they sit and decide what papers should be published and what papers should not be. You have in your Agricultural Department developed a fine spirit. We have been a great deal impressed with it and you have a splendid type of man. I wonder how they do such splendid work under

such discouraging conditions, because none of them has any serious hope of improving their position as officials when they become senior men. Another advantage of the system that has been suggested to us was that the chief chemist, or the chief botanist, or the chief zoologist to the Government of India, must be a man standing out among the chemists, botanists and zoologists of the world. As regards the Forest Department, it seems to me that you have a fairly close parallel in the present organisation of the Agricultural Department. There is an Indian Agricultural Service, of which all the experts are members. The agricultural chemist is a member of the Indian Agricultural Service exactly on a level in status and other respects with any other member of that service. So far as I am aware, the highest posts of the department are open both to the expert agriculturalists and the specialists. There is at present no reason why an agricultural chemist should not become the agricultural adviser to the Government of India, which is the highest post in the department at the present time. In the Indian Agricultural Service I see no reason why there should not be a thorough *esprit de corps* between the agricultural chemist, the botanist and other experts, who are all dealing with the same problem, the improvement of agriculture.

Q. I quite agree, in the absence of a higher one elsewhere. I tell you one thing that I have noticed at Coimbatore, which strikes one as the result of this form of classification. The Principal of the college is an agriculturist, in addition to him there are an agricultural chemist, an economic botanist and, I think, an entomologist. These men are heads of separate little departments with their own clerks, and the Principal of the college has no control over them. If they want to communicate with him the proper channel is through the Director of Agriculture, Madras?—A. The Principal of the Poona College of Agriculture is not an agriculturist but an agricultural chemist, and I do not think that it at all follows that the Principal must be an agriculturist. As far as I know the organisation in the Central Provinces, each specialist has dual functions. He is responsible to the Principal of the college for the teaching of his particular subject in the college. He is also a research officer carrying out independent research work, in respect of which he is not responsible to the Principal of the college but to the Director of Agriculture. In the Central Provinces at least no difficulty has arisen from this arrangement. It is certainly not the case that if the agricultural chemist desires to correspond with the Principal of the college he must do so through the Director of Agriculture. They are in the closest possible touch in their work, and I think that such a thing as correspondence between them never occurs.

Q. The members of the Coimbatore College are in personal touch with each other and they are in the same compound; but they are independent departments. The Principal of the college definitely told me that he could not give an order to the agricultural chemist to undertake any particular work in the college as he is an independent man responsible to the Director of Agriculture?—A. I do not think that is the case in the Central Provinces. I think in the Central Provinces that the botanist and the chemist are responsible to the Principal of the college that the teaching course in the college is properly conducted in accordance with the instructions and suggestions of the Principal.

Q. The agricultural chemist, for instance, at Coimbatore, objects to have anything like teaching work?—A. The combination of teaching and research is a debated question amongst scientific men on which much has been written.

Q. We know there would be difficulties in every system whichever form of classification we adopt—the vertical system of subjects or the horizontal system by the application of subjects. What we are trying to get at is to balance the advantages and the disadvantages in such a way as to find which is likely to be in the long run the best form?—A. In the Agricultural Department, experience has shown that hitherto research can best be accomplished at provincial centres under the local conditions of climate and soil, and certainly at the present stage I should be very sorry to see provincial research regarded in any way as less important than the research conducted at Pusa. It must be recollected that the agricultural department is, in its infancy at the present time, mainly employed in an investigation of local methods of agriculture from a scientific standpoint, and is largely concerned with research into local problems, indeed much more elementary problems, if I may use the word, than we hope to reach after some years of development. Advanced research problems of a wider scope, problems of a more purely scientific nature have not hitherto been very prominent, because there have not been foundations on which to build those larger problems, but with progress I have no doubt that these larger problems will become of more importance in India, and Pusa will then fill much more largely the function which it is supposed to fill in the department, and will gradually attract outstanding men, whose opinions will carry full weight. When we started the Agricultural Department all the men started more or less together. The fact that X was posted to Pusa and Y was posted to a province was very largely a matter of chance, but when the department has passed through two or three generations of official life, I anticipate that only the best men will gravitate to Pusa. The Pusa staff was appointed before there was any intention of appointing a large provincial staff. There has been no opportunity for the process of selection of the most fit man for Pusa, except in one or two recent cases. It was hoped that the reputation of Pusa and the slightly better prospects which men at Pusa enjoy peculiarly would be sufficient to attract the very best men from the provincial departments, and it was contemplated that if there was no man of sufficient

standing in the provincial departments to justify his selection, then an attempt should be made to get a man with a distinctly high scientific reputation from Europe to fill the post. It was designed on the lines that you suggest, that there should be at Pusa the best specialist in each branch, who would be accepted as the recognised authority in the particular line to whom all provincial experts would refer in cases of difficulty.

Q. We shall have the same difficulty arising from the proposal to have local Directors of Industries. Each local Director of Industries will be up against problems connected with soap, oil, drugs, tanning, sugar, alcohol, and so on. All these require independent or distinct specialities, and is it possible for the Director of Industries to employ this variegated group, one for each kind, without having difficulties, and is it likely to attract a good man, unless that man is a member of some Imperial department with prospects of rising beyond what the provinces could give him?—*A.* So far as industrial investigation goes, again speaking purely as a layman, I should think that a centralised department has advantages over provincial departments, that the problems are generally clear-cut problems of wide application, towards the solution of which one expert can devote his energies and arrive at some satisfactory conclusion. For instance, if you want to investigate a particular chemical industry, an expert chemist in that subject can be employed, and I cannot imagine that it would be a good thing for the future development of industries to have a large number of isolated experts each separately investigating the same industrial problem. So far as the industrial side of the question is concerned, your centralised scheme seems to me to have very great advantages. Speaking again purely as a layman, I should be inclined to think that any particular scientific service that it is desired to create for the investigation of industries—and there is no doubt that there is an enormous scope and plenty of practical results to be achieved—should be framed on the lines of a central department with a central head rather than on the model of the Agricultural Department. My main desire has been to show why the Agricultural Department was organised on its present lines, my belief that those lines still hold good, and that it will not be to the benefit of the Agricultural Department for its specialists to be transferred to central departments.

Dr. E. Hopkinson.—Q. We have already come across several instances where agricultural problems involving research have been given up as they could not be taken in hand by the provincial men. In one case it could not be taken in hand at Pusa, and the result was that they had either to take a particular man off from the regular work in the province or at considerable cost get a man from home. If, in this short time, we have come across four or five instances of that sort, there must be in the whole of India a very large number of problems which ought to be attacked and are not for want of adequate staff. It seems to me that the scheme sketched by the President would meet such cases admirably. It might be possible at the same time to continue the present organisation of the provincial agricultural departments by the employment of chemists and other scientific assistants who, though of somewhat lower status and ability, would continue for much longer periods as assistants in the provincial department working under the Director of Agriculture and doing the ordinary routine scientific work which must be dealt with day by day. We came across a case which required a particular investigation as to opium which would take a few months to complete. The Agricultural Chemist of Bengal has been taken away from his work to undertake it and when questioned as to what became of his regular work in his absence, he said, "It is left to take care of itself." He is now employed at Cawnpore, and is entirely divorced from his regular work?—*A.* It is the case that the staff of the Agricultural Department is quite inadequate to take up many important problems that it is desirable to investigate, because the staff is too small for the purpose. It is also the case that problems arise in the Agricultural Department which require investigation by special experts and hitherto few such specialists have been employed. A considerable advantage would accrue to the Agricultural Department from the creation of a corps of chemists organised in a central establishment, from which the Agricultural Department could from time to time ask for the service of a particular man for the investigation of a particular problem, such as you say the opium problem is. But I wish strongly to deprecate any suggestion that the agricultural chemist employed by the Agricultural Department should be in any sense a man of a lower status or lower qualifications than the central department chemist. To my mind the bed-rock of agricultural improvement is the investigation of local conditions, local research into problems, and any idea of attaching to the provincial Department of Agriculture a chemist who may be thoroughly competent to make analyses but not to undertake research work would be disastrous to the department. The agricultural chemist has an assistant who does a substantial proportion of the chemical work of a lower standard, and I am opposed to any system under which the agricultural chemist attached to the provincial Department of Agriculture should be a chemist incapable of doing independent research work into agricultural problems. So far as the improvement of agriculture is concerned, more benefits are likely to result from a chemist employed in the provincial department than from a chemist deputed to investigate particular problems. I should hope that the provincial agricultural chemist would be a man of higher scientific attainments than that of the junior in the agricultural chemical service. In agriculture, I believe the results will be more fruitful from a staff of experts than from a central staff with an expert sent down for investigation of a particular problem.

President.—Q. How are you going to make the provincial service attractive to retain such a man?—*A.* I believe that an improvement in the prospects of service in the Agricultural Department is essentially necessary; that problem has been investigated by the Public Services Commission, which has made recommendations believed to give adequate material prospects.

Q. Do you think that it is good for the health of any scientific man that he should be retained for a long period confined to one particular class of scientific problem and with little opportunity of association with other scientific men?—*A.* I do not think it is good for a scientific man to be confined to a few scientific associates or to a few problems. So far as the Agricultural Department is concerned, we hope to see in the near future a very substantial increase in the number of scientific experts employed in that department which should broaden their outlook, and we hope also to see the scientific experts of the Agricultural Department located in centres where other scientific men are also employed and thus in a more scientific atmosphere. As regards the suggestion that they are concerned with problems of a particular class with a narrow outlook, I do not agree. The problems concerned with agricultural chemistry are so wide and varied that the difficulty is not that the chemist is confined to a particular class of work, but the work is so diverse that the chemist has not the expert technical knowledge necessary for the particular problem that arises. One advantage of the central system would be, not as you suggest that the work would be more diverse, but that the work would be more specialised.

Q. Specialised in subjects, but more diverse in application. Mr. Harrison in Coimbatore has made a very special study of paddy soils. He is confined to work in Madras. Would it not be better if he extended his investigation to paddy soils in other parts of India? It would be narrow in subject but wider in application, not geographical application?—*A.* I agree that one advantage of your scheme would be much more specialisation when you have an expert in paddy soils like Mr. Harrison.

Q. Which is the better form of classification? By subjects and narrowing the man to a subject and extending the range of operation, or extending the range of subjects and limiting the area of operation?—*A.* In the Agricultural Department every expert is overburdened. Any suggestion that the agricultural chemist in the provincial department is cramped or limited by the class of problems that he has to deal with is certainly incorrect.

*Q. Dr. E. Hopkinson.—*There are two respects in which you agree that the present organisation of the Agricultural Department has not worked out as you anticipated. One is the arrangement of the programme of agricultural research work for the whole country, in which co-ordination has not been attained?—*A.* I did not intend to imply that co-ordination had not been secured. In regard to the particular instance given to me, I wished to state that I could not understand how it had occurred under the present organisation. It struck me that it must be very exceptional.

Q. The present arrangement is, I understand, that the programme should be settled by the Board of Agriculture?—*A.* Yes; it is discussed by the Board, and recommendations made.

Q. And we have been told that the Board of Agriculture meets every two years?—*A.* Yes. Every important line of investigation in the Agricultural Department extends over two years at least, and generally for a substantially longer period. By experience it was found that changes in the annual programmes were so few that it was extended to two years, because that was considered sufficient to secure co-ordination.

Q. Do you think that the scheme sketched by the President would have advantages in that respect?—*A.* The advantage that most appeals to me is that you will have a recognised head of every branch of chemistry, a chief chemist of outstanding ability, whose guidance would be accepted by the provincial chemists. I can see great advantage in having expert guidance and assistance from a chemist of established reputation whom the provincial chemist would be prepared to accept as an authority. That, I admit, has not as yet occurred in the Agricultural Department, but I believe that it will accrue in time, and that this particular advantage can be secured in the department itself as well as by the scheme outlined.

Q. The other point is the question of publication. That probably has not worked out as you originally intended?—*A.* The scheme of publications at Pusa was started when I was Inspector-General of the Department, and also of a general agricultural journal intended for the educated reader interested in agriculture. It consisted of a series of scientific memoirs divided into subjects, such as chemistry, botany, entomology, and the like. There was also a series of bulletins, intended for matters of interest which were not of sufficient standing or importance to be included in the scientific memoirs. When the scheme was framed, it was decided that the scientific memoirs should have the first call on every scientific paper written by a member of the service. That was done with the object of building up for the Pusa Memoirs a scientific reputation which would make them comparable to the scientific publications in Europe. It was recognised that it involved a very great sacrifice on the part of the staff. As a matter of fact, we followed the Geological Survey Department in the hope that the scientific records would make an excellent reputation in the scientific world. So far as I am aware, that policy has been almost completely unsuccessful, and the scientific publications are being almost entirely neglected.

Q. Has the policy been entirely successful? Have all results of researches which were of value been published? Is it not possible that a good deal of valuable work has dropped out of sight and never reached the stage of publication?—*A.* If so, I should imagine that it must be the desire of the officer responsible for that work not to have it published. The scientific memoirs are conducted by an editorial staff at Pusa who decide whether the papers submitted to them are or are not of a sufficiently high standard to justify inclusion in the series of scientific memoirs; if any officer has not submitted for publication any scientific paper written by him, I can only suggest that he has some particular reason why he does not desire it to be published.

Q. Mr. Leake's botanical publications are published at home instead of at Pusa. Butler's work is almost entirely published in Germany. He actually showed me his papers published in Germany. He could not find any suitable means of publication even in England.—*A.* I have no knowledge of the present system of publication, which may have materially altered since my connection with the department ceased. I can understand that certain systematic work, such as Butler's classification of fungi, may be so specialized as to be unsuitable for publication in India.

President.—Q. The Geological Survey publishes papers relating to one single subject, so that any man who wants to know anything about the geology of India need not go beyond the Geological Survey Records. To show you how a paper or journal can establish its reputation if it is confined to a definite subject or natural group of subjects, the *Records* of the Indian Museum were started when I was Chairman of the Trustees in 1908. They have now reached something like 14 volumes, confined entirely to zoology; and in spite of the fact that its name has no obvious relation to zoology, it has established such a reputation in the zoological world that men send out papers from home to be published. That publication has established its name now as *the* journal of zoology for India, and zoologists of Europe would not look to the agricultural publications at Pusa, although there is a large quantity of excellent material published there. So that, is it not an advantage for workers out of India to have some journal that is recognised as an authority, that can be complete in zoology, in botany, in agriculture as a science, or in any group of applied sciences? You will establish your reputation at once if it is made authoritative and representative of the whole of India. You will also get exchange publications?—*A.* The last advantage has accrued to the Department of Agriculture from its own series of publications. It receives in exchange a very large number of scientific publications.

Q. Have you any objection to the combination of research and teaching work in the same institution?—*A.* No. The combination has been for good, particularly in India.

Q. You do not say that a research man becomes a better research man if he is given teaching work. You would not allow a first class research man to do simple class work teaching to meet the standard of the university? That is totally different from a research man undertaking a course of lectures on special subjects?—*A.* As I stated before, this general question is much debated even in Europe. There are some advantages in India from a combination of teaching and research, that do not occur in England. The fact that the staff is largely European and the students Indian is a strong reason in favour of research workers having some teaching in order to come in contact with the youth of the country and influencing their outlook on science.

Q. You know that the Geological Survey has been keen on the geological officers having a certain amount of teaching in some part of their history. It helps them to get a broad outlook of their profession. I would not allow the officer to teach elementary classes continuously as part of his duties?—*A.* Experts in the Agricultural Department are not intended to devote a very large amount of time to teaching. They are provided with assistants competent to undertake the bulk of the teaching work, and it was only intended that they should deliver lectures from time to time and also supervise and see that the teaching given by the assistants was good.

Q. You said that in the Central Provinces the officer is responsible for research work to the Director of Agriculture and for teaching work to the Principal of the college. Has any practical inconvenience arisen from that divided responsibility?—*A.* I have not been connected with the provincial department for several years, but I have not heard of any difficulty. The relations of the Principal and the expert staff are, I believe, thoroughly friendly. When I held the office of Director, all the staff met from time to time for discussion, forming a sort of governing body for the college.

Q. Do you know that the same thing obtains in the other provinces?—*A.* I cannot tell you. So far as I am aware, no difficulty has arisen in this province from the duality of functions.

Q. There is one other point which struck me very forcibly during these few weeks, that a great many agricultural problems have been solved in India—purely scientific problems—with extraordinary accuracy and scientific problems, but there has been a breakdown in the application of the results of the solutions to practical results. As soon as you have to

entrench on the industrial side and still more so on the commercial side, they frequently break down so that the scientific agricultural results have not been fully reaped. Do you think that that is an unfair deduction to make from what we have heard?—A. I do not know the conditions in other provinces, but so far as agricultural research has been conducted in this province I know no important piece of research work which has failed to give practical results from lack of organisation to introduce it into general practice. The Deputy Director would be able to give a much better and clearer account of the organisation that exists for that purpose than I can give. I think that the Central Provinces Department of Agriculture can claim with certainty that many important results have been brought into actual agricultural practice. The Deputy Director will be able to tell you how it is done. It is his organisation, and I have never heard any suggestion that it has failed. Such organisation has, perhaps, worked in this province on a larger scale than in any other province of India.

Hon'ble Sir R. N. Mookerjee.—Q. What is at present the check on the chemist or botanist in the provincial Agricultural Department, if by chance you get a bad man who is not very keen on his work or anything like that?—A. So far as check is concerned I place most reliance upon the influence of his colleagues in the department. As I tried to explain, the ordinary chemical problem is not an isolated problem which the chemist works out alone, but part of a complex problem, and his colleagues will always endeavour to get out of the chemist, to take the instance given by you, the particular investigation that they desire from that chemist. Then again, the chemist has to publish his annual report every year, which is subjected to examination by the Director, and is submitted to the Local Government. This report is also subjected to examination by the Agricultural Adviser to the Government of India just as the programme of work goes before the Board of Agriculture. You get some bad bargains in every service in the world, but there is a distinct stimulus and agency that can be applied to correct slacking.

Q. For instance, if you get a bad bargain in the Civil Service, he is pulled up by the District Magistrate and warned. In this case it will take a couple of years before the matter reaches the Board of Agriculture?—A. That is true, and it takes more than two years in the case of the Civil Service. A bad bargain in the Civil Service is perhaps not pulled up so quickly as a bad bargain in the agricultural service at the present time.

President.—Q. We have had a number of cases brought before us very prominently of work done, but there had not been anybody to check whether the work undertaken was of the proper kind?—A. I can only say that it was hoped that the Board of Agriculture would perform that function.

Q. The Board of Agriculture apparently failed in a particular case not only in controlling the actual results, but it is said that there was no one to whom the officers could appeal to act as an arbitrator?—A. There is the Agricultural Adviser to the Government of India.

Q. He happens to be a worthy civilian who is not a mycologist, chemist or economic botanist. Another thing which we found is that the assistant mycologist at Pusa is engaged, and has been practically for the whole of his service there, in doing forest mycology. It is an instance in which if these mycologists were members of a central department they could just be doing forest mycology or agricultural mycology or both. In this case the senior mycologist is doing work with direct application to agriculture, but his assistant is engaged, although he is employed in the Agricultural Department, in forest problems. I think he is actually getting his material by private arrangement from the officers of that department?—A. It is at least an instance of the entire absence of any departmental spirit in the Agricultural Department, but I cannot explain the fact.

Q. It shows that it is not difficult for a mycologist to help the Forest Department or the Agricultural Department or any other. That is why I say that it is not a disadvantage if these men are centralised in this Imperial department. They still would be available for the use of the agriculturist, and the time is coming when the Agricultural Department should have a sufficient number of men taking up cattle-breeding, and dealing with soils, agricultural engineering, growth of crops and demonstration work, forming, in fact, a compact body of scientific agriculturists. There should be a large increase in the number of scientists. And the question still arises whether you are going to develop at the same time correspondingly your agricultural chemist or botanist, or whether they are to be kept as handmaids of the agriculturist?—A. I do not agree that the use of the word "handmaid" is correct. I regard them as entirely equal, and I do not think it is correct, in the Agricultural Department, to suggest that either the chemist or the botanist or anybody also is a handmaid of the agriculturist. So far as material prospects are concerned, I cannot see that there is any very great necessity for adopting a central service. It seems to me that in the Agricultural Department you can have material prospects sufficiently good to attract the class of men that you desire.

Q. There is another point that has been brought before us. I have seen one or two specialists who do not get on very well with their Local Governments, the reason being neither the fault of the Director of Agriculture nor only of the Specialist. Is not a case

could return your chemist, or botanist, and he could be used in other provinces or at the head-quarters?—A. Every officer in the Agricultural Department is liable to transfer to any part of India, and if the necessities of the public interests require that a particular officer should be transferred from one province to another, it does not appear to me to be difficult to secure it.

Q. The central department will be responsible to accept their bad bargains back?—A. We may get nothing in exchange if we return the man who is not quite suitable. I do not think that difficulties are less likely to occur under the centralised scheme than under the present scheme. When officers are in the provincial department, they are regarded in a much more friendly and helpful spirit than the officer deputed for a particular period from the central department.

Q. That is not my experience as an Imperial officer. There will be two types—one like the Public Works officer attached to the province practically for his service, and the other type of specialist who is sent round for any particular enquiry. Both of them, if they are normally well-behaved men, will receive good treatment from any provincial head-quarters. I do not think that anything otherwise happens except to a man who ought to be treated badly, and we treat him just as badly after he returns?—A. In the Civil Service when a man is appointed to a particular province, every one of us will try our best to turn him into a good officer and put him on the right lines, to give him every assistance in our power not only officially but socially and otherwise. I think that feeling would not certainly be so strong in regard to officers deputed from a centralised office.

Q. In the case of the Civil Service you still have a small imperial reservoir, and some of you were not unwilling to go to Simla from the provinces, still carrying a very good provincial spirit with you?—A. That is entirely a different reservoir from the one suggested, a vessel to collect the best cream and not for the storage of the bad milk.

Q. The central head-quarters of this Imperial Chemical Department would have mostly administrative work together with a certain amount of research on certain problems. Some problems you can deal with only when you get material from all the provinces or many of them. These would be undertaken in the central laboratory and the analogy of the Civil Service is not so bad. Those officers would bring with them a fine provincial spirit, and the man from the Central Provinces would attempt to show and succeed in showing that he was a better man than the one who came from Bombay?—A. (No answer.)

Witness subsequently forwarded the following supplementary note.

One aspect of the question not considered in the above evidence is the provision of funds for the expansion of the Agricultural Department. Under the present organisation each Local Government is ready to find funds for the expansion of expert staff required for its own needs. A centralized scientific department would be dependent for funds on the Imperial Government alone, and Local Governments will not be so ready to urge the desirability of, and to provide funds for, an increase of staff in a centralized service, which may or may not even then meet its particular requirements.

If the advantages of the centralized services of chemists and botanists are considered to outweigh the disadvantages from the standpoint of the Agricultural Department, and the advantages are many, there should be a condition that each provincial department of agriculture should be provided by the centralized departments with a chemist and a botanist, who should be employed in that province for a period of (say) not less than ten years, unless the Local Government consents to the transfer. This condition would remove my principal objections to the proposal, which would then have my full support.

WITNESS NO. 148.

Mr. D. Clouston, Deputy Director of Agriculture, Nagpur.

Written Evidence.

I have had very little experience of any industry but agriculture, and it is with a certain amount of diffidence that I offer an opinion on matters relating to other industries. But to a certain extent at least the difficulties we are up against in India are the same in every industry. Labour is cheap but unreliable. For want of technical skill and knowledge, where that is required for manipulating machinery, most industries are placed at a disadvantage. The Department of Agriculture has helped to set up a certain number of small ginning plants on certain seed farms to enable the growers of Roseum cotton to keep their seed pure; considerable difficulty has been experienced in getting skilled men to manage such plants. The department has got over this to some extent by training men in this work on one of the Government experimental farms, but this arrangement is only a makeshift and I look forward to the time when such training will be given in the engineering school at Nagpur.

The same difficulty is experienced whenever any new agricultural machine is introduced. The combined mechanical skill of a village cannot repair it when it gets out of order, and for want of skill in handling it the machine soon becomes less efficient. The department has tried to find a remedy by sending round a trained mechanic to execute repairs in the villages where such machines are being tried. This again is only a half measure. What we really want is a certain number of capable smiths and carpenters of the foreman type scattered over each tahsil. More attention should be given by Government to the technical training of such men and an effort should be made to encourage skilled mechanics to open workshops of their own at head-quarters of tahsils to start with.

My experience of day schools for short-time employes is small, but from what I have seen I am of the opinion that the standard of living and intelligence in this country is so low that there will be no real demand for education among the cultivating class at least till we can raise them in the economic scale and prove to them that education is of some practical value to them. Education in rural districts, in short, will have to wait on the economic development of agriculture.

What the landholder and his labourers stand most in need of, in these provinces at least, is such demonstration combined with training as will enable them to adopt improved methods. Schools of handicrafts of the type started in Nagpur, where boys are trained, under expert foremen working under the supervision of a highly trained superintendent, in neatness, accuracy and efficient methods of work generally should be of great practical value in raising the standard of workmanship among the class to which they belong; but we want ten times as many facilities for practical training of this kind and we want them developed so as to provide for the more complete training of men as supervisors too.

The Department of Agriculture holds practical classes on some of the Government farms for training young men in improved methods of farming. There is great scope for expansion in this direction. All we have been able to do up to the present is merely a drop in the ocean. The department which is held responsible for the development of the particular industry for which the men are being trained should also be held responsible for the quality of the training given; but where teachers are required for the teaching of special subjects, the department in charge should get the assistance of the Education Department.

To improve the labourer's efficiency generally, we want more and better elementary education, though, as I have already said, there will, in my opinion, be no real demand for education, in rural areas in the Central Provinces at least, until we have first raised the standard of living by developing agriculture, our greatest industry. We must first show the cultivator that our improved methods will add largely to his farming profits and that it is his duty to educate his children to enable them to take full advantage of the benefits which such improvements offer them. At the present stage of agricultural development the teaching of the cultivator in new and improved ways of doing things is our main concern.

As soon as trained teachers are available the teaching of nature study should be taken up in rural schools with a view to interest the child in his surroundings, and to cultivate his intelligence. Far more attention should be paid to hand and eye training too so as to train the pupil in accurate and methodical ways of doing things with his own hands. An effort should be made in all such teaching to stimulate the pupil to do things well, to do them punctually and to give him a true sense of the dignity of labour. But in the Central Provinces we have at present no teachers properly qualified to train the mind, hand and eye of the child by such a course of teaching and training. We want for this schoolmasters trained in the method of teaching such subjects: for everything depends on the method employed.

Official organi-
gation.

The Departments of Agriculture and Industries and the Co-operative Societies are the two organisations which as far as I know give most help in developing industries in the Central Provinces. The Department of Agriculture and Industries has always been directed by a civilian. I don't think any substantial progress is likely to be made until we get as a Director of Industries a scientist with some knowledge of engineering. In other provinces, where industries are more developed, to have a business man with a good scientist on his staff to advise him may prove the better arrangement; but for many years to come there will not be sufficient work for two highly paid men in the Department of Industries in these provinces. We want a man who can go round and advise both as regards plant required and ways and means of marketing the produce. The Director of Industries should therefore be an expert with some business knowledge as well: a good man would soon acquire the business knowledge required. The personality of the Director would be an important factor.

A Board of Industries consisting largely of men engaged in business would be useful. To start with, its functions should be purely advisory, I think.

There should be an Imperial Department of Industries under a single head with a staff of experts capable of assisting the Directors of Industries in the different provinces in the development of local industries.

The Department of Agriculture, though only one of several Government departments which are assisting the industries of the provinces, is perhaps the most important from the point of view of results obtained. The department is at present under-staffed. We want one Deputy Director for each division to carry on experimental and district work. We want, too, a larger and more highly qualified staff of Indian assistants, and a Director who will stick to the job for a period of at least 10 years. The department is yet young and we are still feeling our way; but I am of opinion that more attention should be given in future to the training of Indians in our Agricultural Colleges, in order to qualify them in research work. The rate at which we can go on developing the department will depend to a large extent on the quality of the educational work done in these colleges.

The staff of the Provincial Agricultural Colleges should look upon teaching as their primary duty, and research work should be left to a larger extent than is done at present to the Imperial staff of experts at Pusa.

There is considerable over-lapping at present and insufficient control.

The Imperial Agriculture Department should always have as its head a scientist whose work has been of great practical value in developing agriculture. We want a scientist of a practical turn of mind rather than a pure researcher. In the event of such a man not being available in India inducements should be offered to attract one from home.

When men qualified to fill other posts in the Imperial Department are not available in India, they should be recruited at home, where there is a wider field for selection. It would be possible to get men who had made their mark at home to come to India for a period of 10 years or so, if sufficient inducements in the way of salary were offered.

I have devoted almost my whole time since I came to India to the development of scientific agriculture and the department has succeeded in introducing new crops, new improved varieties of existing crops, new manures, new methods of cultivation and at least one new branch of husbandry, namely, dairying on scientific principles.

We have given material assistance to some of the oil-mills by creating a demand for their cake.

Cultivators have not got the reading habit as a rule. The Indian Trade Journal is not read as far as I know except by Government officials. Agricultural journals, too, are not popular even among English-speaking cultivators. The articles are too scientific to be intelligible to men whose intelligence has not been developed that way by the literary education which they got at school. The department publishes a small monthly Agricultural and Co-operative Gazette, which is, I believe, fairly widely read, judging from the queries sent in by readers. Publications of this kind should be circulated in the vernaculars as well as in English. The language should be simple, and there should always be a query column containing replies to readers asking for information.

I do not think that large exhibitions are of much use. Small divisional agricultural shows such as are now held every year in these provinces are educative and stimulating. The industrial side of these shows is now being improved with a view to encouraging some of the local industries. At the Raipur Divisional Show prizes were offered this year for exhibits of silk and brass-work, and an improved fly shuttle hand-loom and a potter's wheel were worked in the show yard. There is scope for the development of divisional shows on these lines.

Our aim is to make these shows as educative as possible, and with that end in view we hold conferences in connection with them, at which papers on agricultural and co-operative subjects are read. To encourage cultivators to adopt improvements, prizes are given for the best exhibits of the staple crops grown in the division and of new crops introduced by the department.

The development of an industry like agriculture on which the prosperity of about 80 per cent. of the population is dependent is of such enormous importance to the country as a whole that Government would, I think, be justified in granting loans to enable cultivators to adopt improvements on a larger scale than is being done at present. In the Central Provinces takavi loans are given to cultivators for the purchase of improved agricultural implements, as well as for cake for manuring sugarcane. Loans are given to cultivators on the recommendation of the department by co-operative central banks for the purchase of improved seed and agricultural implements. The members of the Telinkheri Gadies' Societies have also been given loans by the Nagpur Central Bank.

I am in favour of a much larger amount being given for agricultural improvements both by Government and co-operative societies and central banks.

The Gaolies on the Telinkheri dairy farm have been assisted by the formation of two co-operative societies. The Gaolies were induced to bring their cattle to the Telinkheri farm from the bazar. Sheds were provided for them on the Government farm and food-stuffs for their cattle were stocked and supplied to them daily. There are fixed charges for the different kinds of food-stuffs, for grazing, for godown accommodation, and for the service of the stud bulls belonging to the department. Their milk is sold at a fixed rate to a contractor who is responsible for the distribution.

The first society was started about four years ago; a second was formed about two years ago.

The dairy has been a great boon to Nagpur and the Gaolies are contented and have gradually added to their live-stock on the farm. A school has been opened on the farm for their children and a depôt started from which they are supplied with wheat, pulse, rice, gur and other food-stuffs.

Oral Evidence, 18th December 1916.

President.—Q. You say in your note that you "have given material assistance to some of the oil-mills by creating a demand for their cake". We have had it suggested that the Agricultural Department might be able to increase the demand for oil-cake which at present is not sufficiently valued by the ryots. It is said that the ryots quite understand the value of cotton-seed as a food-stuff but that, in spite of the fact that cake is probably better for cattle, they imagine that, because the cake looks dry and hard, it is of very little use. Are you of opinion that the people are really beginning to appreciate the value of oil-cake?—A. I don't think so. They value it as a cane manure, but not as a cattle food. They have to bring it a considerable distance by rail, and the cost of freight added to the cost price of the cake raises the price above that of cotton-seed very considerably.

Q. So that actually cotton seed is cheaper?—A. Yes, they get it from the village.

Q. How are you going to get over this difficulty?—A. Am I right in supposing that it is a real waste of good material to give cotton-seed as a food, when the oil-cake might be good enough for food after getting the oil out of the seed?—A. I think so.

Q. How is the difficulty to be got over?—A. When we create a demand for cake as a cane manure, cultivators will be willing and able to pay a bigger price for it.

Q. To increase the price of the cotton-seed by a natural demand will prevent its being wastefully used as a food?—A. I think so.

Q. And then I suppose if one had greater facilities for assembling the cotton-seed, and a larger number of oil-expressing mills, there would be no temptation for the ryot to use cotton-seed as a food?—A. No, and if we can create a demand, we shall then be in a position to bring it in large quantities at a time by rail, and in that case the freight would be very much less.

Q. Have you anything to complain of in the way of the distribution of freights here?—A. We were told for instance that from Akola to Nagpur, a short distance, the charge is as great as the charge from Nagpur to Bombay; and the suspicion left in our minds was that the railway company would not allow railway facilities, *i. e.*, cheap rates to Nagpur, because they did not want the rest of the journey to be made by the Bengal-Nagpur Railway; so by increasing the rates from Akola to Nagpur, they are alleged to prevent the transmission of the seed over the Bengal-Nagpur Railway to the port. Do you think there is any possibility of that being the case?—A. I think so. We have, however, got the Bengal-Nagpur Railway to reduce freights by one-half for certain cakes.

Q. You have found railway company ready to come down when a proper case is put before them?—A. Yes.

Q. I have heard of many cases in which they have come well below the recognised rates, when the case has been presented to them, but this is a case in which no reply of a satisfactory sort could be got, and no explanation obtained?—A. That was not our experience. They reduced it by one-half.

Q. Is there any discrimination made between materials estimated on a food basis and materials estimated on a manure basis?—A. They charge twice as much freight for carrying cotton cake (a feeding cake) as for tili and castor, which are used mainly as manure cakes.

Mr. C. E. Low.—Q. Is cotton cake useful for manure?—A. It is useful, but we found that it was not as good as tili cake and castor.

Q. I should like to pursue the point about the relative cheapness of cotton seed and cotton cake as food. When you say that cotton seed is available in villages, does it mean it is usually available round a gin?—A. Yes, most villages are fairly near a gin.

Q. The gins are more widely distributed than the oil mills?—*A.* Yes.

Q. Do you concentrate your efforts in pushing the sale of cake as cattle food within a cart radius of the oil mills; do you find you do better there than elsewhere?—*A.* We have not really tried to push it as cattle food at all. We have recommended it at the divisional meetings of our Agricultural Associations. A few have tried it already, but the cost is so great as compared with cotton seed that they have not continued to use it.

Q. You said that that was because of the cost of railway freight, but in a radius round the oil mills, corresponding if you will to the radius round a gin, the cotton-cake ought to be cheaper than the seed?—*A.* It should.

Q. Are the people using cotton cake as food in the radius round the Akola oil mills?—*A.* Very, very few. I think a few use it for tonga bullocks, but very few for bullocks employed in cultivation.

Q. Do you think any practical good would result from attempting the use of it as cattle food within a cart radius from Akola?—*A.* No, I don't think so. A great many of the people who get their kapas ginned at factories take back the seed. They send the kapas to the gin and take the seed back to the village and use it as a cattle food.

Q. Then you think the solution of it lies in creating a more effective demand from the oil mills for the seed?—*A.* I think that there will certainly be a demand when we start dairies. The Jubbulpore dairy is using a large quantity of it. We use a good deal on the Telinkheri dairy. If we had more dairies a demand would naturally arise.

Q. Does that cake keep better than the seed?—*A.* I don't think there is much difference. It gets a little mouldy if you keep it during the rains, but it does not lose much in quality.

Q. I should like, for the benefit of the other members of the Commission, who are much interested in this question of demonstrations, you to explain briefly what the demonstration organised in your circle is, including the functions of the Agricultural Association and the subordinate menial staff of the department under you?—*A.* It varies from division to division, but if we take Chhattisgarh for example where we have done the greater part of our demonstration work, we have there two or three assistants for each district. We have more in the areas commanded by Government tanks because of the greater scope for agricultural improvements in such irrigated areas. Each assistant is put in charge of 40 or 50 villages. He has a certain number, say, five or six Kamdars, working under his supervision who are as a rule ploughmen who have been trained in the new methods which we are introducing. These men are each in charge of six or seven villages. An agricultural assistant supervises them; while in charge of the agricultural assistant we have the divisional superintendent who goes round from time to time.

Q. Men of the Provincial Service?—*A.* Yes.

Q. What are the functions of the agricultural associations and sub-associations?—*A.* We have almost given up the District Association entirely. We now have instead Tahsil Associations. We started in each tahsil with about 50 members. They were selected from among the leading cultivators of the tahsil: meetings are held three or four times a year. We have a definite programme of work which the members carry out. We get each member to agree to do a certain amount of work; one may undertake to transplant his rice, another to grow an improved strain of seed; each man is supposed to do something in the way of helping the department, either by distributing improved strains of seed or by demonstrating new processes.

Q. What is the organisation of this association; who presides and who acts as secretary and convener?—*A.* The tahsildar is president, and there is a vice-president who is a non-official. The secretary is sometimes an agricultural assistant and sometimes a naib-tahsildar. The assistant secretary is a non-official.

Q. Are the members usually educated or literate people; take Chhattisgarh and Berar?—*A.* They are mostly literate, and are the leading landholders of their tahsils.

Q. They would be more literate in Berar than in Chhattisgarh?—*A.* Yes.

Q. Will you describe the system of cotton seed distribution in Berar?—*A.* We started first with scattered seed farms to which we supplied selected seed every year from the experimental farm at Akola which thus served as the nucleus for our seed business in the cotton tract. In 1912 we had 120 of these seed farms run by private owners. We merely supplied them each year with selected seed. They propagated it, ginned their kapas and distributed the seed to other cultivators. We found after a time that we required so many seed farms, to meet the demand for seed that with our limited district staff of agricultural assistants, we could not possibly supervise the work when these seed farms were so scattered, as we had them at that time. We therefore decided to concentrate our energies by having seed farms at definite centres and therefore started co-operative seed unions. Each union consisted of ten or more seed-growers. Each has a seed

farm, and one of the farms—the most important farm of the union—is called the central farm. All the others are called branch farms. To the central farm we supply selected seed every year from the Government farm at Akola; the central farm propagates this seed and hands it on to the branch farms of the union. The branch farms in turn propagate it and sell it to cultivators. Each union has a ginning plant, by which all the seed of the union is ginned. The plant belongs to the members. By ginning their selected strains on their own ginning plant there is no fear of admixture; nor is the seed damaged to anything like the same extent as happens when kapas is ginned in a factory where the gins are run at a much higher speed.

Q. Do you know how many individual private seed farms you have got this year?—A. We have 40 seed unions and 76 separate seed farms. We gave out this year 15 lakhs of pounds of Roseum through our own seed farms and unions; in addition there were 11 lakhs given out by other people who were not working under our control; about 26 lakhs in all were given out last year.

Q. Do you know what area was sown with the Roseum type of seed?—A. As far as we can ascertain, about seven lakhs of acres are now sown with Roseum.

Q. You recognise, of course, that in order to give the cultivator what gives him the best price at present, your department has deliberately chosen the policy of disseminating seed with a low type of staple; do you think there is any risk of over-doing the market for short staple cotton in India generally?—A. I think not. The demand is very much in excess of the supply. They are using that cotton not only in mills here, but large quantities are used by Japan, and very large quantities were exported to Austria and Germany before the war, and will be exported after the war.

Q. What do you think of the ultimate prospects, roughly speaking, of the long staple cotton in this country. What area would you say was in sight which you could reasonably act on after a term of years?—A. I don't know the conditions of other provinces.

Q. I am speaking of the Central Provinces?—A. I should think that in the Central Provinces there is no great scope for extending the cultivation of long staple cottons, except in tracts like Chhattisgarh and Chanda, parts of which are now coming under irrigation. We find that long staple cottons do very well when irrigated on light laterite soils in these parts.

Q. Do you not think that long staple cotton of the Buri type could be grown in areas like western Chhattisgarh, where the rainfall is rather high?—A. We tried it in Kawarda, where the rainfall is about 45 inches, and we got a better outturn from Roseum than from Buri.

Q. You say, "The staff of the Provincial Agricultural Colleges should look upon teaching as their primary duty, and research work should be left to a larger extent than is done at present to the Imperial staff of experts at Pusa." You believe then in the centralisation of research in the Agricultural Department?—A. I believe in that very strongly.

Q. In spite of the fact that there is a very large number of different provinces with considerable differences in soil and climate?—A. The man who is doing research work would have ample time for his teaching as well. By "teaching" I don't mean that he would spend all his time in teaching; but he would very well give one lecture each day. We have agricultural colleges at home where all our professors are doing a certain amount of research work. We have not a single agricultural chemist or botanist in Scotland who is devoting all his time to research.

Q. You mean by "teaching", teaching to a standard for a degree, and not merely the training of young men, post-graduate research?—A. I mean the ordinary three-year college course, and we might probably get each agricultural college affiliated sooner or later with a university.

Q. What advantages do you think arise from making men do teaching and research?—A. It gives much greater interest to teaching when you are doing research work at the same time.

Q. Do you mean that teaching itself is so uninteresting that you have to add to it a certain spice of research to make it tolerable?—A. I think it much better than whole-time teaching; it also gives the teacher a wider outlook.

Q. The idea has been put before us by several witnesses, with reference to the problem of industrial improvements, that it will require a great deal of chemical research in different lines, for which we do not possess the equipment. The chemists at present employed in India are scattered over numerous departments, and working in their own departments, and their work often overlaps. You have, for instance, chemists employed under the Military Department, on explosives, and you have Forest Chemists. You have the Public Analysts, the Geological Survey; in fact it would not be very easy to find a large department that has not got one or more chemists attached to it. These men are more or less in a dead end. If it is decided to entertain a large chemical staff for industrial research, etc., etc.

fibre metallurgy and the production of heavy chemicals or dyes, aluminium, etc., would it be a good thing to co-ordinate these other scattered chemists, and make them members of a single service with a chemist of high repute as Chief Chemist to the Government of India as head of the service, with a Deputy Chief Chemist as head of the various branches under which these would fall?—A. I think it is a very good idea.

Q. What do you think would be the advantages, besides the prevention of overlapping of work; do you think it would result in the maintenance of a higher standard of work and more scientific discipline?—A. More control and better prospects for the men, and having at the head a man who is recognised as a scientific man of reputation would do the department a great deal of good.

Q. How do you think that would work as applied to the Agricultural Department; the Agricultural Chemist either in the provinces or at Pusa. It has been suggested to us that difficulties might arise in this way that the Agricultural Chemist is a man who eminently requires local knowledge and whom it is necessary to associate for as long as possible with local problems, and another point is that he must also have a good general knowledge of agricultural problems generally, and be agriculturally minded as well as chemically equipped. Do you think that those objections would weigh against the other advantages of making Agricultural Chemists members of a Chemical Department in securing them for service in the Agricultural Department, in the different departments, or at Pusa?—A. I don't think so. If you had a central institution of that kind, you would also want better organisation than you have at present. A great many difficulties would be got over by having better organisation.

Q. You think that some of the present difficulties arise from inefficient organisation; that the improved organisation and co-ordination which would arise under this scheme would make up for any other losses of efficiency from the other causes I have mentioned?—A. I think so.

Q. In training men for the menial work of the department, as Kamdars, or something a little higher, men in charge of small plants, do you find that men who have had a certain amount of education are better than the men who have not had any education at all?—A. Yes, they are distinctly better. They are more intelligent and understand things very much better and also have much more influence with cultivators.

Q. You have among your menial staff a certain proportion of men who can read and write?—A. They can all read and write a little in the vernacular.

Q. It has been suggested to us, especially in Bengal, that the system of education being so largely literary, tends to increase the disposition of the Indian youth in the direction of more speculative and contemplative lines of thought; whereas it is desirable to give him a distinct bias in favour of things which are more practical. You have said something about it in your written evidence, do you think that it is worth while to try to begin the remedy in the earlier stages, *vis.*, in primary education?—A. I think so. I have said in my note that I thought that we should try to give more hand and eyetraining in the middle schools, *i. e.*, to give ordinary education a more practical turn. You can do it to a small extent in the primary school, but most of the time in primary schools is required for learning the three Rs.

Q. What is your experience in Great Britain?—A. It is altogether different there. Here, a boy, when he is to be educated, is sent away from his village to a high school where he is not in touch with practical agriculture; while in rural districts in Great Britain boys get a good education in the small board school, and work on the land at times during their school years. We learn a great deal more of practical agriculture while attending the elementary school in rural districts at home than boys in India have learned even after getting a high school education.

Q. There is no system then of anything one could call primary education in the industrial or agricultural direction in Scotland?—A. There is a great deal now. We have the teaching of nature knowledge which includes gardening among other things. The children have to cultivate their own garden plots and to grow their own little beds of plants, and they do this even when at the elementary school.

Q. How are teachers provided to give this hand and eye training in school; does it not require a very careful system to produce teachers who are competent to teach these things otherwise than by rote?—A. The teachers are very highly trained. They have to undergo courses of training in various subjects. A good many take holiday courses, others attend training classes when they are taking their university degree. They are all highly trained and have to pass examinations before they qualify.

Q. You have seen a certain amount of the attempts made to give an agricultural bias to primary education in the Central Provinces. I understand that these were more or less of a failure? Wherein do you think they failed?—A. They failed almost entirely because the teachers were not taught the method of imparting this particular kind of knowledge. They had not been taught the method of teaching.

Q. What did they try to teach in the schools?—*A.* They had their school gardens and were taught the names of plants. They were supposed to grow certain vegetables and flowering plants. The children themselves refused to do any manual labour, and the result was that the chowkidar was made to do all the work.

Q. But those things that they planted were not the kind of things they were used to in their own villages, very largely, as a rule?—*A.* They were not: English vegetables were as a rule grown in the school gardens.

Q. The masters were supposed to be trained at one time in the method of teaching nature studies in what was then the School of Agriculture at Nagpur which is now the Agricultural College. Do you think that the system of education was adequate for the purpose for which it was intended?—*A.* They were merely taught facts, not the method of teaching.

Q. As a part of their normal school course?—*A.* They took this agricultural school course after finishing their normal school course.

Q. They taught them dry facts but not that method of imparting knowledge which stimulates interest in the subject taught?—*A.* Yes.

Q. Do you know how the matter stands now; whether anything has been done about it?—*A.* The Education Department as yet have no staff trained in the method of teaching nature knowledge. They have brought out readers with lessons on agricultural subjects; lessons which it is supposed will interest children in their natural surroundings.

Q. Perhaps you remember the agricultural primer which was at one time used in the schools, and from which eventually certain lessons were put into the school readers. Those were attempts to make intelligible to village youths theories of plant growth. Do you think that is a suitable kind of thing in preliminary school education in this country?—*A.* I don't think so, because the object of the person who wrote these books evidently was to teach them mere facts, *i. e.*, to give them information about certain subjects. Children can gather that information in the village in a very short time. The great thing is to interest them in certain subjects, and our school books in use at present are not written with that object in view, as far as I can make out.

Q. You consider the functions of co-operative department important for the assisting of seed distribution, for instance, and for other purposes with reference to agriculture?—*A.* I do.

Dr. E. Hopkinson.—Q. Do you state as a definite proposition based on your own personal experience that the man who is best at research also makes the best teacher?—*A.* No, I don't believe that. What I said was that if a man was doing research work at the same time as he was teaching, that that man would be better teacher; the mere fact of his doing research makes him a better teacher.

Q. Would you hold the converse proposition, that he would do better research because he was a better teacher?—*A.* No, I don't think experience gained in teaching would make him do better research work.

President.—Q. But by bringing him in contact with students, don't you think it would colour his research work in a way that would be an advantage? Would it not make him look at research problems from the point of view of application to those students? In the course of teaching would he not get inspiration for research problems?—*A.* That is quite possible. He would get the same inspiration as he gets by studying local conditions.

Dr. E. Hopkinson.—Q. In the course of such teaching as he has to give, do you think he would get more inspiration towards research?—*A.* He would learn a certain amount from the students who had come from the villages and had had a chance of coming in contact with their parent's work, and of learning what their agricultural problems were.

Q. In your evidence you state that the "Imperial Agricultural Department should always have as its head a scientist whose work has been of great practical value in developing agriculture." That is your deliberate opinion that he should be a scientist rather than an administrator?—*A.* It is.

Q. Can you develop that any further; it is rather a strong opinion to express. Why do you consider that that should be the case?—*A.* Because I don't see why a scientist should not be as good an administrator as a man who is not. The head of a scientific department should, I hold, be a good scientist and a good administrator as well.

Q. Don't you rather mean that the head of the Agricultural Department, unless he is a scientific man, would not show sufficient interest in the scientific aspirations of the department and in scientific work?—*A.* Yes, that is so. I am only referring to the Imperial Department.

* *President.—Q.* I suppose you also think that he would be able to discriminate regard to the merits of the different cases?—*A.* Yes.

Q. And even to decide on the merits of scientific problems?—A. Yes; whether the results of any piece of research work are worth publishing or not for instance.

Dr. E. Hopkinson.—Q. So you think that a man who is distinguished merely by an administrator is not a suitable head in the Agricultural Department?—A. That is my opinion.

Q. To go to another point at the risk of repeating the question almost in the same form as Mr. Low asked you; you have devoted a great deal of attention to cotton growing in the Central Provinces, and you have attacked the problem entirely from the point of view of increasing the productiveness of the crop, and thereby increasing the profits of the cultivators?—A. Yes.

Q. Can you in approximate figures give us an idea of the success of your work?—A. This year we will add one crore and five lakhs of rupees to the wealth of the provinces by having introduced Roseum cotton.

Q. That would go to the cultivator?—A. Not all to the cultivator, for the reason that in a good many cases the buyer buys the cotton as kapas, not as lint, and does not always give the price which the high lint percentage of Roseum would justify him in paying.

Q. Still that crore and five lakhs would, all in a sense, be added to the wealth of the country?—A. It is shared between the buyer and the grower.

Q. Not only in the country but in the province?—A. Yes.

President.—Q. What is that increase on last year's results on the old pre-Roseum days?—A. The increase is an annual one. One crore and five lakhs represents the increase for the year 1916-17. It is growing larger every year as the area under Roseum extends.

Q. It really amounts to one crore and five lakhs per annum, since you have introduced this on a sufficient scale?—A. Of course it is increasing every year. I hold that we have, by this one improvement, added in one year to the wealth of the country, a sum that would more than cover the cost of all the Agricultural Departments in India, and more than cover the cost of our own department twenty times over this year.

Dr. E. Hopkinson.—Q. There is then some hope for the future?—A. There is great scope for development.

Q. You have described to Mr. Low the steps taken with reference to seed. Will you tell me what the Akola seed farm is?—A. It is an experimental farm run by the Department of Agriculture. It comprises an area of 271 acres. The farm is divided into two parts, one experimental and the other non-experimental. In the experimental portion we carry on different experiments. In the non-experimental we incorporate the results obtained from the experimental portion.

Q. Have the provincial Government had to give any money assistance to the working?—A. The farm in reality costs the Government nothing as it yields a profit of from Rs. 4,000 to Rs. 5,000 every year.

Q. That is not included in the crore?—A. The crore is what the cultivators are supposed to make on the cultivation of Roseum in their own villages.

Q. Has any Government assistance been required in the ginning?—A. No supervision is required where they have their own gins. We have as seed-growers, enterprising landholders who supervise the work themselves. They now know the different varieties of indigenous and exotic cottons found in the provinces and can discriminate between one variety and another, and they have enough common sense to realise the importance of maintaining the seed pure.

Q. You have undertaken that work with regard to ginning and seed farming as part of your regular duties. Have you had to go further and give any assistance or help or advice in connection with marketing?—A. Not with Roseum, for the reason that buyers already pay the full market value for the lint. They do, however, take advantage of the cultivator when they purchase Roseum kapas (unginned cotton) in so far as they do not allow a sufficient margin for the very high ginning percentage given by this variety at the time of fixing the price. We are now trying to get certain buyers to guarantee to pay the full value for the kapas too. We used to grow a long stapled cotton known as Buri in Berar. By collecting all the lint of this variety for the Empress Mills we got a higher price for the grower than he could get from local buyers. We found, however, on introducing Roseum, that Buri though it fetched a higher price could not compete with this more prolific though shorter stapled variety, viz., Roseum.

Q. I suppose the cotton grown in Berar and the Central Provinces is largely consumed here?—A. The greater part of it is exported. A very large quantity is now purchased by Japan. The area under cotton in the Central Provinces and Berar is 4½ million acres.

Q. What is the quantity in bales?—A. The output this year will be low. We have forecasted 50,000. Last year it was 11 lakhs of bales.

Q. Why is it not used in Bombay?—A. It is used all over.

Q. The amount is so large that there is a considerable quantity left for export?—

A. Yes. The quantity used in the province is small.

Q. You state in your evidence, "To improve the labourer's efficiency generally, we want more and better elementary education." What do you mean by the "labourer's efficiency"; do you mean that he digs better, or ploughs better, or sows better?—A. I think education really gives a man power in so far as it makes him more intelligent and intelligence makes him a more useful labourer.

Q. Does it stimulate aspiration to be a better labourer?—A. Yes, to a certain extent. Education makes him aspire to become more skilful in all his work. The added intelligence which it gives makes him more capable in the handling of agricultural machinery for instance.

Q. You really think from observation that the labourer—the agricultural labourer—does plough better and does dig better, because he can read and write?—A. I am arguing from general principles.

Q. That is what I want to get at, whether you were arguing from general principles or speaking from your own personal experience as applied to Indians?—A. The labourers in Berar and the cotton tracts are better educated than in Chhattisgarh; they do more work and better work.

Q. You think you may fairly attribute that to their better education?—A. I think it is partially due to that. We give a man education and it gives him a certain sense of enterprise. He becomes more anxious to save a little money in order to be able to educate his children.

Q. Do you think that teaching the ryot to read and write will justify itself economically?—A. I am not prepared to answer that question. I could not say to what extent it will help the country economically.

Q. You describe here in the last paragraph of the first page of your written evidence what should be the character of the teaching. In reply to Mr. Low I think you said that that had been tried in the Central Provinces, but had failed, owing to the teachers not being competent. Did you add that at Jubbulpore the experiment was being re-tried, with better-trained teachers?—A. They are starting to train their teachers in the method of teaching "nature knowledge". They have not in the past had teachers trained in the method of teaching this subject.

Q. Have any of them finished their training?—A. I know they have at least started to train them.

Q. You think that the experiment will be thoroughly carried out here in the Central Provinces and given a fair trial?—A. I am sure that if they don't train the teachers, nothing can be done in schools in teaching elementary science or "nature knowledge" as it is generally called.

Mr. A. Chatterton.—Q. You say, "In the Central Provinces takavi loans are given to cultivators for the purchase of improved agricultural implements" and then you say, "I am in favour of much larger amounts being given for agricultural improvements both by Government and co-operative societies and central banks." Will you tell us how these takavi loans are given out here for agricultural improvements, and on what terms?—A. The person who wishes to purchase a new implement, say a cane mill, costing about Rs. 140, applies at present to the Deputy Commissioner of the District for a takavi loan of Rs. 140. We endorse his application and recommend that the loan should be given. Then the Deputy Commissioner enquires into the case to ascertain to what extent the man is already in debt. If he thinks it safe to give him the loan, he gets it. The loan is to be paid back in a certain number of years in instalments.

Q. How many instalments?—A. I think it is three years. It varies.

Q. How long does it take to carry out this system, from the time the ryot makes application for the loan to the time when he gets the money placed at his disposal?—A. When the application reaches the Deputy Commissioner, he takes it up at once. He himself knows that unless the man gets the mill that season, it will be of no use to him. Suppose he applies in October, he gets it in January; there is no great delay.

Q. Are there many loans granted in this way?—A. Quite a number. We sold 56 cane mills in one district last year, most of which were purchased in that way. Government also started some cotton ginning plants in Berar in the same way, by giving Rs. 2,000 for the purchase of each ginning plant consisting of an oil engine and two or three gins. Quite a number of the owners of private cotton seed farms got takavi loans for this purpose.

Q. In these cases is the ryot advised as to the kind of plant to be purchased?—A. He only purchases plants or implements recommended by our department. We generally suggest to him both what to purchase and when to apply for a loan.

Q. Do you think that this system of coming to the aid of the agriculturalist is capable of considerable extension towards the granting not only of more loans but of much larger loans for more extensive plants?—**A.** The system can be utilized with advantage in introducing agricultural machinery of proved utility such as improved cane-mills for example. The Nahan mill which the department is introducing expresses 25 per cent. more juice than the country mill and therefore adds largely to the profit on cane cultivation. In a case of this kind, where we are absolutely certain that the cultivator can make such a handsome profit by investing in a new machine, Government is quite justified in giving takavi loans for that purpose.

Q. Have you any instances in these provinces of setting up power crushing plants on a small scale?—**A.** We set one upon one of our experimental farms. We are only testing it at present; this is its second year under trial.

Q. Is the cane cultivation sufficiently concentrated to justify establishing power mills?—**A.** In a few instances we have about 60 acres of cane in one village; that is quite large enough an area for a small plant.

Q. How would you suggest that villages like that should become possessed of power plants for crushing cane?—**A.** We might hire out a plant to the leading man of a village and allow him to crush the cane belonging to the cultivators at so much per maund.

Q. Would it be possible to do it by creating co-operative societies in the villages?—**A.** That is quite possible, and we are considering that; but we want to make absolutely certain that it is to be an economic success before we advise a co-operative society to finance the scheme.

Q. So far you have been very fortunate in getting loans without delay; do you think it would be an advantage if the Agricultural Department had authority, instead of the Revenue officers, to grant these takavi loans?—**A.** I think it would be a mistake, as we would also have to recover the loans in that case. It is much easier for the Deputy Commissioner to do that.

Q. You say at the beginning of your note that you experience considerable difficulty in regard to getting sufficiently skilled labour in the villages to repair machinery. You know the kind of students they are turning out at the Nagpur School of Handicrafts?—**A.** I have seen them.

Q. Are the blacksmiths and carpenters who are being trained there sufficiently trained for your purpose?—**A.** I think they are sufficiently trained to set up cane mills, to put ploughs together and to do repairs.

Q. Do you think that, in the development of agriculture in this province, power-driven machinery will come into use largely?—**A.** I think so, more especially in the case of the cotton tract where we have already set up several small ginning plants. If cane cultivation is to be extended, certainly it will be necessary to use power-driven cane mills. So long as bullock-driven cane mills only are used there will be no scope for extending cane cultivation; for the reason that the man who has, under existing conditions, both to plant and crush his crop cannot find sufficient labour to deal with anything but comparatively small areas.

Q. In discussing the question of these cotton seed farms, you said that seed unions were provided with gins for extracting the seed. Are they power-driven?—**A.** Yes, they are driven by small oil engines.

Q. Who provided the capital for these; was that lent by Government?—**A.** In most cases it was lent by Government, but in one case they got the money from a co-operative bank. The members of the union belong to a credit society in the village, and were therefore able to borrow from this central bank.

Q. But in the other cases the small ginning factories belong to individuals?—**A.** Yes. The man who owns the ginning plant, gins cotton for the other members of his union, and charges them so much per khandi.

Q. Do you supply any machinery or implements direct from the department on the hire purchase system?—**A.** We have not supplied any on the hire purchase system; we sell direct from our depôts.

Q. Have you depôts scattered about the province for the sale of manure?—**A.** We have nitrate of soda stocked on our Government farm at Akola. In villages where cane cultivation is being done on the improved lines, recommended by our department, we supply cake direct from the oil-mills for any cultivator who may want to apply it as a top-dressing to this crop. We don't store it as a rule but bring it direct from the mills and hand it over to the purchaser.

Q. Do they pay cash for it, or do you execute a bond?—**A.** In most cases they get takavi loans which we recover in instalments. They pay the money to the Deputy Commissioner.

Mr. F. J. Plymen.

Q. Is the takavi loan for one year or spread over several years?—*A.* I think it is for three years as a rule for implements, and for one year in the case of cake. The money recovered by the Deputy Commissioner; we have nothing to do with that.

Q. You don't think it would become more popular if you were to administer the distribution of the loans even if the Revenue Department had to collect them?—*A.* I don't think so. We find the Revenue authorities always ready to help us, and do whatever we suggest. We are in close touch with the Deputy Commissioners, and always get them to do what we want.

President.—Q. Do you think that the work of the department has yet made any appreciable difference in the economic condition of the people of the province?—*A.* I have already pointed out that we have certainly increased the wealth of the province. People are taking a very much more intelligent interest in our work now. At our agricultural meetings we have people coming forward who talk intelligently, and at length, regarding the different improvements we have introduced. They now discriminate between the different varieties of cotton found in the provinces for instance, and talk learnedly at our meetings of the manures, new methods of cultivation, etc., which they have tried on our recommendation. They are undoubtedly taking a more intelligent interest in agricultural development.

Q. You are seeing the result of the spread of a form of agricultural education among them; they are actually beginning to look at things in a different light?—*A.* I think so. They also now read our Agricultural Gazette of which about 6,000 copies are distributed every month.

Mr. C. E. Low.—Q. What scope do you think there would be for the introduction of artificial manures on a very large economic scale, especially artificial manures such as might be produced in the country; I allude particularly to sulphate of ammonia?—*A.* I think there would be a great demand for sulphate of ammonia, if we could get it at a reasonable price, but present prices are very high.

Q. Say pre-war prices, £ 15 per ton?—*A.* Sulphate of ammonia we generally buy at Rs. 15 per cwt. If they could reduce it to about Rs. 10, it would be a practical proposition.

Q. What about nitrate of soda for the cotton fields?—*A.* Even at a high price it gives excellent profits; that is when you use it to supplement cattle dung.

Q. What about basic slag?—*A.* We have tried basic slag, which we got from Tata's works at Kalimati. It increased the outturn of the cane, but the cost of freight is very high and this reduces the net profit.

Q. Did you get an analysis of it?—*A.* Yes, we got an analysis.

Q. You are probably aware that it is much lower in useful phosphates than British basic slag?—*A.* About 7 per cent.

President.—Q. Does it contain any appreciable quantity of lime of any value?—*A.* It is rich in lime but lime is not required for our soil.

Q. Do you find that the soil here responds in any way to potash?—*A.* Very little to potash; it responds to nitrates and superphosphates.

Q. That seems to be general all over India, except in ten districts?—*A.* We have been applying phosphates as a cane manure; it answered very well last year.

Mr. C. E. Low.—Q. What do you think of bone meal manure; do you think there is any demand for that?—*A.* We find great difficulty in getting cultivators to use bone meal as a manure, on account of the prejudice against the use of bovine bones.

Q. You had some experience of bone meal in Chhattisgarh. The Government laid down a lot of machinery for making bone meal, and afterwards got a small mill-owner to take it up himself. Did you create any general demand for it?—*A.* There is no general demand. We sell bone meal mostly to Europeans for gardens; but very few of the cultivators ever apply it as a manure.

Q. Do you think they would be less prejudiced against bones in the form of superphosphates?—*A.* If they did not know what the manure was derived from there would be no objection to it.

WITNESS NO. 149.

Mr. F. J. Plymen, A.G.G.I., Agricultural Chemist, Central Provinces and Berar.

Written Evidence.

Technical aid to education.

*Q. 15—*Analyses of raw materials and of mill products are frequently carried out in my laboratory for the proprietors of oil mills working in these provinces to assist the managers in their control.

At present these analyses are done free of charge.

Q. 21.—I believe the scientific and technical department of the Imperial Institute to be of considerable value. It is a means whereby the Indian producer can get into touch with the home manufacturer and consumer. It is also of great use in collecting information on industrial products from all parts of the world.

Research abro

Qs. 22 & 23.—So long as scientific attainment in the United Kingdom is so much higher and wider than it is in India it appears to me to be a great advantage to have research on special subjects occasionally carried out there. To confine research on Indian subjects to India would be to cut off one of the main sources of valuable assistance unless the scientific staffs in India are made exceedingly complete.

It is difficult to define the exact subjects which should be investigated in England rather than in India but occasions will probably arise when the equipment and knowledge in India will be found insufficient to elucidate some intricate problems.

Q. 24.—For co-ordinating and controlling the work of scientific departments as a whole the present Board of Scientific Advice might be extended into an Advisory Council. This council might form a number of authoritative sub-committees each to deal with some particular branch such as (a) agriculture, (b) forestry, (c) industries, etc.

Q. 63.—At present the Departments of Agriculture and Industries are under one head, the Director of Agriculture and Industries. I recommend that these two posts be divided as the work is too much for one man, and a separate Director of Industries be appointed. Both these appointments should be for a much longer period than has been customary in the past in the case of the Director of Agriculture.

Technical
scientific
ments.

For these provinces the type of man required for Director of Industries is not an expert in one particular industry, as most of the local industries are only just developing. The Director of Industries should be a man with a general knowledge of industrial processes and engineering problems, a sound business capacity, and a good local knowledge of the Central Provinces and Berar and their industrial products.

All appointments of an industrial nature, whether educational or advisory, should be under the Director of Industries.

Qs. 64 to 67.—In order to aid industrial development it is necessary to have a staff of experts in the main industries of the country. These might be formed into an Imperial industrial service or department, and the following branches of industry might each have its own expert—metallurgy, oils, fat and soap, glass and pottery, fibres and cellulose with others as need arises. These men would work at a Central Institute under a head who would be the Director-General of Industries directly responsible to the Imperial Government. The latter would regulate the work of the experts and control the relationship between them and provincial Directors of Industries. The experts would be deputed to work in any special provincial investigation under the orders of the provincial Director of Industries. The Director-General of Industries would criticise any scheme put forward by a provincial Director, and decide whether the scheme were worth the attention of the expert and also the order in which various investigations should be taken up.

Imperial de
ments.

These industrial experts should be men each with a long and thorough training in his own particular industry, and the salary offered should be sufficient to attract the very best men. In view of the length of experience required, young men would not be suitable for these posts, so a high initial salary would have to be offered.

So long as the proposed central industrial institute did not become so large as to be unwieldy it would be a great advantage to have all the experts working at one central place, preferably Calcutta. The advantages of mutual advice and criticism thereby obtained would be considerable in addition to the advantages of a university library, laboratories, etc.

Qs. 68 & 69.—With experts in the main industries provided by the Imperial Government, provincial Governments would only engage instructors for industrial schools, cottage industries and the like, and these men should be placed under the control of the Director of Industries.

Provincial de
ments.

Q. 71.—For the training of the staffs required in each branch of the proposed industrial institute the instruction given in the laboratories of the Indian Institute of Science would probably be very suitable. Such institutions should also supply the men who will eventually be required by various industrial concerns.

Technologi
institutions.

Q. 74.—The Agricultural Department is a scientific department including both Imperial and provincial branches. So far I have not found any marked overlapping of work between that carried on by the Imperial Department at Pusa and that of the various provincial departments. The Imperial department deals with more general questions which provincial departments, for one reason or another, are not in a position to undertake. The provincial departments deal with local questions, and the two departments

Co-ordination
of research.

Local agricultural problems could not well be worked out at Pusa. Agricultural demonstration in the provinces is the application of well established agricultural principles to the conditions of local agriculture, and in the past the principles which have been applied have been those of other countries or adjacent tracts. For further improvement more and more local research will be necessary, the value of which will be apparent as the standard of local agriculture improves.

At present there is a greater probability of overlapping between the different branches of a provincial department than between a provincial and an Imperial department, and it will be necessary, as work and workers in provincial departments increase, to check this tendency. For this purpose I recommend a committee consisting of all the senior officers of a provincial department, which should meet at least every year, to discuss the programme of experimental work, and the results obtained in the past. By this means not only would every officer know the work contemplated in each section of departmental activities and who was responsible for it, but also in what line of work his assistance would be of value. Every piece of work undertaken would then be done with the approval of the whole local department, and suggestions could be made for improving or extending the scheme of any particular piece of work. In this way each provincial officer would feel that the work he was engaged upon had the approval and support of the entire provincial department, and that he was not working in his own water-tight compartment with possibly another officer in the same department working independently along similar lines.

Reference libraries. Qs. 78 & 79.—The second class scientific library maintained in the Victoria Technical Institute is sufficiently complete for general purposes. It would be impossible to have very full libraries at every centre where a few scientific workers happen to be found, and for purposes of reference it would be better to have really big complete libraries at a few centres in India from which, under suitable rules, books could be borrowed. Facilities could also be given for workers from outside centres to visit the consulting libraries when a large number of references had to be made.

Prevention of adulteration.

Qs. 91 & 92.—A strong endeavour should be made to prevent the adulteration of food-stuffs in particular milk, butter, ghee, oils, sugar, etc. It would be difficult at present to take the necessary measures all over India, but a beginning might be made with large municipalities. Health officers or officers of the medical and executive services might be empowered to take samples for analysis, and the various provincial agricultural chemists might be appointed analysts under a Food Control Act. Offenders would be prosecuted by the local executive officers on the analyst's certificate. The placing of food control in the hands of the Agricultural Department has for precedent the system followed in the United States.

Hydro-electric power surveys.

Q. 102.—The possibilities of developing hydro-electric power in these provinces should be investigated. If such power were obtained it would be of great value to agriculture in providing cheaper nitrogenous fertilisers made from the atmosphere, apart from its value to other branches of chemical industry, as for example the manufacture of aluminium from bauxite.

General.

Qs. 111 to 113.—The following industries appear to me to be particularly deserving of investigation in these provinces:—

(a) The hardening of vegetable oils.

(b) The suitability of various local raw materials for paper pulp.

Other industrial processes might be worth attention if heavy chemicals were available at cheaper rates, and I consider the foundation of works for the production of such chemicals to be a preliminary requisite for most other industries.

Oral Evidence, 18th December 1916.

President.—Q. In answer to question 71 you say that for the training of the staffs required in each branch of the proposed industrial institute the instruction given in the laboratories of the Indian Institute of Science would be very suitable. There is no instruction given so far as I know except in electrical engineering. What was your impression?—A. Even if no teaching is actually given there at present, I think the Tata Institute could be made a suitable institute for training the kind of men required.

Q. Have you made any use yourself of the scientific and technical departments of the Imperial Institute?—A. I once wrote to them on a particular question and they replied that they would help me if I sent them samples. That was the only occasion. This agency is useful in bringing one into touch with the home buyer.

Q. Suppose that we had a Trade Commissioner in London representing Indian trade interests and that he had attached to him one member of the Agricultural Department and one member of the Forest Department and one member of the Geological Survey. These scientific specialists being men of not less than 20 years' service and not more than 40 years' service, and being under constant to know the conditions of India and Indian commerce.

pick up tips at home in order to apply them to Indian conditions. Suppose that these men were attached to the Trade Commissioner for a period of two years and possibly for three years in order that he may not lose touch with Indian conditions and that he may not settle down at home. Do you think that a system of that kind would suit your case in passing on problems that you could not deal with here?—A. I think such an arrangement would replace that branch of the Imperial Institute's activities most effectually and with more efficiency than can be expected at present.

Q. The one difficulty about the Imperial Institute is that its officers have no Indian experience. Suppose that anybody in London got information which he thought was worth following up; if he went to the Imperial Institute, the utmost they can do for him is to write to India to get the information. But are there not problems of a kind that specialists with recent knowledge of India could hammer out on the spot in consultation with the technical officers and the commercial people in London?—A. I think there certainly might be. The difficulty in bringing together the scientific investigator in this country and the home buyer is very considerable and anything done to improve present conditions would be an advantage.

Q. Cases are known to me where people in London, who wanted to take up a proposition in India and develop it, went to the India Office and were told that they would get the information available as quickly as possible. But delay was involved and the person is losing in the meanwhile. The information given may not be the information wanted. If there was some one on the spot who could put the man in touch with the right kind of official the man could follow up the problem at once. A scheme of that kind would be of real benefit to the country?—A. I would not do away with the Imperial Institute but I think it would be a great advantage for India if it could be replaced by something more complete. It is not complete at present.

Q. There are problems here that you cannot take up in this country, not because they could not theoretically be taken up, but because you are engaged in other things and too busy with other questions, the day-to-day problems. But there are some cases, such as that of rare earth, which your laboratory cannot deal with. Such problems occur in the Central Provinces, in Madras and in other parts of India, and in Australia and the Crown Colonies. It might be possible to gather these together at some central institution and feed that institution with a continuous series of such problems. Does that appeal to you?—A. Probably the central industrial institute which I have proposed might answer the purpose but if the problem is too complex to be handled here it might be sent to somebody at home.

Q. In your central imperial industrial service you lump together a lot of things that are unrelated. Do you expect all of these to be taken up in one department?—A. I expect each of these industries to have its own head with a separate department but all of them should be under the control of one officer. I term him Director-General of Industries.

Q. There might be room for him and several others of similar rank. The Director-General might gather together the questions connected with glass and pottery. But in the case of fibres, for example, you have not only the physical and chemical problems but also the marketing conditions and the conditions of growth. In the case of oils too, you have quite a number of complicated problems. So that you would only have the Director-General of Industries to apply the results of these specialists?—A. I rather think that the application of the work of the specialist would lie with the provincial directors because the work would have to be applied in the provinces.

Q. There are likely to be clashes of interest, for example between an inland province and a coast province. The coast province looks for export and the inland province for consumption. The Director-General of Industries would bring these different interests into correlation?—A. I should give the Director-General the final veto. His would be the last word as to the order in which the subjects would be taken up.

Q. Do you want him to be the actual senior of so many specialists or would you think it suitable for him to be in charge of what we might call industrial intelligence?—A. The institute would be sufficiently big to have a separate man in charge of the administrative side of the whole work.

Q. There are quite a number of chemical problems in the country, such as chemistry of agriculture, of oils, of fats, of glass and fibres and so on. All these amount to an enormous number of activities in the mining world alone. Do you think there will be justification for the organisation of a Central Imperial Department with a Chief Chemist to the Government of India and appropriate sub-divisions to deal with the different branches?—A. I certainly think it would be an advantage to have all the branches taken under one service. The branches would remain independent of one another.

Q. That would follow as a matter of ordinary administration. Do you think there is any advantage in forming such an imperial service with a view to creating a chemical department?—A. I think it is a matter of ordinary administration. Do you think there is any advantage in forming such an imperial service with a view to creating a chemical department?—A. I think it is a matter of ordinary administration. Do you think there is any advantage in forming such an imperial service with a view to creating a chemical department?—A. I think it is a matter of ordinary administration.

of India, qualified for the different post of Deputy Chemists and so on and with a prospect of being selected as the Chief Chemist not only a qualified chemist but also an administrator and a man of the world?—A. I think there would be an advantage in having all these different branches of industrial chemistry brought under one head.

Q. Knowing what you do of the organisation of the Agricultural Department would you prefer that the agricultural chemists should be members of this Chemical Department and their services lent to the Agricultural Department—either to the Provincial Agricultural Departments or to the head-quarters at Pusa—or would you prefer that the agricultural chemists should be ordinary members of the Agricultural Department as you understand it now?—A. The agricultural industry is likely to be the biggest industry in India for many years to come and therefore I think it is almost big enough to be self contained. It certainly wants provincial men. But as the provincial man wants assistance in certain subjects frequently it would be an advantage to have a supplementary service which could be called upon for special investigations. These men might be retained at some central institute. It scarcely matters whether he belongs to the agricultural service or to the chemical service. It is essential that he should be attached to a province for a very long time. The longer the better, even if it amounts to the whole of his service.

Q. Which now would you prefer on the whole, that the Agricultural Department should have a service of chemists of its own, or should the agricultural chemists be a part of the greater department, the Chemical Department of the Government of India?—A. It is rather difficult to say. I have been ten years in the agricultural service and I am rather biased towards it. If a man comes out fresh to the country knowing nothing of the agricultural or the chemical service I should like him to belong purely to a chemical service but having once been attached to the agricultural service I think the ordinary agricultural chemist will find that his own province is big enough and full enough to employ him for the rest of his service and he would probably not want to go to any other province.

Q. Would he not be jealous of the man who became Chief Chemist?—A. In my case I would not be jealous of the man who became the chemist at Pusa. I think the pecuniary advantages of going to Pusa do not balance losses in other ways that one might suffer. Pusa has a life of its own and one who has been in a provincial department might not like to go to Pusa.

Q. If Pusa had been composed of the cream of the department would you not like to be one among that cream?—A. Professionally, yes! One should aim at going to Pusa.

Q. The present democratic system does not appeal to me. If you had a chemical department you would have nothing to do with vegetable dyes and paper pulp and things of that kind and that would relieve you for the work of your department?—A. I relieved myself of the vegetable dyes sometime ago. As regards paper pulp I want expert advice. I want a department that will take it up.

Dr. E. Hopkinson.—Q. How do you make yourself acquainted with the work of agricultural chemical research going on in other provinces?—A. We have a library here which receives periodicals and journals showing what is done in other provinces.

Q. How in the case of prospective work?—A. We cannot do that.

Q. You have then no means of knowing what is going on elsewhere in India?—A. We only know by the programmes of work published from time to time at the meetings of the Board of Agriculture.

Q. Are these meetings at long intervals?—A. They vary. We had them yearly for a time and some people thought it was rather a waste of time.

Mr. C. E. Low.—Q. How long does it take you to go to Pusa from Nagpur?—A. It takes four days to and fro and seven days for the Board meeting itself, that is 11 days in all.

Q. Do you consider that the time is well spent?—A. Well spent for a chemist who is doing that type of work with which the Board deals.

Dr. E. Hopkinson.—Q. You have very little opportunity of associating with other agricultural chemists?—A. We meet once in two years. Sometimes once a year. I occasionally go away to other agricultural centres when I get a chance of seeing people.

Q. Do you consider such isolation a drawback?—A. I consider it a great drawback.

Q. Do you consider you have work before you of unlimited scope. Are there many unsolved problems to engage you?—A. Any amount of them. I have sufficient problems before me now to keep me going till the end of my service.

Hon'ble Mr. E. N. Maskey.—Q. In answer to question by you that the Director of Industries should be a man with a general knowledge of business, engineering, agriculture, a good business capacity and a good head for management.

provinces and Berar. Do you think that such a man is available?—A. I am afraid that is rather the ideal. If we cannot get a man with all these qualifications let us get a man with as many of them as possible.

Mr. C. E. Low.—Q. In answer to question 111-113 you say that certain industries appear to be particularly deserving of investigation in the provinces and you suggest the hardening of vegetable oils. Would that be a matter for investigation and research or for starting an experimental factory?—A. I use the word investigation there to cover not only the actual experimental work of hardening but also investigation of the commercial possibilities. The question of marketing the product is a very important one.

Q. You mean manufacture on a commercial scale?—A. Yes. I had correspondence on the subject with one or two firms. They said that they were prepared to take up the question of hardening of vegetable oils on a commercial scale in India after the war.

Q. You say that there is likely to be far more overlapping between the different branches of provincial departments than between an Imperial department and a provincial department. Do you consider that the present arrangements of the Agricultural Board and the Board of Scientific Advice affords sufficient means of preventing that?—A. I consider that there should be much more thorough investigation of the programme of the work of a department before the work is undertaken. To take an instance a man may take up a particular question and work at it for, say, two or even three years and then the scientific people at Pusa may approve of the work or they may condemn it. The proper time to investigate the scheme of a line of work is at the start and not at the end. I do not say that work has actually been condemned but it may happen.

Q. Do you consider that some other agency is required for the purpose?—A. Instead of the Pusa Board which is criticising the work of any provincial officer, I think the work of a chemist should be criticised by chemists and the work of a botanist should be criticised by the senior botanists in the service. If a man sends up a monograph it might be easily criticised by these people and they might send it back to him. What I say would apply not only to the outline of the work to be done but also to the work when it is finished.

Q. Supposing the agricultural service were kept outside this general scheme for a chemical service, do you think there is a certain amount of help that might be got in the matter by some co-ordination of the chemical branch of the agricultural service with the general chemical service?—A. I think that if there were a number of chemists outside the chemical service then a man in the agricultural service knowing of the existence of these men would go to them himself for any advice on any particular line of work. I think the actual editing of an agricultural chemist's work should be left to the agricultural chemists. Of course if the agricultural chemists had as their head a man of outstanding ability and seniority it would be a great advantage.

President.—Q. Do you mean to say that there should be a similar head under the Government of India?—A. I mean that the head of a section of the Agricultural Institute at Pusa should be a man of outstanding reputation and a man to whom any one could go and whose opinion would be valued.

Q. He would also have five other little Popes?—A. He would be the only Pope.

Q. He would not be a Pope in chemistry and also in bacteriology?—A. For example take botanical work. The head of the section at Pusa would be the head of the whole of the agricultural botanical work in India and his criticism on any botanical work in India would have very considerable weight indeed. He would have the last word on any botanical subject.

Q. But not also in agricultural chemistry?—A. You might put the Deputy Director General of Agricultural Chemistry as the head of the agricultural chemistry branch at Pusa.

Q. Where would he be?—A. He would be the head of all the agricultural chemists in India.

Q. The head of the mineralogical branch would be at Calcutta, of the organic chemical branch at Cawnpore and so on?—A. I should like to have these as much at one centre as possible. It would be an advantage to have an industrial institution centered in Calcutta. I should not have a cotton institute situated at Calcutta. But an institute for general industrial purposes should be as much centralised as possible.

Q. This scheme of an imperial chemical department contemplates the existence of anything between half a dozen and twenty big institutes, one dealing with agriculture at Pusa, one dealing with the mineralogical part in Calcutta, one dealing with the metallurgical part somewhere near the Tata Works which would become the centre of the metallurgical area. In that way there will be a dozen institutes about the country in their proper places, all controlled by the Chief Chemist with the Government of India. Each Deputy Chief Chemist will have his own laboratories and his own staff round him?—A. I take it that the Deputy Chemist would as a rule be where the institution is. In my proposition I tried to combine all these activities at one centre for the time being.

Mr. E. R. Powell.

Mr. C. E. Low.—*Q.* I should like to take up the same matter that the President was dealing with but from a slightly different point of view. Do you think there ought to be an industrial service or a chemical service leaving out again the question of the Agricultural Department?—*A.* In the Industrial Department the chemists would not be at all sufficient. You will want a number of engineers, you will want textile men and so on. Then you have to bring in also your factory engineer. I think that unless the scheme became too big to come under one industrial service, the latter would be the best plan.

Q. Is the connection between the work, say, of an agricultural chemist and an agricultural botanist more intimate than that between the work of an engineer and a chemist in an industrial department?—*A.* I should think they are of the same degree of intimacy.

Q. Does an industrial chemist require to have the same knowledge of the possibilities of a trade from the point of view of industries as an agricultural chemist has to do of agriculture?—*A.* I do not think the industrial chemist would necessarily know much of the possibilities. He is rather concerned with the raw products and working them up.

President.—*Q.* I suppose it might follow that when a stage is reached when the Imperial Chemical Department might be usefully split into so many independent units, that might be done. For example a large number of textile experts employed by the Industrial Department might form a separate service?—*A.* I think it would be an advantage for the textile work. As soon as any department became big enough it might be made a separate independent unit. I would not advocate a number of small departments.

Q. They could not be smaller than some of the present imperial departments which consist of two men and three men. I do not know how many officers there are in the Zoological Survey. In the Botanical Survey there is one man with two assistants?—*A.* No answer).

Q. Have you got any further suggestion to make by way of supplementing your note?—*A.* No.

WITNESS NO. 150.

Mr. E. R. Powell, Senior Inspector of Factories and Steam Boilers, Central Provinces and Berar.

Written Evidence.

Mechanical engineers.

There is a serious want of uniformity in the standard of examinations for mechanical engineers held by different Boards in India where engineers in charge of prime movers are required to be certificated. The difficulties under the present conditions, as experienced by this Province, are as follows :—

2. (1) Bombay has so far steadily refused to accept the certificates granted by the Central Provinces Board, although other provinces have had no difficulty in recognizing them.

Reasons.

3. Under the Bombay Boiler Inspection Act no Inspector shall be a member of the Board of Examiners appointed under the said Act. The objection to an unbiassed person would seem unreasonable when it is considered that all the Inspectors are Board of Trade Engineers with long and varied experience. (*Witness here gave confidential evidence.*)

4. In the Punjab, it seems that, where necessary, a member of the Board of Examiners is in the first place granted a certificate of competency of the first class under their Act in order to legalize his appointment. This may seem good enough for the purpose of examination, but certainly not for the requirements of the Act where qualified and experienced engineers are necessary.

5. In course of their duties, Boiler Inspectors are in a better position to know the requirements regarding the examination of mechanical engineers, and irregularities, if any, can be easily detected through their agency. For instance, I brought to the notice of the Board two cases where testimonials granted by an oil mill and a distillery were not accepted by the Board as qualifying service, since they had no facilities for the repairs of their engines and boilers. This resulted in certain factories being recognised under the Act.

In two other cases the production of false testimonials before the Board came to my notice and was reported accordingly. In one case the person was criminally prosecuted and his certificate of competency cancelled by the Local Administration, and in the other the benefit of the doubt was given to the parties concerned.

6. Bombay, in the first place, I believe, objected to my appointment, as Senior Inspector of Steam Boilers and Factories, as a member of the Board of Examiners under the Central Provinces Boiler Inspection Act. In consequence, rather than be an obstacle to the province, I made room for another Examiner, although I, being a first class Board of Trade Engineer, saw no reason for doing so. A further objection was then raised to the effect that the Bombay Government was not satisfied that the Central Provinces Board was as competent as that of Bombay. This feeling seems groundless, for while there are to our knowledge no cases of candidates failing in Bombay and passing in the Central Provinces, we have on record 14 candidates who, shortly after failing at Nagpur, appeared before the Bombay Board. All of them being the inhabitants of the Central Provinces and Berar, had no reason to do so but to try the Bombay Board. After passing the Bombay examination they returned to this province and subsequently appeared before the Central Provinces Board with a smile for the exchange of their Bombay certificates.

7. In one case we had a candidate who appeared three times in succession before the Board of Examiners for the first class certificate of competency and failed each time. He subsequently appeared before the Cawnpore Board only a month after his last failure here and passed at the first sitting. The Cawnpore Board is recognized by Bombay as well as this province—as such he had his certificate exchanged by both the Boards. The above, I think, is a clear indication of what is urgently needed to bring about some uniformity in the standard of examination throughout India.

8. (II) To ensure the above, some stringent measures should be adopted to make the examination tests uniform, which may be based on the following principles :—

- (a) A member of the Board should ordinarily be a Board of Trade Engineer, but where such qualifications are not available, an engineer with long and varied experience should be selected.
- (b) *Text-book*.—The point regarding the method of setting test papers is also worthy of some careful consideration. Many of the examiners are in the habit of using a number of books while selecting questions for the 1st and 2nd class certificates of competency examination in place of restricting themselves to Reid's Engineer's Hand Book, which is universally accepted by the Board of Trade—the highest authority in the United Kingdom. In the circumstances the examinations of engineers are almost identical throughout the British Possessions. To me the object of the examination is to ascertain whether a candidate has a fair knowledge of the working and management of engines and boilers, together with their repairs. Reid's Hand Book is usually revised every year and in consequence is an up-to-date text-book. It is to my knowledge the only book translated in the vernacular and as such very useful for vernacular candidates. It should therefore be standardized for the purpose of examination under the various Boilers Acts, so that, like marine engineers, candidates for mechanical engineers' examination may go up with a certain amount of confidence of passing the test. It is probable that some objection may be raised against this proposal; but it should be borne in mind that theory is not all that is required of the candidate, for reason that the practical test in the oral examination finally decides whether the candidate is really fit to be an engineer of a certain class. Further, the class of men that appear for the examination under the Boilers Act is not, as a rule, well educated, and, besides, can ill-afford to purchase a number of text-books for the purpose of examination.

While, on the point of examination, I may be permitted to bring to the notice of the Commission that vernacular examination is most essential in this country for reason that although a candidate may know English, he would, in some cases, prefer being examined in his vernacular, whereby he could, with some confidence, express his views more correctly. Secondly, the want of English language should not, in my opinion, affect the technical knowledge of an engineer. On the other hand if the vernacular examination be stopped, the tendency would be to promote the theoretical than practical man.

- (c) Technical institutes in India should all be recognized for the purpose of examination under the Act provided they offer the students the necessary facilities for being constantly instructed in the management of engines and boilers. The above should be decided by a Board of Trade Engineer or a committee of local technical experts conversant with the working and management of engines and boilers.
- (d) The training and period of service required for a candidate of each class should be revised where necessary and standardized throughout.
- (e) Like the Indian Factories Act, there should be an Indian Boilers Act based on the Board of Trade Rules, as in the case of Bombay and Central

Provinces. If this is not possible at this stage, the rules for the examination of engineers should be framed on the above basis and the certificates so granted recognized throughout India.

In conclusion, I am of opinion that an annual conference of the members of the Board, as also Inspectors of Steam Boilers, be held in turn in different centres of India for the purpose of discussions on various points regarding difficulties and experience under the Boilers Act.

Oral Evidence, 18th December 1916.

President.—*Q.* You say in paragraph 6 of your note that a further objection was raised to the effect that the Bombay Government was not satisfied that the Central Provinces Board was as competent as that of Bombay and that this feeling seems groundless for while there is to your knowledge no case of candidates failing in Bombay and passing in Central Provinces you have on record 14 candidates who failed in the Central Provinces and passed in Bombay after their failure. This does not necessarily illustrate your point. Would it not be due to the fact that the Central Provinces certificate does not carry the candidate beyond Central Provinces and consequently Bombay men would not sit for it?—*A.* This is quite possible under the present conditions.

Q. The evidence given is so far as it goes positive evidence but the negative evidence is not of equal value?—*A.* Perhaps Bombay may be able to give negative evidence.

Q. You don't get the Bombay man who fails?—*A.* No. We have no record of these failures.

Q. We were told by the Chief Inspector of Factories, Bengal, that there was no necessity to have a standard examination. He did not think matters could be improved by having a standard test for engineers. Do you agree with that opinion?—*A.* I am of opinion that every engineer should be duly qualified by a Board and that he should pass certain tests.

Q. The Chief Inspector of Factories in Bengal said that it would be just as well if the whole of the qualifications were abolished. He did not want a standard examination for Bengal. He said that they had no trouble with their present system and there was nothing to improve upon. Do you agree?—*A.* I do not agree. I think that boilers inspected under the Act should be in charge of duly qualified men to look after their management and safety. Otherwise the inspection of such boilers would not be of much value.

Mr. A. Chatterton.—*Q.* There are a number of small ginning plants run by oil engines. Do these come under your inspection?—*A.* No. I do not think an oil engine requires any supervision under the Act. There is not much danger in connection with an oil engine; but gas engines require supervision. They are very few at present in the province. They should have some sort of supervision when they increase in number. There is nothing to explode in the case of an oil engine as there is no reserved energy which could cause destruction afterwards.

Q. In a gas plant there is no reserve energy that could be suddenly liberated and the danger from poisonous gas is practically negligible because they are practically worked in the open?—*A.* They are kept in very well ventilated places.

Q. Can you tell me what pay these third class certificated engineers get in this part of the world?—*A.* They get from Rs. 50 to Rs. 75. The majority of the men in the province are third class certificated men.

Q. Is there no development here of oil engines in the small ginning factory?—*A.* Probably there is.

Q. Does the number of persons in the factory influence the matter at all? Do you have jurisdiction over a factory which has only six persons?—*A.* No. The Act is not applicable to factories employing less than 50 persons on any one day of the year.

Q. Are the boilers required to be inspected once a year?—*A.* Yes.

Q. In a factory which contains 50 persons is it necessary for the boiler to be in charge of a certificated engineer?—*A.* Every boiler working under the provisions of the Act must be in charge of a qualified engineer, irrespective of the number of persons employed in the factory.

Dr. E. Hopton.—*Q.* Do you inspect steam pipes?—*A.* Yes. They are inspected under the provisions of the Act at the time of the boiler inspection.

Q. Do you also see that a proper safety valve is provided for sizing cylinders, and so on?—*A.* That is not provided for under the Act.

Q. Do you think the Act should be extended to such cases?—*A.* I don't think so. From my experience of many years there was only one accident in such cases and then only where a foreman of an iron works tried to caulk a seam of the sizing cylinder under steam pressure and so paid the penalty by being fatally injured.

Mr. C. E. Low.—Q. Is it not the case that these second and third class engineers move about freely from one province to another?—*A.* There is a good deal of that done; but Central Provinces engineers generally restrict themselves to this province, while Bombay engineers migrate to Central Provinces during the cotton season and return back thereafter.

Q. What would be roughly their number in the Central Provinces?—*A.* About 300.

Q. The majority of these are employed only during the ginning season?—*A.* The majority of them.

Q. I suppose the object of Bombay is that being a very large province they do not mind much whether their certificates are accepted; whereas you being a small province attach to it much more importance?—*A.* If we don't recognise Bombay I think this province will be handicapped. (*Witness here gave confidential evidence.*)

Q. Some witnesses said that the vernacular examination for these third class engineers is unsatisfactory and that they should have sufficient knowledge of English. What is your opinion?—*A.* I should not accept that by any means. Most of the third class engineers are really practical men, knowing only their mother tongue.

Q. What proportion of the third class engineers know English?—*A.* I should say that their percentage is very poor.

WITNESS NO. 151.

Mr. A. Green

Mr. A. Green. Superintendent of Workshops, Government Engineering School, Nagpur, Central Provinces.

Written evidence.

Q. 44.—(a) I think that the lack of primary education hinders industrial develop- Training of
and supervising
ment.

Q. 46.—I have had experience with the apprentice system when I was assistant manager with Claud Hamilton, Ltd., Electrical and Motor Engineers, Aberdeen, and manager of the same firm's branch at Ayr, also at Government Engineering School, Nagpur.

Q. 47.—I have observed that boys who had no chance whatsoever of learning a trade, etc., have had such opportunity at industrial schools; also they have many more advantages by being able to go through the different departments, while otherwise, had they been with a commercial firm, they would in most cases have been confined to one or two departments.

Q. 49.—I have found at home that night schools were very beneficial to apprentices in assisting their education and work, and most employers encouraged their apprentices to attend the night schools by paying their fees and, if they passed the session examination, an amount equivalent to the fees was given to the apprentices as a prize.

Q. 50.—In my opinion all industrial and technical schools should be under the Department of Industries, as the students are being trained for furthering industry. The head of these schools should know something of the work he is training his students for, and should be, as much as possible, in contact with the neighbouring factories, workshops, etc., in the provinces, and should have facilities to enable him to visit these places with the students, for the purpose of furthering their knowledge and giving them some idea of the work required of them later. I would suggest more outside work should be done in the workshops of these schools, as it gives the students a much greater variety of work, which otherwise would be too expensive. I find that the students or apprentices take much more interest in their practical training when they know that they are doing something useful and, by doing so, are doing something to pay their scholarships.

Q. 54.—All certificates for mechanical engineers should be the standard for all provinces and should be accepted in the whole of India, no matter in what province taken; but the examination should be practical as well as theoretical, as I have found during my short time in India a few 2nd class engineers are incapable of executing any repairing work, as they have never been trained to do so.

All sea-going engineers at home have to serve an apprenticeship in some ship-building yard or engineering shop from 3 to 5 years, and must have 12 to 18 months' sea experience before they are allowed to sit for their examination. Their certificates stand good anywhere, no matter at what town they sat for their examination.

Oral Evidence, 18th December 1916.

President.—Q. Does not the engineering work in your school, to some extent, overlap that done in the School of Handicrafts? Your men would have to be engaged in elementary courses before going on to engineering?—*A.* They have got to be trained. They get six months pattern-making, then six months moulding; then six months blacksmithing, and the remainder of the time in turning and machine work, and fitting.

Q. Your men are senior to those taken in the School of Handicrafts, and better educated?—*A.* Of a superior education to those of the School of Handicrafts.

Q. Then this practical training is just sufficient for them to become efficient engineers?—*A.* Yes.

Q. You say in your note that you think a good deal of outside work can be taken into the school, of the kind you have got. If that was put into effect in any very material degree, would that not interfere with the carrying out of any systematic curriculum?—*A.* No, I don't think so. At present it is very hard to teach engineering unless you get outside work to do. You can teach them small jobs, like bolts and nuts, but you must have outside work, otherwise when he leaves, one immediately hears that the engineer is not of much use. I have heard from different managers that they are not of much use for a year, and my idea and object is to have them thoroughly trained before they leave our technical school so as to be of some use.

Q. The men you put on, say, to motor repairing work have already done—how much is it in your school—18 months?—*A.* Eighteen months.

Q. They do not do any particular harm to the motor cars there?—*A.* No, we don't allow them near the motor cars. We put them through a course for six months in blacksmithing, and put them into the machine shop for nearly two years before they are allowed to touch the cars. We did try them earlier, but it was a failure. It required so much constant supervision to give them an idea of the working of the tools, and how to do jobs, before we allowed them to touch a car.

Q. What is the total number of years of training in your school?—*A.* Four years.

Q. Have you been long enough established to get any idea of results: are your men out in the world already, earning their living?—*A.* One of the first-year students ran away, because he could get Rs. 50 instead of Rs. 7, but our drivers all seem to be doing well.

Q. That is a different thing; they are not engineers. You have not yet turned out any qualified engineers?—*A.* No.

Q. When will they mature?—*A.* Not before July, twelve months hence.

Q. What then do you hope to get for them; what kind of posts?—*A.* At present there is no motor mechanic in the Central Provinces at all. We have had two letters from Bombay, asking if we could supply them. This we have been unable to do. As the motor industry is increasing very quickly in this country, there ought to be plenty of work for them after two years.

Q. Do you turn out men also who would go as engineers to places like the Empress Mills?—*A.* Yes.

Q. And who may go to be engineers at these various cotton-pressing and ginning mills?—*A.* Yes.

Q. Do you insist on an English standard?—*A.* Yes.

Q. All your men pass the English standard?—*A.* Yes.

Q. And consequently they would be eligible for a first class certificate?—*A.* They are.

Q. Would they be able to sit for that certificate immediately on leaving your school?—*A.* They must pass first and have at least twelve months' training as a second class engineer before they are allowed to sit for a first class certificate.

Q. What kind of certificate would you give of a kind that the country would recognise? You don't qualify them for any university degree, and I suppose there is no recognised diploma at present. What will you do? Will you give them some kind of label or tag that will enable the country to recognise your men from others?—*A.* They can pass through the school when qualified.

Q. Have you established any regular degree yet?—*A.* I am not aware of that.

Q. You have finished a four-year course; at the end of the four years do you give the men certificates?—*A.* It has not come to that yet.

Q. Is that in view?—*A.* That is in view.

Q. You are at present under the Education Department?—*A.* Yes.

Q. You have then in your school two distinct constituents, the class turning out merely motor drivers, and the class training men to be engineers?—*A.* Yes, we have up to the overseer class in the Civil Engineering Department, the Mechanical Engineering Department, and the Motor Mechanics Department—three departments.

Q. They are all distinct from the men who become merely chauffeurs.—*A.* Yes.

Q. Does the training of the chauffeur class interfere with the other classes?—*A.* No, they are separate altogether.

Q. Do you think that a school of that kind ought to be under the Director of Industries, and not under the Education Department?—*A.* I think it ought to be under the Director of Industries. From my point of view we are training men to further industries, and the Department of Industries will have more sympathy with them.

Q. What kind of training do they get in mathematics and the principles of engineering after they come to you?—*A.* That goes under the Theoretical Department.

Q. Do they get lectures in your school?—*A.* They go to the College of Science.

Q. What is the proportion of time; how often have they got to go for lectures?—*A.* From 12 to 4 every day, except Saturdays, when they go from 7 to 10.

Q. Before 12 they are doing practical work in the shops?—*A.* From 7 to 10. I would have it the other way about. I would prefer a greater amount of time devoted to practical work, and less to class work.

Q. Do they learn drawing in the classes?—*A.* Yes.

Q. Now you have got men in the third year; do they show promise of being good engineers?—*A.* Yes, two; and the civil engineers as well. There are only five mechanical engineers, and two show great promise.

Q. No provision is being made for training electrical engineers at present?—*A.* Not just now, but it has been spoken about, I believe.

Mr. A. Chatterton.—*Q.* You told the President that there were three classes of students in this school, civil, mechanical, and motor engineers. Do the civil engineers go through the course of workshop training?—*A.* Yes, through carpentry and blacksmith's work, so that they may understand something about wood and iron work in connection with building.

Q. You give them a kind of manual training?—*A.* Yes.

Q. In the mechanical engineering course, which lasts four years, they spend three hours a day in the workshop; is drawing included in the three hours?—*A.* It is included in the four hours for theory.

Q. Is this school equipped with prime-movers? *A.*—Yes, we have 12 N.H.P. boiler, 55 B.H.P. high speed engine, and two dynamos in tandem, 17 K.W. each.

Q. Do you wish to make your workshops as far as possible into a factory for turning out commercial work?—*A.* No, I would have to take in outside work, such as repair work for the mechanical department. We get quite sufficient for the motor car department, but in the mechanical department we do little, and I would like to do more outside work.

Q. That system probably works very well in the case of an industrial school, where you train a large number of artisans; but when you come to train a much higher class of student, is it not better that they should go through a regular, definite course of instruction? Would you not discriminate between an industrial school—such as the School of handicrafts—and your own school, where you are training a very much higher class of student? Would it not be more economical to put the student through a regular course, rather than let him take up mistrie's work?—*A.* By taking in outside repair work, you get different varieties of work which give the student an idea of practical work. For instance a centrifugal pump comes along to be cast; you can give him an idea what it is like, whereas he would never see it until he went outside. He would probably see a model of one, but making a new one is a different thing altogether. Or, say, a part of an engine comes in for repairs, it gives him an idea of the work.

Q. Does this kind of instruction tend to the formation of rather sloppy ideas of work which would not be the case if you had a regular course of instruction?—*A.* We give them a regular course of instruction, but this is above that. This is in addition to the regular course of instruction.

Q. That is to say, you cut short your theoretical instruction to provide more time to this repair work?—*A.* No.

Q. You said you would rather have four hours than three hours for theory?—*A.* I think three hours are quite sufficient for theory per day.

Q. If that includes drawing, drawing takes up a considerable amount [of time]?—*A.* There are two days for drawing alone, two afternoons; that gives six hours' drawing per week.

Q. Do these students go through any course of experimental work with the engines you have installed?—*A.* Yes, they have Wednesdays and Thursdays for that. We are only starting that now. They are allowed two days for that per week.

Q. They do that in the afternoon?—*A.* Yes, it would take the whole day to do it, *i. e.*, seven hours.

Q. How many civil engineering students, and how many mechanical are there in the school?—*A.* We have got about 17 civil students altogether, and 23 mechanical.

Q. When do the civil students get provision for surveying?—*A.* That comes under a different department altogether—the civil department.

Q. You have the civil students in the workshop?—*A.* Just for the first year.

Mr. C. E. Low.—Q. Is it necessary for you to keep in touch with employers?—*A.* We have to make provision for these students after their time is up.

Q. You also want to shape your teaching to produce the kind of man that is employable, and you also want to get repairing work. What is your arrangement for keeping in touch with employers?—*A.* If we visit these places we may see what sort of work is going on, and if a certain student, for instance, said he would like to take up power station work, we go to a mill, we would push him on in that direction.

Q. Have you any Board of Visitors, or any body on which there are industrialists, mill managers, etc.?—*A.* I believe there is. I have not been in touch with it.

Q. You have personally visited a good number of mills in these provinces?—*A.* Yes, you sent me two years ago.

Q. Your knowledge of these gentlemen has helped you with the school, do you think?—*A.* It has.

Q. And when you contemplate the position of these boys passing out, and you have got to do your share in trying to get them employment, what steps do you think of taking towards that?—*A.* In the first instance, during the last year, the 4th year, we are going to put out these boys for six months' practical training. (Now 9 months.)

Q. Whom are you going to get to take them?—*A.* I have been in communication with one or two people, who have mentioned that they can take them.

Q. You have got more or less of a promise that these people will take them?—*A.* Yes.

Q. As improvers?—*A.* They will be improvers.

Q. You don't know what arrangement the Education Department makes to keep themselves in touch with employers?—*A.* I don't know.

President.—Q. You said that you might have to make a centrifugal pump, and that the making of such a pump for actual use would be a very different thing to making a model. There is an obvious advantage in making the real thing, but at the same time, would there not be a disadvantage in the fact that these men would be able to make a centrifugal pump again, and possibly nothing else, and the time devoted to that might be devoted to general questions of wider application. You would rather work on actual samples of that kind than you would on a series of models?—*A.* Yes, I would rather have actual work. Many things work out very well in theory, but are different in practice.

Q. You would be able to cover the ground that way in a four years' course? You would only have two years after they had gone to the blacksmith's and carpenter's?—*A.* Yes; in the pattern-making they would have an opportunity of making a pattern of new materials after they have gone through their own regular course.

Q. The danger is that you might find your students practically with only one or two types of things, repeating work largely. You have not thought of any kind of diploma for these men?—*A.* The Director of Public Instruction, and the Principal of the College and I would look after that.

Q. You are Principal of the school?—*A.* No, I am Superintendent of the workshops.

Q. You are really a branch of the College of Science?—*A.* We are supposed to be attached to the College of Science.

Note.—Since giving evidence a Board of five gentlemen has been appointed who are employers of labour—*A. G.*

Nagpur.

Q. The whole thing is in an experimental stage at present?—A. Yes.

Witness here added.—With reference to the training for these second class engineers, and to the question whether they should have practical tests as well as theoretical tests, we have had instances of people coming down and saying that these engineers who pass through technical schools and go straight for a second class certificate are of very little use for practical work. At home the Board of Trade distinctly recognises that you must have four years' practical work before you are allowed to sit for your second class examination.

Q. Your own training has been largely in motor engineering?—A. Yes, and electrical.

Q. Do you think that there would be any scope here for introducing electrical engineering?—A. There ought to be a great deal of scope.

WITNESS NO. 152

The Hon'ble Mr. B. P. Standen, C.I.E., I.C.S., Commissioner, Berar.

Witness's Evidence

The opinions and suggestions put forward are based mainly on experience in Berar during the past five years.

Financial aid to industrial enterprises.

2. Existing industrial enterprises in Berar are limited to railways, cotton spinning and weaving mills (2), oil mills (3) and cotton gins and presses. There was a match factory in Ellichpur, but it ceased working some years ago. In all the towns and large villages there are a few flour mills worked from an oil engine, and a few agricultural unions have their own small ginning plant with the same source of power. An inappreciable amount of railway stock is held in Berar. In 1913-14 I had some correspondence with Messrs. Killick Nixon (the Agents of the Central Provinces Railways Company) on the subject of exploitation of local capital. I suggested the appointment of local agents for the collection of capital and the payment of dividends through station masters. The company informed me that they would consider the matter, but I have not heard from them since and have not pressed them for an answer as they are not, I believe, contemplating the collection of additional capital at present. The cotton mills, ginneries and presses are largely financed by Bombay firms; but two spinning and weaving mills and a large number of gins and presses belong to merchants usually from Rajputana or Gujerat who reside in the Central Provinces and Berar. Some of these concerns are joint stock companies, but the number of shareholders is always small. The number of gins is in excess of the requirements: to avoid the rate cutting which ensued, the gin owners in some of the large centres have from time to time combined to keep up the rates, and pool the profits, some of the gins remaining closed. One of the oil mills is a joint stock company with a very few shareholders, all of whom belong to the professional class; another is a private concern, and the other belongs to an important Bombay firm. The match factory was mainly financed by pleaders, I believe. Rao Sahib G. N. Sahasrabudhe will tell the Commission about this factory. The flour mills belong to individuals; the cotton gins used by agricultural unions belong either to individual members of the union or to all the members jointly; in the latter case they are purchased by money advanced to the members by the co-operative societies to which they belong.

The central co-operative banks get their money mainly from Government servants and pleaders; some well-to-do Deshpandias and Deshmukhs have also bought shares or deposited money with them, but they have done this from philanthropic motives or the desire to please their friends or the Government and not because they wish to invest their money in a good concern. These banks pay from 7 to 8 per cent dividend and 5 or 6 per cent on deposits at a year's notice. In the most advanced credit society a few of the members (Kunbi cultivators) have begun to deposit considerable sums (Rs. 700 is the largest individual item, I believe) at 9 per cent.

Wealthy people of the agricultural class who have money put by usually employ it in money-lending business themselves, but a few deposit large sums with Marwari Sahukars on 6 per cent.

There are very large sums lying absolutely idle in the form of ornaments, gold bars and cash. The house of an up-country Brahman (whose family made its money originally by selling horses to the Nizam a couple of generations ago) was broken into recently: the thieves took away 1½ lakhs in gold bars and cash and left more than 4 lakhs. Very large sums are spent on ceremonies (e.g., a quarter of a lakh on a marriage pandal alone). Public benefactions are rare.

The substitution of Roseum cotton for the Gaonrani is adding very largely to the wealth of Berar. About ¼th million out of the 3 million acres under cotton is now under that variety and when it has monopolized the whole cotton area (probably within ten years) the value of the crop at moderate prices will be increased by 1½ crops per annum without extra expenditure or risk.

There is now a very large amount of capital in Berar which might be used for industrial purposes without inconveniencing agriculture, and the introduction of Roseum is largely increasing it.

Capitalists are shy of investing in industrial enterprises because (1) they consider money-lending more profitable; (2) they cannot persuade themselves that they can safely entrust their money to an impersonal thing like a company over whose operations they have no direct control; (3) they are deterred by ignorance of method of investment and payment of dividends, which must appear prohibitive to a man who knows no English. The problem of the exploitation of capital for industrial purposes should be attacked in two ways, *viz.*, by making money-lending less profitable by means of the extension of co-operative credit organizations, and by demonstration of the advantages of industrial investments. It was early discovered that there is only one way of persuading the cultivator that a new use for his land is profitable and that is by demonstration, and we can only persuade the mofussil capitalist that there is a profitable new use for his money by a similar method.

Co-operative credit is well established in Berar and it has just taken a new departure of the utmost importance by the issue of first mortgage bonds for the repayment of old debts. The importance of the step arises from the fact that it will not only remove one of the greatest obstacles to the development of co-operative credit, but will provide a means of familiarizing people in the mofussil with the advantages of investment. A part of any future issues of capital for the construction of light railways in Berar ought to be reserved for local subscription, and subscription and payment of dividends should be facilitated as suggested above. If there be opportunity for the establishment of a new industry (e.g. match-making or the manufacture of paper pulp from cotton stalks) in Berar, it should be established on lines which will facilitate its utilization as a demonstration of the advantages of investment in industrial enterprise. If there is any doubt whether the enterprise will be profitable, Government should establish a pioneer factory, and if it proves successful, every effort should be made to attract local capital from the classes which are at present most distrustful of investment.

Government assistance in the establishment of industries should, in my opinion, be limited to the establishment of pioneer factories to ascertain whether a new industry is commercially profitable and guarantee of dividends with the object of attracting capital. It is essential that the method adopted to secure this latter object should be such as will obscure in as small a degree as possible the real commercial value of the enterprise, and a guarantee of dividends is particularly well suited in this respect.

Government should pioneer new industries and industries which it is proposed to establish in new localities in which conditions are so different from those in which the industry has been already worked that there is doubt whether they will prosper. As an example of the first I would name the manufacture of paper pulp from cotton stalks and of the second the manufacture of matches in Berar. In the case of the former, we know little more at present than that a good pulp can be produced and that there are ample supplies of the raw material at a low price, and before a pioneer factory were established further investigation would be necessary. As regards the latter, we know that there is a good market, that passable material for boxes can be obtained in large quantity on the hills to the north of Berar and that splints might be imported from Northern India at a low cost. We also know that an attempt to make the splints locally was unsuccessful.

**Training of labour
 and supervision.**

I have been President of the governing body of the Berar Victoria Memorial Technical and Industrial Institute for nearly five years. This institute has two departments; the upper department takes boys who have passed not less than the 6th English Standard and trains them to take the 2nd Class Mechanical Engineer's certificate. The lower department takes boys who have passed the 4th Primary Vernacular Standard and trains them as carpenters, smiths, turners and fitters.

Outside large factories there is no demand for accurate and durable work, and it is extremely rare to find an artisan who takes a pride in his work. The customer is content with what contented his father and the workman is intent only on filling his stomach with as little inconvenience as possible to himself. These two propositions seem to me to dominate the problem of the training of labour.

Probably the best way of creating a demand for good work is by the introduction of new forms of articles in common use: a cart wheel accurately made of good material on the existing common pattern will be no more in demand than the ordinary cutcha article, but a wheel on Mr. Cove's pattern will fetch a higher price and pay the workman for the greater labour and better material employed. An organization for introducing such things to the notice of the people exists in the agricultural associations and unions. To produce the proper spirit in the workman it is essential that industrial schools should be boarding schools under the management of a European Superintendent who comprises amongst his qualifications the qualities of a good scoutmaster. Such institutions should either have a commercial department of their own to which boys would be drafted as "improvers" after a couple of years' training or should have an arrangement with some workshop of good standing to employ passed students on similar terms for a minimum period. After two years in the school and three years in the commercial shop the boys would be ready to be planted out in suitable places (preferably their native villages) in the mofussil, provided with tools and a small working capital.

In this way the schools would in time have an effect on the standard of workmanship in the country at large, and a serious obstacle to the development of agriculture, *vis.*, the lack of skilled workmen to repair machinery and implements, would be removed.

Industrial schools should be under the control of the Department of Education, but the Director should have an industrial assistant to inspect the industrial schools and advise the Director concerning them.

It is desirable that the same qualifications should be prescribed all over India for mechanical engineers. At present the Bombay Government does not recognize the Central Provinces certificate, and young men from the Central Provinces and Berar are handicapped by this. It seems desirable to follow the lines of the Board of Trades examinations for marine engineers. It would probably be necessary to make special arrangements to secure a competent examining Board in some Provinces.

The construction of light railways in Berar would do much to develop the country. A beginning has been made and other lines have been surveyed: one of these is the line from Yeotmal to Wun. The G. I. P. Railway which constructs and manages these lines for the C. P. Railway Company is averse from linking up this proposed line with the Bengal-Nagpur 2' 6" line from Nagpur to Chanda because to do so will "short-circuit" the G. I. P. main line. This link should be insisted on. Chanda produces half a dozen commodities (coal, rice, oil seed, forest produce) which are largely imported by Berar and if these were carried direct into the heart of Berar by a line from Chanda to Ellichpur (the line from Yeotmal to Ellichpur already exists) the cost of carriage would be lowered and trade encouraged.

Railways.

Oral Evidence, 19th December 1916.

President.—Q. I have one or two points to ask you about by way of supplementing your note. One is about proposals for preventing the available money being used for money-lending and utilising it for industrial purposes. We tried to get advice on this point from one or two witnesses who seemed to think that it would be desirable and practicable to legislate for the purpose of limiting the interest that could be obtained by lending money?—*A.* I do not think so. The question was referred a few years ago by the Government of India and I gave the opinion that the most that we could do was that no one should recover through the courts more than double the principal.

Q. What objections had you to legislation?—*A.* I think the money-lender would always be able to get round legislation.

Q. By writing a false sum?—*A.* There are so many ways of evading the law. They can give a loan of only fifty rupees and enter a hundred. I think the history of the subject in other countries indicates the impossibility of legislating on the subject.

Hon'ble Sir R. N. Mookerjee.—Q. My experience in Bengal is that the cultivators and other classes are so clever that they will find loopholes in the law?—*A.* I think it all depends on the need of the borrower. If he is very much in need he is at the mercy of the money-lender who can always cover himself.

Q. It seems rather weak that we cannot deal with an existing evil by legislation. Do you think it will have a moral effect on the money-lender if he is made liable to prosecution?—*A.* We can simply refuse to recover the rate of interest if it exceeds a certain percentage. I do not know if the law will go further than that.

Q. It would not in any case amount to a criminal offence. It would come under the civil law of the country only?—*A.* There might be a penalty to the effect that a loan carrying beyond a certain rate of interest would not be recovered by the Civil Court.

Q. We had an opinion from a distinguished lawyer in Calcutta who was quite immovable on the point. He was quite sure that legislation would have a desirable effect in discouraging money-lenders from charging more than a certain rate of interest?—*A.* Of course he is speaking from wider experience than I can claim.

Q. It is not a question of experience. We are simply attempting to imagine what would happen if we legislated?—*A.* I suppose the position in the Deccan could be of some assistance. The Deccan Agriculturists' Relief Act contains various provisions intended to relieve the cultivators in one way or another. One of the provisions is that cultivators may not mortgage the land with possession but to evade this they sell the land outright with a verbal or written supplementary condition that if a certain sum is paid, it should come back. This practice has extended to the Berars from the Deccan.

Q. The Act is being dodged?—*A.* Yes. I believe the money-lenders told the officials that they did not mind what legislation was passed so long as they got some previous notice. You cannot save a man from himself. That is what it comes to.

Q. You have referred to the cotton gins that are used by the agricultural unions. They are in addition to the gins that are established throughout Berar, and some of the witnesses have shown that there are more gins than can be kept in full working and that these are

often set up in order to be bought up by a combine. Do the gins put up by the agricultural unions decrease the number of gins?—A. Not necessarily, I think. They are only put up for a particular purpose to gin the Roseum cotton. There is a great advantage in ginning at home because they are able to get the whole use of the gin.

Q. It is an advantage to have their own gins?—A. It is certainly an advantage.

Mr. C. E. Low.—Q. I understand that these small gins have been worked for custom also?—A. Yes.

Q. What is the ordinary rate per khandi?—A. Rs. 3-8-0, I think, where there is a combine. I think it is a good deal less where there is no combine.

Q. Where did Messrs. Killick, Nixon get the capital for their railway?—A. I understand a lot was raised from big capitalists. That is what I gathered from their letter.

Q. Don't you think that it is a very undesirable state of affairs that you cannot get local capital in a place which is prosperous and enterprising?—A. I do not think it is likely to come in without special efforts.

Q. Do you think that it is reasonable that Government should put some pressure in circumstances of that kind?—A. I think so, I think there ought to be a special man. Probably it might be necessary to put a Tahsildar on special duty for the purpose. You want somebody who could bring influence to bear on the people, somebody in whom they have confidence.

Q. Had you any talk with investors on the subject?—A. I have often talked with people. They gave me to understand that they could not take up anything that was new to them.

Q. You say it is due simply to the feeling of strangeness?—A. I think it is due to that mainly.

Q. We had evidence from one witness a day or two ago that, with the exception of two or three European firms and two or three out-ide firms, most of the capital in the ginning presses and factories was local?—A. I think that is mostly Marwari capital.

Q. You mean the Marwari settled in Berar?—A. I think so.

Q. Are there not local professional men who invest?—A. I do not speak by the book but my impression is that there are not.

Q. What do these professional men put their money into?—A. They have some in Government paper and there is a little in the railways and a good deal in the central banks.

Q. Land?—A. Yes, occasionally land also.

Q. Do the land-holding classes, such as the Deshpandias and Deshmukhs, put their money into gins?—A. I think there is only one who has got a considerable amount of money in gins. He is a regular business man.

Q. Do you think that investment in local railways would have an educative influence with a view to future industrial development?—A. I think so.

Q. If men are ready to invest in railways, do you think they would be likely to put their money in oil mills and paper mills started under auspices which gave them confidence?—A. Investment in railways would break the ground for them and make them more likely to come in.

Q. Have you seen any general outward manifestation of increase in prosperity or commercial progress, or greater capacity to manage their own affairs by the cultivating classes as the result of the activities of the Co-operative and Agricultural Departments?—A. I should say certainly that co-operative credit has done that to a great extent. I cannot say that the agricultural associations are very active at present.

Q. Do the taluq associations show more signs of activity?—A. There are half a dozen of them working. The others want pushing.

Q. Have you seen any signs of increased prosperity owing to the profits made on cotton and other crops?—A. I cannot say I have. I think that is largely because the Berari is very simple in his ideas. He is not a man for show at all.

Q. Has the standard of comfort risen?—A. It is too soon to say anything. It is only a matter of four or five years.

Dr. E. Hopkinson.—Q. What has become of the increased income?—A. I think a great deal of it goes into ornaments. Some goes into land also.

Q. There is no increase in their expenses?—A. They live a very simple life. They live most uncomfortably from the general Indian point of view of living. They feed simply and dress simply.

Q. And are content?—A. Yes.

Mr. C. E. Low.—Q. Do you think that education has had no effect in increasing the standard of comfort?—A. There is no question that the standard of comfort has risen in this generation. Everybody admits that. Even people who say that we are impoverishing India say that the standard of comfort has risen and is rising.

Q. Are there amusements of a western type and are they popular?—A. There are cinemas now, and theatres are constantly coming round.

Q. You speak here of converting many of the advances on landed security into liquid security by the issue of mortgage bonds. Where does the money come from?—A. From the provincial bank.

Q. What is the point of making the securities liquid or readily transferable?—A. I suppose the idea was that they would be more readily taken up. If the thing goes on well, it will very soon get beyond the means of the provincial bank, and the bonds will have to be offered for subscription in the market.

Q. The money is advanced by the provincial bank?—A. It is 2½ lakhs, I understand.

Q. Who issues the advances?—A. The provincial bank.

Q. Issued locally in Berar?—A. I do not know the details.

Q. The question is of interest to us in connection with the financing of industries. I understand that you have assisted Mr. Crosthwaite in working out a scheme?—A. I have not assisted him in the details. I heard the details from him. It struck me as a sound idea. I tried to impress it on everybody.

Q. These shares would readily pass from hand to hand and would be readily saleable?—A. Personally I think so. That is not the opinion generally held.

Q. What is the general opinion on the subject?—A. The opinion of the Central Bank directors at Akola was that it would be difficult to get the borrowers to pay punctually because they had some experience of a similar arrangement on a small scale. They advanced to three or four societies. They advanced a small sum out of their capital for the repayment of old debts on the joint mortgage of the holding of the debtors and they found that the debtors were unwilling to pay unless they all paid in at once. That was why the directors held out so long.

Q. Do you anticipate any difficulty in getting competent local directors of industry with a business turn of mind?—A. I think there would be great difficulty.

Q. What about the cotton mills in Akola? Has their management been a success?—A. I am told not. I do not think it is managed by Berar men. I think it is purely a Bombay concern.

Q. You speak of the agricultural associations and their organisation for bringing improved articles to the notice of the people. Do you think that agricultural associations are suitable for bringing to the notice of the people the industrial products?—A. I think it will work in alright, because the associations have the mechanism for it. They have their annual shows and the people whom they would want to interest in industrial matters would be the same people as those who are interested in agricultural improvements.

Q. My point is this. Do you think that what I may call the cottage industries and the village manufactures could be pushed by a separate organisation?—A. I think you want a separate organisation for village industries, not the same as that for large enterprises.

Q. You think that the agricultural associations would afford better means for pushing these things than organisations worked up *ad hoc* for industrial purposes. Do you separate cottage industries and the village trades from even the smaller forms of organised industry?—A. Certainly.

Q. You say that the technical schools should be under the control of the Department of Education. Would that apply also to the higher forms of technical colleges or would you have them under a properly organised Department of Industries?—A. I think you will have to introduce the education element somewhere. The two things should go together.

Q. Which is the more important?—A. The industrial element is of greater importance.

Q. It has been proposed that the best way would be for the inspecting to be done by the Education Department and the administration to be under the Director of Industries?—A. What I propose would come to the same thing.

Q. I think it is the reverse. Do you propose that the Director should have an industrial assistant and that the whole thing should be under the Department of Education?—A. I think you will find that the assistant will be the man who will have the greatest influence over

the management of the institution. The Director would only have the guiding hand. If you made the Education man an inspecting man solely, the question is whether he would take sufficient interest.

Q. For the purposes of an industrial or a technical school you have to turn out boys who will be employable, and to this end it will be necessary to keep the school in close touch with the employers of labour and their requirements, and the kind of curriculum will have to be suited to that end. Do you think that the Education Department is likely to do this successfully?—*A.* I do not think it will make much difference if the Director of Public Instruction has a technical assistant.

Q. Don't you think that it will be more educational and less industrial as years pass on?—*A.* Not if the assistant to the Director were the right kind of man.

Q. Would he have done practical work?—*A.* He must have had it before his appointment.

Dr. E. Hopkinson.—Q. You suggest that Government should pioneer new industries which are doubtful in result. Do you not think there is considerable risk in that? If the Government takes up an industry and it fails would it not have disastrous effect?—*A.* I think that if the Government takes up a thing, it should do the thing in the same way as any private person would do it.

Q. It has been suggested by some witnesses that Government should take up only those industries in which success has been practically achieved or is certain to be achieved?—*A.* Then there is hardly anything to pioneer. I would certainly not advocate starting an industry in which there was not much probability of success. I presuppose that there is a probability of success.

President.—Q. Have you known of any cases in which Government pioneered industries?—*A.* I have no experience of such.

Q. Don't you think that the Government methods of doing things are a bit cumbersome to bring about anything like a commercial success?—*A.* They may be, but I see no other way of pushing industries.

Q. Supposing Government gave facilities to an industry instead of actually pioneering it, don't you think that will be sufficient?—*A.* If they ran the thing as much as possible on a commercial basis I do not see why it cannot be done.

Q. Government methods necessitate a departure from the ordinary commercial methods in tackling a new industry. There would be an absence of promptness. There is the delay in getting sanction and it would not be conducted with the same energy and initiative as in the case of a private individual?—*A.* Personally I think it is possible to do that under Government control. We have various grades of red tape in different departments.

Q. Would you not be in favour of giving facilities such as bearing a portion of the losses, a portion of the pioneering expenses, and finding a market for the goods and so on?—*A.* It seems to me that it leaves the matter indefinite. You might get some results. But it would be impossible to say how much was due to the special facilities given and how much to the persons who are doing the thing.

Q. You have no case in mind actually of Government pioneering industries?—*A.* No.

Dr. E. Hopkinson.—Q. The whole of the great improvement in cotton growing has been achieved without Government finance?—*A.* Yes, it has cost the people nothing. It cost nothing directly to Government but they have had to maintain the staff and that means so much money on establishment and things of that kind.

Mr. C. E. Low.—Q. There was certain direct expenditure incurred by the Government of the Central Provinces somewhere about the year 1904 or 1905 by way of purchasing superior cotton seed?—*A.* I cannot remember exactly.

Mr. A. Chat'erton.—Q. Is it a fact that the Marwaris withdraw a considerable amount of money from the province?—*A.* Yes, they have all their homes in Marwar.

Q. You say you have been President of the governing body of the Victoria Memorial Technical Institute at Amraoti. Is there sufficient room in this province for two engineering schools, both training up to the second class engineering test? If you had one institution do you not think there would be greater efficiency?—*A.* I think there is not room for two such institutions; but I should not like to see the Amraoti Institute abolished, because it would mean a set back to private enterprise.

Q. In regard to the control of these industrial schools you suggest that they should be under the Department of Education. Don't you think that the Director is likely to be a fish out of water?—*A.* I think he would be a fish out of water to a certain extent, but the actual work would be done by the technical assistant whom I have in view.

Q. If he was under the Industries Department he might look for other prospects than simply remaining in the post of assistant to the Director?—*A.* That is what I contemplate when industrial development takes place.

WITNESS NO. 153.

The Hon'ble Mr. R. M. Dixit, Barrister-at-Law, Member, Central Provinces Industrial Advisory Board

Written Evidence.

The great point to be noticed at the outset is that India is an agricultural country, and not a commercial one. The example that we have of British trade and industries is on such a grand scale that Indians cannot succeed in their attempts at copying this model straight off. What we really want are smaller industries which will supply the local markets with the necessary commodities at a rate which will compare favourably with the imported article. The bigger joint-stock affairs are a matter of slow progress, and they will take some time to engraft themselves on Indian soil, so that the point of view that I take is the smaller concerns which should not require a capital of more than Rs. 25,000. In the case of these concerns Government assistance could be rendered more effective by (i) grant-in-aids, (ii) loans with interest, and (iii) bounties and subsidies. Financial aid.

The form of control Government should have is by inspection and audit. The real difficulty in such concerns is the necessity to have recourse to the local *sowcar*, who will not part with his money even with security on less than 12 per cent per annum. So that if smaller concerns could get money on cheaper rate of interest on security, it would be a real help.

But one thing is necessary, the mode by which such applications for help will pass through the official channels should be a little quicker than in the ordinary course of events. An aid given in time could save the industry, but profuse assistance given later would mean nothing.

I would, therefore, leave the Director in each province to have the final powers in sanctioning such relief up to a certain extent. If, in his opinion, the relief required exceeds his powers, a reference should be made to the head of the Administration.

A college of commerce really ought to follow the natural course of development. The first and foremost difficulty which must be solved is the general level of illiteracy. With a little more literate population the improvements would have more fertile soil to demonstrate their utility. But mere general education in the three R's is not enough, although it may be even up to collegiate standards. The dread or dislike which the educated people have for anything approaching manual work is at the root of all troubles, and the apathy of the educated class is mainly responsible for the inactivity which has characterised Indian industrial progress. To strike at the root of this disease, I strongly recommend that "manual training," or in other words "hand and eye" training, should be a compulsory subject in all Elementary, Anglo-vernacular and High Schools, if only to impress on the young minds the dignity and utility of labour. Somehow or other a very halting step has been taken in our provinces, but I cannot dignify this step even by allowing it the name of a beginning. Technical aid.

The second suggestion I would earnestly make is that our general education curriculum is such that if, for want of accommodation or failure in the promotion examination or owing to some such cause, the boys are thrown out to the outer world, they are good for no other profession except clerks, petition-writers and copyists. This is letting to waste such a tremendous quantity of latent energy that the only remedy I would suggest is the establishment of duality in our educational system. Although the word "Germany" is at present rightly in very bad odour, still I think their system of primary and secondary schools in industries deserves copying. In fact what I suggest is that there should be two kinds of schools in every place—technical schools, as also the general education schools, primary as well as secondary. After these schools are in good working order, then in course of natural development collegiate instruction in technical subjects would be the next move.

As regards the question of industrial and demonstration schools, they cannot catch on unless they are made to run on paying lines. The best proof I can give is the demonstration farms in our agricultural department. The reason being that villagers who see the results get overawed by the tremendous expenditure incurred in getting these improvements.

Q. 15.—So far I find there has been no technical aid provided by Government except perhaps the institution of the Victoria Technical College and the Agricultural Research Laboratory. Even here the training is laboratory training, and not with a view for commercial gain.

Q. 20.—We want a network of peripatetic demonstration factories, say, of improved hand-loom, of small machines which could turn out useful articles to supply the neighbouring towns; also some wood working factories.

Q. 24.—In the existing institutions available for research the staff should be augmented by the experts, who should be under the control of the Director of Industries.

Q. 25.—As regards research institutes in every province and an Imperial research institute, I would advocate a Central Research Institute situated in England where all our Provincial Directors and experts could send their enquiries. I recommend this, since I think many expert research workers cannot be spared from England for supplying the necessary number to each province in India. Taking five research workers to each institution for each province, it will come up to 35 experts. Besides a real expert must charge a fancy price to come over at such a distance and even then perhaps the climatic influences may tell on them. So besides the commercial enquiries, etc., will have really to be made in England and Europe generally so that research institutes situated in each locality will not be of much use. It is better to have one really good institute with 10 to 15 men, than have seven with five experts each. As experts and research workers are so few I am tempted to suggest this.

Assistance in
marketing pro-
ducts.

Q. 28.—Our Board has already approved of the idea of commercial museums, and I agree most heartily in the same.

Q. 29.—The museum should be on a small scale in each district and a central one at the head-quarters of the province. The District Council or the Municipalities or either would, I am inclined to think, be glad to maintain such institutions under the directions of the Director of Industries.

Q. 32.—At the present day there is immediate need for popular exhibitions, but ultimately as people begin to be aware of the existence of these exhibitions, they should then be converted into exhibitions aiming principally at bringing sellers and buyers in contact. In our economic system the village fairs were a great institution. These could suitably be managed in the idea of popularizing several cottage industries, which are likely to interest the people in an active way in those particular industries. The exhibition should have demonstrations at stated periods where the semi-ignorant multitude could see the working of the models.

Q. 36.—Trade representatives in other provinces would be unnecessary, since the provincial Directors could easily be in touch with each other, particularly so if we have periodical publications issued by each province.

Q. 37.—It would be a very welcome change if instead of the present system of indenting from England, lists of articles in vernaculars and quantities wanted could be made available to the public and tenders invited from the general public interested in the same. In our province, wherever an industry has showed some signs of life, the Director has also recommended the articles to Government purchasing departments.

In this respect also I might mention that our D. P. W. workshops have plenty of capacity in turning out efficient and good quality work, and yet even the Government and semi-Government departments do not indent on it to any appreciable extent. The mere maintenance of an up-to-date workshop on paying lines as it undoubtedly is at Nagpur has in itself a very great educative effect, and patronage, if denied, even to such institution, all progress in industries must be despaired of, if for every single trifle of a hitch, we have to send our broken parts to the Bombay or Calcutta firms for repairs.

Land policy.

Q. 41.—The malguzars are made to feel that their principal business is to increase and improve agriculture in their villages. There is always a look cast askance in case lands are booked for industrial purposes. In fact the Land Revenue Act is framed solely with a view to land revenue. Concession should be given on a liberal scale for enterprising cultivators to cultivate on some scale near the irrigated tracts. Experiments have been begun in this direction by giving out land on concession rent and premium in Chanda district and also in Chhindwara district. If these concessions become a little more general in experimental enterprises with a proviso of forfeiture after six years and a sliding scale of rents, a good deal of fruit cultivation, notably sugar-cane cultivation, could be tried.

Q. 43.—The tendency of industrial concerns being to grow from small beginnings to respectable proportions, help from the Government in acquiring land would create an amount of dissatisfaction amongst the resident public. In Bengal there may be difficulties, but in our Province at all events land is easily obtainable, and no reason exists why industrial concerns should be helped in this manner.

Training of labour
and supervision.

Q. 44.—Except the Engineering School, very recently opened, on which it is impossible to base any conclusions, we had no facilities for the training of labour.

A school of handicrafts in Nagpur is about the only other institution which supplies a real need. The pupils turned out from the institution are quite competent and have already acquired a good repute. It is multiplication of institutions like this that is urgently necessary. I have dealt with this in greater detail in the part dealing with education.

Q. 50.—Industrial schools should be under the department of Industries.

Q. 53.—Government should make it a condition before giving assistance that apprentices will be trained in those concerns.

Q. 54.—The other day a question was put in the Local Legislative Council, and from the reply I gather that the question of recognising certificates intra-provincially is engaging the attention of the Government. Mechanical engineers.

Q. 55.—Practical demonstrations are necessary for showing comparative saving of labour, e.g., in the case of hand-loom.

The Government have established a nominated Advisory Board to assist the Director of Industries. The Board has on the average met once a year. It has engaged the services of three experts, and these experts have been busy in doing their work—particularly the textile expert who has been busy at improvements and cheap production of labour-saving devices in hand-loom and who has been busy giving a new impetus to the blanket weavers' industry as also the *kossa* or tussar silk-weaving. The other expert in handicrafts has also had his share of work in metal and woodwork. Official organisation

The present constitution of the Board seems to be not quite liked by the people. There were one or two interpellations in the Local Legislative Council on this subject of the constitution of the Advisory Board.

The Board would improve very much in its activities if more powers are given to it and some specific amounts are placed at its disposal from year to year. The members constituting it should generally be proportionate to the commercial activities of the various districts. At least as a start, it should consist of representatives from each division with suitable travelling allowances to the members, official or non-official.

Qs. 64, 65 to 68.—I am not in favour of an Imperial department.

Q. 69.—The control of the experts should be left to each provincial Director of Industries. Technical scientific departments.

Q. 74.—The co-ordination of research could be very well secured by the issue of an authorised periodical publication in English from each of the provincial directories. This could be issued in the vernaculars of the Province where research is carried on: presumably since local conditions will dictate the lines of enquiry.

Q. 98.—Railway freights are evidently fixed on no definite basis. They are neither by distance nor by weight, but each article is freighted separately. This was particularly noticeable when, on enquiry, I learnt that Kaolin brought to Bombay from Gwalior would leave very little margin for profitable working, only owing to railway rates; and besides the general question of the railway companies' non-liability even in cases of total losses of consignments has a great deal to do to prevent industries starting on any scale. Even as regards coal, formerly there used to be a system by which weighments could be made of waggons on payment of a fixed amount. Even this has now been done away with. This means that if, despite the general supervision of the railway company, goods are lost in transit, no one is responsible. The risk form which is used is responsible. Railway freight

In these respects, I think that the time has come when the general public should not be left to the tender mercies of the rival companies, but that the freight rates should be fixed by the Government or some central body. By the way I might also mention that the railway companies do not even regularly supply the information wanted by the Government regarding returns of exports from particular stations.

Q. 104.—Iron is particularly one of those which deserves to be developed at public expense. There is only one flourishing concern—the Tata Iron Works. India could, it seems to me, give ample room for working of at least half a dozen factories. This should be in the first instance a Government concern. Mining and prospecting rules.

Qs. 110, 112 and 113.—The following are the industries which I suggest as suitable for investigation with a view to their development, since we have abundant raw produce:— General.

(a) Paper pulp from cotton and hemp stalk, raw cane-sugar refuse and *bhutta* corn-stalks.

(b) Thymol crystals from *ajwan* seed. This cannot be undertaken successfully until a liberal provision for the supply of absolute alcohol is made.

(c) Bone, and its conversion into { buttons,
combs,
bone-powder for manurial purposes.

- (d) Lac and its refining by improved methods. Lac bangles.
- (e) Marble and its polishing.
- (f) Tobacco and its curing and allied manufacture of cigarettes.
- (g) Glass-making.
- (h) Pappin from papayya fruit.
- (i) Cassein.
- (j) Chemical industries generally, *e.g.*, production of potash from sunflower stock; producing acids from Harra Myrabolams, extraction of acids from the orange skins.
- (k) Graphite industry and pencil-making.
- (l) Leather tanning.
- (m) Sugar industry.
- (n) Oilseeds and cake.
- (o) Lemongrass oil industry.

For the chemical industries generally, Government assistance in the concession of use of duty-free alcohol would be necessary. Only with duty-free alcohol can these chemical industries prosper, since alcohol is the most important substance in this department.

I am interested in the thymol and marble and lac and bone industries and last, but not least, paper-pulp from cotton-stalk, and potash from sunflower plants.

Oral Evidence 29th December 1916.

President.—*Q.* In answer to question 104 you say, "Iron is particularly one of those industries which deserves to be developed at public expense. There is only one flourishing concern—the Tata Iron Works." There are two as a matter of fact?—*A.* I am glad for the correction. I think I advocate half a dozen. We have raw material for it.

Q. Do you wish the Government to start another concern to compete with these two? Don't you think that the Government have already issued enough information and these two pioneers should set the example for people to develop iron if they wish to?—*A.* One throughout the whole of India is hardly enough for popularising.

Q. Don't you think that there would be a distinct grievance if Government started iron and steel works in opposition to these two?—*A.* Not in opposition. Tata is solely working for gain, but the Government concern need not necessarily aim at profit-making so much. As a matter of fact, there would be room for concerns managed by Government to work without competing with the other firms. I mean these institutions have really very great educative effect. In that sense I advocate them. I suggest this proposal with a view to accelerating the pace of advancement. So far as the local supply of local markets is concerned, there would be the old style of iron works. It would be difficult to work with the huge capital that was spoken of just now, and that is why I began by saying that I am not so much for these huge undertakings, but smaller industries ought to be given an impetus.

Q. In what way are you going to start a small industry in iron and steel? You invite failure at once if you go on with these things on a small scale?—*A.* What I suggest is that there are small articles which can be made locally which will compete with things imported from outside.

Q. You have not given us anything definite as to what you would like to be done in this matter? You want the Government to start a small iron and steel factory?—*A.* In that respect I expect a bigger undertaking to be undertaken. The Central Provinces are supposed to be full of raw iron ore.

Q. Where can you get your coking coal from?—*A.* I could not say very much about that. If an investigation can be made, I submit the Central Provinces experts would be able to come to the conclusion that there is a fair field.

Q. What sort of provincial experts?—*A.* I am afraid we have no iron expert.

Q. You must have all the conditions favourable. You must have coking coal, water, people to run it. You do not wish us seriously to consider the proposal for urging the Government to start any other concern in the Central Provinces as a competitor with the Tata Iron and Steel Works?—*A.* At least I should be satisfied if the Government have really made the necessary enquiries in this direction.

Q. The Government is collecting the necessary information and making it available. These two concerns, which show a certain amount of enterprise and risk their own money and reputation, have been successful and you will harm them if Government pioneer an industry of the same kind in another province. These people have shown what can be done with the information available, with a certain amount of enterprise. We do not want to discourage similar enterprises in other parts of India. The existing enterprises have a greater educative effect than anything that we can possibly do on behalf of the Government. It is exactly the form of education that we want to see. We have got two good examples, and surely you do not want to take the varnish of these two? You do not wish to push your proposal?—*A.* If they have already come to the conclusion that the conditions in this province are not favourable after investigation, I have nothing to say.

Q. It has not been definitely settled that they are unfavourable, but I have introduced you to this point, because that brings me back to your answer to question No. 69, where you say, "The control of the experts should be left to each provincial Director of Industries." Do you mean to say that the provincial Director of Industries is going to be provided with experts for iron and steel, oil, soap, glass and everything else that you can think of in the way of industrial development?—*A.* I do not think that he can take up all subjects at the same time, but I think one or two subjects for a limited period would be quite enough for the Director. Every province would need experts, and if there is co-operation between the different Directors it would be easy to secure work for the experts. If an expert has made his utility felt he is bound to continue.

Q. If these experts were to work sometimes in the Central Provinces and sometimes in the other provinces, why not make them imperial officers available to all the provinces? That is exactly the suggestion made in the question, whether they should be imperial or not? But you are against an imperial department and say that the experts should be under the provincial Directors?—*A.* My point is that research work should be carried out in England or some other central place.

Q. Research work of the kind done by the Agricultural Department could not be done in England? You do not mean that research work could be done more conveniently in England on Indian raw materials than in India itself?—*A.* The convenience of that system would be better.

Q. How much material would you have to send to England to serve as tests? Raw materials differ from district to district, and province to province, from one season to another. If you are dealing with a plant or a vegetable of any kind, it will vary in quality from one week to another in the period of its growth. Could you have research made in England with all these different varieties of materials? And the people to engage on research there would be men who know nothing of Indian conditions and would not follow the research?—*A.* I have suggested this proposal, because I think it would be difficult for the experts to come here such a long distance and even if they do come out, they will not stay here very long.

Mr. C. E. Low.—Q. It was said the other day by a witness that the failure of attempted primary agricultural instruction in schools in the Central Provinces was due to the fact that the teachers taught facts and not methods or principles. That means that teachers were not properly trained although a good deal of money was spent on their training. Have you got any idea of how that difficulty could be got over?—*A.* I think the number of training schools that we have at present is not enough. That is one difficulty, and the second is that there are not very many chances of good promotion for the teaching staff, and that is why you do not get the proper material for that profession.

Q. While admitting the desirability of commencing this sort of training in primary schools, don't you think that in view of the very large number of primary schools there are, and the still larger number there ought to be, it might be as well in the first instance to confine manual training to secondary schools?—*A.* I think that if a beginning has got to be made, it is the younger mind that is best for that kind of training.

Q. I was talking to a young man in the engineering school this morning and he told me that his bent towards mechanical engineering came from the fact that he received manual training in the Poona High School which had given him an idea of carpentry, and that the result of that was that he was learning mechanical engineering. That is a case of the good effect of this type of education in secondary schools. Don't you think that there would be a good deal of effect even if we confined manual training to secondary schools?—*A.* I do not say that if you introduce it in the secondary schools it will not produce any good, but I think it will be better if we start from the beginning.

Q. Don't you realise that you should have a sufficient number of teachers trained in the right way for primary schools for this purpose? I think you will agree that the men for this particular purpose of nature study and hand and eye training must be taught on the right lines, otherwise they are worse than useless?—*A.* It is just like the general literary training. You train the boys to go up for the matriculation, and in the preparatory classes the number of students is limited and the poor fellow has got to go out and he is quite useless. If you include this subject, he would not be worse than he turns out to be at

present. He will be able to devote himself to some manual pursuits and earn his own living. If we want to solve the difficulty we should begin with the training schools. I find that even in the case of girls the number of pupils turned out of the training schools is practically the same for the last ten years. If there are more applicants, there is no admission, and when we ask for the progress that has been made in that line we are told that there are not sufficient teachers.

Q. You are sure of the fact that there is no progress in the normal schools during the last ten years?—A. I am very nearly correct, because only about three months ago we had the Female Education Committee.

Q. You are speaking of female education only?—A. Yes. That is why I say that our beginning should be multiplication of these training institutions.

Q. The number of male teachers turned out by the normal schools has increased a great deal in the last ten years?—A. Yes.

Q. You speak of the idea of having two parallel systems of education, technical schools and general education schools. You think that boys would readily enter the technical schools?—A. I think the boys do not enter the schools according to their desires, but according to their parents' desires. What you want the nation to do in the next generation the pupils must be taught in the present generation. Unless you instil into the boys some desire to do a particular thing, the next generation will not think of it, and it is our present generation which really thinks badly of manual work.

Q. What you mean is that if you give the boys manual training in the primary school a very fair proportion of boys when they come to the stage of secondary school would choose technical branches?—A. Yes, and the colleges and universities would not be so cramped as they are at present.

Q. You speak of pioneer and demonstration farms. What do you mean by demonstration farm?—A. There are several improvements carried out in the agricultural farm, but at great cost.

Q. I may explain to you the difference between experiment and demonstration. Demonstration work is done, as a rule, by getting the cultivators to cultivate or by teaching them how to cultivate plots of certain lands so that their neighbours can come and look at them. Also agricultural assistants and people of that kind go out into the districts and explain practically in the district what the advantages of certain improved methods are. That is what we call demonstration. In the case of experiment, there is a high paid staff, and comparatively extensive buildings, and there is very little demonstration work, comparatively speaking on the farm. Do you consider that the agricultural department has not enabled the people to follow up its lessons?—A. That is exactly what I mean.

Q. We had evidence yesterday that the people of Berar were getting a profit of over a crore of rupees by sowing the cotton seed introduced by the department. Do you consider that it has not proved a success?—A. What I mean is improvement of agriculture by means of labour-saving devices. Researches are no doubt done by the research department, but the transmission of the results to labour-saving devices is a difficult problem.

Q. As regards commercial museums, there is a certain amount of confusion in many peoples' minds. There is one kind of museum where the process is shown and that is called the industrial museum. The other is a sort of glorified sales room which show all kinds of things that are made in the country, and the things can be bought or orders can be given. The latter is the type of commercial museum at present existing in Calcutta. It is intended, as far as possible, to assist the owners of small factories to market their wares. Which kind have you in mind?—A. As far as the museum part is concerned, I had the commercial part of it in view.

Q. With reference to your answer to question 37, do you think that assistance could be given to Indian producers if there were a stores department in this country so as to arrange for a more or less joint order, and secure co-ordination of supply to the consuming departments here from the Indian producers?—A. I am afraid I have not thought about the point. It seems to me that that would be a distinct step towards the furtherance of local enterprise.

To Mr. A. Chatterton.—A. I am a member of the Advisory Board for Industries. The Board meets once a year.

Q. What are the functions of the Board?—A. We go there when we are called. If any one has any suggestions to make, they are discussed and enquiries undertaken, but I do not think that we have any defined powers.

Q. What kind of suggestions are put forward for consideration at these meetings?—A. For instance, the last time we met, we were discussing the question of dyes, and it turned out in conversation that a black vegetable dye is being actively used at present in Nagpur. So the Director thought that that was something which could be investigated and he made enquiries, but at present we do not know how far he has gone with them. Any

member, if he has anything to suggest, suggests it to the Director and then if the Board approves of enquiries being made in that connection, we have a commercial agent who goes round the place and makes the necessary enquiries.

Q. Can you give me any instance of a practical outcome of the work of this Advisory Board?—*A.* I do not know whether the Advisory Board can take credit. Our textile expert is doing some excellent work as well as the School of Handicrafts.

Q. But the textile expert is not working under the Advisory Board?—*A.* That is what I say. I do not know exactly what our powers are, but when our Board meets, I think reports are submitted by these gentlemen to the Board.

Q. The Board takes credit for the work they do?—*A.* I do not know whether the Board can take credit. If there is any subject that comes up, whatever I know about it I put before the Director and I am glad to find that the Director generally investigates a matter if it is really worth investigating.

President.—Q. Are there any supplementary remarks which you wish to make?—*A.* There are some industries which it is impossible for private enterprise to take up. I shall only mention two instances. One is the marble industry in our province—flooring tiles and marble tiles. In Batul we have got a marble mine and I took samples to Bombay and enquired about the rates for cutting and polishing. I found that the rates, with the railway freight, are so great that they can be got cheaper in Bombay. It is impossible for private enterprise to take up the matter. Government should open a marble factory and if it is successful, there will be many people to come forward and take it up.

Q. There is a marble factory at Makrana. You can send young apprentices there to learn how the things are done?—*A.* The other is thymol. I understand that it is being worked at a great profit in Baroda and Calcutta.

Mr. C. E. Low.—Q. If you admit industrial alcohol free of duty, that would mean the ruin of the existing Indian manufacturers of alcohol?—*A.* We get into a better industry.

Q. I understand that in Java they are able to produce industrial alcohol at twelve annas, and I do not think that anybody in India makes it for less than one rupee, and although the duty is not designed to be protective, it works out to be so in practice. If it were taken off the competition which the Indian manufacturer of industrial alcohol would have to submit to would be exceedingly severe?—*A.* I should think that if we get on to a better industry the people would be prepared to forego the manufacturing of alcohol at these rates.

WITNESS No. 154.

Mr. V. D. Kotte, Pleader, Bhandara, Central Provinces.

Written Evidence.

I am an humble co-operator and secretary of the co-operative district bank, Bhandara, Central Provinces.

Generally speaking it is very difficult to get financial aid to start any industries, because the public are very suspicious about the success of any enterprise. Secondly, the lack of expert hands to carry on the enterprise is, in my opinion, a drawback for getting financial aid from the public.

In such cases Government can help industrial enterprises by giving guaranteed dividends for a limited period, supplying machinery and plant on the hire-purchase system, and giving a guarantee that the Government shall purchase the products for limited periods. But, at the same time, if they assist the enterprise, they should not leave it in the hands of the directors entirely, but should keep some control over the working of the enterprise. That can safely be done by appointing Government experts to inspect the working of the enterprise, so long the enterprise is not firmly established.

Banks should be established in all the central towns of the province. When the bank was started in Bhandara efforts were made to assist the local weavers by forming co-operative societies of unlimited liability and advancing money to them from the bank. The bank felt much difficulty in forming any industrial societies on the unlimited liability system, but our efforts were crowned with success and we formed 11 such industrial societies in the district. The number of members in each society was 10 to 15, and they were asked to return the money by instalments of four months each. These weavers used to weave the bordered silk cloth generally worn by Brahmins and cultivators in Berar and Maratha-knowing districts of Central Provinces. They generally depended for the yarn on the local traders, and on investigation we found that the local traders used to take double profits from the weavers. The yarn and silk were advanced to them on condition that the cloth prepared from it should be sold to that firm alone and none else.

Co-operative
banks and societies

Hence the firms used to get double profit on the yarn and silk. This is called "gutta system" in the district. The bank tried its best to stop the gutta system, but they met with failures, first, because the local traders could not purchase the articles prepared by the societies, and secondly, because the societies could not get yarn and silk on credit in the market except from the local traders. To meet this contingency, the bank corresponded with the Empress Mills and obtained a concession for yarn. Thereupon the bank opened a yarn shop in Bhandara, but the difficulty again arose about the purchase of cloth and thus the bank could not meet with success without investing the money in the purchase of cloth for which there is no sale throughout the year. If the bank would have done this, the bank's money would have remained idle and it would have met with loss ultimately.

A third difficulty arose in the meanwhile, and that was of dyeing. The societies continued to work for four years, but owing to the war dyes became very dear, and the weavers who depended upon German dye could not make any profit on the cloth turned out by them. Then they increased the prices, but there was no market for the cloth. Then earnest efforts were made with a request to the Government that they should assist the bank in financing the shop, but Government replied that they were unable to do anything. Local money was subscribed, and for some time the weavers continued to work, but crises came and in 1915 the weavers had to close their looms and go on labour.

The causes which lead to the failure are these:—

- (1) The weavers could not weave cloth of daily use on the looms.
- (2) They were accustomed to work on their looms which required more time to finish the cloth.
- (3) They could not compete with the mill industry.
- (4) The crisis due to the war.

All these would have been avoided if we could have trained the weavers on the improved hand-looms and if we could have taught them to produce cloth of common-day use.

These societies are not working now, and the bank has to recover Rs. 7,000 from them.

The bank had tackled the brass workers in the town whose population is 3,000 to 4,000, but the bank did not obtain any success for the simple reason that we could not teach them the method of getting more profits within a short interval. The Headmaster of the School of Handicrafts had been here to demonstrate the brass-working machine, but want of capital came in the way. The working capital required was Rs. 10,000 to start with, and people would not come forward unless their dividend was guaranteed by Government and business was in the hands of experts. There was at the same time another difficulty, that is, of obtaining brass sheets. To start a factory of preparing brass sheets would cost one million, and unless the Government promises and works out the factory for some time with profit local money would not be invested in the concern.

There are many industries which can be carried on through the co-operative system:—

- (a) Glass working on a small scale and preparing bangles, etc., these articles being of every-day use among all Hindus and Mohamedans in India.
- (b) Hosiery.
- (c) Match factory.
- (d) Toy preparations.
- (e) Boot-making.
- (f) Lac preparation.
- (g) Button preparation.
- (h) Cement factory.
- (i) Weaving.

The organization of these societies has been already fixed by Co-operative Credit Societies Act, II of 1914.

The special object of these societies should be to spread the knowledge of the industry and to educate the people in conducting the concerns.

They should not look to profit only, but also should work so as to be of industrial value to the public in general. In fostering these industries one thing should not be forgotten, that is, the keen competition in the market; articles of the like sort are pouring into the country from all sides, and unless the Government is inclined to impose a tariff duty on the articles imported in India, there is no prospect for the cottage or local industries. This is the first step, in my opinion, which the Government should take, because it has been now found out that unless there is any such prohibitive duty, it is not possible to improve the local industries.

There are so many industries which can be started in India and for which there is no dearth of raw materials that, if proper assistance is given, the Indian market will be flooded with Indian-made goods.

For this purpose an industrial survey is very essential and early steps should be taken to establish an information bureau and advisory board with a research institution attached to it.

Commercial museums would be a great step in advance, because they will open the market readily for the articles for which there is no sale. Secondly, before we open commercial museums it is essential to appoint trade representatives in all trade centres of the world to represent India and give such information as would conduce to the advancement of the industry.

As regards the qualifications of these trade representatives, I think they should be practically commercial men, and not holders of any degree or diploma.

At the same time Government should publish from time to time the list of foreign articles which are introduced in India and which are bought by it for its use.

In this province there is a Director of Industries with an Advisory Board to deal with industrial problems. The important point to be noticed in this connection is the appointment of an Indian Civil Service man as the Director of Industries, a position which is anomalous. The post should be occupied by a person who is versed in commerce and industries.

This Board serves no purpose, so long it has got no executive powers with certain funds to carry out its proposals. The public are very thankful to the Hon'ble the Chief Commissioner in creating an Advisory Board in the province to assist the Director of Industries. As regards the relationship between the Director of Industries and the Board of Industries, I should like to have the Director as the President of the Board.

In connection with trade journals, I think the information contained therein is valuable and efforts should be made to make them more popular by translating them in the vernaculars.

The youth of the province should be educated in technical schools and the schools should be under the control of the Director of Industries.

NOTE.—Witness did not give oral evidence.

JUBBULPORE

WITNESS NO. 155.

Mr. C. G. Leftwich, I.C.S., Director of Agriculture and Industries, Central Provinces.

Written Evidence.

NOTE.—These replies embody my personal views and do not represent the views of Government in these provinces.

It is hardly necessary for me to expatiate upon the theme of agriculture being by far the most important industry in the Central Provinces. While our land revenue alone runs into crores of rupees, at the present time in the Central Provinces there are only 28 joint stock companies with a paid-up capital of Rs. 45,50,000 or a little over £ 300,000 sterling. In the nature of things I have very little experience of large industrial concerns, and I am inclined to think that, provided Government disseminates all important information it can acquire bearing on the possibilities of large industries, it will probably be better to leave development to private or corporate enterprise. The matter stands on a very different footing in the matter of smaller industries, especially cottage industries. In England, the carpenter, plumber, tinker and cobbler survive and are likely to. We can do a very great deal to help cottage industries in the Central Provinces without creating Lancashire conditions. Personally, I would infinitely prefer to improve the standard of work and conditions of life of our weavers and artisans and enable them to stand up against power factories than to establish new Boltons and Wigans. Anyhow, there is the population factor. If we create by artificial means (that is not leaving it to the slow working economic laws) a lot of new industries calling for labour, we shall make it all the more difficult for our existing industries, in particular for our staple industry of agriculture. In my reply to question 5, I have indicated a *laissez aller* attitude, but this does not apply to cottage industries. I believe that we are already doing sound work, and I am convinced that there is enormous room for expansion of work on those lines. Our energies are limited by financial stress and the need for a great many more experts. By the latter I do not only mean Europe-trained experts, but include Indians working under them or

with them as instructors and demonstrators. There is undoubtedly scope for a fairly considerable development of small factories, and there is some slight inclination on the part of private persons to try their hand in developing these with Government assistance. Hitherto, I have not been inclined to do very much, as I have not yet been approached by men who could give the new venture their whole undivided attention or engage experts who will. In the past, already some of our industries have suffered from want of concentration. There are industries, at Jubbulpore for instance, which are unfortunately not thriving as they should, the principal director being very much taken up with other business concerns. One factory which failed in Berar was controlled by a lawyer. A small cutlery factory at Khandwa is controlled by a Brahmin who, in addition to his special training at Sheffield, has also qualified as a lawyer and thinks of supplementing his income from the factory by practice at the bar. I am convinced that for an Indian to make a good thing of any business, he must be prepared to give up legal practice and still more political activity.

Financial aid to industrial enterprises.

Capital.

Q. 3.—As Deputy Commissioner of Nimar, which is one of the important cotton-growing districts of the provinces, I had reason to remark that every year a certain number of ginning factories were lying idle. The pioneer factories in this district made such large profits that numbers of rich individuals or groups of men with savings, to invest ran up more factories than were actually required to deal with the amount of cotton coming into the local markets. When this was discovered, cut-throat competition in rates set in. This naturally led to combines of factory-owners at important centres. These associations more or less map out at the beginning of the season which factories shall work, and allocate shares of profit. Seeing this, one ingenious gentleman built and fully equipped a factory at Khandwa, which, I believe, I am correct in stating, has never run for a single day since it was completed a good many years ago now. Yet I understand that the proprietor has been able to make quite good profits on his investment merely by the terms he was able to dictate to the combine. I believe similar wasteful investment has been made in other parts where cotton is extensively grown.

Government assistance.

Q. 4.—I have had no experience except so far as Government aid was given on more than one occasion to weaving communities in order to relieve distress. This was not ordinary famine relief, but was specially devised in order to keep these skilled workers at their own trade rather than let them scatter in search of employment or destroy their skill by taking up heavy unskilled labour.

Q. 5.—Speaking generally, I may say that I am no advocate of Government aid, either to existing or to new industries, in any form whatever. But that is purely personal, and I recognise the difficulty of applying *laissez aller* doctrines to Indian conditions. Having taken a parental line in most of our relations with the people, we cannot entirely drop it in their industrial concerns. Coming to the specific methods suggested for giving Government aid to existing or new industries, I am bound to say that my already indicated bias does not permit me to recommend methods which seem intrinsically bad in principle such as (1) and (2). I admit, however, that action taken by another Government may render some such action necessary in practice as a protective measure. Before taking such a line, it would be necessary to ascertain, with great care, the extent to which the foreign Government has aided or subsidized various trades.

Methods (3) and (4) would be less vicious economically, especially (4). Even in the case of (4), I doubt whether Government should advance a loan to any particular enterprise, not at any rate without interest. In a backward province like this, however, though there is probably quite a considerable amount of private capital available for investment in industrial enterprise, our private capitalists are still mostly very shy. Possibly, the Local Government could tap this private capital, if allowed to float a public loan for industrial purposes and utilise the proceeds to make advances for, or take shares in, new enterprises; but this is probably not sound finance and trenches on the question raised in No. 10 below. As regards (5), I am again doubtful whether in these provinces, at any rate, Government is sufficiently equipped, or has any prospect of being so equipped in the near future, as to enable it to undertake to procure and hire out or sell, on the hire-purchase system, machinery and plant, unless of the very simplest character. Even as it is, we do actually arrange for agriculturists to obtain machinery from big firms in the presidency towns for agricultural purposes, and in a good many cases such agriculturists have been helped with Government takavi loans. The general arrangement is that such a loan is recommended by the Department of Agriculture and, if granted by the Revenue authorities, is paid over to an engineering firm for the supply of machinery recommended by us. I am bound to say that our experience of this business has not been wholly successful.

(6) is a method which I think is justifiable in a backward province like ours.

(7) I would not advocate this, though patronage by Government in purchasing articles really required by it is a very useful and justifiable form of assistance.

General.—There is one way in which Government can undoubtedly aid the spread of industrialism in these provinces. Generally speaking, the commercial spirit is almost non-existent, though it has begun to develop in some centres of industrial activity. One way of spreading this spirit would be to open up the country by improving communications of all sorts. As a district officer I have always been convinced that the inhabitants of a backward tract are very much more rapidly educated and waked up generally by joining them up with centres of material and intellectual activity, than by setting down any number of schools and leaving the people to educate themselves therein. A glance at a map of any country will always indicate its most important centres of industrial activity by a congeries of roads, railways and canals. Whether the conversion of a sleepy hollow into a beehive of activity adds to the sum total of human happiness is another matter. Another way in which Government aid can perhaps suitably be given would be to go bail for, *i.e.*, to give security to central co-operative banks making advances to industrial co-operative societies. I believe our Registrar is loath to allow such advances on account of the bad security which the societies can afford to the central banks.

Q. 6.—Again, I am up against my doctrinaire principle. It seems to me an A B C of economics that Government assistance should never involve Government interference, that is to say, no more interference than is found necessary in all cases, such as the application of company laws. If Government decides to help an enterprise, it should set an example of confidence to the public when making its investment, and this probably is the form of aid I would be most inclined to ask for in these provinces. Given a group of capitalists ready to venture their small savings in what appears to be a sound industrial enterprise, I might ask Government to put down the balance still required to set it going: but in that case I would ask for it unconditionally except on the same terms as any private investor. We might incur some losses, but, on the other hand, if these were not great, they would probably be good investments in educating public confidence and spreading a commercial spirit. I would not be in favour of a Government representative on the Board of Directors. I believe a good many concerns have been killed in India by constant interference from the Board of Directors or even from shareholders. We have an example in these provinces now of a sick enterprise whose only ailment is such constant interference. At the same time, it is doubtful if public confidence could be secured by mere investment of Government money: the feeling might be that "if Government is so foolish as to risk its money it can afford to lose and won't feel the loss: we can't." The investors would probably prefer the guarantee accorded by some form of Government control. Under the company law every joint stock company must engage an auditor recognized by Government. If it fails to do so, any shareholder can come to Government to appoint one. If Government take shares it might be on the condition that Government nominates the auditor. This ought to give a feeling of security to other investors.

Qs. 7 and 8.—I have no experience of Government pioneer factories. I was recently consulted by the Local Administration about a proposal emanating from Bangalore that we should join in subscribing to a pioneer oil pressing factory. I gave reasons for advising the Central Provinces Government to have nothing to do with it. A pioneer factory run by Government is a tempting proposition in a backward province like ours, but it would be a dangerous experiment without the aid of an expert for each particular trade attempted, and given the expert I am rather doubtful of the need for the pioneer factory. For instance, I had been rather longing to get a leather tanning factory started in view of the enormous number of hides exported from these provinces; but to do so we should want an expert tanner, and I find that a man already engaged in hide business at Kamptee would be only too ready to set up a tanning factory, provided Government help him with expert advice from time to time. On the whole, I would be inclined to think experts can be better employed advising private investors than in running factories for Government.

Pioneer factories.

Q. 13.—I have no very clear views on the subject except that Government aid in any form should never be in the least bit secret. It should be absolutely open and known to the public, for after all it is the public whose money is being utilized. Perhaps, an additional precaution might be taken by notifying beforehand the intention of Government to grant aid in a particular case and inviting objections. This, in effect, is what actually occurs when the Financial Budget comes under discussion in the Legislative Council.

Limits of Government assistance.

Q. 14.—If the established external trade is of enemy origin, then by all means slay it, and let there be no limit to Government aid in doing so.

Technical aid to industries.

Q. 15.—Two years ago the Central Provinces procured the services of a textile expert to improve the cottage industry of hand-loom weaving. As Mr. Wight is being examined as a witness, I leave him to tell his own tale.

Qs. 19 and 20.—I would like to see demonstration factories run by Government of tanning leather, brass and aluminium work, on the lines suggested by Mr. Cove, and wheel-making. I have talked to the managers of pottery works on the subject of glazed crockery, but do not find them enthusiastic. A great deal of imported cheap crockery is sold even in the remotest country districts, and I feel sure there would be a great

Demonstration factories.

demand for large glazedware household utensils, such as those hawked about the country in England by gypsies. At present, our pottery works make good profits out of drain pipes, tiles and fire-bricks. They have not the time nor inclination to take up a side-show like household crockery, but I am convinced there is money in it, and it may rest with Government to demonstrate that this is the case. In all these cases, however, we can do nothing without the services of experts. Our hands are therefore tied for the present.

Surveys for industrial purposes.

Qs. 25, 26 and 27.—The provinces have already been fairly well surveyed as regards their available resources—agricultural, forest and mineral. I doubt if there is any need for Government to take up further survey for such important minerals as iron, coal, manganese and bauxite. All of these are found in large quantities in the provinces, and their existence is well known to the commercial public. Our knowledge in fact is already ahead of our machinery for utilizing these available raw materials. The same remark applies to our forest produce—timber, fuel, lac, myrabolams and mahua fruit: not to mention barks containing materials for tanning purposes. For their exploitation to the full we require in the first place population and in the second place communications.

Assistance in marketing products.

Commercial museums.

Qs. 28 and 29.—Beyond visiting the commercial museum at Calcutta just before it was opened, I have no experience. I would be inclined to think that a museum on similar lines in the Central Provinces would have very little effect on the development of industrialism. It would also be very difficult to keep one up-to-date. Prices, for instance, would be constantly fluctuating, and any one relying upon information obtainable at such a museum might very easily be well let in.

Trade representatives.

Qs. 34 and 35.—I regret I have not had time to study the question. But I consider that my reply to question 36 would probably apply with equal force to 34 in regard to India generally. India supplies raw materials of great importance to the Empire, such as manganese from the Central Provinces and wool from Burma. It is of great importance that these raw materials should be conserved for Imperial needs in the first instance. I believe that at the present time there is not enough competition among buyers of our raw materials to enable the producers to procure anything like what they should as their share of the world value. Also middlemen take enormous agency charges. We badly want to develop closer touch between our producers and the world's markets. This seems to indicate the need of trade representatives in Great Britain, the Colonies and foreign countries, but I have no such experience as to enable me to suggest what should be the qualifications and duties of such representatives.

Q. 36.—I doubt if the Central Provinces are sufficiently developed industrially to require any special trade representative at present. But I can imagine that, after the war when enemy countries will be leaving no stone unturned to recover lost ground in various trades, it might be well to help our comparatively ignorant local dealers to evade the clutches of German agents, in particular at Calcutta, in regard to manganese, hides, myrabolams and lac. A whole-time representative for each of these trades from the Central Provinces and Berar alone would necessarily be idle most of the year; but I imagine it would be possible for us to share the services of a trade representative, and if he be a man of sufficient intelligence and education, I do not see why he could not look after all four trades at once. He would not necessarily have to be an expert in any one of them. He should occasionally come up to these provinces to keep the Administration informed of matters coming within his experience through the local Director of Industries, and also to keep himself personally known to, and thereby retain the confidence of, our local dealers. In the first instance, I think it would be a good thing if he were an Englishman (used in its widest sense).

Government patronage.

Q. 37.—As I have no great faith in a commercial museum for the Central Provinces at present, I would advocate such lists of articles being supplied to the local Director who ought to know of the existence of any concern in the provinces capable of turning out articles required by the various Government departments.

Q. 38.—On the whole, I have found the present rules satisfactory in their working, but it is possible that I may have sub-consciously evaded them on occasion. I have recently succeeded in procuring orders for desk-knives and daltri's scissors required in Government offices and courts of the Central Provinces and Berar for a cutlery concern at Khandwa, and though it was not achieved by a stroke of the pen, I am bound to admit that the Controller of Stationery, instead of taking up a difficult departmental attitude, went out of his way to make helpful suggestions how this could be done. I admit, however, that an officer of a different type holding that appointment might easily have made the deal impossible.

Other forms of Government aid to industries.

Supply of Government-owned raw materials.

Q. 40.—I am not quite sure that I understand the trend of the question. On the whole, I am in favour of all concessions for the supply of raw materials being subject to public auction or tender, which is the principle followed by the Forest Department in these provinces. The same principle is applied in the case of Government quarries.

It would be necessary to provide that only approved persons are allowed to bid or tender, and a close watch will have to be kept in order to prevent enemy agents getting control of important supplies of raw materials. Ordinarily, I consider that the transaction should be kept on a strictly commercial basis. The optimum rate for Government to take would be the maximum which the concessionaire can afford to pay for the raw material in order to run his concession at a reasonable profit. If the rate be distinctly below this, then Government will be unnecessarily sacrificing revenue, while possibly rival concerns will have a just cause for complaint. When the terms are settled Government should be careful to see that there is very little, if any, reasonable ground for such complaint. This sounds easy in theory, but in practice the fixation of rates must always be a very difficult matter.

Q. 41.—Under the Tenancy Act in force in the Central Provinces, any tenant who diverts his land to a non-agricultural purpose is liable to ejectment by the landlord. With the exception of the absolute-occupancy tenants, who hold a comparatively small area of land, no tenant has the right of transfer, and any transfer made by a tenant, unless to an heir, can be set aside on application by the landlord or the tenant's heir. These restrictions made it practically impossible to obtain any tenant land for an industrial purpose, and cases of difficulty in developing industries have arisen owing to this cause. The Gokuldass Mills at Jubbulpore some years ago wished to secure land for the extension of their premises or rather to establish a village for their operatives to reside in. The land was tenancy land so they were unable to secure it by private treaty owing to the law, and the proposal was dropped. Another difficulty that has arisen under the Tenancy Law is a decision of the Additional Judicial Commissioner that a tenant who grows palas trees for the propagation of lac is liable to ejectment by the landlord for diverting the land to non-agricultural purposes. Further, that any lac propagated on trees growing on the tenant's land is the property of the landlord and not of the tenant. The Tenancy Act will shortly come under amendment and these two points can then be dealt with. As regards the first, the best solution will be to allow of transfers or surrenders of holdings for non-agricultural purposes with the sanction of the Deputy Commissioner. As a matter of fact, this has not been provided for in the Bill framed to amend the Tenancy Act. Anyhow safeguards would have to be sought and the law providing for them made most stringent. If unrestricted transfer were permitted, it would be possible to make any transfer under the cover of the law, and the policy of Government in keeping the agriculturists on the land would be defeated. In Berar the difficulty has not arisen. A ryot has there the power to transfer his holding. Generally industrialists do not understand our tenancy laws and are suspicious of leasehold rights. They want a freehold. Therefore we should make it possible for a landlord to transfer some of his own land (or take a surrender of part or whole of a tenant's holding and give it out) in proprietary right for industrial purposes, with the permission of the Deputy Commissioner, who should be authorized to declare the land so transferred there and then as a malik-makbuza holding. The second point is dealt with by defining "agricultural purposes" so as to include the objects excluded by this decision of the Additional Judicial Commissioner.

Q. 42.—The area of Government land in these provinces is comparatively small, and the rent charged for Nazul land at industrial centres where Government land is available is so low that it seldom, if ever, acts adversely to the industry, whether it be new or an existing one. I doubt whether any special concessions in the case of land are necessary, and the most I would recommend is power to exempt a concession from rent for a term of five years.

Q. 43.—Two cases have come before the Administration in which the Land Acquisition Act did not enable Government to help an industrial concern. One was the case of the Gokuldass Mills already alluded to, and the other the case of the Burhanpur Tapti Mills. In the first case, though the tenants were willing to sell, the land could not be acquired under the Land Acquisition Act and a valid title secured, because it could not be stated that the work was likely to prove useful to the public [Section 40 (1) (b)], or on what terms the public should be allowed to use it [Section 41 (5)]. The company therefore failed to secure the land needed. In the case of the mills at Burhanpur, the land required lay in a ryotwari village and, as in the case of the Jubbulpore Mills, Government could not use the Land Acquisition Act. As landlord, however, it arranged for the relinquishment of the land by individual ryots, compensation being paid by the company; but two holders whose land lay in the middle of the area and whose land was therefore essential stood out for absurd prices which the company was compelled to pay. The question whether compulsory acquisition of land in the interests of a purely private concern should be allowed is one which must depend on the nature of the concern, and the general principle which I recommend is that such acquisition should only be permitted in very rare cases. A pioneer industry might be a valuable development which would benefit the general population of a tract so much as to justify the harm done to the individual, and in such cases it might be justifiable to force the owner or tenant to sell his land. This could be secured by removing section 41 (5) from the Land Acquisition Act.

...ing of labour and supervision.

Qs. 44 to 55.—I have no experience of the internal working of any industry, but in these provinces there are two experts employed in the Department of Industries: one for textile and the other for handicrafts. There is an Engineering School under the Department of Education, and Mr. Green, the Assistant, who has charge of the practical training of the engineering students, has been cited as a witness along with the two experts of the Department of Industries. As regards question 47, though absolutely convinced that advantages will follow from the establishment of industrial schools if run on lines similar to that of our School of Handicrafts at Nagpur, yet I have not had time to observe any specific advantages as yet. I would mention, however, in case Mr. Cove forgets it, that already artisans out in the districts, having seen the tools employed and the workmanship turned out by some of our passed students, have been stimulated to endeavour to follow their lead, and have actually come to ask how they can obtain sets of such tools for themselves. We are making arrangements to keep improved carpentry and smithy tools at a depot attached to our School of Handicrafts similar to the agricultural implement depots kept at our farms. As regards question 51, I am inclined to think that our training of supervisors and managers is at present too theoretical, and we do not lay enough stress upon shop practice.

**Mechanics
Engineers.**

Q. 54.—The Local Administration has had a good deal of correspondence with the Bombay Government on the subject of engineer's certificates. Mr. Westmorland is giving evidence on this subject. I have only to add that we are waiting upon the pleasure of the Bombay Government who have promised to take the question up after passing fresh legislation.

General official administration and organisation.

Q. 56.—The Department of Industries shares one Director with the Department of Agriculture. He is assisted by an Advisory Board. My only criticism of this organisation is that the direction of industrial education and enquiry in these provinces has now reached a stage of development at which it can monopolise the whole time of one Director, and certainly the Department of Agriculture demands the separation of these two-fold duties.

Qs. 57 to 59.—For the present I consider that the Board of Industries in these provinces should be merely advisory and should not have executive powers with budgeted funds. My reason for this is that the Board consists of a number of gentlemen who have a great deal of other business to look after, and I think I can safely say that not one of them could possibly give his undivided or even a large proportion of his attention to administration of the department. From my experience of two years' connection with control over budgeted funds of the department, I can assert that it would be intolerable if the Director were required to call a meeting of the Board and take a resolution from them every time he proposes to approve some new form of expenditure or some change in or departure from the allocation of funds already approved. The Industrial Board in these provinces is still in its infancy and we have yet to see into what it will grow up.

Q. 60.—I think there should be a whole-time Director of Industrial Education and Enquiry for the Central Provinces and Berar. I would be very glad if the title of this office could be changed. The present title is suggestive of that arrogant cocksureness with which we civilians are already fairly frequently charged by non-officials and officials of other departments. One can see objections to each of the classes suggested in the question. Taking them in the order given, the appointment of a businessman would be open to the criticism that no successful man of business would look at the job on the pay which Government can afford to offer. This does not follow. He might be a very capable businessman with plenty of administrative ability, but lacking the disposition of a thruster necessary for personal success. Also, the criticism would not apply perhaps to a man who might have served others quite capably in the management of some business, but who could never start his own concern from lack of capital. Another possible criticism of the businessman might be that he would be one-sided or biased. This might possibly be set right if the appointment were for a limited period of say five years. In the Central Provinces, for instance, supposing a successful manager of a tanning concern or another business were appointed Director, his bias would be of great value to the provinces. On the expiry of his term we might obtain the services of one well up in some other line of business of which there is promise for development in the Central Provinces. But it is very doubtful if we could hope to get good men to take up such an appointment in an Indian province for at most five years. To what could it lead for the individual himself? Again, it is possible that a businessman, when it comes to him to advise Government in regard to a private factory, for instance, might be tempted to indulge in venturesome changes which he would not do as a private manager owing to lack of capital or other reasons. Caution.

I come now to the non-expert official and my remarks will naturally refer chiefly to the Indian civilian. I can say at once that an ordinary civilian Director of Industries cannot hope, at any rate till he has been years in his job, to secure the confidence of industrialists generally and more particularly of intending investors. I believe that they will always much more readily confide in a man with personal experience of business management. Personally, I do not fully accept the general view that a civilian cannot also be a man of business. It will depend on the individual and the particular lines of his official experience. I can imagine individual officers of wide district experience who could well be regarded as men of business. Even so no civilian can hope to be given at once the confidence of industrialists and commercial men. Again, when it comes to the development of pioneer industries, the civilian would probably be most anxious to get the whole concern turned out complete in every detail of its equipment and organisation at once. He might delay the start and so perhaps miss opportunities, and would be inclined to make the whole thing perhaps more costly than it need be, instead of starting, like miners striking a new vein of ore, with rough shanties and rude implements. The extensive buildings with an elaborate plant and specialists in charge of each branch of a fully equipped mine are reached gradually, and so, I think, it should be with pioneer factories.

Some, though not all, of the criticisms indicated above for a business man would apply also to the appointment of an expert. As suggested by me in the case of a businessman, so with an expert the danger of bias would not be serious, provided the appointment is for not more than, say, five years. If the appointment could be made sufficiently attractive and one which it is understood must be held for some five years at least, then I can imagine it would be very well filled by a selected civilian of extensive district experience who has been given a year's training in business method. He might be sent to work for three months in the offices of Messrs. Tata and Sons, if they were ready to accept what little service he could render and let him see the inner working of their management. He might then, say, spend three months in Cawnpore attached to the Director of Industries there, and finally be sent for six months to Europe or America to study particular lines of business likely to develop in his province in India. I am sure that a Director for these provinces would turn a great deal if he were to spend a few weeks at each in Madras, Cawnpore, Bombay and Calcutta and then at Marseilles, in London, Staffordshire and in Lancashire. The danger, of course, would be that he might, at the end of this year, imagine himself capable of taking rank with experts in every branch of industry looked into by him.

As a matter of fact, I doubt if a civilian Director really requires such personal training so long as there are experts available for him to have recourse to. My own brief experience shows that a civilian Director recognizing his own limitations will never seek in vain for advice and assistance from experts or business men, however busy they may be. Big men of commerce could never take on a whole-time job as Director, but they are most public-spirited in the way they will help and advise an inexperienced official who knows himself for such and who is doing his best.

Q. 61.—As indicated above, I consider that the Board should be advisory only. The Director should be the provincial Government's adviser in details, but his advice should ordinarily be given after consulting and weighing the opinions of other members of the Board. When the Local Government calls for information on matters of fact, it will not always be possible for the Director to consult the Board as a whole, or every member of it. The Local Government could generally indicate cases in which it desires to have the opinions of the whole Board.

Q. 62.—Ultimately, undoubtedly, we shall want an Imperial Department, but I am not sure that we are ready for one yet. We do not yet know enough to formulate the constitution of such a department, and the general control of the Government of India in the Commerce and Industry Department seems sufficient at present. When such a department does come, its head should serve as a central referee and adviser and should also be responsible for the prevention of waste of energy and funds.

Government organisation for the collection and distribution of commercial intelligence.

Q. 82.—When I have occasionally had reason to consult statistics published by the Director of Statistics it has generally struck me that they are rather antiquated, and it is not easy to get statistics anything like up-to-date. I am aware that this is probably a financial and that it will be impossible to publish the statistics earlier.

Q. 83.—My experience is small, but I have already had fairly frequent correspondence with the Director-General of Commercial Intelligence, both officially and unofficially.

Q. 84.—I have not infrequently made use of information contained in the Indian Trade Journal and have more than once been stimulated to institute enquiries on reading suggestive articles in the Journal.

Q. 85.—I am doubtful if this is the duty of Government, but my experience

Other forms of Government action and organisation.

**Hydro-electric
surveys.**

Q. 102.—In 1905, the Government of India suggested to Local Governments that lists should be prepared of localities where it is thought possible that hydraulic power is available for the generation of electric energy. Lists were prepared by officers of the Public Works Department, and 200 copies were printed giving details of 17 places in the Central Provinces and 9 in Berar which the local officers considered *prima facie* suitable. In the heading of this list it was written: "it must be remembered that these officers have no special experience of electric installations and that the Government accepts no responsibility for the accuracy of any statements in the list." It is believed, however, that the list may be of service to persons interested in electric schemes, and copies will be supplied to private enquirers. Such persons must satisfy themselves as to the actual facts at any site at which they may think of prospecting. No enquiry has been made as to the possibility of acquiring the land, etc., required or regarding the cost of such "acquisition." In 1906, the Superintending Engineer reported that the Nerbudda Falls at the Marble Rocks, 12 miles from Jubbulpore, had been examined and found unsuitable for supplying power to the Gun Carriage Factory. In 1910, an Executive Engineer was placed on special duty to investigate the falls at Ghatkhairi on the Pench River, 22½ miles from Nagpur, and to report on the feasibility of a scheme for the supply of electric power to the city of Nagpur from the water of that river. He found the cost of such a scheme, even when combined with an irrigation scheme, so large as to render it impracticable. But, of course, this does not necessarily mean that no power generation scheme for the supply of local power could possibly succeed at that site. In 1914, Mr. Batchelor, Deputy Commissioner of Amraoti, made proposals for generating power at the Mackenzie Falls near Chikalda, a hill station in that district. The project has not been investigated in detail by experts, as the Chief Commissioner thought the scheme was unlikely to materialise for many years to come, especially as Government would probably leave it for private capital to carry it out, if at all.

**Mining and pro-
cessing rules.**

Q. 103.—I have gathered in conversation with the representative of the Central Provinces Mining Association that members of their association feel that certificates of approval under the mining rules are sometimes too liberally given by the Local Administration. I mention this because I have seen the written evidence of the mining representative, and it contains no mention of this subject. I understood from him that it was not included, as they did not wish to appear to criticise an Administration which they have always found sympathetic and helpful. I gather that they would like a more thorough enquiry to be made into the antecedents of applicants for certificates. There is probably some force in this suggestion in view of the enormous importance of manganese.

Q. 104.—Manganese is probably the only mineral of considerable Imperial importance. I doubt if there is any need to develop its extraction at public expense, though control of its disposal might possibly become necessary.

X.—General.

Qs. 100 to 113.—It seems a pity that the Central Provinces should not develop means of working up locally the products of oilseeds, myrabolams, hides, lac and mahua fruit which are available in enormous quantities and are actually exported in more or less large quantities.

Oral Evidence, 21st December 1916.

President.—**Q.** In reply to question 40, you say, "I am not quite sure that I understand the trend of the question. On the whole, I am in favour of all concessions for the supply of raw materials being subject to public auction or tender, which is the principle followed by the Forest Department in these provinces." Do you approve of this principle of the Forest Department selling their produce by public auction?—**A.** It has served us in these provinces fairly well. Until recently the big firms of the presidency towns had no connection with our forests, and the produce was all extracted by local contractors.

Q. Don't you think that a forest product, whether it is timber or whatever it is, should be subject to fixed and standard prices, just like a postage stamp, and by the post office, or mining concession?—**A.** Is it right for the Forest Department to make revenues in this way?

Mr. C. E. Low.—**Q.** There are two classes of cases: one where there are homogeneous products and the other which constitutes most of the cases, where there are trees and products of different species, mixed up in a coupe, of very varying nature and quantity. Most of the cases are of the latter kind, aren't they?—**A.** Yes. There is a system of licenses also. You can buy a forest license for extracting produce. There are licensed vendors, just like post-masters, dotted about in every village near Government forests exactly on the same principle. The license vendor sells forest licenses as the post-master sells stamps, that is right.

President.—**Q.** I am only dealing with the question of principle; am you in favour of this principle?—**A.** I am in favour of the principle, but I am not in favour of the amount of revenue it is worth.

Q. If the buyer can estimate the value, why cannot the Forest Officer estimate what is fair market value?—A. That is partially due to a lack of staff.

Q. A big question of principle arises here. It applies not only to forests, but also to railways. Should railways get all they can, or should they be public carriers at a fair rate? Should the forest be regarded as a public servant supplying material at a fair rate?—On the analogy of agriculture, it would be better to leave the market to determine a fair rate.

Q. You are suggesting an extension of this system. Do you want this principle followed by the Forest Department to be extended for the supply of raw material?—A. I suggest also tenders as well as auction.

Q. It comes to the same thing, i. e., the biggest bidder. One has to think not of the direct revenue to the Forest Department, but the effect on the industries of the country. It is all very fine for a forest officer who likes to see a big return for his particular circle, but is it good for the country that this should be allowed?—A. Not unless there is some limitation. One can imagine that a high bid for a small portion might interfere with the businesslike disposal of a concession as a whole. One contractor might bid high for one coupe, whereas it might be more convenient to give out a number of coupes to some big firm. But in all cases Government reserves the right to refuse the highest bid or tender.

Q. Obviously from a non-substantial person?—A. Whatever it is.

Q. This position seems to be accepted all over the country as a habit of the Forest Department to do this, and no one seems to have challenged it. I am not satisfied that it is a thing that ought to be allowed in the interests of industrial development. It is an indirect taxation. It looks as if it would be necessary to make Forest officers their own extraction officers?—A. I can imagine that that would be more fair to the public generally, but at present it is a lack of staff that prevents it. They would want an enormous staff for the forests of the Central Provinces.

Q. We have heard about the question of appointing Forest engineers to do the work at present done by Forest officers in connection with the development of light railways, saw mills, ropeways, etc. Do you think it would be an advantage?—A. I imagine it would in these provinces where we have extensive forests with bad road connections. We would be working our forests more economically with such a service.

Q. With reference to your answer to question 41, you say, "Another difficulty that has arisen under the Tenancy Law is a decision of the Additional Judicial Commissioner that a tenant who grows palas trees for the propagation of lac is liable to ejectment by the landlord for diverting the land to non-agricultural purposes." Supposing you were growing apple trees for apples but you also made cider, you could be ejected at once?—A. According to his decision.

Q. Have you got no higher Court in the provinces that you could appeal to?—A. I am afraid not; the remedy would be to legislate.

Q. What about the Chief Commissioner; can you appeal to him?—A. No.

Q. If this is the interpretation put on the law, you want the law revised?—A. I think they are going to do so at once.

Mr. C. E. Law.—Q. Are you opposed to the principle of increasing organised industries?—A. No. In these provinces we have practically no experts and a very small industrial community for big industries.

Q. We might get you the experts?—A. Then probably you will have to get a whole-time Director.

Q. The scheme would presumably be complete, and there would be one, but are you opposed on principle to the increase of large industries; do you think it is a bad thing for the province?—A. Not in moderation.

Q. Don't you think it would lead to the prosperity of agriculture?—A. I think so, yes.

Q. You say you don't believe personally in Government aid to industries; do you believe in Government aid to agriculture?—A. Logically I don't, but in practice I do.

Q. I think you will probably find it rather hard to recognize the obvious benefit that occurs to every body and to the people from Government aid to agriculture. Does it not, curious as it may seem, lead the people to more organised and more critical self-consciousness and more efficiency?—A. It certainly has done.

Q. Do you think that would not be the case if Government assisted industries?—A. Yes, I think it would naturally follow. I am only afraid of it at the present stage, our machinery being so small at present.

Q. I am not asking you to consider it with regard to the existing machinery, but with reference to suitable machinery?—A. Yes; what I feel is that we probably have the provinces

more markedly at present by developing cottage industries and helping them on, than by Government aid to large industries involving expert mechanical skill and business methods, etc.

Q. You say if directors of companies go into politics, they don't make a success as directors, and they therefore should not go into politics?—A. That is an *obiter dictum*.

Q. In England business men go into politics, men such as Chamberlain, for instance?

President.—Q. They are successful business men first:

Mr. C. E. Low.—Q. They don't let their politics spoil their business, do they?—A. If they had not found ready-made businesses they found at least ready-made industrial conditions. In the Central Provinces we have to build up industries. If a managing director is going to spend two-thirds of his time in politics and one-third in industries, he will not succeed.

Q. You think the conditions here necessitate a man devoting his whole attention to industries?—A. Yes.

President.—Q. Supposing we accept the principle, what do you want to do?—A. It is only a warning to Government. I think Government should not extend aid to a man who is not a whole-time industrialist.

Mr. C. E. Low.—Q. What is your experience of these Government loans for the purchase of small plant?—A. We have had some rather unfortunate experiences. A Calcutta firm are at present having to sue several men whom we recommended for the purchase of some of their plant.

Q. Government gave them the loan and they did not pay it over to the firm who supplied the plant?—A. Yes.

Q. Would there be any objection to taking steps to see that the money got to the firm?—A. We have done so now. We have advised the Revenue authorities not to give a loan, except through us, and we see that it goes in the right direction.

Q. Do you think there would be any legal difficulty about that?—A. There might be.

Q. What is the reason why these people do not pay up; was the machine so unsatisfactory that they were not willing to?—A. In one case it was so. He had not got an expert driver. The firm sent their own man to fit up the plant for him. It was a case of four gins. It did not quite work up to expectations. I think in actual practice it would work only three gins, and the fourth would be kept idle. They did their best and offered favourable terms. I think the man who took the loan asked to have it decided by an actual test by an engineer sent there for the purpose. They sent their engineer, and the test was satisfactory, but he still did not pay, and they had to go to court. We should never have allowed it to be delivered, until first tested.

Q. What was the reason in the other cases? Was it simply that the fellow did not want to pay, or had he any excuses?—A. He found that he was not obliged to pay at once. In one case he certainly devoted his loan from Government to the payment of other debts. Then when they began to press him, he had not actually got it.

Q. Was he so much in debt as to make him an unsuitable subject for a loan?—A. I don't think so, seeing the present prices of cotton. He has promised to pay the instalment in February, but they want it now.

Q. Who is the authority who enquired into the man's status and position?—A. The enquiry was rather hurried. The recommendation was made by the Assistant Director of Agriculture. It was not verified by the Deputy Director nor by the Revenue authorities, who took it for granted that it was all right.

Q. Are there any more causes at work in connection with those difficulties, other than these two?—A. Not that I can think of.

Q. Generally speaking, how do you think this scheme works. Suppose you have agricultural engineers who get the plant, and can say whether the engine is of the right size, and supposing you have a careful and thorough investigation of the man's status by the Revenue authorities, do you think under those circumstances it is a desirable system to continue on a larger scale?—A. I do.

Q. You speak of a proposal to start a company among the Kamptee tanners. As you know, the Kamptee tanning industry is a very old industry, which has fallen on evil days. With what results do they speak of starting, and what do they propose to make?—A. I did not ask them the actual extent of the business, viz., how many hides they could tackle.

Q. That is rather essential in determining whether they could stand up to their rivals, did they say what kind of leather they proposed to make?—A. Cow hides.

Q. Made into what, chrome leather or what?—A. At present they do not understand chrome.

Q. The man does not seem to have it very clearly in his head. Supposing he did start, he might find himself considerably short of capital to tackle any proposition that would have a real chance of commercial success?—*A.* I rather doubt that, because I think tanning is a particular form of industry in which you can make a success with very small capital.

Q. Do you think that these Kamptee people would raise enough capital among them to tackle it with expert advice and guidance?—*A.* Their attempt would not be on a very large scale.

Q. How much capital, do you suppose they could get together; is it only one man or more?—*A.* There is one principal Mahomedan; he could rope in three or four others with him. I don't know quite what capital they would put up; probably from ten to twenty thousand rupees. That would not carry them very far, I am afraid.

Mr. A. Chatterton.—*Q.* That would be absolutely useless for chrome leather?—*A.* Another tanner has started. He is now tanning on quite a big scale, but in the same old-fashioned way with the help of a so-called expert from Madras.

Mr. C. E. Low.—*Q.* Where do they get their tanning materials from?—*A.* Mostly from the surrounding forests.

Q. Do you know how much cheaper they get their hides than Calcutta; do you know the freight?—*A.* No, I don't.

Q. What was the proposed oil expressing scheme from Bangalore; what did it amount to; and what was your reason for not deciding to join in?—*A.* I have got a copy of my memo. to the Local Government on the subject. (Read the following memo.) :—

"There can be no doubt that the oil business is one of very great importance to India. From the 1st of April to the 31st August in the current year India imported nearly 2 crores rupees worth of oils including tallow stearine and wax, while at the same time she exported 6½ crores worth of oil seeds. In spite of this I have great doubts whether the Central Provinces Government will be justified in joining the scheme put forward by the Indian Institute of Science. From paragraph 11 of Sir Alfred Bourne's letter* to the Government of Madras, it appears that the total cost of the buildings and plant proposed to be put down will amount to some 4 or 5 lakhs of rupees and the recurring expenditure is estimated at three-quarters of a lakh per annum. We are invited to put down three-quarters of a lakh out of hand and Rs. 9,000 a year for six years. I have not the detailed figures of the area by me at present, but from the closing words of paragraph 13 of that letter it appears that the amount we are asked to put up is roughly proportional to the area under oil seeds in the Central Provinces. From paragraphs 6 and 7 of the letter* to Madras it appears that one of the forms of experiment will be the testing of different types of machinery at present used in the trade for expressing oil to see which is most suitable to Indian conditions. Each of these sets of machinery would be of a commercial size, though there is no idea of running the central experimental factory on commercial lines. I do not know how many such types may be at present in vogue; there might easily be, say, 4 or 5. Surely it cannot be the duty of Government to purchase, set up and test each of these. In the Central Provinces we have at present three oil expressing factories, and there is not unlimited scope for numbers of such factories. Are we going to put down a lakh and a quarter in order to get some advice based on experience to be gained in the next 5 or 6 years at Bangalore, which advice may or may not be of advantage to the proprietors of three concerns or even, say, six, concerns in the Central Provinces? Supposing one result of the experiments so conducted is to condemn the types of machinery at present owned by the Hon'ble Rao Bahadur R. N. Mudholkar and Rao Bahadur D. V. Bhagwat, what help could it be to those gentlemen? Again what is to become of the machinery purchased by the Institute and rejected after experiment as unsuitable to Indian conditions? Presumably it would be sold as scrap iron and not as suitable machinery to some unsuspecting adventurer in a new industry. The whole scheme strikes me as unwarrantably extravagant. For all the benefit that it is going to do to the Central Provinces in the early future I am sure I could put the money to better use in other ways. I would rather set up our own experimental tannery for instance.

"2. In paragraph 8 of the letter I see it stated that at present the only procedure open to the organisers of an oil pressing factory is to engage at a very high salary, as manager, a European expert who is totally unacquainted with Indian conditions. I contest the accuracy of this statement. Not one of our three oil pressing mills in the Central Provinces has a European manager. Rao Bahadur Bhagwat's mill is managed by himself as a business manager with one of his sons, fully trained as a chemist, testing and experimenting in the refinery branch, and his other son, a trained mechanical engineer, in charge of the works and machinery. I admit that such favourable conditions would not be available in every case in which a new enterprise is being organised.

"3. This may all appear very useless destructive criticism, and I have only what may appear a feeble suggestion to set against it. My suggestion is, by all means engage an expert or possibly two experts, one for the machinery and business part and the other for the chemical part of the business. These officers should go round to all existing

"oil expressing factories and refineries, find out all they can about existing conditions, offer any advice they may have to give and perhaps invite co-operation in experiment. If a particular experiment is wanted to be made, I have no doubt it will be possible to get it carried out for a consideration by the proprietors or management of some existing running concern. Bangalore is admittedly not a centre of any extensive oil seed producing area. There is no particular reason except the existence of the institute why it should be selected as the site for experimental factories of the kind contemplated. No man of commerce would ever dream of setting up an oil pressing factory there, it being neither near the source of production nor the market, and I contest that no reliable datae whatever could be obtained upon the actual cost of working, which is one of the claims made in paragraph 6 of the letter to Madras "

Q. Have you gone into the question of the disposal of the oil and oil cake from these factories?—A. I have not gone into it minutely. I have talked with them at their factories.

Q. What is the main difficulty; the disposal of the oil or cake?—A. When I was there last, it was disposal of the cake. Since then they have got enormous quantities disposed of.

Q. For what purpose?—A. It is exported home.

Q. You are no doubt aware that they export under disadvantages, apart from the question of war freights, as the oil cake deteriorates, and they get lower prices. What do you think of the prospects of getting people to use oil cake either as food or manure?—A. I think they are quite prepared to. I heard a complaint made by the Hon'ble Mr. Mudholkar that we were not giving them help. It is not strictly true. At one time we wanted cake from them, but they were getting such good prices at home, it was not a business proposition for us to take it from them. We wanted it for both manure and cattle food.

Q. Is it not the case that the cake was not used as manure?—A. Yes, it is now thoroughly established as very valuable manure for sugar cane.

Q. Not for anything else?—A. For pan.

Q. Have any steps been taken by the department to try and popularise the use of it as cattle food?—A. Yes, all our agricultural assistants and divisional superintendents are now advertising it. We mention it at our agricultural meetings and in Berar the Commissioner himself has helped us by preaching it whenever he has the chance in camp. We have done a great deal to help them. As a matter of fact, Mr. Clouston forgot to mention that in our own case we get all our oil cakes from Raipur, because the Raipur man quotes better terms.

Q. Is he better off as regards freight?—A. I have not gone into that, but I don't think it is very much. It comes over the Bengal-Nagpur Railway.

Q. What do you think of the prospects of oil cake as a cattle food in these provinces?—A. I think it certainly ought to catch on. The Agricultural Chemist is proving its value as food.

Q. Do they buy it in the form of cakes?—A. Broken cake as a rule.

Q. Is that broken small enough for cattle?—A. No, I don't think so.

Q. Don't they want some form of crusher before they can use it?—A. Yes.

Q. Has any attempt been made in that direction?—A. Mr. Clouston crushes all his own cake.

President.—Q. But if you want the cultivator to take it for his cattle, you want to put him in the way of getting a crusher?—A. The mills themselves are not doing it.

Q. Is it not part of their duty to put the stuff on the market in a form in which the ryot can buy it?—A. I don't think so. It is a matter of business not duty.

Q. Won't the cake deteriorate otherwise?—A. It might possibly, because cake does get a little mildewed on the surface.

Mr. C. E. Low.—Q. Do you think that the sale, on the lines at Cawnpore, of the products of cottage or other small industries, would be of help to them?—A. I think it certainly should. I would try it myself if I had the machinery, but I am so short-handed. I have not seen Cawnpore.

Q. If you had an agency of that sort, would you be prepared to recommend that it should be tried, i. e., simply stock the things as the agent of these people and send the money to them when you got it; or would you purchase up to the limit of an estimated demand?—A. I have not thought of that. I would prefer to start with the thing as agent. In that connection Mr. Wight, in answer to some questions, said that he considered his duty ended by showing the weavers how to produce better stuff. I don't agree with that. As a matter of fact, Mr. Wight had personal experience of selling stuff for cottage workers in Dindigul.

and he ought to give us the use of his experience. I don't accept his reply in that case. I think what he felt was that he was not expected to have any special connection with co-operative societies as such.

Q. I see the experience of the co-operative society was very unfortunate; they were very badly hit by the war; in fact so much so that very large numbers of weavers were in receipt of Government help?—*A.* Yes.

Q. You say that purchasers of India's raw materials, owing to the absence of competition, don't pay enough?—*A.* I am afraid that is also an *obiter dictum*, that is my impression. For instance, in the case of lac and myrabolam and hides, our local dealers are very small men, and they are very largely in the hands of rogues in Calcutta and Bombay. Our small men in the Central Provinces are not able to look after themselves thoroughly.

Q. You don't imply that people in foreign countries, who want the stuff, do not pay a profitable price for it?—*A.* I don't mean that.

Q. Because the competition to obtain our raw materials, when the supply has been slightly narrowed owing to war restrictions, has been very, very acute. In things like the cotton and wheat trade, the export business has been cut extraordinarily fine. We will come back to your real point that there is a lot of waste, and unnecessary intermediate profits between the man who produces it here and the man who finally ships it to the ultimate buyer in foreign countries where trade is organised. Could you give us any particular instances, or state what your impression is based on. Take lac, for instance?—*A.* I cannot remember the figures.

Q. Never mind the figures. You had a reference to the lac trade. The general impression is that there is a great deal taken off by the middle man; does not the middle man undergo a lot of risk in the case of lac?—*A.* We have one case of a man who actually went bankrupt—a European.

Q. How do you think that the commercial agent for India in foreign countries would help in a matter of that sort; is it not a matter of dissemination of information up-country from Calcutta?—*A.* I did not think only of prices; there are other factors besides prices. What the producer wants is the form in which the particular product can be put on the market. That can only be determined by the man who is closely in touch with the market.

Q. You mean when a man is preparing a thing in Gondia, which will go to the U. K., it will be advantageous for him to know whether anyone else would give him a better price?—*A.* That is so. But I also mean that he should know the best form in which to export his produce, whether as shellac or stick-lac, for instance.

President.—Q. Aren't there cases of this kind, where a product might be sold for a declared purpose, so far as the public knows, and that the raw product may contain a bye-product which may be valuable, and even as valuable to the buyer as the first product. This information being concealed from the seller, the buyer is getting profits that the seller does not think of, and a trade representative in London, accompanied by technical experts to advise him, would enable India to detect cases of the kind. There are cases of bauxite being sold from Ireland for alumina, whereas one knows that the buyers are making it into alumina for the acids it contains. I should like to know whether in your opinion that is an additional reason for this trade representative in one of the big markets accompanied by technical experts to advise him as to what is being done with our raw products?—*A.* I feel sure there must be many cases of that kind in which India is suffering.

Mr. C. E. Low.—Q. Who are the members of your Industrial Board?—*A.* There are two Government nominees, besides myself; one is a representative of the Public Works Department, who is an engineering expert, Mr. Joyce, Mechanical Engineer; then there is the Director of Public Instruction, or his representative (hitherto it has always been his representative); a representative selected by the Registrar of Co-operative Societies; Sir B. D. Mehta; Hon'ble Mr. Mudholkar, and Hon'ble Rao Bahadur Kelkar.

Q. Were these last gentlemen nominated by any authority?—*A.* They were nominated by the Chief Commissioner, being selected as business men. Then there is the Hon'ble Mr. Dixit. I have not quite understood what his selection was for. I would like some more men of business, pure and simple. In response to my request for business men, the Chief Commissioner nominated Mr. Westmorland, Ralli's Agent at Shegaon.

Q. Have you ever seen an industrial survey which was of any practical use when it was made, or in which any action which was taken could not have been taken without the industrial survey?—*A.* Your own industrial survey.

Q. The industrial survey to which you allude was a survey of possible cottage industries. Do you think it likely that there is a better agency to conduct industrial surveys than those which exist at present in the Forest and Geological Departments?—*A.* No, I cannot say that I have thought there would be an improvement on them.

Hon'ble Sir R. N. Mookerjee.—Q. You are opposed to any kind of Government assistance in the development of industries, at any rate in your own province?—*A.* Not exactly.

Q. But that is what you have said here in your written statement; and you choose to use such strong language as "vicious"?—A. Vicious economically.

Q. From your experience do you say that, or from your imagination?—A. I have had experience of Government actions leading to results not expected. I think that that is the danger of Government interference. Some measure appears plain sailing. Government sails in, and results occur that were not anticipated.

Q. Then you prefer things going on as they are without any attempt to develop industries on the part of the Government?—A. As a personal view, yes.

Q. You are opposed to any sort of assistance by Government, but in paragraph 1 you say that you should prefer that Government should stand security for any loans given. Don't you think that that would be more risky than giving a guarantee for any limited period and asking the firm to return the money?—A. There is a good deal of risk in it.

Q. You are not prepared to recommend a guarantee for a limited period, but you are prepared that Government should stand security for any loan that the banks would give?—A. I do not very much wish that it should do so.

Q. You said that in your statement; do you want to alter that?—A. I would like it to stand as I realise we should do something. In the particular case of the Central Provinces so long as we have a particular man at the head of the co-operative movement, I would recommend Government security for loans advanced by co-operative banks to industrial societies. I would not like it to go in as my opinion for general application everywhere.

Q. Is your province so backward that you would like to abolish your own department?—A. I think in another paragraph I have strongly advocated greater activity in regard to cottage industries.

Q. You know the system of hire-purchase in regard to machinery: you are also opposed to that?—A. In these provinces I am.

Q. Do you know that private commercial firms always do that? There is no difficulty there. You are the Government, but ordinary private commercial firms hire or sell?—A. It is not the principle of hire-purchase I dislike, but that Government should purchase the machinery and then pass it on to the consumer on the hire-purchase system. It is the Government dealing which I object to, because we have no machinery in the Central Provinces for determining what is the proper or suitable machinery that we can pass on, on the hire-purchase system.

Q. I am an industrialist in your province, and want a certain machine. I have not got the money to buy same and write to you and say, "if you give me this on the hire-purchase system I would like to buy the machine and pay you in 5 or 6 years." It is my responsibility, telling you the particular machine?—A. I have no expert at present to advise me. I would take all the trouble to find out a business firm to whom I would refer you.

Q. But you would not help me with the sort of help I want?—A. I would help you with advice.

Q. That can be had any where gratis. Advice is a very cheap thing. You say you are in favour of cottage industries. Most of these industries can not get money, and this is a most innocent form of help. In the case of a loom or any other machinery, the man has not the money to buy it and he wants the machine to be sold to him on condition that he pays back the value of it gradually. That is the whole sum and substance of the hire-purchase system?—A. In the Central Provinces I have no expert to advise me. Supposing an expert were appointed for machinery of a particular class. He would presumably be appointed on Rs. 1,500 a month. When you ask him his advice, he is bound to give some advice. I can quite imagine that that advice in your particular case might not be of the very best, but then it would be accepted and you might be let in. Government might also be very badly let in. Government might purchase a machine which was not suited for the particular work required of it.

Q. I said the man requests the kind of machine he wants. He has not got the money. There are hundreds of people who have not got the money, and they want, say, fly-shuttles?—A.

President.—Q. Why should not the Government be let in?

Hon'ble Sir R. N. Mookerjee.—Q. Why do you defend Government like that? It is for the good of the country; the public wants it?—A. I am not quite sure that any helping you would cause the public to put up the money.

Q. It seems to me that you have not a good word to say for the directors of shareholders. You do not like directors. No company can be formed without directors?—A. I have not suggested

Q. You say "we might incur some losses, but, on the other hand, if these were not great they would probably be good investments in educating public confidence and spreading a commercial spirit." You also say, "I believe a good many concerns have been killed in India by constant interference from the Board of Directors, or even from shareholders?"—*A.* Yes, by constant interference.

Q. The directors are appointed to manage the concern. They are like your magistrate and police. How will you manage a concern?—*A.* It seems to me you have no idea of a joint-stock company. How can a joint-stock company be managed without directors?—*A.* I don't think I have suggested that. It is the constant interference that I object to.

President.—Q. It is only a matter of wording. We all know what Mr. Leftwich means. With interference a good manager can do nothing. The remedy is for the directors to be business men.

Hon'ble Sir R. N. Mookerjee.—Q. The idea is to help you to suggest the means by which industries can be developed.—*A.*

President.—Q. It is no use making remarks to us if you cannot act upon them?—*A.* The trend of my argument is that if Government, in putting up the money, demand the right to appoint a director, the director would be apt to interfere a great deal too much. The director would be very likely just as well intentioned and just as well informed as some of the other directors, but being a Government director would be inclined to interfere too much. I wish emphatically to contradict the suggestion that I advised "joint-stock companies without directors or shareholders".

Hon'ble Sir R. N. Mookerjee.—Q. Then as regards these civil servants as business men, if they are sent to foreign countries, to Tata's and other firms, how long do you think they would stick to the post?—*A.* It ought to be for at least 5 years.

Q. Will you be content to remain in your post after all these years of experience?—*A.* I certainly think the man should who had been given that training by Government. The appointment should be on an incremental scale of pay. We have an example in our province now in the appointment of the Inspector-General of Police. He should not be left to chance grading.

Dr. E. Hopkinson.—Q. Were you appointed to both Director of Agriculture and Director of Industries simultaneously?—*A.* Yes, the two go together.

Q. You are the first Director here, are you not?—*A.* No, Mr. Low was.

Q. You have had the means of observing what should be the natural boundary line between the two posts; do you find that the duties of the two posts are interlocked in any way?—*A.* Not at all.

Q. Take the particular instance of the ginning of cotton; do you regard that as purely a matter of agriculture or a matter of industry?—*A.* I don't quite follow; do you mean from the Government point of view?

President.—Q. Supposing the appointment were separated; which Director would make it his business to give his attention to the ginning of cotton?—*A.* The Director of Industries, because it is controlled by the factory laws, which would have to be administered by the Director of Industries.

Dr. E. Hopkinson.—Q. I suppose you would consider that particular instance as coming very near the duties of the Director of Agriculture?—*A.* Very near; the two might seem to overlap, and they do in these provinces especially.

Q. Do you think the sugar factories and the cotton ginning mills should come within the province of agriculture?—*A.* I find it difficult to give an academic opinion. I don't quite see where the Department of Agriculture is going to come into the question at all, either in the sugar factory or the ginning factory. If it is a question of Government aid, then it would be the Department of Industries. In regard to the Government inspection of factories, it would be the Director of Industries. I cannot imagine any way in which the Department of Agriculture would interfere with the working. I cannot quite see in what form the department would come in contact with the sugar factory or the ginning factory, except as an enquirer. If it was a question of giving aid that aid would certainly have to be given by the Department of Industries.

Q. To put the question in a more general form, have you found any disadvantage in occupying the dual post?—*A.* The disadvantage is certainly that I cannot do credit to either. I would like to have a whole-time Director of Industries for the Central Provinces; the one duty certainly interferes frequently with the due performance of the other.

Q. Do you consider that industrial education should come within the province of the Director of Industries?—*A.* In its practical branch, I think it should.

Q. I hope industrial education is practical?—*A.* I consider that industrial education

Q. I suppose in the Central Provinces there must be a large production of hides and kipps?—*A.* Yes, very large.

Q. Does that business come under your supervision?—*A.* Yes, I noted from the trade returns that we were exporting 40 lakhs of rupees worth of hides from these provinces in the year, and we imported ten lakhs of rupees worth of leather. That did not seem economic, and I went round to the Saugor slaughter-houses. There is a very large opening in the leather trade in Saugor. They slaughter up to 500 animals a day and about half that number in the neighbouring district of Damoh.

Q. I suppose the channels have been completely changed through which business has been done, owing to the war?—*A.* Undoubtedly. German and Austrian agents looked after many of our industries before the war. That has been eliminated now.

Q. What I want to get at is whether that sort of thing comes within the province of the Director of Industries?—*A.* It certainly should.

Q. You have not devoted attention to this feature?—*A.* I take a personal interest in it. I always jot down notes when I come across it, but at present I have no means of doing very much in the matter.

Q. Putting it in another way, we know that the trade has passed from German hands to British hands. Did the Administration think it worth while to consult you as to this transference?—*A.* They have not done so up-to-date.

Q. You are not familiar with the details of that transference which is now going on?—*A.* Except that my department held an enquiry to see whether there was any boycotting of any particular firm in the trade. There was one Ispahani who complained that he had been boycotted by the rest of the trade. We made enquiries which showed that Ispahani had practically never had any business with these provinces. My inspection of slaughter-houses was made particularly to help to frame the rules, and in the course of that I was able to pick up a great deal of information about the bye-products which show an opening for other connected trades, such as bones, glue, gut, etc.

Q. Do you consider it part of your duties as Director of Agriculture to make yourself acquainted with the result of researches carried on at Pusa?—*A.* I try to.

Q. I assume you consider that to be particularly the duty of the Deputy Director?—*A.* I consider it the duty of the Director also. He cannot follow the details, but should keep himself informed of results. In reading journals I frequently mark paragraphs and send them to the Deputy Director to ask if he had noticed them, as he is so very busy, he might miss an important article or paragraph of local bearing.

Q. We have had our attention drawn repeatedly to shortage of labour in the case of every one of the industrial undertakings. Has that come frequently before you?—*A.* Undoubtedly. It is the cry all over these provinces. Our biggest industry, manganese, is suffering from it very greatly.

Q. Can you suggest reasons for it?—*A.* It is a matter of population in these provinces. Our population is very light.

Q. Actual shortage?—*A.* Actual shortage of population. We have a lot of unpopulous tracts. Some of our industries happen to arise in unpopulous tracts. The development of Central Provinces industries has very nearly killed emigration from these provinces to Assam tea gardens.

Q. If the labour was brought up to a proper standard of efficiency, do you think it would then be sufficient in the Central Provinces?—*A.* For the present I think it probably would, but we hope to develop further. I am not sure that the population is going to increase at the same pace as the development of industries. I think if labour were efficient, at the present time it would probably be sufficient.

Q. Do you think that the need for labour might increase at a rapid rate, and there would again be a shortage which could only be met by labour from other provinces?—*A.* Yes.

President.—*Q.* What is going to increase the efficiency; have you got any ideas?—*A.* Industrial education must, up to a certain point. One hopes to increase it that way; even if we are not able industrially to double our effective labour, we can, at any rate, train our mates and overseers. At present most of our mates or under-foremen are practically labourers, hardly better, and many of them are illiterate.

Dr. E. Hopkinson.—*Q.* Do you think industrial education would do it?—*A.* No, I don't. We must educate them and stimulate ambition. As a matter of fact I disagree with Mr. Wight. He was asked whether he observed the birth of any ambition amongst the weavers after they had been introduced to the improved loom. He was unable to answer. But it is a fact that when the coarse weaver, who used to make a coarse type of

cloth, is once introduced to the fly-shuttle he is not content with that; he immediately asks for a dobby to weave fancy borders. That means he wishes to raise himself a whole grade, as a weaver of bordered cloths ranks a grade above the others.

Q. Were you responsible for the appointment of Mr. Wight?—*A.* Not for his selection. He was selected by the Secretary of State. He was appointed in Mr. Low's time.

Q. You are responsible for the general direction of the policy pursued?—*A.* Yes.

Q. One of the chief points of the policy which you are directing is the introduction of superior qualities of materials for handloom weaving. Is that a definite policy which you are advocating and pushing?—*A.* Not improvement in the quality of the yarn.

Q. I mean taking more valuable material like silk and wool rather than cotton?—*A.* We are trying to convert our common cotton weavers into silk and woollen weavers at the weaving centres.

Q. That conversion is going on satisfactorily?—*A.* It has only just begun. Wool weaving was unknown entirely in these provinces. There was no such thing as woollen wovens, except blankets.

Q. That is quite a definite feature of your policy?—*A.* Yes, and this encouragement of coarse weavers to take up fine work, because the coarse weavers must inevitably go under to power looms.

Q. Is much handloom weaving done by females?—*A.* None.

Q. Is there any tendency at all to increase female labour in cotton industries?—*A.* I have not seen any. They help in the sizing, spinning, dyeing, etc.

Q. Would you say the handloom industry does largely employ female labour?—*A.* Yes, in a way, for the weaver's wife does not go out to any other labour, except at certain times like the harvest.

Q. What I want to get at is, is there any unused fund of labour?—*A.* If there is then its employment would have to be in another cottage industry alongside, because they have to make the weaver's food and look after his house generally. If a woman can spare time for other duties, she sometimes helps in spinning, dyeing, etc.

Q. Is that assistance carried as far as it can, or is there still a fund to draw upon?—*A.* There is undoubtedly a large labouring population in the village who are not continuously at work, I should not think in the weaving caste there is a very large reserve.

Q. I don't think Mr. Wight told us whether you have any peripatetic classes for weaving?—*A.* Yes, we have about four teachers. Mr. Wight's Indian assistant was trained at Madras and had experience of peripatetic work. He has done quite a lot. We have introduced new fly-shuttles in villages right out in the districts. Our demonstrators sit down in a village for almost a fortnight and teach the local men to use the loom properly. When a weaver has once learned, they offer him one of the sleys on the hire-purchase system at Re. 1 a month. We have only got about fifty of them out at present, but have been held up for want of organisation for making the sleys. Once we get well started we hope to get along very quickly.

Q. In reply to question 3 you speak about a factory at Khandwa; is that a ginning factory?—*A.* Yes.

Q. But you rather suggest that that was put up almost for the purpose of blackmail and was never intended to work?—*A.* It is my firm conviction that it was.

Mr. A. Chatterton.—*Q.* Have you anything in the nature of a cattle census in the provinces?—*A.* Yes.

Q. Have you ever compared the figures of the census with the output of hides that are exported from the province at all. What I want to know is if there is any large waste of raw material through inefficient arrangements for collecting the hides?—*A.* In the particular case of our Saugor slaughter-houses the result would be vitiated by the fact that a great number of cattle are brought from the surrounding native states, trans-frontier.

Q. Can you give us a little more information about these slaughter-houses, because I understand they are an institution peculiar to the Central Provinces?—*A.* I have not gone into the birth of this industry, but I believe I am right in saying that it started with famine. A great many head of cattle were sold because the cultivators were hard up, and some astute Mahomedan contractors saw their opportunity and started a regular business. It became so considerable that they were able to offer fair prices, and it has come to stay. The principal industry is not hides but jerked meat. This is cut up into strips, dried and made into bundles like bundles of firewood, and then sent down to Calcutta for export to Rangoon and the Malay States, and some gets as far as China.

Q. Have you any idea of the value of this trade at the present time?—*A.* No, I have not asked the proprietors for information.

Q. Have these slaughter-houses aroused any local feeling in the matter?—*A.* They have aroused local feelings of greed and not of indignation. I think you will find that many of the municipal members are shareholders in these yards. Brahmins and Hindus are also found to be shareholders, I believe.

Q. Turning to the question of oil cake, do you know whether there has been a very large extension in the use of kerosene oil in these provinces?—*A.* During my service it has been tremendous. My own personal experience is that on going out into a district one would see one hurricane lamp in ten square miles; now one or more kerosene oil lamps are used in every village.

Q. Has that led to a decreasing extraction of oil in native oil mills, and consequently a decreasing amount of oil cake available for agricultural work?—*A.* I cannot say that as a fact, I have no statistics.

Q. One would imagine that there would be great demand for oil cake in mills to make up this hiatus if it had occurred?—*A.* I have taken no census. I have no statistics for that.

Q. Has any attempt here been made to extract oil by solving processes in any of these oil mills?—*A.* I am afraid I don't know.

Q. The oil cake which is purchased by the Agricultural Department for eating purposes, is that analysed?—*A.* Some of it has been analysed by the Agricultural Chemist. It is not analysed as a regular thing before we take delivery.

Q. In your evidence you state that you are in need of a great many more experts to deal with these cottage industries; to what particular class are you referring now; do you mean European experts?—*A.* I mean expert teachers, say, for wood work, metal work, dyeing work, etc.

Q. You want good tradesmen and good craftsmen?—*A.* Yes, they must be craftsmen essentially.

Q. Would you be content to get men from other parts of India, or do you want Europeans?—*A.* No, we would be content to get men from other parts of India.

Q. In regard to the appointment of Government directors, you say that if Government put their money into anything, they should do so unconditionally, except on the same terms as any private investor. Would that not mean that Government would have the same right as a private investor to nominate or elect directors on the Board?—*A.* Yes, on the basis of a shareholder.

Q. Would you have objection to a Government director appointed in that way?—*A.* No.

Q. Then you say you would like to see demonstration factories run by Government, of tanning leather, brass and aluminium work, on the lines suggested by Mr. Cove, and wheel-making. These demonstration factories would compete with existing factories outside the state; for instance at Poona there is a large brass factory which exports to these provinces a considerable amount of brass work, and another one at Lucknow. Don't you think it would be rather unfair interference with the existing rights of these factories?—*A.* I can quite imagine it might be, and that is what I indicated as one of the possible results that would be unforeseen.

Q. Would you rather see this kind of work done under Imperial control, *i. e.*, the control of the Government of India rather than under the control of the local administration, so that a wider view might be taken of these matters?—*A.* Yes, I would like general control. I think we have already wasted time in these provinces from not having it.

Q. You state that in the case of one of these mills, the Land Acquisition Act could not be applied in connection with the acquisition of land for the erection of houses and buildings for operatives, because it was not a work that was likely to be useful to the public. Surely the erection of housing accommodation for work people is a matter of benefit to the public?—*A.* I agree. In the other case in question I was myself Deputy Commissioner of the district, and I did some special pleading to try and induce Government to bring the case within the Land Acquisition Act.

President.—Q. Who decides the interpretation of this clause of the Land Acquisition Act, which adviser of the Local Government?—*A.* The Financial Commissioner; he advises the Chief Commissioner, but probably consults first the Legal Remembrancer or Standing-Counsel.

Mr. A. Chatterton.—Q. With reference to your statement that you received a proposal from Bangalore that the Central Provinces Government should join in subscribing to a pioneer oil pressing factory, would you not be of the opinion that statement as "a pioneer oil pressing

factory" is hardly accurate. The meaning of the circular sent out was to the effect that it was proposed to undertake a complete scientific investigation of the oil seeds of India, and of the possibility of working them up into products which could be utilised in the country. You seem to lay undue emphasis on the statement that some mechanical experiments were to be made as well as a large amount of chemical work?—A. I admit that I have not understood it. I took a rather one-sided view of it as a mechanical experiment with machinery.

Q. In that case would you be prepared to modify that statement with regard to the "pioneer oil pressing factory"?—A. Yes. I thought that an oil press could only be economically used on a large scale. I imagined that Government was going to set up a factory with separate sheds, each with an oil-pressing plant of different type.

Q. The main idea is chemical work; it is a subsidiary matter running various kinds of presses, and for that reason your description is inaccurate?—A. I should like to modify my view then.

President.—Q. Do you know what action the Local Government has taken?—A. The Local Government has accepted my views that it is not advisable for the present for the Central Provinces Government to come in as we want all our money for other developments. The reply of the Local Administration was that the time was unsuitable, having regard to the finances of the province.

Q. Did the letter convey any idea as to whether it was sent to the Government of India?—A. No, it came direct to our administration. It came from the Madras Government.

Q. Have you got any supplementary remarks to make?—A. I have jotted down a few points in regard to the evidence of some of the other witnesses with which I don't agree. One is that capital for local gins and presses has always been put down by Marwaris. I know many that were subscribed for by local landholders. I have also in my answer to question 103 stated that certificates of approval under the mining rules are sometimes too liberally given by the Local Administration. Since I noted on this matter of the policy of the Local Administration, I have had a letter from the Deputy Commissioner of Nagpur very strongly putting forward the same views.

Q. You say that the Local Government have been too free in granting certificates of approval?—A. That is a point brought up by the Mining Association. They say that the result has been that a certain class of jackals has arisen, who, following honest prospectors, merely try to make money.

Q. The certificate of approval expires on the 31st December of the year in which it is granted?—A. In the particular case mentioned by the Deputy Commissioner of Nagpur he refused to renew a certificate to the man who appealed. The Deputy Commissioner had to put up a very strong case to get his orders upheld. He asked in his letter for a declaration of policy by the Local Administration in regard to these matters. He has given his reasons.

Q. The mining rules so far are particularly clear. A certificate is granted readily, unless there is something definitely known against the applicant. That certificate is granted up to the 31st December. If, in the meantime, the man shows that he is an unworthy person, it is not renewed. It is only right that the officer who refuses the certificate should give his reasons. In this case the Deputy Commissioner has given satisfactory reasons, and I don't see any point to grumble in that. If he did not grant certificates of approval freely he would cause considerable delay in the granting of prospective licenses to people who are really worthy. If there is anything definite against the applicant, obviously the certificate of approval would be refused at once. I cannot see that you have established any case for the revision of the rules granting certificates of approval?—A. I think so myself. This letter only draws the attention of the Local Administration to the fact.

Q. If your Administration varies in its interpretation of these rules we cannot interfere unless you can show that the rules are so worded as to admit of unfair variations?—A. In the matter of Government loans the rule limits the loan to three times the rental value of the land. In the event of a man holding a piece of land extremely cheaply, he ought to be in a better position to take a loan, but according to our rules, he is less able to. Under the Takavi Loans Act, we are not able to give much help.

Q. Did you make definite representation on that point?—A. No, the case arose in the examination of Mr. Clouston.

Q. You are not prepared to make any recommendation on that point?—A. No.

Mr. A. Chatterton.—Q. When land is tendered as security, how do you value it?—A. Purely according to the rental assessed by Government.

Q. You don't make a valuation of the land?—A. No.

WITNESS NO. 156.

*Mr. H. R. Crosthwaite, J.P., Registrar of Co-operative Societies, Central Provinces,
and Governor of the Central Provinces Federation of Co-operative Banks.*

Written Evidence.

NOTE.—Strictly speaking, it is anomalous that an official Registrar of Co-operative Societies should also be the non-official head of a co-operative banking organization. But the business of co-operation calls for special knowledge and constant study, and it is still new in India; the expert non-official co-operative worker, such as Haas of Germany, or Buffoni of Italy, living for the co-operative movement and paid by it, does not yet exist in India. Hence, of necessity, the Registrar has to fill a dual rôle. Then again there is no State money in the co-operative banks of the Central Provinces. In answering the questions set by the Commission, I shall speak in my non-official capacity as a co-operative banker and organizer, except where I state clearly that I speak from the point of view of an official Registrar.

Capital.

Q. 1.—Agriculture is far and away our most important industry in the Central Provinces and Berar. 76 per cent. of the provincial population are engaged in agriculture; of the remaining quarter 3 per cent. only are engaged in the textile trades and 7 per cent. in other industries. If agricultural co-operation means so much to Germany with only 36 per cent. of her population engaged in agriculture, what ought not agricultural co-operation to mean to the Central Provinces?

For agricultural and, in a much less degree, for industrial co-operative credit I have had experience of raising capital. Thanks to the prestige of Government and to the support of a small band of non-officials, aided powerfully by officials, we have now between 50 and 60 lakhs of working capital together. Most of this has come in since 1911. In June 1911 the co-operative movement was in possession of about 3 lakhs of working capital. I am not counting any money twice over, e.g., the money of the provincial bank passed on to central banks.

As regards agricultural societies, central banks (the local non-official directors are the judges of credit) are ready enough to finance them. As regards societies of weavers, workers in bell-metal, and the like, great hesitation has always been exhibited. This was, I think, by slow degrees, turning into confidence when the War broke out. Following on the financial crisis (which produced a great contraction of *hundi* credit and knocked out many small middlemen) the effects of the War have been bad for co-operative societies of small producers. Default has been the rule, and the central banks refuse to finance these societies further until their members commence to reduce their present debts and to sell their goods at a profit. Here is the great obstacle to the success of the society of small producers. Co-operation may secure great economies in the cost of production: it cannot ensure a sale at a large enough profit. The "workers' society" is on a different footing to the society of small producers, and this type exists only under circumstances and amidst surroundings which do not exist in the Central Provinces and Berar. On the continent of Europe the society of small producers, selling independently of each other, has never met with success. A notable instance is furnished by Germany. The Prussian State Bank was founded expressly for the benefit of the small producer. Yet despite every effort on the part of Government the capital of this bank has gone to agricultural co-operation; the reasons for this are purely economic and of an ordinary business nature.

I see no prospect of finding much money for industrial co-operative societies until the movement has proceeded to a much more advanced stage of development, which I shall indicate in replying to another question.

Q. 2.—Our capital has been obtained from local sources, e.g., pensioned servants of Government, lawyers, persons still in Government service. We cannot claim to have tapped a wide field as yet, but we get more money than we can, under existing conditions, use in the province. We do not push for deposits, and we have never failed to meet our obligations to depositors. We have tried to deserve confidence, and (it must not be forgotten) there is the Government controlled audit, the Government guidance, and the Government prestige behind us.

Government
assistance.

Q. 5.—Take (2) and (7) together. What the cottage industries require, especially the weaving industry, is a profitable market. If Government will help us in this direction there is every prospect of success before the societies of small producers. This is really the key to the whole situation of cottage industries on a large scale co-operative basis with co-ordination of units, etc.

Q. 6.—In my opinion the driving force behind the economic activities of the co-operative movement is supplied by Government. Take that away, and co-operation will never develop into a great Indian asset. It is my belief that the driving force employed at present is insufficient, and that, in its zeal to bring out the non-official aspect of the co-operative movement, Government stands to lose time and opportunity; the policy of Government involves the danger of chilling to extinction an enthusiasm for co-operation which is, as yet, based on sentiment rather than on a knowledge of world politics. In a province as large as ours—rather larger than England, Scotland and Wales put together—with an area of almost one hundred thousand square miles, with a very important

system of communications, with a population of 14 millions, of which only 33 per mille are literate, with many months in the year during which villages cannot be reached or agricultural operations keep villagers too busy to attend to anything else (such as instruction in the means to secure better farming, better business, better living)—with all these facts to encounter it is, I submit, unreasonable to expect great progress in return for an average monthly expenditure of Rs. 8,195, or less than Rs. 1 lakh a year. From non-official funds supplied by the co-operative organization I spend Rs. 6,250 a month, and this figure is mounting rapidly. Taking official and non-official expenditure together, we spent last year Rs. 1,73,365 on the organization and development of the co-operative movement, and this represents 7 per cent. on our turnover, which was Rs. 2,59,11,000. Agriculture being far and away our most important industry. Government should, in my opinion, spend more money on it and pay better organized, more systematic, and more concentrated attention to its improvement and development. There should be more and not less Government initiative and guidance and instruction, and it is wanted not at the bottom, not to carry out simple audit or to introduce red tape, but at the top. We want more men of the stamp of the Deputy Directors of Agriculture. Both in agricultural and industrial co-operative enterprises State control is essential in India. It may be difficult for the State to find apostles in numbers; but that, I am convinced, is what the State ought to try and do.

Q. 8.—I would go so far, in connection with cottage industries, as to start model societies if I had improved looms, etc., to introduce. I would select my members and start them, at first, as paid workers on wages. Then I would take them on to piece work, and gradually steer them to their independence. This scheme depends on the provision of a profitable market. The question before Government is "Are cottage industries, as a State asset, worth saving by whole-hearted protection or not?". Short of whole-hearted protection, I can think of no measures which would give results of a satisfactory and substantial nature.

Pioneer factories.

Q. 9.—(i) Cottage industries.

(ii) The development of small scale private industries.

Financing agencies.

As regards (i), take the weaver or the dyer. As a rule his operations are conducted in a vicious circle. He is really the slave of the *mahajan* or the middleman; he borrows from these men for food, clothes, etc., when trade is slack, as it so often is (in a *Singhasht* year, for example); he buys his raw material from them; he sells his finished products to them. At each stage he is bled, and his margin of profit scarcely yields a living wage. Nor does the middleman always grow affluent in the process; for he often finds it difficult to sell. The result on the industry is, in general, deterioration of quality in goods, loss of public esteem, failure to meet competition,—all the results, in fact, which follow the struggle to maintain adequate margins between the cost to the producer and the price paid by the consumer.

(ii) Take the case of a man who wants to set up a small flour mill, or even an oil engine working a ginning plant, a grinding mill, and a fodder cutter. If he works on borrowed money, money from the private lender, he will pay not less than 24 per cent. per annum, and, ten to one, there will be other conditions besides the payment of interest and repayment of principal attached to the loan. The honest lender exists; but there are very many—too many—dishonest lenders trying to get the best of dishonest clients. A higher standard of honesty is wanted and greater mutual confidence.

Q. 10.—I do not know where to begin to reply to this question. We could do much more than we are doing at present, but organization and construction take time. For instance, we hope to supplement our Raiffeisen banking system, with a chain of Haas societies for agriculturists for whom unlimited liability is unsuitable. Such societies might well produce and sell *ghee*, breed cattle, gin cotton, produce selected seed, etc., etc. They would work directly with the provincial co-operative bank. We hope, too, to get a system of Schulze-Delitzsch banks organized; they will help the tailor who wants to buy a dozen sewing machines or so, the man who wants to start a small scale factory for hats or socks, the man who wants to go into trade, all, in fact, who are of the towns, are outside our rural circle, and who want the services of an honest lending agency which will help also to thrift. Beyond these schemes, and when we have taught our people more about banking and have reserves of non-official staff, we hope to see a provincial joint stock bank with country branches, working separately, but in linked co-operation with the co-operative system. We have definite aims and a programme. How long we shall take to carry it out depends very largely upon the progress of the country in other directions. We may claim to have made some progress, but we recognize that a co-operative system is, and must be, a manifestation of general progress in other directions and of the existence of certain qualities of mind and of character amongst the people at large. Those who know the province cannot fail to understand the formidable nature of the task which Government has to face.

Q. 11.—We have 53 co-operative credit societies of weavers, 5 of dyers, 3 of workers in gold and silver, 7 of basket makers, 4 of workers in brass and copper, 2 of potters, 7 of petty traders, and 1 of leather workers. Membership, 1,666; working capital about Rs. 25,000; and reserve funds Rs. 6,000.

Co-operative societies.

These societies were, for the most part, organized by the Director of Industries and the Registrar of Co-operative Societies. In every case the members have secured some benefit; but circumstances beyond our control have been against the weavers. Some of the weavers have been dishonest; some have, on the other hand, gone to Bombay and worked in the mills and have sent remittances towards their debt accounts by postal order. The dyers have put up a good fight and have struggled to pay. Given a profitable market, we could do much for the weavers and dyers. The Director of Industries has helped much by negotiating supplies of raw material at reasonable prices.

Q. 21.—We shall continue to do all we can to organize and finance co-operative credit societies of weavers, dyers, etc., but we cannot afford to take any greater risks than the ordinary commercial banker takes. Personally, I hold that the development of the town co-operative store offers one path to future industrial development. There ought to be a great future for stores in India. The dividend to custom and the contribution to education, combined with a policy of centralised expansion under a wholesale, fit members to understand and support a progressive policy. The thrift developed by the dividend provides capital; then co-operation proceeds beyond distribution and finds itself in possession of funds not wanted for distributive business. Next, co-operative effort is carried back to the previous stage of production. I may instance the corn mills owned by groups of British stores. The British wholesales control industrial production on the largest of scales. When I was last in England (1911) they produced goods annually to the value of about £8,000,000 or more.

The store movement in industry is, however, limited in its scope, and, generally speaking, it extends only to the production and distribution of goods for local consumption, e.g., the manufacture of wine by the Unione Co-operative of Milan. Surely, in India, there is room for the manufacture of hats, boots, buttons, etc., and the organization of much local industry under a system of co-operative organization? Raw materials will be wanted, and the law of supply and demand should operate to develop both agriculture and industry. But, of course, the store movement does not arrive at production at once; it gets there *via* distribution and thrift and education in common sense business. What stands in the way? The absence of any desire on the part of the educated classes (who alone can take the lead) to initiate a store movement. Again, Government will have to teach, persuade, organize, and supervise. Have Government at present staff for all this work? They have not.

Land policy.

Q. 41.—In my opinion the tenancy laws of the province hamper to a very dangerous extent the development of the co-operative movement. In Germany, and in other countries which (like this province) are countries of small holdings, legislation has steadily progressed towards and has reached ownership. In Germany cultivating owners occupy more than 90 per cent of the cultivated area; in France they occupy about 60 per cent. Belgium is, it is true, a land of tenancy; but elsewhere (e.g., Roumania in 1864) the movement is towards a peasant proprietary. In the creation of a peasant proprietary military considerations play an important part; but it cannot be contradicted that in every country of small holdings co-operation is the corner-stone of the development of agriculture. In our province we have the small holdings without the peasant proprietary, and though I would not go so far as to grant proprietary rights all at once, I do not see how we are to solve the various banking and credit problems before us unless we confer, by legislation, upon all classes of tenants the unrestricted right of transfer in favour of the primary society. Unless this be done, we cannot tackle the all-important question of existing indebtedness, and until that question is tackled nothing approaching the full benefits of the co-operative system can be gained by the province. I speak of the Central Provinces only; in Berar the position is different, and there we can proceed and are proceeding to tackle existing indebtedness. The point is that on the security of transferable rights in land money can be advanced for long terms; on the other hand, on mere personal security, even though backed by unlimited liability, advances for long terms cannot be made without risks which no banker can accept. Further, on the security of land mortgage bonds can be issued; and a mortgage bond converts a lock-up into a form of security which is fluid. But for the insecurity of tenure (from the lender's point of view) existing in respect of Central Provinces tenants, we should not have been forced to invest more than Rs. 10 lakhs outside the province, and even to lend money to other provinces which we cannot use (with safety) ourselves. A co-operative society is not a land-grabbing usurer, and the tenancy laws should foster and not hinder the growth of the co-operative movement. The Committee on Co-operation considered this particular question "outside the scope of their enquiry." True, it bristles with difficulties of an administrative nature. But co-operation and insecurity of land tenure (once a man owes money to the *malguzar*) combined with restrictions on, or prohibitions of, the pledge of real security to the lender, do not go together. If the co-operative movement is to succeed, then the laws of the land must be favourable to it. The industrial progress of this province will follow in the wake of the development of agriculture; the development of agriculture depends upon the co-operative movement; the co-operative movement depends upon sound finance; and sound co-operative finance on sound and fully effective lines there cannot be till the tenancy law is altered.

Oral Evidence, 21st December, 1917.

President.—Q. You say in answer to one of the questions that the effects of the War have been bad for the co-operative societies of small producers. Have you satisfactorily eliminated the possibility of the War being a mere coincidence and the fact that the causes at work probably date much further back?—*A.* They date much further back. I have already referred to the matter in one of my annual reports. But for the War we could have struggled on. We could have struggled on in an unsatisfactory way; but the War was the culminating factor in a succession of adverse influences.

Q. My impression gathered in other provinces is that the co-operative system has not extended to agriculture fully and successfully and I should like to know whether that is a fair impression to gather?—*A.* I think it is. But the co-operative movement is comparatively new in India, and co-operation in agriculture is a difficult matter depending for its success on many things such as the state of general education, good roads, railway facilities, etc., etc. Agricultural societies for supply and production appeared in Europe in 1860; but they did not appear in England till as late as 1900.

Q. Eliminating the conditions due to the War could you tell us what are the causes of the difficulty of applying co-operation to the cottage industries?—*A.* The real difficulty is one which is felt all over the world. Wherever there is a small society of producers (selling as individuals) there is great difficulty in securing a sufficient margin of profit on sales. On the other hand, in the case of a society of workers which sells as a body there is to be had a market for the goods in bulk. The society of small producers fails to compete against the modern factory. The society of workers is, as it were, itself a co-operative factory and it does not appear on the scene until modern industry has appeared, *i. e.*, in countries in which industry is highly organized. In the society of small producers each member sells to his particular middleman; and the influences of the factory are neither emulated nor challenged, the result being that the factory wins.

Q. The question then narrows into one of market. Do you mean to say that results would not be satisfactory unless there is co-operative selling?—*A.* I think the question is one of market. Given the market, co-operative sale would be most valuable. Such sale requires very expert organization.

Q. Would sales agencies facilitate the matter in any way?—*A.* I think they would if the sales agencies could be helped by Government. If we can protect cottage industries to the extent of producing and selling at a price which will yield a satisfactory margin of profit then there is scope for co-operative organisation. Otherwise not.

Q. Have you seen the sales agency at Cawnpore?—*A.* No.

Q. Have you formed any opinion as to how sales agencies should be formed and maintained?—*A.* I have not been able to find a good opening for the formation of any such agencies in this province, and so I have not worked out details.

Q. Would it not be well if some officer visited the sales agency at Cawnpore?—*A.* I have sent men to travel with the products of the co-operative societies; but the difficulty is to find purchasers. People who bought home spuns now prefer the cheaper factory-made article with its brighter colours and smarter appearance.

Q. Do you think that bad tastes are setting in?—*A.* I cannot say that; but purchasers prefer the cheaper mill-made article, though it does not wear so long.

Q. Now the number of weavers amounts to a very small fraction of the population and one wants to know whether they will have to be left to themselves or whether there is any real hope of saving them?—*A.* I think it is impossible for co-operative banks, pure and simple, to save them. The problem is one for the State. As a banker I cannot use the money of private depositors in financing industrial societies which cannot sell their products to advantage. If Government steps in with a subsidy or a guarantee and does not mind whether it gains or loses, then co-operative banks and societies can help.

Q. Do you think that there is any real hope of saving them from the technical side which will react financially?—*A.* They might be saved, perhaps, if they were organised by experts from the bottom to the top into cottage factories and if they could be grouped together and if their methods and their products could be improved.

Q. Do you mean to say that even from the technical point of view the case is not very hopeful?—*A.* I do not consider it is hopeful.

Q. You say that you are making attempts to save them by introducing improved methods in the hand loom?—*A.* We are doing our best. One great difficulty concerns money. We have no Government money, and the matter rests largely in the hands of the non-official directors of the central banks. These directors have had experience of the industrial revolution and their own refuse to finance them.

Q. Can you say definitely whether, if the hand loom weavers were helped by experts from home with a view to improve their methods, and a good system of co-operative finance were provided, and the market conditions were improved, there is a balance of judgment in favour of the policy now being adopted apparently tentatively by the Government? What is your opinion?—*A.* From a strictly banking standpoint I should not recommend Government to attempt the task of financing cottage industries on a strictly co-operative basis.

Q. You think it is a hopeless task?—*A.* I think the attempt is doomed to ultimate financial failure, for it cannot be placed on a sound business footing, nor yet on a sound co-operative footing.

Mr. A Chatterton.—Q. Don't you think that in all our attempts to help the weaver by the introduction of improved appliances we have lacked the necessary amount of experience and we want to make further experiments?—*A.* I have not the necessary expert knowledge to answer that question; but I think that all experiments ought to be made with State money.

Q. Do you think it is worth while to incur the expenditure?—*A.* As an administrator I should say 'yes', but as a business man 'no'.

Q. Do you think the attempt is necessarily doomed to failure?—*A.* I think that has been the experience in Germany and all over the world. The co-operative society of small producers is no good.

President.—Q. It seems evident that the work now being done by Government is half-hearted and is limited to the employment of a casual expert now and then. The practice of one province is not followed in another. There is such a great variety of methods from province to province. What I want to know is whether if one tackled the problem in right earnest there is any hope of saving the people?—*A.* If you can turn them into so many societies of workers, which are a distinct thing, then I say definitely that though it will be a long and hard task there is some hope. If you are going to turn the weavers or other cottage artisans into co-operative societies of small producers then there is no hope. I would not attempt a society of small producers at all. There are groups of weavers in some of the towns who live separately in so many different hamlets.

Q. Are they units big enough for your purpose?—*A.* Certainly.

Q. Do you think that is the only really hopeful line along which work could be done?—*A.* Yes.

Dr. E. Hopkinson.—Q. By village factories do you mean that the looms are collected in one building?—*A.* Not necessarily. The weavers live in certain specified weavers' quarters and their houses are next door to each other. It would be for industrial experts to say whether it is possible to leave the looms in their houses or whether they would have to work in a small factory under supervision. The village weaver in the rural tracts makes and sells his coarse cloth. He does not compete with the mills. He sells in the local bazar which is probably a few miles off from his home. In his case it is largely a question of the family carrying on the trade from one generation to another, and selling to generations of other families. There is, as it were, a good will attached to the family business.

President.—Q. Will that last long?—*A.* I think it will last for a long time. It will last until communications become very much better than at present.

Mr. A Chatterton.—Q. Is not the survival of these weavers due to the fact that they do not use the yarn which the mills use?—*A.* I do not think so. I think it is simply due to the fact that they are in a water-tight compartment at present.

Mr. C. E. Low.—Q. Is it not the case that in the Central Provinces the weavers have an additional handicap in that the demand for their goods is reduced to a minimum at certain periods of the year and that makes it difficult to finance on a basis which would carry them through?—*A.* That is exactly the case.

Q. Is not the question of a free market also an essential difference between the agricultural societies and the societies of weavers?—*A.* That is the essential difference.

Q. Are not the bulk of the weavers in the Central Provinces scattered?—*A.* I should say that the weaving population is scattered with the exception of centres such as Buxaripur, Jubbulpore, Nagpur, and Raipur. If you go into any one village you will find comparatively few weavers. We actually went into the question and we found that there were only 12 villages in a whole district where you could get ten weavers to register as a co-operative society.

Q. Do you think that the scattered workers offer a greater prospect of success than the concentrated groups of finer workers?—*A.* I do not think so. It would be a very difficult problem to deal with scattered workers.

Q. Turning to other cases are there any successful societies of basket makers and others who have a free market for goods?—*A.* The basket makers are successful in the market.

makers and in each case they have left their trade and bought musical instruments with which they manage to earn more.

Q. They are able to buy these instruments by loan from the central banks and they repay?—*A.* And very quickly too.

Q. Do you think that what is wanted is a free market?—*A.* Yes.

Q. What about the potters? You have two societies?—*A.* I think they are going on all right.

Q. That also narrows down into a question of free market?—*A.* It is all a question of free market as far as I, as a co-operative organizer and banker, am concerned. When we have a free market there is no difficulty which we find insuperable.

Q. Supposing greater technical efficiency were secured by improving the methods of the weavers by the help of experts, do you think then that the weavers would be able to compete with the mill-made articles?—*A.* I do not know. I cannot venture to prophesy. But I should anticipate that the mills could undersell the cottage weavers for long periods together.

Q. Have you considered the question of developing the mochis?—*A.* We have been into that question. They are developing on lines of their own and they scarcely need such help as we are, at present, in a position to give.

Q. The difficulty is apparently in regard to finance. At present they have to borrow at high rates of interest. Do you think that a good banking system would help these people?—*A.* The town co-operative bank will help certainly, if each borrower can bring two good sureties.

Q. Has the work of these town banks or urban societies been confined to trade or have they assisted industries?—*A.* I should say that they have definitely assisted industries.

Q. Are there any societies of that type successfully working in the province, a bank helping small trades and industries?—*A.* We have had no time to turn our attention to that side of co-operative enterprise.

Q. Do you think that banks like the Schulze-Delitzsch banks would help?—*A.* I think they would be successful. They are rather difficult to organise, but when organised they will, I believe, be successful.

Q. Do you think a bank of that type would help these mochis?—*A.* Yes.

Q. In connection with the question of finding money to finance industries strictly speaking, as opposed to commercial loans, the system of bonds to finance mortgages on lands in Berar looks as if it might, if developed, assist in the financing of an industrial bank. Could you give us a short account of how this system works?—*A.* First of all, the individual member of a society in Berar, as you know, has absolutely transferable rights in his land. We make sure that he is in a position to grant a first mortgage, and then he mortgages his land to the society with power to remortgage to the central bank. If an individual member defaults his society deals with him. If the society defaults the central bank may pursue the society and may enforce the unlimited liability of any one or more, or, indeed, of all the members, by sale of land or other property. Then the central bank remortgages to the provincial bank, which is the bank of issue for the bonds. A mortgage bond is redeemable at six months' notice on either side. Bonds of Rs. 100 each are issued and sold to the public and they carry 6 per cent interest. We can get deposit money at 5 per cent., and can therefore afford to lock up this 5 per cent. money in a 5 or 4½ per cent. first class and easily realizable security, because on the mortgage business we have a definite two per cent. margin of annual profit. In this way we provide immediate cover against possible notice by holders for the redemption of their bonds. From annual payments a sinking fund is formed for redemption of bonds on maturity, and as this accumulates it liberates the initial covering investment made for each series of bonds.

Q. The amount of money held up is very large?—*A.* It would be but for the conversion of the lock-up by the bonds. I have a waiting list of private persons who will buy bonds to the extent of Rs. 2 lakhs.

Q. You have been working at this scheme for the last three years?—*A.* Yes. I think that if you want money for industries there is every prospect of your being able to float mortgage bonds provided that the margin of security is big enough and the bank of issue possesses public confidence.

Q. Supposing an industry started and received a certain amount of money from an industrial bank, then do you think that in turn the industrial bank could float mortgage bonds on the security of that industry?—*A.* I think so, if the bank carried enough weight with the public.

Q. Supposing the industry itself provided half its capital, the remaining half might be floated in the form of mortgage bonds?—*A.* I think that could be done; and that is exactly where a bank like the provincial bank could help as a bank of issue.

Q. Is it not the case that you have obtained very large sums for the co-operative societies without any Government guarantee?—*A.* It is the case. We have no Government guarantee at all.

Q. You had no Government guarantee for your provincial bank although in a much wealthier adjoining province it was considered necessary?—*A.* That is so.

Q. What do you consider the attractiveness of co-operative deposits due to?—*A.* First of all, there is the substantial rate of interest. We can pay rates as high as 7 per cent. for five years. Then the directors of our central banks are the leading men of the localities they work in, and they carry the confidence of the local public. They are men who have done an enormous amount of unpaid work. Then we have the Government audit, and the Registrar's supervision. Some Deputy Commissioners also take an interest in co-operative work. There is undoubtedly an idea abroad that Government, even though it has not given any guarantee, is deeply interested in the welfare of the co-operative movement. These facts induce a feeling of security.

Q. There are two points of view. People may think that if anything goes wrong Government will pay, and, on the other hand, there may be the belief that Government will not allow things to go wrong because the Government organisation is efficient. Which is the one that weighs more?—*A.* I cannot say. Personally I should say that the idea of the majority is that Government will not let things go wrong. I have heard many people say that Government could not afford to incur the odium of letting things go wrong.

Q. Let us take an instance. You have been Registrar for some time and people have come to have confidence in your powers of management. Supposing another Registrar came, do you think that he would get deposits so readily as you can?—*A.* That is an extremely difficult question to answer in public.

President.—Q. You are willing to say that the personal element is a great factor?—*A.* I think it has great weight. Mr. Low understands the position. I can scarcely describe it. We have the backing of the Allahabad Bank although we owe no money to that bank; and all our doings are closely watched not only by that bank but by our depositors as well as our shareholders.

Q. That means to say that by the selection of the proper officer people have come to place confidence in the banks?—*A.* They have been told there is no Government guarantee. Our connection with the Allahabad Bank is now of old standing. It began in 1907 when I obtained the support of the late Mr. Deans for our first central bank. We obtained a cash credit of Rs. 5,000 and we got it increased, in time, to Rs. 15,000; and as confidence increased we got more. When I raised the question of floating the provincial bank, I had already had experience of the Allahabad Bank and I went to the directors with credentials. I met the Board and discussed the whole scheme with them. Later on, I persuaded the directors to depute Mr. Renwick for three months to tour with me and investigate our Central Provinces system.

Mr. C. E. Low.—Q. Whatever the investing public may think much must depend on Government action? Investors are attracted by the efficiency which they think is ensured by the Government control?—*A.* I think so. Among our biggest depositors are the directors of the central banks themselves. We publish quarterly statements, showing our financial position, in the Central Provinces Government Gazette. That is done under the orders of the Government of India. I think it serves to strengthen the idea that Government does accept responsibility, implied if not express, for the control of co-operative banks.

Q. Among your directors are some of the biggest men in the province?—*A.* There are.

Q. You speak of the Raiffeisen and the Schulze-Delitzsch banks. Would you distinguish between them briefly for the benefit of the members of the Commission?—*A.* In the Schulze-Delitzsch organization, as it now exists, limited liability is becoming more and more the general rule with share capital and two sureties for every loan; in the Raiffeisen system the whole basis of credit rests ultimately on unlimited liability and therefore, the primary society is confined to neighbours who know each other. In the Schulze-Delitzsch society neighbourhood is not so essential as in the Raiffeisen society.

Q. The difference then is that in the Raiffeisen system each man knows every other man and pledges his unlimited liability for him, and in the Schulze-Delitzsch the liability of each member is limited and any one may stand security for any of the members against the society?—*A.* Yes, that is one of the main differences. The Schulze-Delitzsch organization is for short term industrial (mobile class producer business). The Raiffeisen system is for agricultural (long-term) credit.

Q. You have a general knowledge of co-operation in India. Do you think that there are any societies of the Schulze-Delitzsch type working anywhere in India?—*A.* I should say some of the Bombay societies are very close to the Schulze-Delitzsch type. There is this difference, that the societies in Bombay which I have in mind are mostly caste societies, and there is caste behind the co-operation.

Q. Then about the cottage industries, you are not very sanguine about helping the weavers by co-operative agencies?—*A.* From the purely administrative point of view I am in favour of all efforts calculated to temper the wind to the weavers in their misfortunes. I do not look upon the matter as a business proposition, but as a problem which Government ought to tackle. I am in favour of using public money for the purpose of helping cottage industries, because I think such a policy will help the development of the country; but as a banker I cannot use depositors' money except in banking business; and the support of decaying cottage industries is not, I need scarcely say, banking business at all.

President.—Q. I should like to know your judgment on a special case of co-operation which we have had before us. It has been cited as an instance of successful co-operation in connection with carpentry. The society consists of 53 members and the shares are Rs. 50 each and the capital is Rs. 2,650. They have overdrawn their account from the district bank by Rs. 28,000 against which they have buildings and plant. I do not know what these are worth. The stock amounts to 12 months' working of the society and it has apparently not been saleable. This has been quoted as a successful instance of "co-operation among carpenters". What would be your judgment?—*A.* I should say that the society is, most probably, fast drifting towards a position in which it will be unable to get any more credit.

Q. You don't think it is a fair instance of "successful co-operation"?—*A.* It is very difficult to say unless you can see for yourself on the spot. A society may look bad on paper but on actual inspection its position may be found to be satisfactory.

Q. But what about the stock on hand?—*A.* It certainly looks as though the members are not able to sell it. I do not know what sort of stock it is.

Q. It is mainly furniture?—*A.* It certainly appears to be very unsatisfactory that they have been unable to sell their stock and that they have accumulated so much.

Mr. A. Chatterton.—Q. With reference to the term "a free market," what do you exactly mean by it?—*A.* I mean a market in which goods can be sold easily and speedily and at a satisfactory profit. I am not referring to such things as tariffs and protection.

Q. With reference to industrial co-operation, is not the difficulty due to the fact that co-operation cannot supply what is needed, namely, technical improvement in the methods of working and managing the industry and so on?—*A.* I do not think that is the only difficulty. I may instance the case of a society of bell metal workers. These people had most detailed attention from the Industries Department when Mr. Low was Director of Industries. He paid that society more than one visit. Mr. Cove who is an expert paid much attention to the society, and he made various suggestions for improving methods; but the members would not listen. Narrowness of outlook and want of education, and an attitude of stupid suspicion are very real difficulties; and even if these were abolished economies in production are of no avail unless products can be sold at a reasonable profit.

Q. Our problem is to find out means for getting these workers a decent livelihood. The mere association of workers in co-operative societies has proved ineffective. The other alternative is the creation of small hand factories. Should we proceed to train a certain number of the more intelligent workmen or bring in the educated classes and train them up so as to make them master mechanics and master weavers and so on to supervise and generally to direct the operations of small groups of workmen?—*A.* What you really want is a man in charge who understands the particular trade, an expert who could be put in charge and who would be "father and mother" to that trade, with the assistance of the State and of State funds. I should not import outsiders into the trade. The men in the trade are the men you want to raise and train.

Q. You allude to the creation of a class of master craftsmen who will become managers and owners of small factories or associated groups of artisans?—*A.* I do not think that co-operation alone will produce such a class. If co-operation is the only possible remedy, then I think that the cottage industries will disappear. If the persons now engaged in cottage industries are to be numbered—they or their descendants—amongst the industrial classes of the future, then I consider that the State must take action either in conjunction with or independently of the co-operative banks. Too much is being expected from the co-operative banks alone, and also, I venture to say, from the insufficient staff of experts employed by Government and from the ignorant class of people from whom the members of co-operative societies are recruited. It is futile to pitchfork a man into co-operative work and at once parade him as an expert. It is almost as unreasonable as it would be

to appoint a Deputy Commissioner to be public analyst. Government cannot understand that the business of co-operation is a constantly progressive and highly scientific business demanding detailed knowledge both of men and of things, and endless study. Until that is understood the economic wants of this agricultural country will never be provided for, and the development of industries will not follow, as it should, fast on the heels of the improvement of agriculture.

President.—Q. You have seen a reference to the fact that certain witnesses have proposed to us the formation of an industrial bank assisted or guaranteed by Government. We have also had other proposals put before us which are rather difficult to carry out. Could you (as an expert financier) help us with your ideas about an industrial bank?—*A.* I have not yet had occasion to face the problem of an industrial bank, pure and simple.

Q. Have you any idea as to how such banks in Japan are financed by Government?—*A.* They are financed largely by money from the Post Office Savings Banks at a small rate of interest. I think it is at present three per cent.

Q. Could you give us any correct idea as to whether such a system is feasible and also how it is done in other countries such as Japan. We have had many statements from several witnesses but they cannot be called accurate?—*A.* I will send Mr. Low a copy of my new book, and there you will find a chapter on Japanese methods.

Q. Have you got any supplementary remarks?—*A.* No.

WITNESS NO. 157.

Mr. G. Evans, B.A., Deputy Director of Agriculture, Northern Circle, Jubbulpore, Central Provinces.

Written Evidence.

General.

Owing to the short notice given and to pressure of work I regret that I have been unable to devote as much time as I should have liked to a consideration of the problems involved.

Briefly, however, I am of opinion that in these provinces the industry of paramount importance is that of agriculture. It would probably be best to concentrate on improving agriculture and its subsidiary industries. The superior grades of the Agricultural Department will have to be greatly strengthened, if appreciable progress is to be effected within reasonable time.

Co-operative Societies.

Q. 11.—Agriculture is in a very backward state throughout these provinces, and this may be put down broadly to two causes, viz.—

- (1) lack of knowledge,
- (2) lack of capital.

Better methods are being worked out and demonstrated by the Agricultural Department, but progress in many directions is checked by the lack of capital. Money is advanced at reasonable rates of interest to agriculturists by co-operative banks through their credit societies, and as a result the tenant can now, to a certain extent, purchase better bullocks, implements, seed, etc. The Agricultural Department in my circle has always worked in close connection with the Co-operative Department, and demonstration work is primarily conducted in those parts in which the co-operative movement has made most headway.

Great progress has been made in the improvement of the seed supply by this means in the Sehora taluk and the Betul district, both tracts where the co-operative movement is firmly established. There are several thousand acres of selected wheat now sown by members of co-operative societies in Sehora. In Betul during the last few months 1,300 maunds of selected wheat seed have been supplied by the Agricultural Department through the Betul central bank to co-operative societies. The difficulty in this connection is in the production of sufficient seed, for which the demand far exceeds the supply. More Government seed farms are urgently required.

The question of the supply of improved machines and implements has also received attention. Certain types of cheap ploughs are stocked at selected central banks, and these depôts have sold 1,325 implements valued at Rs. 7,940 in the last two years. This is quite apart from the implements sold from the farm depôts.

A member of a society who wants a machine applies for a loan through his society from the central bank and can obtain it at once. He can also get spare parts to replace breakages, as these are also stocked at the central banks. The question of the purchase of more expensive machines, such as winnowers, by a society for the joint use of the members is being tried and offers a promising field for progress.

A credit bank cannot expect to do more than the above, and it is indeed a moot point whether the agency for the sale of implements, etc., is not outside its legitimate functions. In order to introduce better methods of cultivation, demonstration in the field will be necessary, and it seems to me that an agricultural co-operative organisation working in close connection with, and supplementary to, the agricultural department will be necessary. Such an organisation must have funds and staff of its own, and might work on separate but parallel lines to the credit banks. The District Agricultural Association made attempts in this direction, but are stagnating as they have no funds or staff and the members have no pecuniary responsibilities.

Q. 19.—Great difficulty is experienced in obtaining reliable supplies of certain machines. Special types of implements and machines have had to be designed to suit local conditions. Ploughs of the right design are now made for us by firms abroad, but other machines, such as winnowers, iron gur pans, iron mholes, etc., etc., have to be made locally, and this presents great difficulty. There is a good opening for a company which will turn out reliable machines of this sort. Demonstration factories.

At present, however, they are made by several small private firms, and the greatest difficulty is experienced in obtaining a regular supply of machines up to sample. My own opinion is that such a workshop will have to be started in the first place by Government or with the help of a Government guarantee, and under the supervision of an agricultural engineer. In a few years' time it should be possible to hand it over as a going concern to a company. Speaking for my own circle, which is purely agricultural, there appears to be no agency available to start a workshop of this kind except Government.

Q. 31.—Agricultural shows are held annually— Exhibitions.

- (1) at the divisional experimental farms at Jubbulpore and Hoshangabad;
- (2) in each district.

These shows, as a rule, create much interest and, in my opinion, help on our work a great deal. The Agricultural and Co-operative Departments hold meetings at the same time, and in one or two of the more advanced districts prizes are also given to encourage any local industries that may exist.

Q. 63.—An agricultural engineer is badly needed for these provinces. He should be in supervising or advisory charge of any workshops that turn out agricultural implements and machines, and should also have a staff of trained mistries whose services should be available for repairing machines in the villages. The agricultural engineer would also advise as to the establishment of pumping plants for irrigation from wells, rivers, etc. Organisation technical scientific departments.

There is a large amount of experimental work to be done in designing or adapting agricultural machinery and implements to suit local conditions. This branch of work should also be placed in charge of the agricultural engineer.

Q. 89.—A system of Government certificates of quality should be established for cotton and sann hemp in particular. Certificates of quality.

In the case of cotton, the Harda market formerly held some reputation as producing cotton of superior quality. Rough short staple cotton was raised by enterprising dealers to Harda on purpose to obtain the Harda mark and so get the better price. As a result Harda cotton no longer has a good name.

As a consequence of all this, it is impossible to introduce a better staple cotton as we have found that quality as a general rule is accompanied by a slightly lower yield. Unless the cultivator can get a premium on his better staple, therefore, it pays him better to grow the bigger yielding rough varieties.

Sann hemp is an important product in the Satpuras and, as it is not particular as to its requirements and will grow on poor soils and is a good rotation crop, from an agricultural point of view, it is a crop to be encouraged. Jubbulpore sann, however, is not in such good repute as it used to be, and many complaints have been made from both the Calcutta and London dealers of the amount of dirt present and also of the uneven fibre due to carelessness in retting. In the small local markets which I have visited it was noticeable that there was very little higher premium paid to the grower for bright clean sann. The local dealer, when making up his bales for Calcutta, puts a little clean fibre on the outside and inferior stuff in the middle and gets the price of good fibre for the whole.

The cultivator is not therefore encouraged by a good premium to produce cleaner fibre. The question of the mud percentage in sann hemp certainly requires attention.

Q. 110.—For the development of the agricultural industry in the Central Provinces it will be necessary to immediately strengthen the staff of the Agricultural Department. The demand for assistance from the public is now very great indeed, and it is already practically impossible for the present meagre staff to extend operations. We have no staff whatever to fall back on in case of casualties.

Oral Evidence, 21st December 1916.

President.—Q. In answer to question 19, you told us that ploughs and other agricultural implements are being made by several small private firms, and that they cannot meet the demand for uniform quality. You think that Government ought to start a workshop, or that a workshop ought to be started with Government guarantee, if necessary. What about the old question of cutting into private enterprise here. Are we going to be met with that?—*A.* I am rather in favour of such an industry being started with a Government guarantee. You would have to have something of that sort before you could start it.

Q. Even if Government guaranteed, it would be to particular firms, and the little ones would be cut out?—*A.* There are very few little firms making them. We are getting most of our material from abroad. We have had to design all our ploughs and reapers to suit local conditions. I consider ordinary English ploughs to be absolutely useless in this country, and we cannot get them made up to the required quality in India, or at a suitable price, therefore we handed over the designs to firms in England, and they are making them to our patterns. Now that the import is stopped, we cannot get them.

Q. There are several engineering firms in this country; have none of them been tackled on this point?—*A.* I was thinking more of certain improved implements like winnowing machines which are made largely of wood and sheet iron. It is the freight that raises the prices of bulky machines in the Central Provinces. If such implements are imported the price is almost prohibitive on account of the freight.

Q. In the Central Provinces alone there would be a sufficient market to keep one factory in full operation?—*A.* I can give you figures for my circle, which is a poor one. In the last two years I sold 2,865 machines, etc., valued at Rs. 28,630, and that in spite of the fact that I had great difficulty in getting supplies. Last year for winnowing machines alone, we had orders for several hundreds, but could not supply them.

Q. Twenty-eight thousand would not be much of a turnout for any shop?—*A.* The only advertising medium is the Agricultural Department, which is understaffed.

Q. The facts would not be sufficient to warrant starting a firm?—*A.* They would have to make other implements as well.

Mr. C. E. Low.—Q. You say you had an order for several hundred winnowing machines. Winnowing machines run about Rs. 120 each. If you had a free supply of reapers, how many do you think you would have sold?—*A.* One of the things against a rather intricate machine like a reaper is that you have got to teach people how to use them; and secondly, you have to supply spare parts. You would have to arrange for depôts at various places.

Q. Assuming that that could be arranged, how many do you think you could sell?—*A.* I think you would sell down in the Hoshangabad Division probably 100 a year.

Q. They were priced at Rs. 250?—*A.* Yes.

President.—Q. After the first year would the sales continue?—*A.* Two years before the war started I obtained a consignment of 20 and exhibited them at the agricultural show and received orders for 32 in one day. That was mostly from the Nerbudda Division and the Native States round about.

Mr. C. E. Low.—Q. The difficulty in the Jubbulpore Division is that so much gram is mixed with wheat; they won't touch gram?—*A.* Yes. Before you get reaping machines you want better cultivation. The fields are so rough and so small in many cases.

President.—Q. You have not made a proposal of this kind to Government?—*A.* I have sent it up demi-officially to the Director, and have mentioned it in my Annual Report.

Q. You have not gone further and indicated the amount of capital that would be required?—*A.* No. I don't feel that I am specially qualified to do so. This branch of work ought to be taken over by an agricultural engineer.

Q. That leads the way to your suggestion that you ought to have an agricultural engineer supplementing your scientific experts at present; and generally you are of opinion that the agricultural staff might be very largely increased?—*A.* Yes, that is so.

Q. In answer to the last question you say, "We have no reserve staff whatever to fall back on in case of casualties." Would this be strengthened by the further appointment of senior officers from Europe, or by a mere increase of subordinate staff?—*A.* Both senior officers and a subordinate staff.

Q. Can you indicate any scale on which you would like to enlarge?—*A.* We want one Deputy Director at least for each division.

Q. Those are also the views of Mr. Clouston?—*A.* Yes, I believe so, the matter has gone up to Government, but has been held up on account of the war.

Q. When it comes to bringing your staff up to something like what you have reasonable hope to expect in India, your agriculturists would completely out-number your scientific experts like the agricultural chemists?—*A.* Yes.

Q. Do you think their work would be of a kind that would justify their being greatly in excess?—*A.* I think so.

Q. In other words, your Agricultural Department will become a department of agriculture with a few scientific experts attached; I mean by that, limited specialists somewhere of the order of 80 per cent. agriculturists and 20 per cent. specialists?—*A.* Yes.

Q. The reason I am asking this is with reference to the discussion that took place in Nagpur, where it was indicated that scientific specialists have the same opportunities of rising to the top posts as agriculturists, but if they were completely out-numbered by agriculturists, and the department took a tone of pure agriculture, I suppose those scientific specialists would feel themselves rather out in the cold?—*A.* I suppose they would. If you take the case of the agricultural chemist, I think you would have to have an Imperial Agricultural Chemist in a much better position than at present. He would be the man in control, and this would be the post to which the provincial chemist might ultimately hope to rise to.

Q. Could you hope that the agricultural chemist would ever be Inspector-General of Agriculture?—*A.* I think it possible.

Q. Won't it be more likely that the head man will be an agriculturist?—*A.* I think it more likely.

Q. If that be so, don't you think it might be just as well to run your Agricultural Department as a body of agriculturalists, borrowing from an appropriate Imperial Department the specialist that you want, for long periods, and even in the provinces borrowing your chemist from the Chemical Department, etc.?—*A.* I think it might work satisfactorily. As a matter of fact the agricultural botanist and the agricultural chemist are more or less specialists in their own lines.

Q. And consequently, he would not ordinarily be appropriately senior agriculturist in India?—*A.* In my position as Deputy Director, what I feel most is that I have several official superiors to help me in my administrative work, but I have absolutely no one to advise me in my technical work, and I feel it a great deal. It is not the case at home where you have a number of experts near by to help you. At present our Agricultural Adviser is not an agriculturist.

Q. You think that there is room to form in India a distinct Agricultural Department composed of what we know to be agriculturists—men capable of knowing enough of the different sciences to apply them to agriculture?—*A.* I think so. There is a department of that type in America.

Q. We are thinking of what might be the ideal in a country that is new and developing. The ideal, however, is not the most practical form. Now we have reached this size of department in India, you think it time to consider a sub-division of experts?—*A.* I think it will be necessary.

Q. You would have a more compact department; men with common ideas, and the senior man, presumably also the most distinguished man, would form your natural guide in policy. This would not necessarily disturb the long periods that a particular agriculturist would devote to provinces?—*A.* No.

Mr. C. E. Low.—*Q.* Have you any experience of cotton markets in your circle, or what was till recently your circle?—*A.* I have had a certain amount of experience in Harda and Khandwa.

Q. Will you describe the system in those cotton markets—how the market is organised and how the cotton is sold?—*A.* I know the Harda and Khandwa market. Carts of kapas are brought direct into the ginning factory, and the manager usually has to buy several hundred carts a day. He has no time to look at the cotton properly. He looks at the outside and briefly handles the kapas and gives the cartmen his money on the spot. He has no time to really study the class of cotton. I have known many cases, especially in Khandwa where the cart loads have frequently been found to contain stones in the middle of the kapas to bring up the weight. The cartmen got their price without detection. That system puts a premium on anything like quality. You cannot get any premium on quality.

Dr. E. Hopkinson.—*Q.* Is the cotton sold to the ginning factory?—*A.* Yes, in those parts the cultivator brings his carts direct to the ginning factory and gets his money on the spot.

Mr. C. E. Low.—*Q.* You know the system in the cotton market in Berar, by which a very large proportion of the cotton sold goes direct to the market before going to the ginning factory. Is there anything like that in Harda?—*A.* In Harda it is however a fact that the cultivators bring their carts direct to the ginning factory.

Q. In the Khandwa market?—A. It is the same there.

Q. Do you know enough of the Berar cotton market system as to pass an opinion as to whether what is going on in your circle is the same as that going on in Berar?—A. I cannot say.

Q. You consider the present system bad?—A. Yes, distinctly bad.

Q. What would you consider the system which you think profitable?—A. I should not care to make a statement off hand. Cotton is not an important crop in my circle.

Q. How far is local labour adequate for agricultural purposes?—A. It is absolutely inadequate at certain times of the year. For instance, in the wheat tracts for the last two or three years, there have been large losses of wheat because growers have not been able to harvest and winnow their crops before the monsoons. Last year a considerable proportion of the crop in the Jubbulpore district had not been winnowed before the monsoon came. The monsoon was of course rather early last year.

Q. That is a state of affairs which is tending to get very much worse during the time you have been in India?—A. Yes. It has been slightly relieved lately since the war started, owing to the curtailment of labour on public works. As soon as the war is over, it will become as acute as ever more particularly is this the case where we are trying to introduce better methods of cultivation which require more labour. Increased labour for instance is required for irrigated land. There are some tracts in the Jubbulpore Division which are now commanded by irrigation, but at present labour is absolutely inadequate. Government will probably have to initiate some system of colonisation for these irrigated areas or we shall never be able to make progress quickly.

Q. Agriculture usually has first claim on a man so far as his own holding is concerned?—A. Yes.

Q. And anything that industrial concerns get is what is left over?—A. Except just round the big towns like Jubbulpore.

Q. My question arose out of the fact that we were talking to the manager of a cement factory, and he informed us that most of his labour was local, and it appeared to be very largely either cultivators or agricultural labourers. He explained the difficulty he felt in getting labour at this particular season of the year during the harvest?—A. They will have that difficulty always. In October and November it is very difficult to get labour, and also in the hot weather at rabi harvest.

Q. What does the agricultural labourer in this district get?—A. He is earning between three and four annas per day. It all depends. At harvest time you may have to pay as much Re. 1 per day.

Q. Do you know how much that is in excess of what they got before you came to this division 12 or 14 years ago?—A. You used to get them at harvest time for 4 annas.

Q. That included the grain they receive in part payment?—A. Yes, if you work it out as cash.

Q. And you allow for what they steal?—A. That doesn't allow for what they steal.

Q. You had a difficulty in regard to the making of ploughs by Calcutta engineering firms. Were the difficulties due to bad casting and inefficient tempering?—A. Yes.

Q. You can get English-made ploughs tempered on one side?—A. We have the Meston plough of which we are selling several hundreds annually, chiefly for rice work. A Calcutta firm started making these ploughs, and we commenced an agency for them on the farms. Ransomes, Sims and Jeffrie also made this plough, which they were able to land at Jubbulpore and sell at 8 annas dearer than the Calcutta firm. I could not sell any of that firm's ploughs, as the cultivators refused to touch them.

Q. In spite of the fact that you tried, as far as possible, to push the sale of Indian-made goods?—A. Yes.

Q. They are also unable to make the detailed castings of complicated machines?—A. Yes, cogs and things of that sort, or rather they do not make them as I suppose it is not worth their while.

Q. And where they do make them, they require so much finishing off afterwards?—A. They don't last. In the English and American-made machines, the cog wheels last for years. We had to get the cog wheels from Cawnpore two years ago, and the cogs wore out in one season. Some of the old machines originally sent from America are still going strong, and have been working for 15 years. The wood-work has been renewed, but the cogs are still serviceable.

President.—Q. Are there any patent rights in connection with these agricultural implements, which would clash with your proposal to have a factory here?—A. In the monsoon plough there is one particular part which has given a lot of trouble, and the local mistries are copying that part for their ploughs. It is not, I believe, patented in India. I saw it

case mentioned in the Punjab, in connection with the Rajah reaper. The local mistries there are copying one particular part, and the Government resolution said there was no transgression of patent rights.

Q. Is the Rajah plough a patented plough?—*A.* I don't know whether it is patented in India.

Q. They would take steps to take out a patent if you manufactured these ploughs on a large scale in India?—*A.* There has been no trouble about that up to the present.

Q. A local mistry would not be worth prosecuting, but I meant if you started a factory?—*A.* Burn & Co.'s Meston plough is almost exactly the same as Ransome's M. S. N. plough, both made by different firms.

Mr. C. E. Low.—*Q.* Will you describe what process you go through when you want a new design like that of the monsoon plough; how do you succeed in getting a design?—*A.* When I took over charge at Hoshangabad I found a large collection of ploughs gathered from all parts of the world by various people in the past, from firms in Canada, America, and England. As used to be the case, India was the dumping ground for agricultural machinery. They were bought very often by rich zamindars, and were all absolutely useless, not being designed to meet local conditions. I had tried all these ploughs in detail, and got in my mind's eye what I wanted, but not being a mechanic, I could not make them myself; so I wrote to Messrs. Ransome, Sims and Jeffries' plough designer, who was then touring the world. He had never been to India, and I asked him to come *via* Bombay. He stayed with me for ten days, and we tried some of the ploughs. He went away with the blue print of this plough in his pocket.

Q. Is that patented?—*A.* I suppose so. It is not made in India.

Q. In a case of this kind, would it be worth considering the possibility of encouraging a firm to set up its works on a Government guarantee?—*A.* I think it certainly would. They would take up agency work as well.

Q. The question of agency interferes with any firm now in India?—*A.* The reason why I suggested a Government workshop is because a lot of advertising is necessary. You have also to employ mistries to go round and repair machines. There are no blacksmiths as a rule and the ordinary ryot has not seen a spanner or any implement of any sort. It is rather an uphill task at present, and it is more or less Government's work to put the business on a sound footing and give it a fair start.

Q. The guarantee is only a guarantee that Government will undertake to purchase themselves, or sell through the Agricultural Department a certain number of ploughs, or certain other implements. Do you think that is practicable?—*A.* I should think that is quite practicable for the whole of the Central Provinces.

Q. That being so, what control would you have over prices which they may dictate?—*A.* I don't think they would be in a position to dictate terms. If prices were too high, the people would not buy the machines.

Q. But prices might be too high and yet the people may buy. You are thinking now of prices that are so high that people could not afford to buy them. That does not mean that they would be charging twice as much as they need charge?—*A.* They would have to keep their prices down for the first few years before people would buy.

Q. You, at any rate, know the present prices of these things?—*A.* Since the war started prices have gone up to anything like 50 or 75 per cent. and the demand has gone down a good deal in consequence.

Q. That would be under control by importation, because having established their works with comparatively cheap labour, it is probable they might be in a position to make more profit than they would be justified in making?—*A.* I would let them make what profit they can. It is a new industry, and I don't think there is any need for control to start with.

President.—*Q.* It is all very fine if a ryot cannot afford to pay Rs. 10, but he can afford to pay Rs. 9, and the article might be sold at Rs. 5; the ryot is still being done by Rs. 4?—*A.* I don't mean a permanent guarantee, but a guarantee to start the show.

Q. No firm has ever made a proposition of that kind to you?—*A.* There has been some talk, not a complete proposal. They suggested putting up the capital, and would do it if they got a guarantee from Government, or perhaps a loan.

Q. The other plan would be less likely to be challenged; the only question is the question of the price as the number of articles made may be very varied.

Mr. C. E. Low.—*Q.* In view of the shortage of labour you allude to, do you think that there is a big future for agricultural implements. I recognise that there are many operations for which we have no labour-saving appliances. Do you think the future would be a big one?—*A.* I think so, but you want better communications; you cannot get your machines about at present.

Q. Communications are especially bad in the Jubbulpore district?—A. Very bad.

Q. You have practically no roads?—A. Nor carts.

Q. Your proportion of carts to ploughs is lower here than anywhere else?—A. Yes.

Q. How would you work this system of Government certificates of quality for raw textiles, referred to in your answer to question 89?—A. I suppose we would have to have Government Inspectors, and big central markets.

Q. You have got to get your markets first?—A. That is so; at Khandwa and Harda for instance you would have to have markets.

Q. Generally speaking, do you think the marketing system here is satisfactory for agricultural produce in general?—A. Not absolutely satisfactory.

Q. I leave out of consideration the fact that many cultivators have to sell to particular purchasers, owing to the financial relations between them, but apart from that, and where a man is at liberty to sell, you consider he doesn't get the price he should in most cases?—A. That is the case in the Jubbulpore Division, almost everywhere. But in the Hoshangabad district they are very much more advanced in certain products, particularly wheat and oilseeds. The quality is well maintained and they get their price there, as the competition is keen.

Q. Is there a market, in the strict sense of the word?—A. There are Government markets as in Berar. A man with a good quality wheat will however usually get a premium on his quality in the Hoshangabad District.

Q. But there is no supervision for the control of those markets by anybody, and no means of detecting and punishing malpractices?—A. None at all, simply the check of competition. As regards cotton in Harda, there is an amalgamation of the ginning factories. Last year the Japanese bought the whole crop. They had a private arrangement with the local gins.

Q. Will you describe, for the information of the members of the Commission, the manner in which the ryot sells his crop in the Jubbulpore district?—A. The main crop that is sold is wheat, the money-making crop. The cultivator sells to a Lalla who comes round from village to village with hack ponies. He generally exchanges his crop for other articles, such as sugar, spices, cloths. He seldom gives cash. The Lalla sells to other middlemen, and the latter sell to the exporters. The result is there are no carts in the villages and the cultivator does not take his produce into the market and consequently does not get the proper price for his produce.

Q. Do you think the market question of sufficient importance to guarantee its being taken up systematically and an attempt made to introduce a more organised system?—A. There has been much talk about improving staple in the Punjab. The only way they introduced American cotton was by holding Government auctions. It will be absolutely impossible for us to improve the staple of cotton until the superior qualities get a better premium, because the coarser qualities always yield better.

Q. Would the existing premium in the market at Bombay be effective for your purpose?—A. I don't think it would, as the middleman makes the profit.

Q. You mean the greater values are not sufficiently divided between long and short staple cotton?—A. Not when it has reached the cultivator. I worked it out on Buri cotton and tried to sell on the basis of my results to the Tapti Mills; they promised me one thing but did not pay the real difference in price to the cultivator who consequently went back to the bigger yielding short staple.

Q. Suppose you get the Bombay price as really effective as in the case of the Empress Mills, would it be enough to pay people to grow the long staple cotton?—A. I think we can breed a much better staple than we have at present. We want a proper organisation to make it possible to establish it however. The Buri cotton in the Burhanpur tahsil yields one maund per acre of kapas, less than desi cotton. If we got the Bombay price, it would pay cultivators to grow it.

Q. The baling of sann hemp; was that practised before you came to this circle?—A. Yes.

Q. Have you seen the way in which the sann hemp trade has sprung up in any fresh places?—A. I know the Chappara market and that at Keolaree.

Q. How is it organised there?—A. Growers bring their cartloads of fibre in and receive cash per cart. The middleman manipulates the fibre.

Q. The better the fibre the more it lays itself open to dishonest adulteration; won't they pay a better price?—A. The extra weight of the mud makes a lot of difference. I believe the Hemp Dealers' Association in London have had to take action about this. The Board of Trade have insisted on the cleaning of the fibre from the mud. The dust shaken out during the dressing processes rendered the air in the factories detrimental to the health of the operatives.

Q. Are any of the larger and more enlightened firms who deal in sann hemp represented up-country, close to the buying points?—*A.* I think so, and they have their Indian agents.

Q. But are those agents of a type that is sufficiently enlightened to give a price for quality?—*A.* I don't think so. From what I have seen, such agencies want to be put on a better basis. Sann is a very valuable crop.

Q. You think it good but that it requires expanding, and that there are facilities, provided you got price for quality?—*A.* The retting arrangements are absolutely inadequate, but we are trying to work out processes of retting in vats.

President.—Q. Is sann hemp grown mainly for green manure?—*A.* No, all for fibre. The price of seed is so great, greater than that of wheat, that it is doubtful if it could pay to grow it for green manure.

Hon'ble Sir R. N. Mookerjee.—Q. With reference to your answer to question 63, don't you get small help from the Public Works Department?—*A.* No; they have got so much work of their own that they have no time.

Q. They have got workshops and could do little repairs?—*A.* The repairs required are all out in the villages, such as for oil engines for pumping and things of that sort, and it means that at present you must have men going out to mend these things, into the villages.

Dr. E. Hopkinson.—Q. A great deal of flax is grown in this part of the province?—*A.* As an oil seed.

Q. Has experiment been made in growing for fibre?—*A.* We have carried out a number of experiments. We have been trying to combine the two, and have made a very large series of experiments with both Dutch and Russian seed, but it does not pay. We carried out these experiments in collaboration with the Fibre Expert from Bengal.

Q. And you came definitely to the conclusion that flax could not be grown for fibre purposes?—*A.* Not under our local conditions. It might give a fair crop for one year but is uncertain and you would have to import seed at regular intervals as it deteriorates.

Q. I think the same difficulty has not been met in Bihar or Assam?—*A.* In Bihar they had an expert from Belgium for five years. You have got the planters there who would take the matter up at once if there was money in it. Our climatic conditions here are not suitable for the production of this fibre. The cold weather is very dry, and the hot weather comes very early. We have retted a lot of this Russian fibre and the percentage of tow was very high indeed. The fibre was inclined to be brittle.

Q. Have the results been published?—*A.* Yes, in the Agricultural Reports about five or six years ago.

Q. In reference to the question about long staple cotton, can you say that you have made a specific investigation in the case of cotton of particular quality, where you have taken not the Bombay price but the Liverpool price?—*A.* All these cottons are grown in consultation with the Imperial Cotton Specialist and he has sent several of these samples home to Liverpool. The Liverpool prices are even better than Bombay.

Q. In those cases which you have investigated, taking Liverpool prices and making allowances, is that not a more profitable market?—*A.* If we get the market all right, but the cultivator does not get the extra price at present.

Q. The whole difficulty is a question of marketing?—*A.* If we could get the marketing we might make progress.

Q. Do you not think that Government might give assistance to marketing?—*A.* Yes, I should like to see it.

Q. Assuming that Government can not give assistance, are there not organisations within the Empire which can and will do so?—*A.* The British Cotton Growers' Association has done something.

Q. It exists for that sole purpose?—*A.* It gave us some money to grow cotton and carry out experiments.

Q. There you have an organisation for the sole purpose of increasing the growth of cotton within the Empire?—*A.* However good the prices are in Liverpool unless the cultivator gets his share he won't grow the better staple cotton.

Q. My point is, have proper steps been taken to ensure the marketing of a better quality of cotton to the best advantage?—*A.* We have had private arrangements with the Empress Mills; they purchased a certain amount of our long staple cotton.

Q. Do the Empress Mills buy at competitive prices?—*A.* No, nothing has come of it.

Q. What have you in view?—*A.* The difficulty is to get a sufficiently large area under cotton, and not a large area for a new quality of cotton.

President.—Q. Supposing you improve your transport facilities; would not that be a first step?—*A.* No, you want to get a local market organised for purchasing the new variety.

Mr. C. E. Low.—Q. Is not what is wanted this, *vis.*, simultaneously establishing a decent marketing system with punishment for marketing offences; and in the second place, until these improved varieties cover an area which would give a free natural market, get official assistance from the department, or from some trade organisation to purchase at fair prices?—*A.* Yes.

Dr. E. Hopkinson.—Q. I put it another way; are not influences actually at work which tend to prevent cotton grown in India coming into the world's market?—*A.* I cannot say. Another point is that we have not really tackled the question of long staple cotton properly. We have simply been trying outside varieties, American cottons and cottons from Cambodia and Egypt, etc. What we have to do is to breed cotton ourselves in India, under local conditions. Our climate is different from up-country, for instance.

Q. You started by saying that if Liverpool prices could be obtained, the long staple cotton which you can grow would be a better proposition?—*A.* What I meant to say was that if you want to start the thing we have got to get nearer the yield of the local cotton, and not rely too much upon the difference in prices. I don't think we have gone into that matter sufficiently. If we had got a better price for Buri cotton, we might possibly have established it. We want to breed much better yielding cotton than Buri however. Even if we did breed better staple cotton, it would be difficult to establish it on the market. You would probably never get the same yield as for local short staple cottons.

President.—Q. Supposing you can grow the cotton which you prove can be grown on a small scale; supposing that the market facilities were clear, *i. e.*, there was no special difficulty in marketing your long staple cotton; would it pay the ryot then to grow that variety; would you get in a free open market a sufficiently different price to make it worth his while to grow? Is the difference in quality sufficient to warrant it?—*A.* I think it could be done. I don't think we have got the variety yet. We want to do more research work in that line.

Dr. E. Hopkinson.—Q. Are you proposing further research work?—*A.* Yes.

Q. Do you not think it would be better to sell under some better system of marketing?—*A.* That would have to go concurrently. Even if we did get a good variety it would be difficult to establish it.

Q. Leaving aside the world's market altogether, we were told by the highest authority in Cawnpur that they would welcome any amount of cotton with long staple. Are we to deduce from what you say that it is all very well for them to say they would welcome it, but they won't pay a proper price?—*A.* That is one thing, but I think the reason is that although they might have got a fair price for Buri, it has not proved really suitable. In some seasons it will give you a good crop, but taking it season by season, it cannot compare with the local variety in anything like outturn and hardiness; therefore we have not got to the stage when we have a variety that we can recommend in respect to yielding characteristics. We have not got far enough in our research work.

President.—Q. In a case of this kind would it not be feasible for the Government to undertake to buy a new variety, whether cotton or anything else, which would yield more to the ryot under fair conditions? At the recognised market rate *minus* cost of transport?—*A.* I think it would, once you have gone carefully into the matter and threshed it out.

Mr. C. E. Low.—Q. Has that not been done in several other provinces by Government?—*A.* In Madras and Bombay it has been done, and that was the foundation of American cotton in the Chenab Colony.

Dr. E. Hopkinson.—Q. You know that they are actually importing American cotton into the market?—*A.* Yes, they have been importing it for a long time.

Q. You have good hope of putting a stop to that in the course of time?—*A.* We hope to. As a matter of fact, the cultivators are getting such a good profit for any sort of cotton that they don't mind what they grow. That is really at the bottom of the whole thing. If the cultivators really clubbed together, they would get a good price, but as a matter of fact, the price of cotton has been very good for years, and it pays better than other crops.

Q. You mentioned a short time ago that you were in communication with Mr. Leake at Cawnpur. I want to ask how does that communication come about—in the natural course of your duties?—*A.* I know Mr. Leake personally, and have seen his cotton, and not being contented with the local cotton I asked him to send some of his selections down to me for trial.

Q. Have you enquired what is going on in Sind and the Punjab?—*A.* I sent a lot of my own wheats to Sind and the Punjab and I have sent several hundred maunds of selected wheat to Bundelkhund. We are always interchanging views.

Q. Do you find that other agricultural experts are ready to interchange views and get to know what you are doing?—*A.* Yes, they are always corresponding with me.

Q. Do you think the system of inter-communication is now quite satisfactory?—*A.* I think so. I have had no difficulty at all. Much of my correspondence is D. O. I think that has very largely come about by holding the Boards of Agriculture, where we have a chance of meeting each other. I attended the last meeting two years ago. That is one of the main functions of a Board of Agriculture.

Q. I think at the last meeting the first thing that was done was to abolish the Programme Committee?—*A.* I don't think the programmes were of very much use. You cannot criticise without seeing a man's work on the spot.

Q. Is there any means of preventing overlapping?—*A.* That can be done by the Agricultural Adviser.

Q. Have you published anything yourself?—*A.* I have written several articles for the Pusa Journal.

Q. Are those articles subject to any sort of editing?—*A.* The Journal edited by the Agricultural Adviser, the Bulletins and Memoirs are edited by the Committee. My articles have appeared without alteration.

President.—Q. Aren't there many cases of results obtained that you have not worked up to the stage that you considered to be suitable for special purposes, and yet are valuable and suggestive to other workers?—*A.* Yes, there are.

Q. In that case the Imperial Agriculturist should keep the different provinces in touch, because he would not be in a position to write long letters to somebody in Madras or Bombay giving him tips?—*A.* All our work is really published from the different agricultural stations. If the man wanted anything he would write to me direct.

Dr. E. Hopkinson.—Q. I understand that you have definite scientific results which you are prepared to publish, but which you will not publish under present conditions?—*A.* The Central Provinces Department of Agriculture can publish them. We publish our own bulletins, which are circulated all round India.

President.—Q. That is not my point. You reach a stage which gives suggestive results, but are overloaded with other work and cannot follow up these results. You have got a line which ought not to be dropped, and which you intend to take up when you have time. If the Inspector-General were actively in communication with you, he would know of these things, and would get somebody else to take them up.

Dr. E. Hopkinson.—Q. I understand that you have published things in the Central Provinces bulletins, which, in your opinion, would be more suitably published in the Pusa bulletin?—*A.* Not necessarily. I have had no trouble with Pusa about publishing my results. Most of the things I have been working on are of primary importance to the Central Provinces.

Q. And you think that the Central Provinces bulletin get sufficient circulation?—*A.* They go all over India and the Colonies. We send them to all the scientific journals at home.

Q. With regard to the establishment of workshops, I understand from your evidence that agricultural implements which have been bought in large quantities have been bought through the co-operative credit societies?—*A.* Only a certain proportion of them; less than half of them in the last two years; the rest from depôts.

Q. Who runs the depôts?—*A.* The Agricultural Department. They provide the capital. Government gives me a permanent advance to keep a stock.

Q. Do you sell outright, or on the hire purchase system?—*A.* Outright, never otherwise, and we therefore sell to those who can afford to pay up the whole money. If poor people want to purchase, they have got to get a takavi grant or a loan from the co-operative bank.

Q. You sell at a profit?—*A.* We take 5 per cent. profit, our idea being that when we hand this arrangement over to private firms—which we hope to do sometime or other—the prices won't increase very much.

Q. You being comparatively large buyers can buy on more favourable terms; you get tradesmen's terms?—*A.* No, we don't; we cannot buy very large quantities. My permanent advance for Hoshangabad Farm is only Rs. 4,000 for instance.

Q. In the case of the monsoon ploughs, would it not be wise for the Government of India to buy the ploughs and get the tradesmen's discount?—*A.* Yes, it would.

Q. Has the proposal ever been put forward?—*A.* No, it has not.

Q. Do you personally supervise the buying?—*A.* Yes. They are all ordered by me.

Q. Whom do you buy from?—*A.* Different agents in India, sometimes direct from abroad, if there is no agency in India. Certain implements which are now established I have simply handed over to an agency of private firms; for instance, Volkart Bros. have taken over the agency for Nerbudda reapers.

Q. Do you fix the price, or are they allowed to raise the price on the ryots?—*A.* They can do what they like in regard to price.

Q. You suggest that sales might be made by agricultural co-operative societies, or some other organisation?—*A.* That is a point that is under consideration. At present the central banks are appointed as agents, and it is a question whether these banks should act as agents.

Q. You have a different idea independent of credit banks; you say, "it seems to me that an agricultural co-operative organisation working in close connection with and supplementary to the Agricultural Department will be necessary"?—*A.* The point is that at present we are trying to get the credit banks to do all this work, and it is really not their business. You would have to have some sort of separate organisation to deal with this branch of business. That is the general expert opinion.

Q. Such an organisation will require the backing of Government?—*A.* Yes, we will have to raise the capital somehow or other, and get an additional Government loan. Something of that sort will have to be done. The Agricultural Department cannot do business on the large scale that is developing.

Q. Arising out of that you suggest the appointment of an agricultural engineer?—*A.* That is not necessary. We want an agricultural engineer for all sorts of purposes. The workshop for making agricultural implements was quite a separate thing.

Q. The repairing and making of agricultural implements, could that not be done by co-operative organisation with skilled assistance from Government?—*A.* Government would require somebody to supervise. They will have to employ mistries to repair machinery, etc., for the first few years.

Q. It is possible that that could be done by local effort, with the assistance of Government so far as skilled supervision goes, and possibly to some extent as regards capital?—*A.* Yes.

Q. But no continuous financial help?—*A.* No, I don't think so. In time it ought to stand on its own legs.

President.—Q. Do you know the constitution of the Irish Agricultural Societies? Do you know that they do work of this kind?—*A.* Yes, but they are not credit associations.

Dr. E. Hopkinson.—Q. If you studied their constitution do you not think you might get some valuable ideas as to how this scheme might be developed?—*A.* Yes, this idea is Mr. Crosthwaite's. We are working together and we have been trying to run unions, attached to the credit banks but find there is no staff to do it.

Q. You told us that when the sale of certain implements is established you hand it over to an agent. Presumably that is for the purpose of freeing you for what you describe as more important work?—*A.* We have not got the staff who could do it.

Q. Who decides at what point you hand over to an agent?—*A.* I think it was considered by the Board of Agriculture several years ago. The policy of handing sales over to an agent was in order not to interfere with private sales.

Q. Then each province is at liberty to decide for itself as to when that stage is reached?—*A.* Yes.

Q. Are there no variations in judgment as to when that stage is reached?—*A.* There are.

Q. Do not cases arise where a Deputy Commissioner considers the rule inapplicable? What then?—*A.* He goes to the Local Government. The Board of Agriculture only recommends.

Q. Coming back to the question of hemp, if the quality of the hemp could be made more uniform would not the fine quality always command a higher price; in other words, are not the cultivators too apt to adulterate the fine quality and so spoil their chances of gaining the buyer's confidence?—*A.* I don't think so. The presence of a lot of mud is not always intentional. They have got to rett the sann in muddy water, and a lot collects in that way.

Q. If they could be taught to put on the market a cleaner sann hemp, the buyers would respond?—*A.* Yes, I think so.

Mr. Chatterton.—*Q.* You say that "An agricultural engineer is badly needed" for these provinces." You have the Director of Industries and Agriculture combined; would you attach the agricultural engineer to the industrial or the agricultural branch?—*A.* I should be inclined to put him in the agricultural branch. I don't think it matters much in this province, because we would be in close touch with him.

Mr. F. Reid

Q. Is there any scope here for the extension of the use of pumping plants?—*A.* A good deal from rivers. The difficulty is lack of mechanics, and the remoteness of the villages. If a machine goes out of order, we have to get mistries from Bombay at present. I have several pumping plants established which are doing very well. All I do at present is to satisfy myself that there is a sufficient supply of water in the wet place and then refer the matter to one of the firms in Bombay or Calcutta to send an engineer and erect the plant.

Q. That makes it expensive to the ryot?—*A.* Yes, very prohibitive.

Q. You would want more than one agricultural engineer?—*A.* Yes, eventually, but we would be quite content to start with one.

WITNESS NO. 158.

Mr. James Reid, Manager, Perfect Pottery Company, Limited, Jubbulpore.

Written Evidence.

Q. 5.—Different industries and different persons or bodies would need different treatment. One would like to be supplied with machinery on the hire-purchase system, another a loan at a reasonable rate of interest on the security of his plant and machinery. Government assistance.

Personally I think pushing persons with a knowledge of their trade should be helped by Government.

From my personal knowledge I am aware of a man starting an industry in such a way and within the short period of a couple of years capitalists have come forward, paid the pioneer handsomely, and started the work into a company.

Q. 18.—I am of opinion that any research by a Government expert for a private person should be kept confidential. Technical aid.

Q. 37.—I am of opinion that Government should either call for tenders or forward lists of requirements to factories, leaving factories to take action. Government patronage.

Q. 42.—If the land belongs to Government it should be leased on reasonable terms. If private land, it should be acquired for the starting of an industry on reasonable terms. Land policy.

Q. 43.—Acquisition proceedings should be expedited so as to enable possession being taken as soon as possible instead of allowing proceedings to hang on for years.

Q. 111.—So far as I am aware there are good openings for the starting of pottery works as there appears to be sufficient raw material in abundance, and many of the wares at present imported could easily be manufactured in the country. General.

In conclusion I may be permitted to say that having landed in India about three years ago I have had very little experience of industries in this country. All my experience has been confined to the pottery works of which I have been manager. I cannot, however, refrain from saying that in undertaking an industry, especially like a pottery works, the services of a really competent workman should be secured before commencing operations.

Oral Evidence, 21st December 1916.

President.—*Q.* You have in Jubbulpore a fairly good centre for pottery factory?—*A. Yes.*

Q. And the raw materials are obtained near at hand?—*A. Yes.*

Q. In the matter of transport of pottery do you get any special concession in railway freight?—*A.* In some cases, but not in all. We have a special rate for Bombay, for instance

Q. For all forms of pottery?—*A. Yes.* Our customers in Baroda can purchase goods at Bombay cheaper than they can purchase direct from us. If we send goods direct, the Bombay-Baroda and Central India Railway for their part of the railway charge three times the price, and to-day a customer was complaining to me about the same, that he was compelled to take goods from our agents at Bombay instead of dealing direct with us. *

Q. And pay the agent's profits also?—*A. Yes.*

Q. What about Calcutta?—*A.* We cannot compete in Calcutta at all.

Q. But the distance from here to Bombay is approximately the same as to Calcutta?—*A. Yes.*

See note at the end of the oral evidence of this witness.

Q. And still you do not get a favourable rate for Calcutta?—*A.* We have up to Shalimar over the Bengal-Nagpur Railway.

Q. And not over the East India Railway?—*A.* No.

Q. You have tried both of them?—*A.* We have not been doing much business in Calcutta. We cannot compete with Ranigunje factories or with Messrs. Bird and Company.

Q. East Indian Railway has got a fair justification for not offering favourable rates?—*A.* Yes.

Mr. C. E. Low.—*Q.* Where do you get your labour from?—*A.* Most of our labour is from Khols and Chamars from the Native States.

Q. You house your labour?—*A.* Yes.

Q. Do you get any Kumhars?—*A.* Very few.

Q. Do you employ them in the more skilled portion of the work?—*A.* Yes.

Q. I suppose none of your labourers are literate in vernacular languages?—*A.* The majority of the labouring class are illiterate. They can neither read nor write.

Q. Do you notice any difference between those manual labourers who are literates and those who are not?—*A.* The majority are illiterate. We have 3 or 4 literates.

Q. Do you notice that they are better than the others?—*A.* I think so.

Q. Do you take any apprentices?—*A.* Yes.

Q. From what class?—*A.* Now we have taken on apprentice Babus, and we find that they take a better interest in the work than the labouring class do.

Q. What is the education that they have had?—*A.* Of course, they can read and write vernacular. They do not know English.

Q. On what terms are they coming in?—*A.* They work under a contractor, and are paid according to their work. There are no special terms. We have just begun taking apprentices.

Dr. E. Hopkinson.—*Q.* What kind of pottery do you make?—*A.* We make all kinds of ware.

Q. Is any high class pottery made in India?—*A.* I do not think so. We are commencing to do it. We make enamelled wares. The raw materials are very good for that class of ware.

Q. You have every hope of making it a commercial success?—*A.* Yes.

Q. Where do you get your white clay?—*A.* From home. We require a very small quantity.

Q. I suppose the high ocean and railway freights from home for that kind of ware have given you an advantage as against the British maker?—*A.* I do not think so. The home maker can compete with us in India. The railway freight to the coast kills us.

Q. Where do you expect to send this class of ware?—*A.* Calcutta, Bombay and Delhi. There is a big demand in Delhi.

Q. I suppose that it is the ocean and railway freight up-country which has really induced you to start that class of business?—*A.* Yes. That is so. We ought to be able to make much cheaper in this country where raw material can be had than it is to get it from home.

Q. You say that an industry should not be started without the aid of skilled foremen?—*A.* Yes.

Q. Do you mean that the Government ought to provide such foremen?—*A.* No.

Q. You, at any rate, do not want Government assistance?—*A.* No.

President.—*Q.* Have you been in touch with the results that are being obtained in the Bombay School of Mines in connection with clays in India?—*A.* No.

Q. They are making a large number of experiments on different kinds of clay obtained all over India. You may get into touch with the Superintendent of the School and you may find out whether he can give you any information as to the occurrence of clay that may suit your purpose?—*A.* I have tried a few clays myself.

Q. You do find there is a dearth of information regarding clays in India?—*A.* Yes.

*Witness subsequently sent the following note:—*The attached list shows the rates of railway freights in force for some of the railway stations in India where the Perfect Pottery Company's goods have been despatched during 1916. It will be seen that in some

cases the Great Indian Peninsula Railway Company has given concession rates for certain stations, e. g., Bombay, but higher rates in proportion for intermediate stations. It will also be apparent that in through booking with the Great Indian Peninsula Railway, the Great Indian Peninsula Railway have granted the reduced rates as far as the lead on their line is concerned, but then the other connecting railways have made their rates exorbitant, thus making it impossible to deliver wares at profitable rates at destination. For example, the freight rates shown in the enclosed list for Bangalore are Re. 0-0-3, Re. 0-7-4 and Re. 0-5-0 or a total of Re. 0-12-7 per maund. The consignments in this instance are loaded at the works siding and booked from Howbagh, Bengal-Nagpur Railway (narrow gauge), to Bangalore *via* Jubbulpore. The distance on the Bengal-Nagpur Railway from works to Jubbulpore railway station is only 4 miles (charges being made on the minimum of 11 miles) and Re. 0-0-3 is charged. At Jubbulpore the transshipment into broad gauge waggons is done by our labour. The broad gauge waggon then goes up to Guntakul, Raichur being a station of the Great Indian Peninsula Railway; 880 miles from Jubbulpore, the freight is charged at Re. 0-7-4 per maund or 10 pie per maund per mile scale. The line from Raichur to Guntakul is broad gauge Madras and Southern Mahratta Railway, from Guntakul to Bangalore metre gauge Madras and Southern Mahratta Railway. The mileage from Raichur to Bangalore being 250 miles the freight charged is 24 pie per maund per mile scale or nearly 2½ times more than the rate of the Great Indian Peninsula Railway. This rate should be the same as on the Great Indian Peninsula Railway, i. e., Re. 0-2-0 per maund. In other words in through booking the consignments with other railways similar rates should be charged on all railways concerned.

If this were the case the freight to Baroda and Ahmedabad would be much lower as far as the Bombay-Baroda and Central India Railway line is concerned, thereby making it unprofitable for the merchants to go to Bombay to get pipes, etc., cheaper there than by purchasing direct from the makers (Perfect Pottery Company).

In the list it will also be seen that the lowest rate for some places only is 10 pie per maund per mile and much higher for other stations such as 40, 24, 33.

Sufficient data not being available, it is impossible to compare ship freights with the railway charges in India.

Subsequent to my examination it has been brought to my notice that the East Indian Railway Company have equalized the rates for Calcutta.

WITNESS NO. 159.

Mr. K. K. Bernard, M. A., Professor, Robertson College, Jubbulpore.

Written Evidence.

I am interested in inventions. I have already obtained patents on a few and have several others on hand which I purpose to patent when the war is over.

Firstly, I beg to point out the great handicap there is on inventors in India,—the difficulty of getting models of inventions made, and the further difficulty of getting any article (unless it be of an extremely simple nature) manufactured in India.

on a commercial scale. I may be permitted to say that I invented three things lately—an automatic recording attachment to a billiard cue, a storm-and-punkah-proof attachment to an ordinary lamp chimney, and a novel and interesting naval war-game. I could not get any one of these manufactured in India at a cost at which it could be marketed commercially. I beg to suggest, therefore, that there should be established, in the capital cities like Bombay, Calcutta, etc., properly equipped workshops which would undertake to help inventors in making working models of their inventions; and that the Department of Commerce and Industry should undertake to put inventors in touch with firms and other parties who would be willing to undertake the manufacture of any saleable and useful invention.

In America and elsewhere there are agencies and patent attorneys who act as intermediaries between inventors, on the one hand, and, on the other, capitalists and investors who are looking out for useful and profitable inventions to place on the market, either on a royalty or other basis. Could not something similar, even on a small scale, be undertaken in India also?

Secondly, I beg to point out that India is not included in the list of countries which have joined the "International Convention for the Protection of Industrial Property," in which even such countries as Tunis have joined. This places inventors in India at a great disadvantage, as an inventor in India who has applied for an Indian patent does not get the benefit of the priority of claim in the countries joining the Convention which an inventor in one of those countries would get with regard to the other countries included in the Convention.

I beg to suggest, therefore, that India should also join the International Convention.

Oral Evidence, 21st December 1916.

President.—Q. You are a professor in the Robertson College?—*A.* Yes. I am a professor of English.

Q. How is it that you are interested in mechanical inventions?—*A.* I am an M. A. in physical science. It is by mere chance that I happen to be professor of English.

Q. Then how did you become a professor of English?—*A.* I am a first class graduate in English language and literature of the Madras University.

Q. What is this International Convention for the Protection of industrial Property that you speak of?—*A.* It is a convention of various countries, so that any invention that has been made in one of the countries that have joined this Convention is automatically protected for a period of twelve months in all the other countries.

Q. Do you mean the International Patent Convention?—*A.* Yes. (Witness showed a book referring to the Convention he speaks of.)

Q. Have you seen the text of the Convention?—*A.* No.

Q. But you advocate it to us as something that the Government ought to take up. We should like to know more about it.

Dr. E. Hopkinson.—Q. Why do you say that India should join the International Patent Convention?—*A.* The advantage is that the invention of an inventor who applies for a patent in India will be protected for 12 months in all these other countries. If India does not belong to the Convention, and I apply for a patent to-day in India, to-morrow anybody else may apply in England, and I shall be ousted.

Q. The Convention applies to both sides in that the inventor who applies for protection in England would also get protection in India?—*A.* Yes. India is very much worse off than England. As a matter of fact many inventors do not even care to patent their inventions in India, because India is so backward in the matter of manufacture.

Q. Are there more inventions in England or in India?—*A.* In England.

Q. Is it not then more to the advantage of India that the inventor in England should not get protection in India rather than the small number of inventors in India should get protection in England?—*A.* It handicaps the inventor in India. You will be hit the other way.

President.—Q. If we belonged to the Convention, if you had an invention here, your invention would be protected for twelve months in England, but at the same time there would be 200 inventors in England who would be covered in India, and probably one of these 200 would have anticipated your patent. I do not think you have made out a case for recommending the proposal to the Government.—*A.* I was merely making a suggestion.

WITNESS NO. 160.

*Mr. M. Hill, C.I.E., F.L.S., Chief Conservator of Forests, Central Provinces.**Written Evidence.*

The produce from Government forests is broadly classified as major forest produce, which includes timber and fuel, and minor forest produce comprising bamboos, grasses, fruits, leaves, fibres, resins, gums, oils, tannins, catechu, honey, wax, minerals, etc. As regards major forest produce, for the valuable timbers, *e. g.*, teak, sal, shisham, etc., the uses of which are well-known, there is generally a ready market and the amount of outturn available under the working plans is usually disposed of at good prices. The work of extraction is now mainly done by purchasers, though Government in past years has frequently led the way in converting and transporting timbers to suitable markets, by departmental agency, *e. g.*, sleepers, timber from the Andamans. Generally speaking, the use and value of the more important species are sufficiently well-known to ensure their utilization.

Forest Department.

It is among the species generally considered to be of comparatively little value that there seem to be possibilities of industrial development, *e. g.*, utilization in the form of wood pulp or as sleepers after treatment in match industries, etc. Several investigations have already been made in these directions by experts engaged by Government and by the staff of the Forest Research Institute.

Of major forest produce removed in the form of fuel there is not much to be said; the gradual improvement of communications (roads and railways) makes it possible to work profitably areas where the cost of extraction and transport has previously been prohibitive. But it is, I think, in the utilisation of minor forest products that the greatest possibilities of commercial development exist.

A good deal has been done already in this direction, but there is a great amount of work still to be done, and the prospects are such, I consider, as to justify fully a large staff of experts. A certain amount of pioneering work has been done by Government, *e. g.*, rubber plantations in several provinces, notably the hevea plantations in Burma and the ficus elastica plantation in Assam, which are, I believe, with the possible exception of the Java plantations, the pioneer rubber plantations of the world. The tannin factory at Rangoon was erected to demonstrate the uses of certain barks for the manufacture of tannin extracts, and since the creation of the Forest Research Institute, investigations have been made into a large number of minor forest products, and the results have been published from time to time.

But the existing staff is only sufficient to undertake enquiries into a few of the numerous products available. A glance at works such as Watt's Dictionary of Economic Products and the various forest floras and descriptive lists of species, that are available, will show that there is scarcely a tree or shrub that does not yield something that may prove on expert examination to be of commercial value.

Remarks such as "The inner bark yields a strong fibre", "Fruits and flowers are used medicinally", "Bark yields a gum", "A dye is obtained from capsule", "Seed used as a substitute for coffee, etc. etc.," frequently occur, and many diseases are mentioned for which the medicines obtained are considered to possess curative properties.

What we require is a body of highly trained and practical experts who would make full investigations and experiments into single products or group of products on a sufficiently large scale to demonstrate their commercial value, and where the value of any product is well-known to improve on the wasteful methods of native manufacture. The experts should, I consider, be full-time men, with good pay and prospects and I think their research work might be independent of the Imperial Institute in England, save that this Institute might give aid in placing any particular product on the market.

The experts for forest research might form part of an Imperial scientific and technical department. When the commercial value of any product has been proved, it is, I think, probable that some firm would be found willing to undertake the manufacture on terms sufficiently favourable to Government.

I am doubtful as to the necessity for financial aid from Government. Capital has, I believe, been found for practically all the schemes for developing trade in Indian products,—coal, jute, manganese, timber, paper-pulp, etc.,—and would probably be attracted to any promising industry in minor forest products.

Financial aid.

If it is considered necessary in any case for Government to provide part of the funds necessary, it would perhaps be best to provide part of the capital, Government to share proportionately in the profits. Some form of control would be necessary: possibly, the appointment of Government directors and Government approval to the auditors to be appointed. The supply of machinery and plant on the hire-purchase system might suitably be adopted in some cases, more particularly where the product is being exploited by Indian agencies, *e. g.*, manufacturers of rosin oil, catechu, etc.

As regards the principles to be followed in order to prevent Government aid competing with existing, or discouraging fresh, private enterprises, I do not think any Government aid should be given, if private enterprise is willing to step in and undertake the work without financial aid. Generally speaking, the policy of the Forest Department in the past has been not to work by departmental agency when private contractors are willing to do the work. In the Central Provinces and Berar, practically all forest produce is exploited by private enterprise, mostly Indian.

The available resources of the Indian forests are fairly well known at least in regard to products already commercially exploited, and I do not think a general survey is needed, but it would be necessary in the case of any new product to ascertain our available resources and what steps might be necessary to increase the supply of any product in the case of a large demand.

Exhibitions.

As regards the value of industrial exhibitions I am somewhat sceptical. The Forest Department has, from time to time, sent large exhibits at considerable cost to Paris, America and elsewhere, but I am not aware of any practical results in regard to industrial development. Provincial industrial exhibitions may perhaps serve some useful purpose, but for the best practical results they should, I think, aim rather at bringing buyers and sellers into contact than be of a popular nature. Central commercial museums to exhibit products available from the forests should serve a useful purpose, but the most practical way to develop trade in any particular form of forest produce is, I think, to get in touch with the firms trading in or requiring that produce in their manufactures and send them samples with prices and quantities available. Advertisement might also be resorted to. The resources of the Indian forests, if fully examined on scientific practical and commercial lines, could not, I think, fail to yield an increased quantity of material in the form of dyes, oils, tans, fibres, medicines, etc. etc., for use in industrial enterprises and the investigations now being carried out by the Esocet Company in conjunction with the Government expert, which have already led, I believe, to valuable and practical discoveries, indicate, I think, the general lines on which the Government experts I have advocated should work.

In general, I consider that in order that Indians may improve old indigenous industries and become more skilful in these and learn new industries, the facilities for technical instruction should be increased.

Institutions something on the lines of the more or less self-supporting Government Engineering School at Nagpur should lead to useful practical results.

With the increase of skilled knowledge, higher wages would be commanded, and this should lead to the improvement and elevation of the working classes and a higher standard of living.

Oral Evidence, 22nd December 1916.

President.—Q. You have called attention in your note to the possibility of the development of minor forest products and you have given illustrations of the possibilities of some of these. We have had brought before us in Calcutta, especially, cases of a kind that may occur more frequently in the future, where persons who wished to obtain certain plants or trees from Government forests for starting new industries found difficulty in doing so. Apparently, trees of the kind required occur comparatively in small numbers over large areas, or when an industry is new and the demand is small, the ordinary local contractors are not prepared to deal with articles of the kind on terms that the consumer can afford to pay. Can you suggest to us any way by which a difficulty of that kind may be got over? I am referring to India as a whole. Although you are the Chief Conservator in this province, you have been in many places, and you know more of India than most of the forest officers?—*A.* To take, first of all, the Central Provinces, suppose there is a demand for a species required for bobbins, or something of that sort. Most of these species occur here and there, and in these provinces the annual coupes are sold *en masse* to the local contractors who dispose of the timber, etc., in any form they like. The only way that I can see would be to arrange for the timber required to be removed before the coupe is sold, once it has gone into the hands of the contractor we can do nothing, besides asking him to help. On the other hand, if it is only a small demand, it is undesirable to hold up the sale of a coupe because some firm happens to want a particular species.

Q. Is it possible for you to sell your coupes with conditions of that kind attached, so that the contractor might be obliged to get out these small quantities at rates adjudged to be fair by the forest officer?—*A.* I should think that the best way would be that we should put a clause in the agreement that certain species are not included in it.

Q. Then comes the difficulty as to who is going to take it out?—*A.* Then you come to departmental agency which is always a difficult thing. If there is a definite demand for a certain quantity we might say to the contractor that he must agree to supply a certain quantity under such terms and conditions as would be agreed upon.

Q. A particular instance we had from Darjeeling where there was a species growing more or less sporadically which was good for matches, and the difficulty was that the contractor who bought the coupes held them up?—*A.* If you let another man into the contractor's coupe there is likely to be trouble.

Q. Similar cases relating to minor products useful for medicine occur. They have a lot of information about the distribution of suitable species, and they were told by the forest officers that there was no way by which extraction could be effected in consequence of the fact that areas had been let to the contractor and no conditions laid down as to the contractor's dealing with these species. I suppose the purchasers of that kind are actually in the hands of the contractors who dictate their own terms?—*A.* If a contractor has bought the coupe he might ask a prohibitive price. It often happens that the produce is of more value in its original form. Take babool bark which is valuable for tanning. We have babool in Berar and there should be a large export of babool bark. But the fact is that the people get the same price for babool as fuel as they would get for babool bark, and that they get without any trouble. In case of definite demand we could arrange, if the species is there, for it to be extracted by Government agency.

Q. The difficulty in the initial stage is so great that no man who is actually prospecting for the species with a view to finding out its commercial value is able to say what his demand will be until he definitely establishes a manufacturing process?—*A.* Suppose you wanted a definite species which would, under the working plan, be felled in the following year, we should simply go and extract departmentally the quantity required. There is always a certain amount of difficulty in that the firms are not always willing to pay the real value. I remember years ago supplying bark of a certain species and so long as we supplied it practically free, the firm took it, but when asked to pay a price profitable to the forest department there was difficulty.

Q. You could not possibly reserve certain species when you are selling a coupe?—*A.* We do to a certain extent.

Q. Species which are known to your scientific officers to contain materials of special value apart from their value as timber?—*A.* We keep a number of the best species as seed-bearers and could keep others to meet a specific demand.

Q. Under the present circumstances I understand that your officers have so much to do in the work of conservation and administration that you have no time left to undertake the duties of extraction and in some cases, where extraction means the organisation of rope-ways, or light railways, or the development of roads, etc., you have not sufficient engineering knowledge to organise these methods of extraction?—*A.* This is to a certain extent true. A Divisional Forest Officer generally has a large area under his charge, and he has got the ordinary forest work, roads, bridges, annual reports, etc., etc., and he cannot undertake an unlimited amount of work. The question of forest engineering was discussed at the Board of Forestry this year. It seems to me that the arrangement that we have here is good. We have made nearly all our own roads. If we have got a difficult hill section to do, we have a right to call on the Public Works Department to make it for us. That settles the road question. Similarly, we can make nearly all our bridges such as we want. If we want a big causeway, we get the Public Works Department to construct it. If I want a rope-way, I know where to go to get it constructed. I do not think that in these provinces there is much work for an expert engineer.

Q. There is no doubt that for extraction your department is at present insufficient?—*A.* If we undertake extraction it means that the staff is not used on its purely legitimate work. If you add extraction duties on a large scale, the staff will have to be increased.

Q. That being so, problems connected with extraction, such as the development of roads and bridges are comparatively simple. But as regards wire rope-ways, it requires a certain amount of special knowledge for suitable projects being worked out for rope-ways. For light railways, again, it requires a certain amount of survey work, and for laying it economically and along the most suitable alignment, it would require a certain amount of special training. Development of saw mill and so forth as part of the extraction process would again require a certain amount of engineering knowledge. Do you think that it is advisable, I am putting it to you most specifically, to increase the number of ordinary forest officers, or to meet these engineering developments; do you think it is practicable to add to the Forest Service a line of forest engineers numerous enough and to grade them from assistant forest engineer to provincial forest engineer. The assistant forest engineer's grade would correspond to that of the assistant conservator and he would work on a parallel line to the ordinary forest officer. The senior man would be the right hand man of the Chief Conservator, and there would be engineers for the divisions and districts in the same way in the order of seniority, and you will have then, in effect, two parallel lines somewhat analogous to the lines that you have in the mercantile marine—the navigating officers and engineering officers. The navigating officers are, on the whole, senior to the engineering officers. The captain of the ship is senior to the chief engineer, but the chief engineer is senior to the 4th or 5th navigating officer. Which of these schemes would you prefer?—*A.* The whole question was discussed more or less by the Board

of Forestry, and each representative of each province was asked to say what engineering works were likely to be necessary. Take this province. I know of no engineering work that is likely to need such engineers. If I wanted a saw mill I should get an expert saw mill engineer to design and erect one. If I wanted to lay a light railway I would go to one of the firms dealing with light railway. I might find it useful to have a consulting engineer to say whether the scheme is sound, but the idea that a forest engineer is going to do all these works seems to me somewhat impracticable.

Q. You say that an engineer who would advise would be useful?—*A.* My idea is that he would be a sort of consulting forest engineer. He would propose and suggest work. I do not want him to construct the railway and I do not want him to erect a saw mill.

Q. You want an engineer to see that Government is properly treated in all these projects that might be undertaken by separate firms. Above all, you surely want an engineer to indicate to you the projects that are desirable and feasible?—*A.* A consulting engineer would be alright, more particularly, in other provinces, he would be of great use, *e. g.*, in Burma, the United Provinces, in the Punjab and so on, especially in the Himalayas. There it is more a question of rope-ways, and he would be able to indicate whether they would be useful, if erected.

Q. Have you any idea as to how many engineers would be required, apart from the Central Provinces? How many would be required throughout the whole of the Forest Service in India? 30 or 40 engineers?—*A.* Take Burma first. There we have a number of eminently practical firms. They naturally study whether in any case a machinery would be of any use from the commercial point of view, but they have not introduced very much machinery. They have got to use elephants, and though elephant mortality is high and their prices vary from Rs. 5,000 to Rs. 7,000, and they are liable to be stolen from the Siamase side, they are using elephants in preference to anything else. Taking the whole of Burma, apart from saw mills, we had a big scheme for moving timber in the Rangoon depôt, but for that there have been various schemes brought up and a number of engineers have advised, and I do not think that the scheme has yet come to maturity. With my knowledge of Burma I could not mention off-hand any large number of works that would engage the attention of forest engineers. The firms themselves do not, I think, use engineers to any extent in the forests. In Assam we had a light railway. It was a hand tramway, and it was said that it was necessary because there were no carts, but it was not difficult to point out there were no carts because there were no roads. If you make roads the carts would appear soon enough. I am not prepared to suggest any form of mechanical transport that we consider necessary there. It is very easy to talk airily of the great advantages of mechanical means of conversion and extraction and so on. There are cases where rope-ways would work undoubtedly in the Himalayas. Frankly, I cannot say that there is a sufficient number of schemes to employ a large body of forest engineers. We have got one in Burma, but I am not sure what he is doing.

Q. You do not see any justification for anything like the number of engineers I have suggested?—*A.* There would be work possibly for one in the Punjab, one in the United Provinces, possibly two in Burma, one in Assam, although I am not quite sure of the work that I should put him on to. I do not know Bombay and Western Ghâts well enough. The question was considered at the Board of Forestry only this year, and it was put to each individual officer how many engineers he wanted. Each Conservator stated what he thought was necessary, and it probably came to what I have stated, that is, one for Bombay, one for Madras, one for the United Provinces, one for the Punjab, two for Burma, one in Assam, and we, in the Central Provinces, might have one. The exact statements are recorded in the Proceedings of the Board of Forestry.

Q. Supposing it was decided that your estimate was justified, how were you going to provide the four or five engineers? Would they be members of the Forest Department, or would they be borrowed from the Public Works Department?—*A.* It is very difficult to say. If we want any real advance in the methods of extraction we should get men from Canada and America where they are more ahead in that matter. I do not know of any institution here that could supply forest engineers.

Q. I suppose the ordinary engineer will soon get accustomed to forest conditions?—*A.* I think the best thing would be to have the cadre of forest engineers on a parallel scale. You could not possibly have them on the same scale, because the one is for administration and the other is purely for forest engineering.

Q. It need not be on the same scale. If you have a separate cadre for forest engineers with not more than four or five engineers, how are you going to deal with the question of their prospects and promotion?—*A.* You simply put them on the increment pay on the lines of the pay of Deputy and Assistant Conservators and it is then merely a question of appointments over Rs. 1,250 and upwards. They would have an increment pay up to Rs. 1,250, and then might be given one or two posts on Rs. 1,800 and 2,000. Undoubtedly it would be a difficulty with so small a cadre to provide sufficient prospects of advancement.

Q. And in the earlier years you would have quite junior men?—*A.* You should have men who have had experience. He would not be obtained in the ordinary way as a forest officer is. He would have to be appointed on a pay of, say, Rs. 850 and should have had experience when he is appointed.

Q. Am I right in assuming that you think that something is required in the way of forest engineers beyond the present provision for it, but not on the scale that I have just sketched out to you?—*A.* We should want engineers to advise, first of all, on the suitability of a project, or to recommend one, and if it was for me myself, I would go straight to the firm which makes the saw mill for instance.

Q. You see room for the employment of four or five engineers, but not for the employment of 30 or 40?—*A.* Yes. Indeed, if you had 30 or 40, I do not know the work you could employ them on.

Q. Of course, a good man makes work?—*A.* Yes. You have to consider each work from the financial point of view also, whether it is going to pay, and, where the produce is of small value, if you put down a lot of capital you may perhaps never hope to see any adequate return on the money expended.

Q. Am I correct in assuming that at present your forest resources are well in excess of the extraction to such an extent that there is thirst in the country for forest products? Timber is high in value, even firewood is high in value and it is difficult to get at reasonable rates most of these ordinary forest products. Is that correct?—*A.* I do not think so. I have pointed it out in my written evidence. I have taken the products in their order. For major products, such as timber of good quality, practically all that can be supplied is in full demand. Take deodar. People often ask why does not the Forest Department supply our railways with sleepers? That question has been raised. Deodar is mostly what they are thinking of. The thing is that under the working plan so much deodar as is available to be extracted is put up to auction, if the seller is able to get Rs. 3 a cubic foot by selling it in large beams and scantlings, and he will not supply the railway with sleepers at Rs. 2-4-0 a cubic foot.

Q. But if there are greater facilities for extraction and transport it would not be impossible for both parties to be supplied with all their requirements. From your answer, it is clear that there is thirst for forest produce to such an extent that the man gets Rs. 3 or 4 a cubic foot and would not supply the railway?—*A.* At present in some areas, *e.g.*, Himalayas, the difficulties of transport and the cost of extraction make their working prohibitive. That is where a forest engineer might well be useful. One would first want to inspect these areas.

Q. It has been put before us several times that the difficulty of extraction and the cost of transport is standing in the way of the full development of forest produce, and you are not convinced that that is the case?—*A.* In each province there might be areas where if it were possible to formulate some scheme of cheap transport or introduce wire ropeways, you might be able to get produce out at a profit. It is sometimes difficult to get them out under the present methods. But cases are not so very common. Practically, the whole of the United Provinces is worked, I believe, save the new areas recently added. In Burma, right down to the Shan States, elephants work out the timber. One would like to know what the particular areas are. Where areas are unworked, it might be that they could not be worked at a profit, or it might be that the demand was not always sure.

Q. The forest economists have told us that there are many products that are not properly developed at present and they thought that it would be an advantage if the Forest Department had attached to the ordinary officers of the department a number of men with commercial experience to push, as I understood, forest products and to see that they were developed on business lines. Can you give your views on the question?—*A.* It was proposed in Burma when I was there that we should have a sort of separate service of men who would work on the lines of assistants in the firm of Burma Bombay Corporation, that is to say, they should know how to log and prepare timber in sizes most suitable to meet the market demands. In Burma there might be some scope for such commercial assistants. To take the Central Provinces, practically all the minor products of known value are disposed of. These minor products are known and I do not know what the commercial assistants would do particularly. The people here sell to the local people who again dispose of the produce to the known markets. I do not think that commercial assistants would be of much use in the Central Provinces. Practically all major and minor produce is disposed of at auctions or by leases to contractors.

Q. What I have gathered as the result of my monsoon tour is that there is a distinct feeling in favour of having forest engineers, but by no means a unanimity of feeling in favour of those so-called business men being attached to the Forest Department. It is generally supposed that it is much better that the forest officer himself should get into touch with the business requirements and even, if necessary, to increase the strength of the department so as to develop this business side?—*A.* Take this province. The forest officer has got to dispose of his coupes which he puts up

to auction. One man on the spot is required to do it and you would want additional men for every division. What I would much prefer to see is whenever you could make out a case for sub-division, to divide the areas both of Conservators and Divisional forest officer's charges. The Southern Shan States for example is nearly as big as England. Many of the Burma Division are much too large for adequate control. In the United Provinces the divisions are of a much more manageable size. The size a division should be, is largely dependent on the value of the forest growth.

Q. You think that there is no doubt whatever about the desirability of increasing the number of ordinary forest officers generally?—*A.* Yes.

Q. And that would pay?—*A.* It would pay. At the present time, if you want an increase on establishment it takes years as a rule, and finally it has got to go up to the Secretary of State for sanction.

Q. You are not satisfied that there is any real need for special men with knowledge of business methods?—*A.* Not I think in the Central Provinces; the produce, major and minor, available annually is sold in suitable sized areas to contractors, who arrange for the disposal of the produce to the people, and suitable markets.

Q. If you had these business men attached to the Forest Department, their point of view would be utterly different from the point of view of the Conservator who naturally looks to conservation as a matter of the first importance and disposal of products as the next thing. Would there be friction between the business men and the conservation officers?—*A.* Not necessarily. He would have absolutely nothing whatever to do with the amount of the outturn. The outturn is regulated by the working plans. It means that you only take the interest and do not impinge on the capital.

Q. The business man might want to make the Forest Department show a return which would be the instinct of a business man; it does not necessarily follow that it is in the best interests of the country?—*A.* The main policy of the Forest Department is to work immediately for the interests of the people present and future and profit is a secondary thing. We do not work primarily for profit, although I am afraid Government has been inclined occasionally to consider successful results from a financial standpoint.

Q. I take it from your note that the minor products are so numerous and varied that the scientific side of the research side of forestry in chemistry and possibly in economic botany is so great as to require a considerable addition to your scientific staff?—*A.* I should say undoubtedly.

Q. Do you think that it would be practicable to work a staff of that kind either as members of the Forest Department or by borrowing the services of specialists from the appropriate scientific departments?—*A.* I do not quite know the best way of doing it. What we want is more or less a whole-time staff, to ascertain how the known products can be better utilised or better prepared for the markets and secondly to experiment with the less known products which might yield some thing of value; it seems to me that there must be great possibilities, but the Government would take a risk in the matter no doubt.

Q. There are many forest products that are now exported that may be turned into manufactured products in India?—*A.* Yes, and they should be prepared in the best way for the market. The difficulty so often with products worked by the Indian is that he resorts to adulteration.

Mr. C. E. Low.—Q. Have you given any special concessions for match factories in Government forests?—*A.* Not in this province, within my experience.

Q. With reference to Kota Match Factory have you given any concessions?—*A.* I do not remember.

Q. You used to have a good deal of departmental extraction in the Central Provinces. Why was that given up?—*A.* On general grounds. The first thing is that it takes up the time of the forest officers which should be devoted to other work. The second thing is that the local contractors know what the people want.

Q. With reference to this question of Government extraction did you find it less profitable in cash?—*A.* If departmental extraction throughout India had been maintained, our revenues would have certainly more than doubled. Burma is a case in point.

Q. Leaving Burma aside, what about the other provinces?—*A.* When we undertook departmental extraction we extracted timber, etc., cheaply and sold it, as a rule, at a good profit. It is true that we occasionally lost money by the produce rotting, or by our not being fully in touch with the market. On the whole, Burma is the most important province where departmental work would have paid. I do not think it would make very much difference in the Central Provinces.

Q. Do you sell any species like, for instance, sal on fixed royalties in the Central Provinces?—*A.* In the Central Provinces the sal that we have at present is sold on lease to two or three firms.

Q. Do you charge a fixed royalty or sell the coupes?—*A.* In some cases we have sold the trees standing, but in cases where the lessees saw sleepers and scantlings, rates of royalty for the period of the lease are fixed.

Q. Your agricultural demand is very intense?—*A.* Practically the whole of the produce is consumed locally as timber and fuel apart from sleepers.

Q. The local agricultural demand is so intense that it has led to a considerable rise in prices locally obtained within the last 10 or 15 years?—*A.* You mean the prices that they give us or sell to the people? The prices that we get at auctions steadily increase.

Q. Any considerable exploitation of the forests of Central Provinces and Berar for external use would hit the local agriculturists pretty hard?—*A.* Yes, but we would be quite prepared to take protective measures. In the Central Provinces we look very carefully after the interests of the agriculturists.

Q. It is taken special care of by special revenue officers in connection with the working plan?—*A.* Whenever we introduce a working plan we have the provisions of the plan examined by a civil officer to see that the requirements of the people are provided for, more particularly in regard to grazing, and also timber for the agriculturists.

Q. You do not find much stuff left over in your coupes?—*A.* They are generally pretty well cleaned.

Q. Turning to the question of forest engineering was it not the case that some years ago a forest official purchased an engine for the Alapillai forests under the impression that it included a boiler and found afterwards that it did not?—*A.* Yes, there was also another case? A very keen and enthusiastic forest officer obtained sanction of the Government to the purchase of a road tractor which was afterwards found to be unsuited to forest work.

Q. That is comparatively a recent case?—*A.* Yes. The difficulties that were not realised were that it had to be used on a road some seventy miles long, and in the hot weather it became so hot that no native could stop in the cab, and it required water and fuel at frequent intervals.

Q. There was a discussion so far as I remember from about the year 1902 until 1907—what happened then I do not know—about the desirability of constructing a light railway for the extraction of topa sal?—*A.* There is an excellent road going straight through the place. I should doubt whether a railway would pay. I know something of mono rails.....

Q. The scheme was considered with a lack of expert knowledge and nothing came out of it and they are still continuing to move the timber over sixty miles of road. Do you think that some form of light railway would have been profitable there?—*A.* I doubt it. It would not leave a sufficient margin if you put in a railway with all its attendant cost of staff apart from the initial cost it would involve.

Q. You have also taken into account the fact that many other forest products may be available which are not now exploited such as bamboos?—*A.* Yes, I should be very glad to have the advice of a consulting forest engineer occasionally. But if he made a good scheme I would not have him to do the work. I recommended a ropeway in the Melghat to bring timber out which might suitably be done by a ropeway.

Q. If you put in a scheme like that in the absence of a forest engineer, before they accept your dictum, they would probably send it to the Public Work Department?—*A.* I think on those grounds there is a good opening for a forest engineer and besides we want to move with the times in any case. The forest engineer who would be a specialist in the subject might give us much valuable advice.

Q. Don't you find in practice that the Local Government do not accept with confidence any proposals of this kind put up by forest officers without special engineering knowledge?—*A.* As you say, it is sent to the Public Works Department for criticism and they might not have any special knowledge of that particular work, and certainly any proposal would be much more readily accepted by the Local Government if it had the expert forest engineer's support.

Q. Similarly, when you get a scheme put up by a reputable firm for a light railway, the Local Government may want to know whether the thing is a suitable one and in that case the consulting forest engineer would be of use?—*A.* Undoubtedly.

Q. As regards the question of the availability of forest products, was it not the case that there was an immense increase in the output of bamboos and of minor species owing to the Satpura railway passing through Balaghat up to Katangi?—*A.* With out reference I cannot give the exact figures, but undoubtedly all our development depends upon that. Directly railways come in, we may make feeder roads to it and the advent of railways always means increased extraction.

Q. Do you think that some thing of the light railway type running along the edge of the forests and coming down to the railways at intervals would make a tremendous difference

in the amount you would be able to extract compared to carting in a rough country?—*A.* That would be possible, but whether it would pay must be decided by examining each special case.

Q. By what agency?—*A.* It would be a case for the forest consulting engineer.

Q. Take Hoshangabad, for instance. There you have got forests parallel to the railway at a distance of from five to twenty miles. Take the southern portion of Balaghat division and you have the same thing there with large areas of bamboos?—*A.* Yes.

Q. Would it not come out a great deal cheaper to the consumer?—*A.* Yes, but whether it would pay for laying a railway is the point.

Q. Don't you want an expert staff to be able to deal with such questions?—*A.* I think one consulting forest engineer should suffice.

Q. Supposing you have got an expert and put him on one or two things and he says that they have worked all right, then you can do something in that line?—*A.* Yes.

President.—*Q.* You first of all said that the forest were being worked to the full and yet you afterwards said that if railways were developed in the forests, you would get greater extraction?—*A.* I do not remember saying that forests are being worked to the full. There are plenty of areas not worked at all.

Q. For want of means of communication?—*A.* Want of demand. There are a number of reasons. There may be large areas of malguzari forests. The malguzars are not conserving their forests to any extent and they compete with the Government forests.

Q. They would not compete if you had better means of communication to bring your forest products to wider market? You have also told us that the Shan States were being worked all over. There are only two railways?—*A.* I said large areas in different provinces are not being worked. They are working and endeavouring to do something in the Shan States.

Q. The Shan States were tied up actually for want of railways?—*A.* But the only paying way to get timber out of the Shan States is the present way to float it down the rivers.

Q. But you want lines to assemble it at the Salwin?—*A.* That is practically done by elephants.

Q. Your elephants might assemble them at points conveniently where you can put up a light railway and assemble your material and transport them through the river. Surely that would be better?—*A.* The manner in which the timber is worked is that the elephant first of all drags it to the floating stream which is dry in the cold weather, and when the rains come on the stream becomes full of water, the elephant with its tusks helps the timber down the floating stream. A number of elephants drag the timber and finally it gets to the bigger stream and so on to the main river. The cost of extraction is very small.

Q. You do not think it may be improved by developing railways to assemble the timber at the river banks straight instead of having to be taken on these intermittent tributary streams?—*A.* It would not, I think, be practicable.

Hon'ble Sir R. N. Mookerjee. *Q.*—Have you had Government teak forests in the Central Provinces?—*A.* The only available teak forest from the point of view of size and good quality is the Alapillai forests in Chanda, but practically throughout the whole of the province we have teak which however does not grow to a great size and is used by the people in the form of poles and scantlings.

Q. What steps are taken to let the outside people know that there is teak forest in the Central Provinces that can be utilised?—At present the Alapillai teak forest is being worked by Bombay firm who have erected at Chanda a very up-to-date saw mill, and they supply the Bombay and Calcutta markets.

Q. As regards the system of auction, you auction a certain number of trees to be cut by the men from the jungle?—*A.* Yes.

Q. The trees which are marked by your rangers?—*A.* Marked by our staff or rangers. We train a staff for this.

Q. Is it a fact that you have the same people without attracting any outside people to bid at your auction?—*A.* No. They vary very often, generally local men who have been working and who know.

Q. Would it not be more important both from the point of view of the Forest Department and the public that these timbers are felled and brought to a certain depot and then auctioned generally, as it is done in Burma?—*A.* No. The primary requirements of this province are to supply the agricultural people with their needs in the shape of timber and fuel, and the consumption is mostly within the provinces.

Dr. E. Hapkinsen.—*Q.* Do you think that the rivers in India could be further utilized for floatation purposes for forest produce?—*A.* I do not know. As a rule when there are roads and railway communications, the preference seems to be for them.

the extraction is practically by water, from Upper Burma right down to Rangoon, and similarly from the Southern Shan States nearly all the timber comes down the Salwin. The Brahmaputra is little used.

Q. Are there not many cases in the Himalayas, where road and railway transport is not available?—*A.* In the Himalayas, deodar sleepers are already floated down the river. I think that that system is applied to other things also. The method of using water transport wherever possible seems to be fairly common. They do use waterways considerably in the United Provinces, Garhwal and elsewhere.

Q. Putting the question in another form are the existing surveys of the waterways of India sufficiently complete to enable the Forest Department to say whether they can be used or not?—*A.* I should think so. Every local man knows where the local rivers are.

Q. By survey I do not mean the geographical course of the river?—*A.* But then the local officer is fully aware of his existing water communications.

Q. He is aware of the existing waterways, in his own particular district, but he does not know what happens to the communications when they get below his own district?—*A.* Where it seems natural to use water communication as in Burma, every officer knows the whole set of communications in Burma. He is concerned with his own local rivers until they meet the Irrawadi.

Q. You know there are provinces where much is known about waterways as in Burma?—*A.* I think so. Much is known, but probably it is not considered as a suitable means of transport.

Q. You say that as far as you know no further use can be made of rivers for floatation purposes?—*A.* I do not know of any particular cases where waterways, if they were really suitable, had not been utilised or tried. It is a rather big question.

President.—Q. Is it not the fact that rivers in India are mostly intermittent and that actually interferes with the question of river transport seriously?—*A.* Yes. But surely there is river transport going on all over India at favourable times. In the Nerbudda the produce goes down in country boats. The Central Provinces are almost unique in the distribution of forests. In every district in the Central Provinces there are Government forests.

Forest products are sold by auction?—*A.* Prior to selling by auction the Government used to work departmentally in nearly all these things, brought out timber, etc., and established the trade and then handed it over to private enterprise. In certain parts of the United Provinces for years all the sleepers were cut and extracted by Government.

Q. It is being done now in the United Provinces in Kumaon?—*A.* Perhaps to lead the way.

Dr. E. Hopkinson.—Q. Supposing you had a staff of consulting engineers such as we have discussed, would you desire to put some of the engineers on to the problem of considering waterways further from the floatation point of view?—*A.* Yes. It would come within the sphere of their work, more particularly to examine them to see what obstructions required to be removed.

Q. It would be advantageous to have such a corps of engineers?—*A.* Yes. I think that consulting engineers would be very useful. There would be more scope for them in the other provinces than in this province.

Q. Should they be an integral part of the Forest Department, or should they be taken from an Imperial service of engineers?—*A.* I think that they had better be on an Imperial cadre of their own.

Q. Such as you suggest for experts for research?—*A.* These are the gentlemen to whom I attach more importance.

Q. Supposing you have such a corps of engineers, would you have them on parallel lines to the experts or as an integral part of the Forest Department?—*A.* I should rather think that they should be a separate cadre.

President.—Q. Have you any supplementary remarks to make?—*A.* I have already referred to the question of utilisation of experts and I have noticed the lines on which it should be done. I refer to the Government Engineering School only as a small means of showing what practical results are obtained, how directly an Indian can do anything, not merely talking, but can do something practical, his value immediately goes up. A case occurred to me the other day where a man who has not even been through the Engineering School but happens to know something of motoring and his ordinary wage would be Rs. 8 or Rs. 10 is at once given Rs. 20 or Rs. 30. That I quote with reference to the advantages of technical education. As for the other industries, I think there are a lot of industries that are likely to be developed and can be developed. Take for example, paper mulberry. Experiments were made in Dehra Dun years ago. In a five years' rotation you could obtain any amount of paper material. There are a number of things that we have made preliminary investigations into and if we had experts we could do a great deal.

WITNESS NO. 161.

Mr. P. C. Dutt, Bar-at-Law, President, Municipal Committee, Jubbulpore.

Written Evidence.

Financial aid to industrial enterprises.

Q. 1.—I have had experience in the raising of capital for various industrial enterprises, the most important ones being the Katni Cement and Industrial Co., Ltd., the Sleemanabad Copper Company, the Jubbulpore Manganese Company, the Shealachmanpur Diamond Mining Company, the Indian Bauxite Corporation, and the Jubbulpore Steatite Company.

I have had great difficulty in raising funds for some of the industries in which I am interested.

The difficulties are that Indians are not educated enough to understand or foresee the complex problems involved in the development of a new industry in a country which chiefly depends on other countries for manufactured articles.

Most of the European merchants in India are mere middlemen whose prosperity depends on the goodwill of the export firms of Europe and other countries for whom they principally act as agents.

Generally the members of the European mercantile firms come to India when very young and have to stick to their work till they retire. They have neither initiative nor facilities for investigating and then risking money, time, etc., on new ventures.

I have found that firms in England are too occupied in carrying on their well-established businesses and are not inclined in the least to look into any proposition concerning Indian industries, and their chief arguments when refusing to consider an Indian proposition are that "If it is really so good as you represent, why don't the Indian and English people in India who are familiar with Indian conditions invest their spare capital in such a proposition;" and others who are interested in similar businesses as proposed shrug their shoulders and say, "We are getting all the profits we want in exporting our manufactured articles to India, and why should we risk our capital by building factories in India and sharing profits with people there who possess the raw materials, etc?"

In my opinion the present war will cause a change in the views of English people and Indians for the better. No one can force people to change their views, and therefore I cannot make any suggestion except that English people may be taught when at school all about Indian conditions and business prospects.

Q. 2.—Capital is generally drawn from Indian and European mercantile communities.

Q. 3.—I do not know of any such enterprise.

Q. 4.—I have had no experience of Government assistance to any industrial enterprise.

Q. 5.—(4) I recommend Government loans with or without interest.

(5) Also supply of machinery and plant on the hire-purchase system.

(6) Provision of part of share capital of companies on the same basis as public subscription of capital.

(7) Guaranteed Government purchase for limited periods.

I disapprove of (1) Money grants in aid, (2) Bounties and subsidies except to compete against enemy and rival countries' products.

Q. 6.—If the Government lends money or supplies machinery or subscribes part capital, it should have a certain amount of control.

Q. 7.—I have had no experience of any Government pioneer factories.

Q. 8.—The Government should help to establish and pioneer all such industries concerned with the manufacture of munitions, articles required for railways, telegraph and all other Government requisitions which are now imported.

As soon as pioneer industries are firmly established, they should be handed over to public companies.

The Government under no circumstances should be allowed to become the permanent owners of such enterprises.

Q. 9.—Almost all industries in India are hampered, because the financiers take the lion share of profit of most enterprises.

Generally the financiers of Bombay manage to get hold of about three-fourths of all prospective profits of any new industries. This retards the development of many promising industries in this country.

Q. 10.—I can only suggest that industrial banks may be started on the principle of the agricultural co-operative banks and societies.

Q. 11.—Agriculture.

Q. 13.—Government aid should not be granted where it would discourage fresh private enterprises unless the existing enterprises were in a moribund condition.

Q. 14.—There should be no limitations on Government aid to a new enterprise, even if it competes with an established external trade.

Q. 15.—I have had very little experience of technical aid from Government experts in establishing my enterprises.

Technical aid to industries.

Q. 16.—In my opinion the Central Provinces manganese and the Tata iron industries have been benefited by the research work conducted by the Geological Department of the Government of India.

Q. 17.—The Government should always lend available experts to private persons, firms or companies on easy terms.

Q. 18.—The results of the researches made by Government paid experts should not as a rule be published without the consent in writing of the private persons, firms or companies on whose behalf the experts were engaged; otherwise in my opinion it would be nothing short of breach of trust.

Q. 19.—In places where a particular industry is being worked, but not satisfactorily, the Government should open demonstration factories.

Q. 20.—Demonstration factories should be established in Central Provinces to manufacture glass, also porcelain, earthenware, namely, dinner and tea sets, etc., and various kinds of oil by up-to-date machinery.

Q. 21.—From 1904 I have always received the greatest kindness and assistance from the technical department of the Imperial Institute, and it is only due to the institute's assistance that I have been able to successfully carry out some of my important industrial schemes, namely, The Katni Cement and Industrial Company, Limited, and part of my bauxite scheme.

Its advantages are very great and numerous, for instance, an impartial and correct judgment is given after careful consideration of every factor regarding a new and proposed industry, and the investigations are always very thorough and up-to-date. The imperial knowledge of the institute is very great and therefore it has the greatest facilities to judge correctly of the possibilities of projected industries within the Empire, and especially with regard to India, which has no independent official trade relationship with any other part of the Empire.

Its disadvantage is that it is starving for want of proper financial aid from the British Government, India and the Colonies which makes it shorthanded, and consequently there is sometimes delay in research work. In my opinion the Imperial Institute holds the unique position of great trust to the Empire and especially to India, whose princes and people collected a very large sum of money to build it.

Q. 22.—Yes, there should be provision for research work for special subjects in England under the scientific and industrial research department established by the British Government.

Research on any important chemical and allied subjects should be carried on in London, because the best and most experienced scientific men, proper laboratories and appliances are available there.

Q. 23.—The Advisory Council for Research in the United Kindom would be the proper authority to direct all research work for Indian industries.

Q. 24.—I think that there is no college in India which is competent enough to handle properly any research work as is being done in the United Kingdom.

Q. 25.—It requires a thorough survey to further develop the agriculture, forest mineral deposits and their attendant industries.

Q. 26.—It should be organised by the present Imperial Departments, such as the Geological Survey of India, Forests' Research Department and the Government of India, Agricultural Department.

Under the directions of these Imperial Departments each Local Government should organise their own special survey department. Their precise objects should be to develop the production of raw material and to find out an outlet for the same in this country and abroad and, if possible, start industries to manufacture goods from raw materials, etc.

* Q. 27.—The results should be made known as soon as possible to the various parties interested in the particular industries and to place them before the Government officials, whose duty should be to give aid in starting or promoting industries in India.

Q. 28.—They are very useful to all concerned.

Assistance in marketing products. Q. 29.—In my opinion commercial museums should be developed and increased in number. They should be located in any commercial town of importance or towns having over 50,000 Indian inhabitants.

They should be worked under the direction of the Director of Industries for the province, the local executive officials, the municipal committees and district councils.

Q. 31.—In my opinion industrial exhibitions are of real value to educate our people.

Q. 32.—The Government should encourage such exhibitions and should take active part in them.

Q. 33.—These exhibitions should be popular in character and also aim to bring buyers and sellers together.

Q. 34.—There should be trade representatives for India in Great Britain and foreign countries, and the Colonies.

These trade representatives should be business men and be under the Consular Service. Their duty should be in every way to promote the welfare of Indian industries, sale of raw materials, to promptly report and advise on all fresh developments and new inventions on all industrial matters which might directly or indirectly benefit Indian industries or help to dispose of raw materials in suitable and advantageous markets.

Moreover they should constantly report confidentially all trade developments which might benefit India. They should be subjects of His Majesty, but not naturalised alien subjects. Special commissioners should be appointed from time to time.

Q. 36.—Yes.

The Local Government should arrange for these representatives.

Q. 37.—Yes, they should do both.

Q. 38.—At present the Government departments do not carry out the rules relating to the purchase of stores from Indian markets.

These rules should be rigidly enforced and their non-performance should be severely punished by the Imperial Departments and the Local Governments concerned.

Q. 39.—The co-operative societies or proposed industrial banks should help in the matter, of course with the assistance of the trade agents.

Other forms of Government aid to industries.

Q. 40.—During war and famine times.

Q. 41.—It is difficult to promptly secure land in this province for industrial purposes, and sometimes the Government gives preference to agricultural purposes to any prospecting for minerals.

Q. 42.—The Government should always help in every way possible by granting on nominal terms land for establishing new or for the development of existing industries.

Q. 43.—It is very defective and it requires radical amendments.

The law should be simplified so as to give the courts a free hand to promptly acquire lands for industrial purposes.

During the settlements of villages in Central Provinces the Local Government should be empowered by the revenue law to enter into agreements with the lessees of the villages that in future all land required for industrial purposes should be given at a fixed rate of compensation.

Q. 44.—I have tried to improve labourers' efficiency and skill by making them petty contractors in manganese and bauxite mining. I found that they greatly improved.

Q. 45.—(a) Labourers' efficiency and skill can be generally improved by increasing their daily wages and gradually inducing them to become mates of gangs of labourers and ultimately petty contractors; but above all they should have some elementary education.

Q. 45.—(b) The same suggestions will apply to the mining of manganese, bauxite, diamonds, coal, etc. In these mining industries I have had considerable experience.

Q. 46.—I have had no experience about the training of apprentices, etc.

Q. 47.—I have had no experience about industrial schools.

Q. 48.—In my opinion better results would be obtained by apprenticeship system, without which theoretical education in an industrial school is absolutely useless. I should suggest that when a person has finished his apprenticeship he should go through a course in an industrial school, but this is not absolutely necessary.

Q. 50.—The industrial schools should be primarily under the Department of Industries, but the financing and general control should be with the Department of Education.

Both these departments being under the Local Government, I see no reason to suspect that there would be any friction between them.

Q. 51.—They should have some sound general education and apprenticeship in the particular business which they wish to take up.

Q. 52.—There should be technical scholarships open to these men for studying in foreign countries.

Q. 53.—Such firms should be compelled to train technical experts.

Q. 54.—It would be better to have uniform tests in the standard of examination for mechanical engineers for the whole of India.

Q. 55.—The law for the Central Provinces requires qualifications for an engineer, etc.

Q. 56.—The Department of the Commerce and Industry and a Director of Industries and Agriculture. General official administration and organisation.

I think the Director of Industries should be a man experienced in business, and not merely a civil servant. The present arrangements are radically wrong and useless for the purpose of promoting any other industry except agriculture.

Q. 57.—I do not think a Board of Industries for these provinces would be of much use towards the future development of industries.

I am against such a board in any form for the Central Provinces.

Q. 58.—I do not advocate for the Central Provinces an Advisory Board.

Q. 59.—There should be a Director of Industries for the Central Provinces.

He should be a man of business experience with some scientific education or knowledge; he need not be an expert on any particular subject, but he should know the people and local conditions thoroughly, and he should have lived at least ten to fifteen

Q. 61.—I am against the formation of a Board of Industries. The Director of Industries should be under the Local Government.

Q. 62.—There should be frequent and free exchange of information between all the Directors of Industries in India, and they should meet in conference at least four times a year in different parts of India.

It is practicable to form an Imperial Department under a single head. The department's functions should be to correlate the works of all Directors of Industries, industrial bodies and everything concerning industries. It should be the medium through which all research work in foreign countries be organised and be the controlling authority of all trade representatives and technical students abroad.

Q. 63.—The only technical and scientific work which is done as far as I know is by the Agricultural Department and by the chemist attached to it.

Only lately some efforts are being made to improve scientifically agricultural industries. It is difficult to suggest briefly any recommendation.

Q. 64.—I recommend Imperial Departments.

Please refer to my reply to questions Nos. 25 and 26.

Q. 65.—Please refer to my reply to question No. 62.

The officials of this department should be trained scientific men recruited from any part of the world or from India according to the qualifications required to fill such posts.

Q. 66.—The head of the department should have almost absolute power of control subject to the supervision of the Government of India in Council.

Q. 67.—For the time being he should be entirely under the control of the Director of Industries; of course the Local Government should have supervising power over him.

Q. 68.—Please see my reply to question No. 25.

Q. 69.—Under the direct control of the Director of Industries.

Of course under the supervision of the Local Government, but under the final control of the Imperial Departments

Q. 70.—On a good salary and a bonus if good results are obtained under the said expert's guidance.

Q. 71.—All such institutes should work together, and not as independent units.

Q. 72.—It would be better for each institute to confine its energies to deal with a limited group of allied subjects.

Q. 73.—Yes.

Imperial control.

Q. 74.—Yes, it is desirable that strong measures should be taken to co-ordinate and prevent unnecessary over-lapping of any research work. I can but quote from the conclusion of the Report of Advisory Council of Scientific and Industrial Research of England for 1915 and 1916:—"First, a largely increased supply of competent researchers; secondly, a hearty spirit of co-operation among all concerned,—men of science, men of business, working men, professional and scientific societies, universities and technical colleges, local authorities and Government Departments. And neither condition will be effective without the other."

Q. 77.—They should be given facilities of leave and full pay to study abroad under the directions of either the Imperial Institute or the scientific and industrial research department of England.

Q. 78.—The difficulties are very serious. In provincial towns of India there are no technical or scientific libraries for reference work. I have always to procure books from Europe and America for my use, and I have to wait sometimes four or five months for a book or a journal.

Q. 79.—Yes, every Government college in large towns should have a complete and up-to-date library containing all scientific and technical books, including patent journals and other current technical papers, reviews and journals for references. These libraries should be open to the public on application.

Q. 80.—Certainly not.

Q. 81.—I do not think that a college of commerce could in any way assist in the development of any local industry.

Q. 82.—Yes, the statistics are neither comprehensive nor up-to-date. It is very difficult to get any statistics on many important subjects. There should be improvement in collecting statistics, tabulating and making them full and up-to-date. These should be published oftener.

Q. 83.—Same as 82.

Q. 84.—None.

Q. 85.—Yes, but they should consist of the latest information collected by the foreign trade representatives, Directors of Industries and experts under them.

Q. 86.—My reply is the same as to question 85.

Q. 87.—Monographs are useful in placing local information at the disposal of any investigators of the particular subjects.

Publications by the Geological Department are of great use for the development of mining and allied industries, but the publications should contain more information regarding the commercial interests than scientific work. I suggest that the procedure adopted by the United States' Geological Department may be followed with advantage. The records of the Geological Survey should be published oftener than usual.

Q. 88.—Please refer to my reply to question 85.

Q. 89.—Yes, fibres, indigo, wheat, oil-seeds and other agricultural produce. Some should be compulsory, others voluntary.

Other forms of Government action and organisation.

Q. 90.—The Imperial Agricultural Department jointly with the Collector of Customs should organise the testing and certifying.

Q. 91.—Yes, drugs, fibres and some agricultural produce.

Q. 92.—Inspectors to examine and prosecute.

Q. 93.—When misdescription of goods is found, the goods should be confiscated and the owners fined.

Q. 94.—The Indian law for trade marks and trade names is very defective.

Q. 95.—The patent laws applicable to India are radically defective.

Foreigners take out patents not to work but to prevent others establishing similar industries in India. The patent laws should be applicable to the Native States and the laws should be just the same as in England.

Q. 96.—No.

Q. 97.—More railways, roads with culverts and bridges are needed in the Central Provinces.

Q. 98.—Yes, the railway freights should be lowered in the case of new industries which require large quantities of coal, salt and other imported goods to the extent of one-eighth of a rupee per maund per mile.

The same rate should be applicable for minerals which cannot be profitably utilised in this country, and have to be exported.

Q. 99.—Yes.

Q. 100.—I do not think so.

Q. 101.—The external trade is very seriously handicapped because of the high shipping freights. The remedy is apparent, namely, building more steamers.

Q. 102.—Very little.

Yes, in the Central Provinces and the adjoining States of Rewah, etc.

Q. 103.—I think the Local Governments should be given a free hand to renew prospecting licenses up to five years, when the Government is satisfied that *bond fide* prospecting has been done and that for reasons beyond the control of the prospector the prospecting licenses could not be matured into mining leases.

Moreover, very large powers should be given to Local Governments to reserve for any prospector large tracts of mineral deposits for the development of new industries, about which the prospector by his diligence, perseverance, foresight, expense, influence and experience, formulated and proved the possibilities of a future promising industry.

The Local Governments should be allowed to grant prospecting licenses without any surface rent payable by the prospector.

The terms for mining leases require revision regarding the payment of dead-rent, which is generally fixed very high for a new industry; preference should be given to prospecting and mining to agriculture. The forfeiture for not working the mines after the first year of lease requires radical alteration.

Q. 104.—Yes, there are some, which are well known to the Government.

Q. 110.—Half from the Government.

Q. 111.—Yes, Soda, Alumina, Aluminium and various chemicals.

Q. 112.—Bauxite. The difficulties are want of capital and the past inability or neglect of our Government to prevent German and other foreign exports to India to compete against British manufactured articles, in this case aluminium metal utensils, &c., and sheets and ingots.

Oral Evidence, 22nd December 1916.

President.—Q. You say in that the Central Provinces demonstration factories should be established to manufacture glass, porcelain, earthenware and various kinds of oils. Do you think that in the case of earthenware Government should have a demonstration factory?—A. Yes, none of the pottery companies, such as Messrs Burn & Co., Limited, would take it up as they said that skilled artisans were necessary who would be able to modify their systems to the local conditions. I, in conjunction with the Bombay Mining and Prospecting Syndicate, fully investigated this matter in England and we came to the conclusion that it would be quite feasible to start an earthenware industry in this district.

Q. If it is quite feasible why not go ahead with it?—A. I have ceased to have any connection with the Bombay Syndicate. Since it formed the subject of one of the questions issued by the Commission I advise that the Government might start a demonstration factory.

Q. If you have severed your connection with the Bombay Syndicate that leaves you free to take up the thing and go ahead?—A. One of the questions was whether there were any industries that Government might take up and that is my reply. I have not treated it as a personal matter.

Q. There is no use taking up a thing which has been found to be feasible and which can be taken up by private individuals?—A. Because private individuals have not taken up the thing, I suggested it. I am otherwise full up. I think that Government should come up when no one is ready to come forward.

Q. In other words you have given up the idea of doing it?—A. I have no spare capital now, otherwise I should start it myself. I am going to ask the Government of the Central Provinces to take up this industry.

Q. In answer to question 87 you say that the procedure adopted by the United States Geological Survey might be adopted with advantage. What is the exact procedure?—A. Mr. R. Mitra.

I think that they have a better system of reporting on the economic side of the geological possibilities of a country, whereas here the scientific and the economic questions are mixed up. I have studied the United States Geological bulletins for some time. They have a more elaborate system and they give one a very good idea as to what minerals could be taken up profitably, its economic value and valuable informations regarding its uses and manufactures, etc. I do not say that the system should be copied, but I thought it might be followed in some ways.

Q. The question really turns on the strength of the staff?—A. I know that our Geological staff is poor. Our staff will have to be increased. I know this quite well.

Q. Do you think that the staff should be increased as to admit the publication of information regarding the economic side as well?—A. Yes, probably four times the present staff might be required and certainly should be provided for.

Mr. A. Chatterton.—Q. Could you tell us something about the Indian Bauxite Corporation?—A. It is a corporation composed of the aluminium trusts of France, the late senior partner of Messrs Jardine, Skinner & Co., of Calcutta, myself and in England two other friends. In the beginning I had technical help from the Director and Dr. Henry of the Imperial Institute. The idea was to manufacture aluminium by a French patented process; full information about which I have placed with Dr. Havden of the Government of India, and the Commerce and Industry Department. Just before the war we arranged to form a company in France with half a million pounds capital to work my bauxite areas; the approval of the Secretary of State for India was obtained. Everything was ready and just at that time War was declared; there the matter remains and I do not know when it will be realised.

Q. Is the scheme simply hung up on account of the War. Afterwards do you propose to go ahead?—A. That is certain as far as I can see. They have not got the men for it now. It is an altogether new process and requires new and complicated electrical plant which cannot be fitted up by anybody even in England, so I must wait for the assistance from the French people. The Government of the Central Provinces and Sir Benjamin Robertson know all about it.

WITNESS NO. 162.

*Mr. R. Mitra, A.M.I.C.E., Superintending Engineer, Public Works Department,
Central Provinces (Retired.)*

Written Evidence.

Introductory.

Qs. 4, 11 and 56. —The industrial life of the province is synonymous with its agricultural life. There has been marked activity in recent years in mining enterprise, and such excellent factories as the Empress Mills of Nagpur, the Pottery Works of Burn & Co. of Jubbulpore, and the Cement Works of Katni denote a high order of industrial achievement. Yet the vast resources of the province remain untouched and it stands to day as it was, pre-eminently agricultural. As in other parts of the world, manufacturing industry, rather than agricultural, must raise the fabric of economic advancement. A new force of industrial activity must arise before any real progress can be made; for the manifestation of this force our hope is centered in the co-operative movement which Government has so thoughtfully inaugurated. In the words of the Act this movement aims at the promotion of economic interests in accordance with co-operative principles. A distinct and very encouraging advance has been made in the direction of agriculture; but what little has been accomplished on the non-agricultural side is most disheartening, for the rustic societies are destined, before long, to be overwhelmed by the increasing pressure of modern industry. The young co-operative plant has to be trained to spread and grow, slowly but vigorously, in more directions than one; and the Government and the people must join hands in feeding its roots and aiding the development of leaf and bud with fostering care.

Preliminary Survey.

Qs. 25 to 27.—The preliminary surveys for industrial purposes must be conducted by Government. The Director of Industries has, I believe, collected valuable information regarding the available resources of the province. Facts and statistics in this connection cannot be brought together in an accurate and useful form by any other agency. The Director is a high officer of Government of proved capability and weighty experience. He is in touch with local officers and has at his command official records in all branches of the Administration. He has thus every facility for compiling and maintaining up to date a careful and systematic record of all that is known on the subject. An annual memorandum on the precise industrial position of the province drawn up by him would prove of inestimable value to the investing public.

Much of this information lies on the surface. Even a week-end tourist, if so inclined might gather facts and notions for himself with astonishing rapidity. Round about Jubbulpore, for instance, will be found the extensive flourishing Pottery Works of Messrs. Burn & Co, whose skilful management has produced the only profitable industry out of the "Gondwana" clays of Jubbulpore; another similar factory which is struggling for its existence for want of good management and efficient machinery; a tolerably successful cotton mill, being one of the three or four of its kind which have come into being for the utilisation, in an infinitesimal measure, of the produce of the immense cotton tracts of the province; an insignificant looking factory of glass-ware possessing elements of great productive value but perishing as a result of impoverished capital and nerveless effort. A short afternoon drive towards the Mandla range would take you to the hamlet of Barela, a typical *entrepôt* for the export of vast quantities of myrabolams of good quality known as the "Jubbulpore myrabolams," which might form a nucleus for the growth of important tinctorial and tanning industries. It would, moreover, give a bird's-eye view of the picturesque basin of the Nerbudda and that of its tributary, the Gour, wherein the possibilities of hydro-electric power might be found awaiting investigation. The heavy traffic on the road would draw pointed attention to the need for railway feeder extensions in this province. A couple of hours' railway journey from here would take you to Katni where there are clustered together a number of industries varying from the crudest forms of manufacture of lime and mineral pigments to the highest and most up-to-date processes of cement and pottery works. The capacity of these excellent cement works is largely below requirements and the pottery branch is exhibiting symptoms of failure, because it is placed outside the Gondwana formation. A few hours' further journey would land you in an atmosphere of noxious gases from the slaughter-yards of Damoh, wherein one might discern the germs of a great and prosperous leather industry. A similar journey southwards would afford you the opportunity of examining the very useful match factory of Kotah which is languishing for want of adequate support and wood of the right description.

Promotion of Industries.

Qs. 56 to 61.—A preliminary survey such as outlined above merely furnishes an indication of what is *possible*. The next step is to determine what is *practicable* and likely to prove *remunerative*. This brings us on to the stage of investigation and acquisition of special and more comprehensive knowledge which paves the path for "promotion." This stage is of the highest value in industrial progress. It is at this stage that the seeds of success or of failure are sown. It represents the great period of "waiting" which might occupy months or years of arduous labour before any benefit in return could be hoped for. An enterprise which passes successfully through this period of toil and responsibility emerges full of the richest promise. Absence of this stage or its precipitancy, on the other hand, spells failure.

There is no organised agency in this province with the requisite capital and business capacity for "promotion". Capital and business capacity are as essential for promotion as at the ultimate stage of working and proceeding to earn profit. The present policy of *laissez-faire* for which the Government and the people are alike responsible, leaves everything to chance and individual effort—two most excellent factors in their way but in their resultant effect not always conducive to the best results. A giant of the Tata type who possesses all the highest qualities of philanthropist, business man, leader of men, *entrepreneur*, is a rare phenomenon. Philanthropists of the class who have flocked round the "Swadeshi" standard, although enthusiastic champions of the cause, often operate in the mists of speculation and conjecture and, armed with unassimilated facts and statistics, strive for light without a match and for a match without wood.

After these come a host of speculators and adventurers, a mere fraction of whom are really sound or capable of taking an active part in engineering a business with advantage to themselves and to the public at large. The majority are graft-licking but not taking, and observe the art of acquiring something without doing anything.

manufacture, oil and *sarkhi* mills, printing and cotton presses, which have appeared and vanished in India in the last twenty years, it would reveal an appalling record of fraud, failure and ruin. It would illustrate why, in the industrial world, capital remains shy, effort lies crushed, and talent wanders unemployed.

What we need most in this province is a strong organisation for the promotion of industries based on co-operative principles, supported and guided by Government, assisted by the Registrar of Co-operative Societies, and presided over by the Director of Industries. Schemes thought and worked out by such an influential body would at once attract capital, and the great financiers of Bombay and Bengal and distinguished business firms like Messrs. Martin and Company of Calcutta and Messrs. Killick, Nixon and Company of Bombay who have contributed so largely to the advancement of the industrial cause of India, would readily come forward to place the development of the province on a sound footing and provide the dynamic impulse for its ultimate triumph. The proposed organisation should confine its activities, for the present at any rate, to promotion only. The time will no doubt come, perhaps at no very distant date, when it may extend its sphere of action and begin to branch off into separate co-operative societies or to help in the formation of local private syndicates for the promotion as well as the actual working of provincial industries without any outside help.

Financial Aid.

Qs. 1 to 8 and 13. — There are hardly any large capitalists in this province. The very few there are have their hands full with their own affairs and have neither the time nor the inclination to attend to other objects. Since my retirement last year I have been approached by several would-be promoters for help and advice and some of the projects placed before me were of a very promising character. In nearly every case the requisite capital was not forthcoming for the preliminary investigations. In one instance where the difficulty of capital fortunately did not arise, the project was buried out of sight because co-operation with other people capable of bringing it to a successful issue was highly distasteful to the party. There is abundance of capital outside the province which, I have been assured by men of the highest position in industrial circles, would be ready to flow in if carefully worked out schemes of a profitable nature could be definitely laid before them.

Capital.

It is significant that the only feeder railway in the province, the Central Provinces Railways Company, owes its existence to outside influence. That influence has, however, not been persistent enough in the same way, for instance, as in Bengal where Messrs. Martin and Co., Gillanders, Arbuthnot and Co. and McLeod and Co., of Calcutta are steadily multiplying such railways. Time was when Government promissory notes constituted the only form of investment for the middle classes. Railway enterprise has been rapidly winning the confidence of the public and railway shares have come to be regarded as gilt-edged securities, sometimes even without any guarantee of interest on capital from Government or District Board (*e. g.*, Shahdra-Saharanpur and Dehri-Rohas). The salvation of this province lies in its own hands; the people must learn the value of thrift and self-reliance, and Government must help and guide the people in working together on co-operative principles. The aggregate working capital of the co-operative banks in the Central Provinces and Berar stands this day, I believe, somewhere in the neighbourhood of 45 lakhs. One object lesson such as this should suffice to fill our minds with hope and faith in the future.

To begin with, Government must take upon itself the task of establishing a co-operative organisation for the promotion of industries in the manner indicated above. Once a machinery of this description is properly set in motion, the evolution of projects falling under the heads of the following classification would become a matter of time and systematic effort :—

Government assistance.

Class A.—Remunerative projects which private capitalists or syndicates would take up readily.

Class B.—Projects which would have a reasonable prospect of proving commercially practicable.

Class C.—Projects the commercial practicability of which would be somewhat uncertain but not altogether so.

Class D.—Projects which would prove to be commercially impracticable.

There would be no lack of capital for the class A industries and Government assistance would follow the lines adopted for railway enterprise. The public has become familiar with the operation of the system of guarantee given by Government for railways and by District Boards and Municipalities for railways and electricity schemes. Nothing beyond this would be necessary to ensure success in the case of this class of projects. Class D projects would of course be shelved, at any rate for the present.

Pioneer factories.

Projects under classes B and C would come under this category. I have no experience of Government pioneer factories but am inclined to think that these should, as far as practicable, be run on strictly commercial lines. I would invite private capitalists or companies to work these industries, certainly those of class B, by giving a guarantee of dividends higher than in the case of class A, coupled if necessary with the supply of machinery and plant on the hire purchase system and the promise of Government purchase of products for a limited period, in the event of a still further concession being deemed expedient. Endeavour should, in the first instance, be made to deal with class C on the same basis, offering if necessary even more favourable concessions than in the case of class B. Failing this, Government must pioneer industries of class C utilizing jail labour and expert departmental agency (*e. g.*, Forest and Agriculture) for the purpose where practicable. In the event of these pioneer industries proving successful no time should be lost in placing them in the hands of private companies for further development. The field for industrial operation is so great and the number of private enterprises is so small that, in this province at any rate, Government assistance need not bind itself to any limits. Private capital and private effort have been exceedingly shy in their appearance and a certain amount of preliminary courtship will be necessary before they can be brought forward to the open-air life of industrial activity.

*Co-operative organisation.***Composition.**

Qs. 10 to 12, 56 to 62, 97, 99 and 102.—We may now proceed to look somewhat more closely into the scheme of co-operative organisation the vital importance of which, in the present industrial state of the province, I have ventured to urge in the foregoing paragraphs. It is conceivable that when the principles underlying the scheme are fully understood private syndicates formed on co-operative lines or otherwise might come forward to take the field in the right way and spirit. But there has been a long enough pause in this direction and the time has, I think, arrived for co-operative movement by the united efforts of Government and the people. We must proceed slowly, with due caution and deliberation, and without going to the opposite extreme of running at railway speed. The control of this organisation should be vested in a Board or Syndicate composed as follows:—

PRESIDENT—Director of Industries.

VICE-PRESIDENT—Registrar, Co-operative Societies, who will preside in the absence of the President.

MANAGING DIRECTOR OR SECRETARY—An experienced man (preferably non-official) who would have the confidence of Government and the public.

MEMBERS—1. Commissioner of the Jubbulpore Division.

2. Chief Engineer, Buildings and Roads (who deals with railway and electricity matters).

3. One of the recognised leaders of the province (*e. g.*, Sir Gangadhar Chitnavis and Sir B. K. Bose).

4, 5. Two leading business men of the province (*e. g.*, Sir Kasturchand Daga and Sir Bezonji Dadabhoy).

6, 7, 8, 9. Four prominent members of the co-operative society (in addition to 3, 4, 5).

10, 11, 12. Representatives of outside business firms (*e. g.*, Messrs. Martin and Company of Calcutta and Messrs. Sassoon David and Company and Messrs. Killick, Nixon and Company of Bombay).

Functions.

The principal task in front of the Board will be the promotion of industrial schemes; towards the fulfilment of that object the presence on the directorate of financiers and business men of high repute is essentially necessary. The time is opportune for investigation and promotion; the activities of the Industrial Commission have brought into prominence the urgent needs and almost unlimited resources of the province; and the War has caused a lull which can be turned to advantage in prospecting, collecting statistics, working out approximate estimates of outlay and profit, getting up cut-and-dried projects, and holding ourselves in readiness to begin work immediately normal conditions are re-established. At the same time the Board can employ itself in disseminating knowledge, awakening the people to a sense of responsibility in regard to their economic advancement, educating them in the methods of promotion and the advantages of prudent investment, and preparing the public generally for the laying out of capital when the time comes for financing industrial enterprises.

The development of industries is seriously handicapped by the inadequacy of communications and the almost entire absence of railway feeders. Much has been done towards road construction but a vast deal more yet remains unaccomplished. Energetic steps must be taken for the improvement of road surface and river crossings to ensure the uninterrupted passage of traffic throughout the year and facilitate the establishment of transport services of the most modern types (*e. g.*, motor lorries and buses). Even measures such as the imposition of a special cess or the falling back upon the primitive if not pernicious system of levying tolls, however distasteful in their operation, must not be shrunk from if proved inevitable for the salvation of the province. In the front rank of schemes to be promoted must be placed feeder railways and electricity supplies. The one railway feeder can with the utmost advantage be increased a hundred-fold and in place of the one electric installation we can easily afford to have twenty. Projects of this type are invaluable, for their advancement from inception to fruition lies in the hands of Government and its subordinate District and Municipal Boards. The surplus capital of the wealthy, the hoardings of the poor and the savings of the middle classes are being steadily drained away to the neighbouring provinces for the fulfilment of such objects, and an earnest and determined effort must be made to arrest this outward flow and divert it towards our own enrichment.

Roads and rail

Other schemes for promotion will soon begin to unfold themselves. The mining enterprise which has already achieved so much has before it a very large field of activity. The Gondwana clays which have been raised by handfuls may be extracted in tons. The existence of materials for glassware has been proved. The pressing of oil in the great cotton and oil-seed bearing areas is likely to prove profitable. The rich sugar-cane tracts will afford an excellent opening for sugar industry. The immense *hurrai* forests, the thriving trades in hides and skins, the extensive speculation in lac, etc., offer promising fields of research in the direction of dyeing, tanning, manufacture of tannin and leather, etc. The desultory inquiry into hydro-electric schemes has so far merely led to the discovery of sources of power beyond the range of industrial centres. A simultaneous and carefully organised effort towards the development of power and the growth of industries within driving distance would be productive of valuable results.

Other schemes.

The capital required for promotion will not be very large and in due course it may perhaps contrive to live and grow on its own earnings. This capital is not, as in the case of agricultural co-operative societies, to be issued in granting loans to others but for consumption in the search after profitable schemes. No highly organised machinery is, therefore, necessary to raise capital for this object. The simplest course would be to arrange for the co-operative movement being financed by the provincial co-operative bank to or by an industrial bank, preferably the former in order to promote cohesion between the existing and the new co-operative organisation. Sir Benjamin Robertson has in a recent pronouncement called attention to the fact that half of the provincial bank's capital is invested outside the province, and to the coming time when there should be a wide field for the local investment of resources. The new movement would signify a partial fulfilment of his anticipation. If banking facilities must be sought elsewhere, an industrial bank might be brought into existence for such purposes as an offshoot of one of the presidency banks (Bank of Bengal or of Bombay) but not of any private bank. There are several private banks whose stability is beyond question, but the co-operative societies are not free from elements of uncertainty and it would be highly inexpedient to add to these by any further risk which might possibly arise from the failure of a private bank, however unlooked for.

Financing agency

The recurrent charges will consist of the salary of an office staff and interest on the capital laid out. I am not a great believer in absolutely honorary work and it seems to me that the need will be felt for a paid managing director or secretary. Some public spirited person possessing the requisite qualifications might perhaps offer his services on a comparatively small remuneration: otherwise a good business man on a substantial salary must be appointed. Then there will be the outlay on investigation, collection of data and statistics, reconnaissance surveys, prospecting new areas, expert advice and research, and travelling and other miscellaneous expenses inseparable from such an undertaking. Above everything else, thoroughness must be constantly aimed at. With the help of departmental records and the active support and assistance of the heads of departments and district officers, it should be possible to keep the outlay within very reasonable bounds. The annual expenditure will depend on the number and nature of schemes taken up; of this no forecast of value is possible at present. The expenditure will, of course, grow from year to year, but it will probably not go beyond half a lakh per annum during the first three years.

Outlay.

I have no means of knowing what private promoters or established business firms make out of the "promotion" charges. I am told that in the flotation of a flourishing industry of recent date a private syndicate recovered three times the actual cost of promotion. Among the projects placed before me for professional scrutiny, I noticed that one

Earnings.

would be syndicate estimated return of Rs. 100 per cent. and an aspiring promoter with certain crude data for a scheme of apparently high promise calculated upon clearing six times his outlay. One can form some idea of the promotion and floating expenses of a railway company from the clear and concise prospectus which it ordinarily issues for taking the public into its confidence. A typical feeder railway on the 2'-6" gauge, 25 miles long, costing say 10 lakhs, would probably bear something like the following charges debitable to capital outlay :—

Preliminary expenses	7,000
Surveys	15,000
Raising of capital, commissions, brokerages, and other incidental expenses.				50,000
Advertisements, printing, legal and registration charges etc.				3,000
				<hr/> 75,000 <hr/>

It would appear that 7 to 8 per cent. of the capital outlay is usually absorbed by the promotion and floatation charges. If the co-operative movement proceeds methodically with the requisite energy, perseverance and intelligence, I do not see why it should not earn at least one per cent. out of the capital raised in this manner. If 40 to 50 schemes could be successfully launched in the course of five years—which is not an over-sanguine estimate, considering that they would probably include some thirty railway and electricity projects—the percentage earned on an aggregate capital of 500 lakhs would probably bring in 5 lakhs equivalent to an average return of one lakh per annum.

Profit and loss.

Of the four classes of projects indicated above the promotion of classes A, B and C would be of a remunerative character. That is to say, the Board would charge promotion money in each case, which would cover actual expenses *plus* a fair margin of profit, and go against the capital cost of the undertaking. Class D would thus be the only source of loss. Of the extent of loss likely to be sustained in this way no idea can be formed until some advance is made in actual operations. The profit and loss account will adjust itself satisfactorily in a series of years, as soon as success begins to over-balance failure, through skilful management. Government must be prepared to face the contingency, however remote, in which a partial deficit may have to be recouped in spite of all suitable precautions. It may be reasonably hoped that with due exercise of fore-thought, prudence and economy, the co-operative movement will become self-supporting and a source of profit to itself as well as to the industrial public at large.

Conclusion.

The predominant task before us is the vigorous advancement of industrial progress. For the accomplishment of that task, a powerful agency is needed for investigation and promotion. In a hurried memorandum like this all that can be attempted is a very rough outline of the organisation requisite for the purpose; its form, functions, fields of operation and financial prospects. The precise determination of these essential particulars must rest with Government guided by the recommendations of the Industrial Commission. The co-operative organisation herein urged is designed to take the place of spasmodic efforts of individuals which have proved ineffective and inadequate with the result that this province is at the present moment a mere looker-on while its neighbours are climbing resolutely, step by step, upon the great ladder of industry. It is to be the vital nerve-centre from which industrial activity will flow and radiate in every direction. And the wave of prosperity that must set in in response to the united impulse of Government and the people cannot fail to satisfy the aims and aspirations of the province in the fullest measure.

Oral Evidence, 2nd December 1916.

President.—Q. I have only one point on which I should like to ask you and that is with reference to what you say in the concluding paragraph which is not very clear as it is worded now. You say 'the co-operative organisation herein urged is designed to take the place of spasmodic efforts of individuals which have proved ineffective and inadequate with the result that this province is at the present moment a mere looker-on while its neighbours are climbing resolutely step by step upon the great ladder of industry.' In what way has this province been differently placed to the neighbouring provinces? Have they had any special organisation or assistance which this province has not had?—A. I do not refer to matters of assistance. They had more private capital and business capacity. There has been no organised effort in this province.

Q. Do you think that this will not occur if Government had the initiative?—*A.* I think Government help is very necessary. The mere fact that we have not advanced so far shows that something is wanting and that Government assistance is necessary.

Q. Before anything like a serious development takes place you consider that it is necessary to have a big organisation such as you have sketched out here with the Director of Industries as Chairman. Who is to provide the capital for this?—*A.* I have indicated how the capital is to be derived. First of all the Directors can do something. Take the example of the Central Provinces Co-operative Bank. Every director has to purchase shares to the extent of Rs. 5,000. If you have 12 directors that would bring in Rs. 60,000 and then a minimum subscription of Rs. 10 might be laid down for members.

Q. That would be a sort of development company which would branch off into subsidiary companies later on?—*A.* Not immediately. That will come some time afterwards.

Q. Would you allow any industries to be developed without regard to its parent company?—*A.* Any schemes that may be formed will have to be placed before the Board. We should not court failure and dupe the people. Certain industries have been started in way and that has led to failure.

C. E. Low, Q.—You speak of industrial surveys. Do you consider an industrial survey made by non-expert agency of any use?—*A.* There are so many departments of industry that you cannot have an expert for every department of industry. I think an intelligent man who knows the province can easily make a survey of the province on the lines indicated and a haphazard see what the province is capable of doing.

Q. The possible sources would lie in minerals and agricultural products and forests and there are the Geological, the Agricultural and the Forest departments. Would they not be more suitable agencies than these non-experts?—*A.* There must be some authority who would co-ordinate the activities of these departments and at the same time extend their enquiries in all possible directions. There should be a central authority for doing this. He ought to be a man who would bring all the facts and experience together and place it before the public.

Q. He would not do anything himself?—*A.* He would not be a mere compiler and in doing his work he would bring his own experience to bear upon the subject.

Q. Have you hitherto seen any practical result from an industrial survey?—*A.* I do not know if there has been a regular industrial survey so far and no effort has been made to take advantage of the survey.

Q. Under the scheme which you contemplate would they get their own experts or would the Government place its experts at its disposal?—*A.* If we cannot get expert advice ourselves we shall have to get it from outside and that will have to be paid for.

Q. Does your scheme arise from the fact that the Government have done nothing or is it due to the fact that your scheme would be better than having a Government department with experts to do the thing?—*A.* I do not say that the Government has not done anything. What I say is that the people must also do something in that direction.

Q. You would like to bring in the people?—*A.* Most certainly.

Q. With reference to what you say about the co-operative organisation are you a considerable investor?—*A.* Yes.

Q. Is the confidence of the people due to the fact that Government has got an expert controlling agency?—*A.* Not merely that. I think there is the feeling that the organisation will not be allowed to fall to pieces for want of proper control. That is because Government is at the back of the thing, not as a responsible agent but as a controlling agent.

Q. There is the belief that the control will be effective?—*A.* Yes.

Q. Do you think it would help if Government undertook the research portion of any enterprise?—*A.* There is no objection to Government taking up research work, provided the results of the work are placed before the Board.

Q. Do you think it is right to have a large number of people?—*A.* Very largely. I could easily name half a dozen who have got in a couple of weeks.

Q. They don't invest much in Central Provinces?—A. I have not got the prospectus. I suppose not.

Q. Do you think that local manufacturers would have a better chance of supplying stores if you had a department of stores in India under the Government of India?—A. I don't think so. I think we ought to proceed on perfectly commercial lines. I do not think personally the stores department of the India Office has been a success.

Q. Do you think it has been a success from the English point of view?—A. Rather on but not from the Indian point of view. I would have fairplay throughout.

Mr. A. Chatterton.—Q. Would you not like to have a Director of Industries in addition to a Director of Agriculture?—A. I think it would be rather an advantage to have both industries and agriculture together, because I am proceeding on the suggestion that it should be a co-operative organisation.

Q. Is there not sufficient work for the whole-time Director of Industries?—A. I think it would be much better if the work of the two departments were co-ordinated. I don't think there is sufficient work for a whole-time Director. We ought to proceed very slowly. Separation may be necessary later on but at present I would have the Director of Industries and Agriculture in one. We ought to make a slow start at first. If it is found necessary to have two, we can do that later on.

WITNESS No. 163.

Diwan Bahadur Seth Ballabhdas, Banker and Landholder, Proprietor of the
 Jubbulpore Glass Factory, Jubbulpore.

Written Evidence.

Capital.

My experience of the raising of capital for industrial purposes is confined to the Central Provinces, where, in addition to other works, I started in the year 1882 the Gokaldas Ballabhdas Cotton Spinning and Weaving Mills. Later on, in the year 1905, I started the Perfect Pottery Co., Ltd. Both of these are limited liability concerns. In the year 1908 I started the Jubbulpore Glass Factory, and in 1910 projected a hydro-electric scheme to utilize the Gour river. At present both of these are my private concerns, my intention being to turn them into limited companies only after a fair prospects of their being successful.

In spite of my position and influence as a landholder and banker on this side, I had considerable difficulties in subscribing the necessary capital for the mills and pottery works, and the only way in which these concerns could be started was to take the bulk of shares myself. In my opinion the following are some of the reasons why I could not raise the necessary capital, and why difficulties are experienced in general in the raising of capital for industrial purposes:—

- (a) India is purely an agricultural country. In spite of demonstration farms and Government assistance, cultivators continue to follow in the footsteps of their ancestors, and resort to primitive modes of cultivation, without the assistance of labour-saving implements. The science of fertilization is not understood, and hence the productive power of land is being reduced year by year. In the absence of regular canals and water-supplies, crops are mainly dependent on the monsoon. All these causes combine to make agriculture dear, and profits from agriculture are not so large as they are generally supposed to be. This is supported by so few well-to-do cultivators attaining to the status of malguzars. Agriculture being dear, profits are necessarily low, there is no much saving, and hence very little surplus capital is available for industrial purposes.
- (b) The Indian capitalist expects a quick return on his outlay, and is therefore induced to invest his surplus cash in landed estates, rather than in industrial undertakings, where realizations of profits are late and doubtful owing to the following causes:—
 - (i) *Want of skilled labour.*—When I started the Gokaldas Ballabhdas Spinning and Weaving Co., Ltd., I had considerable difficulties in finding suitable labour, and had to send men to Bombay to be trained at the place. The profits of land being reduced as stated above, labour prefers emigration. What labour is available is unskilled, and is to be trained at a considerable cost, and consequent reduction of profits.

- (2) *Want of proper experts, and the very great difficulty in inducing really good experts to come out to India.*—Prospects were not bright at the Perfect Pottery Works for some years till the arrival of a manager from America. Since the starting of the Jubbulpore Glass Factory, I am doing my best to get really good experts, but have been unable to secure the services of good smelters or blowers. Considering that Germany and Austria were the centres of glass trades, as was then imported to this side, I called out, at very heavy expense, German and Austrian workmen from Europe. These workmen did not give the least satisfaction. Up-to-date I have spent about Rs. 5,00,000, which amount, in spite of best results in future, I do not expect to realize back. In spite of this very heavy sacrifice, I have no expert to attend to smelting and blowing departments of the glass factory.
- (c) The very low standard of business morality of those concerned in some of the recent failures in presidency towns (the most notorious being the Indian Specie Bank affair) has acted as check on investment of capital for industrial enterprises. I have lost a sum of Rs. 2,00,000 in the Specie Bank in my zeal to encourage Indian efforts, and this sad experience is likely to prevent many more victims to lay out their capital for industrial concerns.
- (d) The present system of education does not inculcate a taste for industrial enterprises.
- (e) The duty on Indian cotton mills' products has given a false idea to the capitalists in India that the Government is against the encouragement of Indian industries, and will always favour a protective system in favour of home industries.

For removing the difficulties set forth by me as above, I suggest :—

- (1) That agriculture should be made as cheap and productive as possible. The scope of demonstration farms should be expanded. The average cultivator has no knowledge of the means by which his land could be improved, and therefore he should be taught the advantages of manuring his land and of labour-saving implements. Experts should be appointed to study the cheapest mode of fertilizing different areas of country, and the results of their inquiries should be made known broadcast in the language of the people. Arrangements should be made to supply a steady water-supply for cultivation, as far as possible.
- (2) If agriculture is made lucrative, labour will not migrate and a class of capitalists will be created, and under the fertilizing effect of capital, labour will thrive and will become productive. To train labour, arrangements should be made to get out good experts. In my opinion the present system of getting out experts is not satisfactory. The expert must be up to his work, his remuneration should be substantial, and the period of his engagement should be a long one. Without good remuneration a really good man will not be induced to come out to India, and his services are not likely to be productive unless his stay on this side is a long one. On his arrival here, he has to study the resources available, and if his services are not engaged for a long time, he will be just leaving at the time when he has secured sufficient experience. In my opinion this engagement should be for at least seven years.
- (3) I am not in favour of any form of Government control over industrial concerns but, in my opinion, the duties, responsibilities, and powers of certified Government auditors should be increased, to enable them to detect irregularities and frauds.
- (4) As the system of education now stands, an average Indian student thinks a lucrative Government post, or a legal degree, as his goal. Owing to this there is a cramming up of youths educated on a particular line, who are quite unfit for business and industrial purposes, and there is more than enough of lawyers. Owing to there being more lawyers than needed, we see much litigation which ultimately results in making many of the litigants penniless. The system of education should be remodelled and a taste for business, industries, and agriculture should be inculcated.

he first opportunity should be taken by the Government to repeal the duty on Indian cotton mill products, and the deficiency should be made up by increasing duty on non-British importations. The Government should declare definite policy for the maintenance of existing and for the starting of new industries.

Government assist-
ance.

As regards the methods of giving Government aid to existing or new industries, I am of opinion that any of the suggestions made under question No. 5 would be suitable, but perhaps different industries would require different treatment.

General official
administration and
organisation.

I am of opinion that there should be a Director-General of Industries for the whole of India, and that the Directors of Industries of the several presidencies and provinces should be under the Director-General. An Advisory Board should be established to assist the various Directors. This Board should be composed of members selected for their business and industrial capacities. If necessary, these members should be paid men.

A Director of Industries may be a business man, but a Director-General should certainly be an administrative officer.

As to the Government organisation for the collection and distribution of commercial intelligence, in my opinion, for years to come, these journals will be of no practicable utility to the masses, unless they are translated and promulgated in the language of the people.

I have projected a hydro-electric power scheme for the utilization of the Gour river near Jubbulpore. Up to now I have spent about Rs. 40,000, as preliminary expenditure, but nothing definite has resulted owing to the diversity of the opinions of the experts. I am anxious of putting the papers before the Administration, and to ask their assistance in the matter.

NOTE.—Witness did not give oral evidence.

RAJ J. M. MITRA, B.A., Registrar of Co-operative Societies, Bengal.

WRITTEN EVIDENCE.

Q. 1-3.—I have had no experience of the raising of capital for industrial enterprises but I have considerable experience in raising capital for the co-operative movement. At first people did not trust the movement and we experienced the greatest difficulty in getting funds. On the first occasion on which I raised money in Calcutta from the public I had to pay as much as 12½ per cent. but even then money did not come in very freely. Gradually as the working of the co-operative societies came to be known money began to come in freely. At present we do not find any difficulty in getting money at 6 to 7 per cent. and, in fact, we get more money than we can profitably employ.

Another reason why we do not find much difficulty in getting capital for the movement is that in the districts we have always been successful in associating the leading people—men who have the confidence of the public—with the movement. I am of opinion that so far as Bengal is concerned, although the extent of hoarded capital has been greatly exaggerated, a large amount of capital is available which may be attracted to industrial undertakings. The co-operative movement is likely to play an important part in this direction. A development of banking habits among the people will form one of the best means of encouraging investments in industrial enterprises. The circumstances of the country do not, however, permit of a large extension of joint stock banking in the interior, especially in the near future, and the only banking system which is capable of indefinite expansion is co-operative banking. Co-operative banks have in many places been successful in attracting hoarded wealth and in developing a habit on the part of the people of investing their savings. Secondly, co-operation by encouraging thrift will give a powerful impetus to the creation of capital. Thirdly, by reducing the general rate of interest and by putting a stop to usury it will encourage investments in industrial concerns. Fourthly, co-operation, by reducing the heavy load of indebtedness of the agriculturists, will set free a large portion which is now employed on agriculture and which is now earning a rate of interest which industrial concerns can hardly afford to pay, and will thus directly promote and encourage investment of Indian capital in industries.

The principal sources from which capital for industries may be drawn are the savings of middle classes and the savings of substantial agriculturists. In my opinion whenever a new industry is started in any locality an attempt should always be made to get the people of the place to subscribe the necessary capital.

Qs. 5 and 6.—Supply of machinery and plant on the hire-purchase system to industries Government which have been co-operatively organised and to small concerns which agree to put themselves under the guidance of the Director of Industries will be an excellent method of assistance.

I think whenever there is Government assistance there should be some Government control. It seems to me difficult to express an opinion as to the form of this control; but I doubt very much whether the appointment of Government Directors will be productive of much good. The control should, as far as possible, be legal in form. I do not think that any appreciable progress will be made in industrialism in this country till people learn associated action and I would therefore urge the necessity of taking proper steps to develop joint stock enterprises. My suggestion is that a more elastic Act than the Indian Companies Act should be framed to encourage the formation of joint stock enterprises and also to provide for an adequate Government control over such concerns. The Director of Industries should be empowered to register joint stock concerns under the Act. The Act should not be open to big concerns, and the Director of Industries should be given a free hand to register a concern or not. If the Director thinks that the concern is not one which should be registered under the special Act, it will be open to the promoters to have it registered under the Indian Companies Act. The Director should be given special supervisory powers over concerns registered under the Act. It should, however, be made clear that registration under the special Act is no guarantee of success, solvency and good management, but it will afford proper safeguards against abuses and fraud. The Indian Companies Act is based on the English Act, but the present English Act was framed as a result of the experience of the development of joint stock enterprise in the country and did not precede such development as

Qs. 9 and 10.—I doubt very much whether there will be sufficient scope for industrial banks. Financing agencies should be encouraged and I think to begin with, direct Government loans or loans through Presidency banks should be encouraged. Later on when there are sufficient institutions to finance it may be possible to have a separate bank for financing industrial.

Q. 11.—Some arrangements have been formed to assist the weaving industry Co-operative societies have been formed in the districts of Burdwan for assisting the local

- (2) Advances at moderate rates of interest to free them from indebtedness to their money lenders and for maintenance during the period of production and also advances against finished products.
- (3) Arrangements for the sale of finished products in better markets.

There is scope for co-operative societies with regard to the following cottage industries :

Silk-reeling.—There is a promising field of work amongst the reelers of Malda and Janipur for the purchase of improved reeling apparatus and for the joint sale of the silk spun by the members.

Brass and bell-metal.—Societies may be formed for the introduction of labour-saving appliances, such as improved lathes, hydraulic presses, etc.

Pottery.—Societies may be attempted amongst potters for the production of better class of articles, such as enamelled tiles, tea cups. An enterprising person in Dacca has succeeded in putting enamel upon ordinary earthen pots, but the industry is still in an experimental stage. Expert advice and scientific appliances are necessary to make the experiment a success.

Mother-of-pearl buttons.—This is a new industry, about 10 years old. The principal seat of the industry is at Dacca. There are about 200 workers who make these articles in addition to carrying on their vocations. Societies may be attempted amongst these men for the purpose of getting better classes of shells and also for the introduction of labour-saving machinery and joint sale of the articles manufactured. Here also expert and scientific advice is necessary for improving the finish of the articles manufactured. There is a continuous demand for the articles. The country-made things are successfully competing with foreign articles. Attempts may be made to extend this industry in other districts.

Carpet-weaving and blanket-making.—These industries can be organised co-operatively.

Conch shell industry.—This industry is organised on a factory basis. Different workmen work at different stages. Societies may be formed by taking in all classes of workmen; but considering the present condition of the conch shell market, it is not advisable to try to organise any society amongst the conch shell workers. About 10 lakhs of shells are annually imported from Madras. The Madras Government has a monopoly of these shells. Formerly Government used to sell the shells by auction. A Dacca man has, by offering a high price, now entered into a contract with the Madras Government for the monopoly of shells. He is said to have purchased the shells at the rate of Rs. 12 per 100, and is now selling them at about Rs. 60 to Rs. 65 per 100, whereas formerly they were sold at Dacca at rates varying from Rs. 15 to Rs. 28 per 100. I think the Bengal Government ought to enter into some arrangements with the Madras Government by which the shells may be sold to these people at a reasonable rate. I understand several conch shell workers have been thrown out of employment.

Shoe-making.—Two such societies have already been organised for purchasing raw materials at wholesale rates and for retailing them to the members. Similar societies may be attempted in other suitable centres.

The industry of the blacksmiths.—Attempts may be made to organise societies at suitable centres amongst blacksmiths for manufacturing agricultural implements of improved kind at a cheaper price. Improved tools and improved designs may be introduced amongst these men through the medium of co-operative societies.

Carpentry.—There is scope for co-operative societies for carpenters for the supply of wood and for the sale of finished products.

Mat-making.—This is another industry. There is always a large demand for mats. The workers are wholly in the hands of local dealers.

My own opinion is that adequate steps should be taken for the development of the cottage industries in India. Cottage industries at present play an important part in the economic life of India. I believe, if they are properly organised, cottage industries will still survive the stress of factory competition. Skilled artisanship which is connected with cottage industries is necessary to the development of intellectual and aesthetic life in India. The existence of cottage industries has a great value to the community as a whole. The cottage workers are more useful members of the community than mill hands and the country as a whole will be loser if they are allowed to sink to the level of a city proletariat. In developing industrialism in India we should try to avoid the worst aspects of modern industrialism in Europe.

With regard to the maturity of cottage industries, combination and co-operation may solve many of the existing difficulties. At present the industries experience difficulties with regard to the supply of raw material and the sale of finished products. Cottage industries have to buy their finance dear and sell their products cheap. The industries are wholly in the hands of middlemen who supply them raw material very often at exorbitant rates and take over the finished products at a price which leaves the industries very little margin of profit and which reduces the workers to starvation wages. Co-operation will not only enable cottage industries to get a supply of raw material at wholesale rates but will enable them to dispose of finished products at an advantage. It will also enable them to obtain improved machinery which is beyond the means of individual workers.

I would like to mention here that there is also scope for the improvement of handloom weaving by the establishment of small factories under the control of, or owned by, master

weavers" by which term is meant men of some education with a practical knowledge of the modern developments in hand-loom weaving. But in order to improve the general condition of the weavers by means of establishment of such factories, care should be taken to organise them on a profit-sharing basis.

Q. 13.—The principle of *laissez faire* is no doubt theoretically the best principle that a Government ought to follow in regard to economic and industrial activities. But in India where State socialism prevails in many spheres of economic activity, the policy of paternalism is not objectionable, provided always that it is adopted in cases where the people, through lack of knowledge or want of proper initiative and guidance, cannot take full advantage of the situation. The function of the State in India in industrial sphere should be to help the people to help themselves, nothing more or less than that. If in the case of any industry the people cannot be trusted to help themselves the State should not step in. If, on the contrary, the State helps an industry to come into existence, it does not discourage private enterprise but rather encourages it by showing the right lines of advance and helping the enterprising to help themselves.

Q. 14.—I should not think that there should be any limitation; it should be the effort of every country to be as economically self-contained as possible.

Q. 25.—Before any cottage industry is co-operatively organised a proper survey should be made of the conditions of the industry, particularly as to how such industries obtain their raw material and how they dispose of their finished products and how labourers are financed and whether any improvement in appliances is possible. Technical aid.

Q. 30.—I think it is very necessary that sales agencies or commercial emporia for the sale of unorganised cottage industries should be established. With regard to societies among cottage workers the greatest difficulty is now experienced in marketing the finished products. At the initial stage it is necessary for Government to arrange for funds to start a depot in Calcutta for the sale of finished products. In time it will be possible for the societies to take over the cost. Sales agencies.

Q. 41.—The opinion is held by many that the slowness of industrial development in Bengal is due to the permanent settlement which encourages investments in land in preference to investments in industrial enterprises. Land policy.

Q. 43.—Under the Land Acquisition Act land may be acquired for a company, but it is necessary for a company to prove that the acquisition is needed for the construction of some work and that such work is likely to prove useful to the public. It is extremely difficult to prove that any work in connection with a particular industry will be useful to the public. Government should be given a free hand to acquire land required for a company. All applications for land should be submitted through the Director, and land should be selected by him in consultation with the district officers so that such acquisition may not entail hardship on individual persons.

Q. 45.—The best way of improving the labourer's efficiency and skill will be to introduce primary education amongst artisans. An attempt should be made to bring the instruction into touch with their occupations. In the case of several industries the efficiency of labourers will be considerably improved if a substantial improvement can be effected in the condition under which labour is recruited. Training of labour.

Q. 50.—I think industrial schools should be under the Department of Industries but the Director of Industries should consult the Department of Education on educational curricula. I may point out that some sort of combination of general education with manual instruction is necessary to create amongst the people a mechanical and industrial aptitude. Any scheme for giving technical education to the people, particularly to the lower bhadralog class, which does not take into account their hereditary craving for general education, is doomed to failure. Industrial schools.

Q. 56—62.—As regards the development of official administration, my opinion is that there should be a large Imperial Department in charge of a Director General of Industries. He should have special scientific departments for research and should be assisted by a body of experts. The research scholars should be engaged in suggesting improvements in material and labour. There should be a central school of design for preparing and circulating design books for workmen. In each province there should be a Director of Industries not necessarily an expert, but an officer with administrative experience. He should be a sort of intermediary between the Imperial Department and the local industries. He should bring all improvements which the Imperial Department recommends to the notice of local industries. He should advise the central department whether with regard to any local industries there is scope for research. His advice and assistance should be placed freely at the disposal of all the industries in the Province. He should arrange for technical advice and assistance to local industries in consultation with the Imperial Department. He should make investigations as to the suitability of any industry to any particular area and should advise the people about the steps to be taken to develop the industry. He should try to develop joint stock enterprises very much in the same way as the Registrar of Co-operative Societies tries to promote the development of co-operative societies. To begin with, it may not be necessary to place experts under him. He will have the experts of the Imperial Department to assist him. Later on when there has been some development I anticipate that it will be necessary to place whole-time experts under him. General organisation.

I would recommend the appointment of an Advisory Board consisting of officials and non-officials. The Director of Industries should be directly under the Provincial Government and the Member of Government in charge of Commerce should preside at meetings of the Board of Industries.

Colleges of commerce.

Qs. 80-81.—I would like to see colleges of commerce established or preferably commercial universities which will combine general education with theoretical and practical training in special industries. This will satisfy the passionate yearning of the people for university degrees and will enable students to specialise in special industries.

General.

Q. 112.—In the case of conch shell industry the supply of raw material is retarded by preventable causes (*vide* answers to questions 11 and 12).

ORAL EVIDENCE, 3RD JANUARY 1917.

President.—Q. May I understand from your answers to questions 5 and 6 that you want some Companies Act introduced, that will not be like the present Indian Companies Act, to deal with smaller concerns?—A. Yes.

Q. In what respects would it differ fundamentally from the present Companies Act?—A. Under the existing Companies Act, any person can float a company and can get any company registered if he shows up the articles of association in conformity with the provisions of the Act. That company may be a bogus company, but he can get it registered.

Q. He has got to supply information about it in the prospectus?—A. Yes. If it complies with the requirements of the law it can be registered. I want an Act which will give the Registrar whoever he may be, (I have suggested that the Director of Industries should be the Registrar), power to refuse registration or not.

Q. That is to say, the Director of Industries will have to look into the prospectus of the company, in other words, he will have to see whether it is a sound investment or not?—A. Whether there is a reasonable chance of success or not.

Q. The difficulty is that you throw an enormous amount of responsibility upon the Director of Industries?—A. Not exactly. Just like the Registrar of Co-operative Societies, he can refuse registration, if he has any doubts about it. It won't interfere with private enterprise because the promoters can fall back upon the Indian Companies Act. Still if the people in the districts know that there is a separate Act and a company registered under that Act will be, to a certain extent, under Government supervision, they will be careful to enquire why any company has not been registered under the special Act.

Q. It seems to me that you are suggesting a proposal that is difficult to work in practice—an Act for good companies and the existing Indian Companies Act for bogus companies?—A. Not exactly that. There must be a rule making it clear that it should not be open to big concerns and to achieve this object the Act should define the maximum amount of share capital of a company under the Special Act.

Q. Under any Companies Act it is possible for a company to come to grief and there would be no private enterprise if there were no failures?—A. Taking the co-operative society. A co-operative society can get itself registered under the existing Companies Act. If a co-operative society is registered under the Indian Companies Act, nobody in the mofussil would put money in that society because it will not have the benefit of Government supervision.

Q. In the present Indian Companies Act safeguards have been provided to prevent bogus companies coming into existence?—A. Still there are bogus companies floated under the Companies Act. To a certain extent the companies registered under the Special Act will be under the supervision of the Government.

Hon'ble Sir R. N. Mookerjee.—Q. Will the people like it?—A. I do not think that Calcutta people will like it. I think middle class investors in the mofussil would like it.

President.—Q. You do not mean to say that the present Indian Companies Act is unsatisfactory?—A. It is unsatisfactory so far as small industries financed by the savings of middle class men are concerned, because there is not really sufficient safeguard except that every company must get itself audited by an authorised auditor or accountant.

Q. It is going a step further to extend the paternal attitude of the Government and to make the Director of Industries responsible practically for the soundness of these smaller concerns?—A. I do not think that the Registrar of Co-operative Societies is responsible for the soundness of the co-operative societies at all. He is not in any way responsible. He makes it very clear to the people that he is not in any way responsible for the safety of the movement and I have clearly stated in my note that registration under the special Act should not be regarded as a guarantee of solvency or good management.

Q. Would it not be equally good if the co-operative principle were extended to ordinary small industries like those you mention?—A. The co-operative principles should be applied to cottage industries. I doubt very much whether small industries can be worked on a co-operative basis. I am suggesting a new machinery for those companies which are not big enough for a company or small enough for a co-operative society and for training the ordinary investing public in associated action.

Mr. C. F. Lee.—Q. You are aware that the English Companies Act and the Indian Companies Act are practically identical?—A. Yes.

Q. And why is it there is so much trouble under the Indian Companies Act?—A. The English Companies Act is really the development of joint stock enterprise. Here you have practically no joint stock enterprise. We have copied the Indian Act *en bloc* from the English Act.

Q. In what way is the existing Act unsuitable for the smaller companies? Did it impose too many obligations on them?—A. It is not elastic.

Q. Do you want to move in the direction of greater restriction or less restriction? There ought to be restrictions, and when you know that the thing is not working well you ought to have a machinery to change that?—A. Under the Indian Companies Act it is very difficult to change even the articles of association or the memorandum of association.

Q. You wish to move in the direction of relaxing the law?—A. Relaxation but subject to proper safeguards.

Q. You would like to have it on the same or similar lines as the Co-operative Societies Act?—A. Yes. In the case of small industries we want an organisation by which the Director of Industries should promote small industries and be in charge of the working of the Act.

Q. You want a special Act for companies of the class satisfying these two conditions, they have got to be industrial companies and they have got to be small?—A. Yes.

Q. Should it be controlled by Government?—A. Not exactly controlled by Government. I have not thought over the matter in detail, but there should be some supervision, and the supervision should be legal in form.

Q. Could you carry it further and submit to us a note as to the detailed way in which it should be worked?—A. Yes. I shall very gladly do that.

Q. Turning to the report* on the Bankura Weavers' Relief which is appended to your note . . . ?—A. I have submitted it to the Government. I did not mean it for the Industrial Commission, but I should be very glad to answer any questions on it.

Q. Is this a fresh idea in Bengal?—A. It is an entirely new idea.

Q. It is a thing which is being done for the last 20 years in most of the provinces?—A. At least I do not know anything about it.

President.—Q. Why don't you know about it? Would there be no means by which you should know all these things?—A. I do not know.

Mr. C. E. Low.—Q. The inspector of weaving societies writes the report. Is he one of your men?—A. One of our men. I deputed him to make enquiries into the work of Bankura Weavers' Relief Committee.

Q. There is a post under you like that of the inspector of weaving societies?—A. Yes.

Q. How many weaving societies have you got?—A. About 25.

Q. Are they all over the place, or particularly in certain districts?—A. Most of them are in Birbhum and Murshidabad districts, and others are scattered here and there.

Q. The branch weaving schools are affiliated to Serampore?—A. Yes. The co-operative department has no connection with the Serampore Weaving Institute, and I do not see how there could be any connection between them. Our object is that as soon as the Department of Industries is constituted in Bengal, we should send down weaving inspectors to instruct these co-operative societies in improved methods of manufacture and other things and try to introduce improvements recommended by the Department of Industries. The Serampore school is a mere school for instruction. It has no out-door staff for sending it down to villages. There is one weaving master in Bengal and he is under the Director of Agriculture.

Q. He has nothing to do with Serampore?—A. No. It is rather a curious arrangement, but all the same it is a fact. When I asked for the creation of the post of inspector of weaving societies I suggested to Government that the inspector of weaving societies should know something about weaving but Government did not think it was necessary.

Q. This officer who inspects the weaving societies—does he do anything by way of helping them on the business side to purchase yarn?—A. He helps them in purchasing yarns and finding markets for them.

Q. Obviously the Bankura Weavers' Relief Committee seems to have a considerable difficulty in finding markets?—A. That Committee has been organised to assist not only those weavers who are receiving direct assistance but other weavers who are not receiving direct assistance from them, so they have made it a condition that they should not place their goods on the local market in order that the local market may not be flooded. The work is really carried on, not on a business footing but on a charitable basis.

Q. Have the ordinary co-operative societies with which your Inspector is concerned been successful in improving the market for their goods?—A. In many places he has been very successful in finding a market for them. At present I am organising a sale depot in Calcutta and in fact I have taken rooms for the purpose and it is to be a sale depot for the articles produced by the members of co-operative societies, because we found that unless we made arrangements for finding a market for their goods it was impossible to make any progress in organising co-operative societies.

Q. A discussion that we had with the Registrar and the weaving expert in another province led me to the conclusion that it was very difficult to run a co-operative credit society with success among industrialists for whose products a free market did not exist?—A. As far as Bengal is concerned we have a free market, except in the case of artistic industries and fine weaving.

Q. Suppose you increase your output by mechanical improvements and improvements in handlooms, would that market be still free?—A. Yes.

Q. In the case of the Bankura Relief Committee apart from the restriction which they imposed upon themselves in order to prevent injuring people whom they were trying to help, do you think that a free market exists for their products?—A. So long as these weavers were carrying on their occupation they were finding a market for their goods. It is only on account of scarcity and the fact that prices of yarn have gone up tremendously on account of the War and there is no fixity in the price of yarn, that they are experiencing difficulties.

Q. Leaving the War out of the question, you think that before the War they had a free market?—A. Yes.

Q. What other industrial societies are there apart from weavers?—A. They have three shoe makers' societies and two societies among carpenters, but then in the case of societies among carpenters they are merely credit societies, and we have not yet made arrangements for supply of raw material.

Q. Don't you find it necessary to train the men in co-operative idea, first of all, through credit as the soundest form of co-operation?—A. We begin that way and then we try other forms.

Q. Purchase and distribution?—A. Yes.

Q. In the case of shoe makers you have not got distribution?—A. In the case of shoe makers we have begun co-operative purchase and distribution of raw material. We have not made any attempt at co-operative sale because those people have a ready market.

Q. You cannot better their market?—A. Unless they improve the quality of their shoes we cannot find a better market for them. There is a good deal of local demand for the kind of shoes they make.

Q. You mention various cottage industries for which co-operative societies may be formed. Are you referring to credit as a rule or to co-operative purchase and distribution?—A. I refer both to credit and co-operative purchase and co-operative distribution. In all these things we must have co-operative purchase and distribution combined. It is desirable to begin with credit first to teach them the principles of co-operation.

Q. Whose function would it be to look after things like distribution and purchase?—A. I think that the Registrar should have absolute control over these societies, because the Registrar arranges for their finance, but then the Registrar should always be in touch with the Director of Industries and take his advice just as we are doing in the case of fishery societies.

Q. The Registrar should not be bound to register a society if he thought that it was not on sound lines?—A. Yes.

Q. You would also carry that a step further and say that you would not agree to your central bank financing any enterprise which you think is unsound even if it is backed up by the Director of Industries?—A. Yes.

Q. Hon'ble Pandit M. M. Malaviya.—What is the total number of co-operative credit societies in your province?—A. About 2,500.

Q. And of co-operative banks?—A. By co-operative societies I include co-operative banks.

Q. Can you tell us the number of co-operative banks as distinct from co-operative societies?—A. The bulk of the co-operative societies are co-operative credit societies and they are loosely spoken of as co-operative banks. There are other forms of co-operative society too.

Q. Do these co-operative credit societies help only agriculturists at present?—A. Yes, and also industrialists by which I mean cottage workers. Here and there some of those who own small factories are members of co-operative societies and take loans from co-operative societies to carry on their business.

Q. If these co-operative societies advance money to industrialists, why is there any need for your having a new institution to help cottage industries?—A. We want to start co-operative societies among cottage workers.

Q. Could you not do that under the present Act?—A. Yes.

Q. You only want to multiply their number?—A. So far as cottage workers are concerned.

Q. You speak of a more elastic Act to bring them into existence than the Indian Companies Act?—A. For supporting small industries.

Q. Cannot these small industries be assisted by co-operative credit societies organised under the present Act?—A. By small industries I do not mean cottage industries. I mean industries which are not very big concerns but which are on a small scale and financed by the savings of middle class men. They are too small for the Indian Companies Act and too big for the Co-operative Credit Societies Act.

Q. You suggest that machinery and plant on hire purchase system may be supplied to industries which have been co-operatively organised and then you suggest that they should agree to put themselves under the guidance of the Director of Industries?—A. There are really two propositions involved in that statement. The supply of machinery and plant on the hire purchase system to industries which have been co-operatively organised, and the supply of machinery and plant to small concerns which agree to put themselves under the guidance of the Director of Industries.

Q. What kind of guidance do you want the Director of Industries to exercise?—Is it mere inspection and report or more than that, actual supervision of the business of the concern?—A. It must be advisory. He cannot actually supervise.

Q. You do not mean that there should be actual supervision? You mean advice at starting?—A. Yes, but if it is read in connection with my suggestion of a more elastic Act, when the Director of Industries registers the concern, the concern must agree to put itself under the guidance of the Director.

Q. Suppose a more elastic Act does not come into existence, do you mean that the Director should offer advice as to machinery or as to the locality where the concern might be located general information and advice,—or do you mean anything beyond it? You have said that you do not want him to supervise the work?—A. I did not make any general statement. That will depend more or less upon the Director of Industries. If a company wants supply of machinery on hire purchase system, then it will be a matter between the company and the Government to make a contract as to the supervision that it will receive.

Q. You mean inspection of machinery as one thing?—A. Inspection of the general work too.

Q. Supposing the Director comes and expresses an opinion and the manager of the firm finds that that opinion is not sound, whom would you wish to go to to decide the matter?—A. That will be a matter of contract. When a company wants to take machinery from Government on easy and reasonable terms, the company must enter into an agreement with Government and the agreement to be entered will depend upon the particular circumstances of each case.

Q. Do you think that people will be willing to bind themselves to be guided by the advice of the Director of Industries in preference to that of the manager of the firm?—A. If the Director of Industries finds that a company which wants machinery is entirely in the hands of wrong men, he might insist that they should be guided by his advice before he could recommend to Government that that machinery should be given to the company. I want that the Director of Industries should have a free hand, as a matter of fact. The company may not take the machinery if the Director insists on impossible conditions.

Q. Suppose he is an incompetent man?—A. Why do you have an incompetent man in the first place?

Q. Suppose the manager of the company is satisfied that he is working on right lines?—A. Let him raise money personally and let him not come to Government at all.

Q. You say that the Director should be given special supervisory powers over concerns registered under the Act that you propose. Suppose the Government thinks that the Director should not have such supervisory powers, then would that stand in the way of your having a more elastic Act?—A. In that case I would not have a more elastic Act.

Q. You say that an appreciable progress may be made in industrialism in this country if people learn combination and co-operation. What steps would you suggest to develop joint stock enterprise apart from the proposal of a more elastic Act? Have you any other proposal to make?—A. I do not think there is anything else except propaganda.

Q. Have not pamphlets been issued in Bengal to inform the people generally of the value of co-operative credit societies?—A. Yes.

Q. And is the work being carried on even now?—A. Yes.

Q. Do you mean that that should be done on a larger scale and more vigorously in the case of joint stock enterprise?—A. Yes. It is being done in the case of co-operative credit societies.

Q. You want it to be done in relation to joint stock enterprise also?—A. Yes.

Q. Have you any definite points to urge against the present Indian Companies Act? You say that it is copied from the English Act, but have you anything definite to suggest?—A. I am afraid I have nothing definite to suggest. That is the general impression which I have.

Q. You say that where there are sufficient industries to be financed a separate bank may be had?—A. Yes. At present, if you begin with an industrial bank you would not get sufficient industries to finance.

Q. Where will these small industries that you wish to promote receive their financial support from?—A. For the present they may receive financial support from the Government or take loans from the presidency banks on Government guarantee or anything like that.

Q. Suppose the Government do not see their way to advance loans directly to finance industries and suppose the presidency banks cannot help small industries, would you in that

case advocate the establishment of an industrial bank to help these industries or not?—A. My apprehension is that if you start an industrial bank at once you may not have sufficient scope for lending out your funds. An industrial bank should be organised on a very big scale to be a success.

Q. You think that there are not a sufficient number of industries at present to feed a separate industrial bank?—A. Yes. It can be done in conjunction with other work by the existing banks, but for an entirely separate industrial bank I do not think there is scope.

Q. Have you heard that people find great difficulty in obtaining money to finance their industries?—A. Yes.

Q. Do you think that that complaint is well founded?—A. In some cases it is.

Q. What suggestion would you make to meet their requirements?—A. Direct Government loans or loans from the presidency banks for the present, till a sufficient number of industries are organised in this country to make it worth the while of any one to start an industrial bank.

Q. Would you fix any limit as to the size of the industry, as to what industries money should be lent directly?—I cannot say.

Q. Are you aware of any efforts being made to employ the principle of co-operation for the sale of products?—A. In the case of cottage industries we are doing that.

Q. Do you find that it works well?—A. So far it has worked well but it is still in the experimental stage. I cannot make any definite statement.

Q. You do not want the Government to follow the principle of *laissez faire* in the matter of industries?—A. No.

Q. You say that the best way of improving the labourer's efficiency and skill would be to introduce primary education among the artisans. You do not want to confine it to artisans?—A. No.

Q. You want it to be general?—A. Yes.

Q. And you would bring that instruction into touch with their occupations by putting in some manual training later on, some training in their particular industry and the technicalities of their art?—A. Yes.

Q. You say at the end of your note, "The Director of Industries should try to develop joint stock enterprises very much in the same way as the Registrar of Co-operative Societies tries to promote the development of co-operative societies." Would you advocate a propaganda similar to what your department have been carrying on, to point out the benefits of joint stock enterprise?—A. Yes.

Q. And also to convey information as to what industries can profitably be worked?—A. Yes.

Q. And also information as to the markets for the different kinds of industries?—A. Yes.

Q. In fact, you would expect your Director of Industries to constitute a bureau of information for supplying more commercial and manufacturing information?—A. He might get the information from a separate bureau of information. At any rate, he should be the medium of information.

Q. With regard to raw materials, where machinery can be had, and where finished product may be disposed of?—A. Yes.

Sir F. H. Stewart.—Q. Will you develop your answers to questions five and six a little more clearly in a short note,* stating what difficulties there are at present and what your suggestions are for meeting them?—A. Yes.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. You say you do not find any difficulty in getting money at six to seven per cent.?—A. Yes.

Q. For what periods?—A. Four years, three years.

Q. Then you can easily lend to these industrial societies too?—A. We are lending them money.

Q. About the Director of Industries, suppose he was touring to inspect industries, how are the Board's meetings to be held, how could they manage their affairs if nothing is to be sanctioned unless the Director passes it?—A. The Director of Industries would not manage the industrial concerns at all. He will only supervise and his power of supervision should be limited by the Act. The Registrar of Co-operative Societies under the Co-operative Societies Act has not unlimited powers at all. He has got very limited powers, much more limited than people imagine.

Q. Have you any unions here?—A. Yes.

Q. You say, "In developing industrialism in India we should try to avoid the worst aspects of modern industrialism in Europe." May I know what they are?—A. We know the evils of modern industrialism very well. Crowding in towns and all sorts of things.

Q. You would also have factories in the cities?—A. At the same time we should keep our cottage industries alive. You should not pay exclusive attention to starting and developing mills and other things.

Q. Of course the cottage industries must go on and mills ought to go on too?—A. Yes.

Q. You say that the Director of Industries should be directly under the provincial Government, and at the same time you say that he should be a sort of intermediary between the Imperial department and the local industries and that he should bring all improvements which the Imperial department recommends to the notice of local industries. Must he correspond through the Local Government?—A. It will mean too much delay.

Q. What is your objection to having a man from the Imperial department?—A. He must know the local conditions. It will take a long time for him to know. He must be a provincial man.

Q. He may be a service man?—A. To begin with, my idea is that it is better to have a service man.

Q. How could he have any idea of industries?—A. But then he will have the Imperial department to advise him.

Q. Do you think it would be workable to have the Director of Industries under the Local Government always communicating directly with the Imperial Government?—A. So far as the business side of the industries is concerned.

Q. The Government can appoint a local man as Director of Industries under the Imperial department. They can easily do that?—A. I do not think that will work well. There will be a good deal of friction between the provincial Government and the Director of Industries if he is an Imperial man.

Q. You want the Director appointed by the Local Government, should directly communicate with the Imperial Government?—A. With the Imperial department and not with the Imperial Government. The Department of Agriculture always corresponds with the Imperial Agriculturist direct.

Q. With the sanction of Local Government?—A. There is general sanction, I think, to correspond on technical matters.

Mr. A. Chatterton.—Q. With reference to your answers to questions 5 and 6, you make certain suggestions. Are they based on actual experience of difficulties in connection with small industries?—A. It is based on a general impression of them and not on actual experience.

Q. You promised to submit a note on the subject, and may I suggest that you should first enquire as to how these difficulties have actually been dealt with in other provinces. You may get information as to how they have been dealt with by the existing agency. You are proposing an entirely new method of dealing with them and asking for special legislation?—A. The Registrar of Co-operative Societies in other provinces have nothing to do with industries.

Q. If you suggest that special legislation is necessary for these industrial companies which are too big to be dealt with under the Co-operative Societies Act, should there be any limit to the size of the society as regards financial transactions?—A. Yes. There should be such a limit. Small industries cannot be dealt with by the Co-operative Societies Act because when you start an industry you want to make as much profit out of it as possible. Industries cannot be dealt with co-operatively, except cottage industries.

Q. You have been talking about these industries, but you have not mentioned any specific one of the class that you want to deal with under this Act?—A. Take, for instance, the Rangpur Tobacco Factory Co. That is a small company financed by the savings of middle class men. That is not a big company. There are a lot of fishery companies started, which are absolutely bogus and useless, but the Registrar cannot but register them so long as the articles of association and the memorandum of association conform to the requirements of the Act. The Registrar of the joint stock companies is bound to register them.

Q. What was their capital?—A. Sometimes Rs. 10,000 sometimes Rs. 20,000 and sometimes a lakh of rupees. They are absolutely bogus. They play on the general ignorance of the people in the mofussil and get money from them and after two or three years we hear no more of them.

Q. Is it not possible to deal with these under the existing law?—A. No.

WITNESS No. 165.

MR. A. C. CARR, A. M. I. M. E., Chief Mechanical Engineer, Bengal-Nagpur Railway. *Mr. A. C. Carr.*

WRITTEN EVIDENCE.

Qs. 44-51.—There is at present a scarcity of competent skilled handicraftsmen in the various trades on which mechanical and electrical engineering depend and there is great difficulty in obtaining competent foremen and chargehands for the subordinate supervision of engineering workshops. Training of labour and supervision.

Most of the large railways in India have systems of apprenticeship for Europeans, Anglo-Indians and Indians, but the demand latterly, owing to the continued expansion of railways, the mining and other industries requiring trained mechanics, has exceeded the supply from this source. Railway workshops would seem for some years to come, as in the past, to continue as the principal training ground for skilled mechanical handicraftsmen.

It is impossible to expect either technical colleges or industrial schools to meet a demand of this nature, and money spent on such institutions with the object of turning out skilled handicraftsmen is money wasted. Apprentices in a large workshop are influenced by the standard of workmanship maintained by a number of skilled workmen, to a degree which is impossible in an institution where there may be only one or two skilled instructors, such as a technical college or industrial school, in which the majority are learners.

As a rule lads trained exclusively in a technical college or an industrial school are never competent to supervise and carry out the practical operations required in the workshops, and I have never been able to employ such lads advantageously owing, in the first place, to their want of knowledge of practical operations, and also to the impossibility of paying the salary which the possession of certificates might perhaps have led them to expect.

The standard of workmanship in an Indian engineering workshop is much more easily improved by example than by instruction; it is therefore necessary that foremen and chargehands should be experts in the particular work which they supervise.

Apprentices for training in railway workshops are recruited from three classes:—

- (1) Europeans or Anglo-Indians.
- (2) Illiterate or partly illiterate Indians.
- (3) Indians of some education.

The standard of general education of the European and Anglo-Indian lads offering themselves as apprentices is, with few exceptions, lamentably low, and this is a severe handicap to instruction in the theoretical subjects allied to their practical work. Standards of education appear to vary in the various provinces and, in the case of the children of railway employes, liable to transfer on a railway which may traverse two or more provinces, the want of a uniform standard is somewhat of a difficulty.

The larger proportion of skilled mechanical labour is recruited from the Indian agricultural classes who as a rule are illiterate, but many of this class, in spite of this very great handicap, develop into first class workmen when associated with competent foremen and chargehands, and with opportunities given for suitable education when young, would in years to come be competent foremen and chargehands and possibly rise beyond that grade.

Possibly due to the fact that skilled handicraftsmanship is at present usually accompanied by illiteracy, until quite recently Indian lads of education have not taken to work necessitating skilled manual labour; there is, however, an indication that this reluctance is disappearing. The prestige, however, attached to Government appointments and the legal profession apparently induce many parents to maintain their sons in schools or colleges, with this object in view, to an age beyond that suitable for starting life as a mechanical apprentice, with the result that in many cases the lads eventually drift into clerical or similar work with little prospect of advancement. For the educated Indian lad who undergoes a thorough workshop training and takes opportunities given him of theoretical instruction during this period, the possibilities for his advancement in years to come should be many.

The standard of education of the educated Indian lad offering as apprentices is higher than that of the European or Anglo-Indian lad and it would appear possible to start technical classes on a higher level than is possible with Europeans and Anglo-Indian lads. It is impossible at present however to say whether Indian lads of this class will continue to come forward and undertake practical work in workshops; all that can be done is to provide the opportunities.

In connection with their system of apprenticeship some of the larger Indian railways maintain technical schools for their apprentices, receiving a small grant from Government in their aid. Some of these schools hold classes at night and I believe some hold them during the day.

The Bengal-Nagpur Railway, with which I am connected, have provided a comfortable home for European and Anglo-Indian apprentices, supervised by a matron, and in the same building are situated class rooms in which technical classes are held in the evening; certain classes are also held for the educated Indian apprentices we have at present. We also hold classes in the evening for Indian apprentices who are illiterate or nearly so, where they are taught reading, writing, elementary arithmetic, and drawing. I may say this class has shown that they appreciate in a marked degree the opportunities we have been able to give with our limited resources.

I have been engaged on Indian railways for 25 years and I am firmly of opinion that, considering railway workshops must be looked to for some years as the principal training ground for skilled mechanical labour, and from the point of view of the dependence of the development of indigenous industries on this labour, it would be sound policy to treat the question of training Indian apprentices in railway workshops from a much broader point of view in future than that of meeting individual requirements.

It is suggested that the scope of existing railway technical schools should be extended considerably at the principal railway centres; they would be subject to the control, as at present, of the Education Department, but the course of studies should be subject to the approval of the Locomotive and Carriage Superintendents' Committee of the Indian Railway Conference Association; this committee is composed of mechanical engineers controlling large bodies of men in all mechanical and electrical trades on all the railways of India.

Additional facilities for training apprentices in Indian railway workshops will doubtless involve extra expenditure in supervision, quarters, hostels and schools run in conjunction with workshop training. Such expenditure might, however, be met by diverting some of the funds at present allotted to the Education Department. Under such conditions, practical training in real workshops and theoretical instruction would run concurrently at a time of life when a lad's mind would be in its most receptive condition, and practical and theoretical training would appear in their proper relation to each other.

The best of the lads who have been through these proposed schools run in conjunction with railway workshops might be given some opportunity of either entering some college or university, where a degree in mechanical engineering could be obtained, or else, if competent, without further instruction, of entering direct for such an examination. Some such scheme, which is simply a proposal to extend existing organizations, would go far to promote the education of the country in the mechanical engineering industry on practical lines.

(Witness here gave confidential evidence.)

Many of the large Indian railway shops are well organised and equipped with the most modern plant and machinery and the work turned out of them compares favourably with that of some of the best shops in the United Kingdom. It should therefore be possible for Indian apprentices, provided proper opportunities for technical instruction are given, to obtain as thorough a training as could be obtained in the United Kingdom.

As regards European and Anglo-Indian apprentices, the case is somewhat different. There is always a tendency to look on at an Indian workman than actually do the work, and I have always encouraged such lads to go to England for a couple of years or more when their apprenticeship is ended where they must do their fair share of the work in a workshop. In many cases I have obtained employment for such lads in railway and locomotive workshops and such men, whose interests are bound up with India, on their return are likely to develop into extremely useful men.

Considering the unlimited supplies of raw material in India, possibilities in the mechanical and electrical engineering industry are great. Expansion in steel and iron works, including the manufacture of plates, sheets, tyres, axles, spring steel and sections of all sizes would probably be necessary prior to any very marked progress in an indigenous mechanical engineering industry and also an adequate supply of skilled mechanical labour.

Any discussion of labour questions in India which omits some reference to the housing question cannot be considered complete. It is impossible to expect any improvement in the labourer's efficiency and skill if comfortable housing accommodation is not provided and measures of sanitation adopted.

It is possible at present for any new industrial settlement laid out with the greatest care and maintained in a high state of efficiency to be threatened by epidemics originating in the various bustees which eventually spring up on the boundaries. These bustees are under no control either as regards laying out or sanitary maintenance, and with the possible growth of new industrial settlements in India, are an evil which requires attention.

Whatever the amount of land taken up for the purposes of an industrial settlement, I do not suppose it will ever be possible to prevent the springing up of villages immediately outside the boundary of a settlement, but it should not be difficult to enact that such villages within a radius of one mile should be laid out with wide streets with due regard to prevailing direction of wind and other features tending to effective sanitary measures being made possible.

ORAL EVIDENCE, 3RD JANUARY 1917.

President.—Q. Your note brings many facts that we have already come across. There is one point that I should like to ask your opinion about and that is the reason why young boys do not go into engineering so much as in the case of law and medicine, where if they fail they then turn their attention to engineering with the result that they take to engineering very late in life to be of any value. In addition to that there is the point that the boys who go into engineering do not get the opportunity of rising to the top of the profession as in the case of law. They are therefore moving in a vicious circle. Can you tell us how we could get over this trouble?—A. Until quite recently we have never had any educated Indian lads at all.

Q. If the boys do go and prove their worth then they get a chance?—A. It all depends on the boy himself. It is the same in the profession of law. When a man studies law, he does not know what he is going to rise to.

Q. Do you find that the European and Anglo-Indian boys are lower in standard of education?—A. Much lower.

Q. Don't you get boys from schools like the St. Joseph's?—*A.* We get boys from all over India. A few are fairly well educated. It is very difficult to start theoretical training in the case of some of the lads who have not a proper grounding.

Hon'ble Sir R. N. Mookerjee.—*Q.* Is it not the general impression that Indians should not be allowed to occupy places where they would have to control Europeans?—*A.* I think that the real reason is that they do not start at the bottom. The question of prejudice has never arisen. Existing conditions do not admit of such a supposition.

President.—*Q.* Have you tried boys from Sibpur?—*A.* We have had one or two. They did not have enough practical experience.

Q. What age?—*A.* From 19 to 21. I cannot say that I have had very much experience with them.

Q. Do they come from the apprentice department?—*A.* I cannot tell you offhand.

Q. Are they trained in electrical engineering?—*A.* I suppose so, up to a certain point. But still in a college of that sort a boy does not get the actual experience that he would get in a workshop. Without proper co-ordination of theory and practice I do not see any prospect of progress.

Q. Have you had anything to do with the proposal to establish a technical college at Sakchi?—*A.* No.

Q. The proposal has been considered by a small committee and the idea is that they should establish a technical college at Sakchi which will be devoted largely to the metallurgical side. That of course would necessarily include electrical engineering. Would not your own province be sufficient to justify anything of the standard of a college?—*A.* I have suggested that in my note. I suggest that in all large railway centres our present system of night schools should be very much extended so as to give more provision for education of that sort. In Sakchi mechanical engineering is subsidiary to the manufacture of steel and iron.

Q. Do you want any Government assistance in this matter?—*A.* I propose that the whole scheme should be financed by Government. It is not part of the duty of the railway company to do what I suggest. The railway is only justified in providing for its own requirements which it has done.

Hon'ble Sir R. N. Mookerjee.—*Q.* Would the railway co-operate with the Government?—*A.* That is my proposal.

President.—*Q.* What would you provide?—*A.* Hostel accommodation for students and a staff of competent teachers.

Q. And facilities for training in the workshops?—*A.* Yes, so that theoretical and practical training may go hand in hand.

Sir F. H. Stewart.—*Q.* Would it be a development of what you have already?—*A.* Yes, I think the details may be arranged later on when the scheme is further developed.

President.—*Q.* Do you think there is room at Khargpur for an engineering college with or without Sibpur?—*A.* I do not think the Sibpur College meets the conditions at all. As regards civil engineering it does. As regards mechanical engineering it does not.

Q. Would you like these colleges to specialise, one for civil engineering at Sibpur, one for mechanical engineering at Khargpur and one for metallurgy at Sakchi and so on?—*A.* I propose that such institutions should be established at all large railway centres in the country. It seems to me that a large part of the money spent in technical education might be utilised for this purpose to better advantage.

Q. How many students would you get in the higher grade college at Khargpur?—*A.* I do not propose to establish a higher grade college. A school would be sufficient where education up to a certain point might be given. After that they might go to a higher college or a university where they might get higher instruction in scientific subjects.

Q. You do not propose to have an institution there that would train a boy in the theoretical side of mechanical engineering and electrical engineering beyond that required for a foreman?—*A.* That may be done eventually. What I propose now is only for the average lad. The clever lads can well look after themselves.

Sir F. H. Stewart.—*Q.* In that case would it be necessary to send Anglo-Indian boys home?—*A.* As a rule I do not think it would be necessary. They can be sent occasionally.

President.—*Q.* Have you had any experience of the scholars who are sent to England?—*A.* The men I refer to go on their own initiative.

Q. You have never met a returned scholar?—*A.* No.

Mr. C. E. Low.—*Q.* What pay do these foremen and chargehands get?—*A.* As regards the chargehands it varies from Rs. 200 to Rs. 250 a month and the foremen go up to Rs. 500.

Q. With reference to what you say about the lads trained in a technical college or an industrial school, I suppose you never had instances of men coming for employment who have been in a technical college or school and taken apprenticeship and then came to you for employment?—*A.* No. I have had many applications from men who have been in technical schools. They produce certificates but a few questions showed that they were not competent to undertake any work in the shops.

Q. Do men come to you from Sibpur as apprentices?—A. I have not had any applications from such men.

Q. In connection with what you say regarding the education of apprentices, can you say what sort of education they have had? Are they failed matrics?—A. We have laid down a certain standard of education. Our conditions are that the candidate must undergo some preliminary mental and physical test to find out his general fitness. He must produce a certificate that he is between 15 and 17 and he must also produce a certificate of character from a respectable person and from the school where he was last showing that he has at least passed the 5th or the 6th standard.

Q. Are these young men mostly Bengalis?—A. Some of them are.

Q. Are they of the Bhadralog class, that is the educated middle class?—A. I suppose so. Their fathers are clerks and men of that class.

Q. When did you make this offer to educated Indians?—A. Early last year.

Q. What was your reason in making that offer?—A. It was chiefly due to our own requirements. In our staff we have 16,000 men and the recruitment of the staff is a very important consideration. Railway carriage building in India although perhaps not generally known is a very important industry. The Bengal-Nagpur Railway alone has spent 10 lakhs a year for the last five years on new carriages. The difficulty has been to find competent men to supervise the construction of new carriages. The ordinary Anglo-Indian boy with traditions of the past is inclined to go to the locomotive shop. Carriage building has never had a proper standing in India and the opportunity was taken to get another class which had no traditions at all and this scheme which was accepted by the Bengal-Nagpur Railway was instituted. So far the scheme has been successful and the lads are doing very well indeed. We have got 20 odd lads now.

Q. Had these any previous training?—A. None at all. We took them as apprentices and in drawing up the scheme we were of opinion that it would be advisable to be precise about what the prospects would be. I was not actuated by any other reason except that of providing for our own requirements. We tried to make the prospects a little better than would be the case if the lads took up clerical positions.

President.—Q. Your prospects are little better than if they entered as clerks?—A. The prospects are very clearly laid down. Beyond a certain stage it all depends upon the man himself.

Q. These men will be qualified to be chargehands and foremen?—A. Yes.

Q. They can rise to Rs. 500?—A. It depends entirely on the lad what they eventually rise to.

Mr. C. E. Low.—Q. What are your shop hours?—A. 7 to 11 and 12 to 4-30.

Q. Have you had any trouble about unpunctuality so far?—A. Not so far.

Q. Where do they live?—A. With their parents and guardians who are at Khargpur.

Q. What pay do they get when they come in?—A. I think they start on Rs. 15 a month and in the next year Rs. 17, Rs. 19 in the third year and so on and in the fifth year Rs. 25.

Q. They pay no premium of any kind?—A. No.

Q. What class of men do the teaching?—A. Our own office staff, the foremen and the chargehands.

Q. Are not these men too tired to be able to profit by the teaching?—A. They manage it all right. We have two classes a week. We cannot do more.

Q. Because of the shortage of staff?—A. We have not got sufficient staff.

As regards the pay I said that they get Rs. 25 in the 5th year. Under the agreement they can go up to Rs. 100 a month. After that the boy's prospects are in his own hands.

Q. You have done a good deal in the way of housing the employes. Do you find that sanitary surroundings and things of that sort have an effect on their efficiency?—A. Undoubtedly. If a man has got a comfortable home that reacts on his efficiency as a workman.

Q. Do those men who have not houses show any desire to get houses from the company?—A. Very great desire. There is always great competition for the houses. We can never keep pace with our requirements.

Q. Do these Indian artisan classes take to any particular form of amusement or recreation?—A. In Khargpur we have an Indian institute where there is a library. There are billiard tables, tennis courts and other forms of recreation.

Q. That is for the superior Indian staff?—A. As regards the other staff there is a project on foot to provide a recreation ground for football, etc.

Hon'ble Pandit M. M. Malaviya.—Q. Were you educated at any university or at some works?—A. I acquired my knowledge both at a college and at the works.

Q. What university?—A. Durham College of Science

Q. Did you have any good workshop attached to the mechanical engineering department there?—A. There was no workshop at all. I served my time in the shops of the North-Eastern Railway.

Q. That was after receiving the theoretical instruction?—A. It was at the same time. I used to attend the classes in the evening. How many days in the week?—I cannot remember. It is a long time ago.

Q. How far were these works situated from the college?—A. About a mile and a half.

Q. And what was the total number of students that used to attend the college?—A. I cannot remember that. It was over 25 years ago.

Q. Supposing you had a workshop attached to the Durham College, fitted with modern machinery appliances, and you went there for practical training, would that not have suited you equally well?—A. No. The spirit of a workshop is never present in a workshop attached to a college.

Q. In what way?—A. In a workshop attached to a college you are never face to face with realities. In a workshop you are up against real difficulties. Moreover in a workshop attached to a college you cannot have more than one or two skilled instructors.

Q. If there were a larger number of them?—A. At the most you might have half a dozen. In a workshop you will get more practical instruction than if you simply attended lectures or demonstrations. Moreover there is the spirit of the workshop which can never possibly be obtained in a college workshop.

Q. In your opinion is the theoretical part of the instruction much better imparted in a college?—A. You cannot get theoretical instruction in a workshop.

Q. But theoretical instruction is also valuable?—A. Quite so. My point is this. Theoretical training and practical training must go hand in hand. The practical training you must get in the workshops. Theoretical training you must get in the college.

Take for instance the University of Birmingham. They provide mechanical training, and it is throughout experimental.

President.—Q. That is only in the Calendar?—A. In practice it is not so.

Hon'ble Panit M. M. Malaviya.—Q. I only want to clear this one point. Suppose you had a college where instruction is imparted both in the theory and practice of mechanical engineering and if the student undergoes a certain standard of examination, is he not likely to be more successful than one who has not had such previous grounding?—A. I think the only practical training for a mechanical engineer is in a proper workshop; and theoretical instruction should be had at the same time.

Q. You say that you have only two evening classes?—A. That is simply due to shortage of staff and accommodation.

Q. Do you think that you will be able to take a larger number of students who may wish to take up mechanical engineering?—A. There is no accommodation and it is simply a question of accommodation.

President.—Q. You are taking 20 every year. That brings it on a level with Sibpur?—A. I do not suppose we take in 20 every year. At present I am going into the question of hostel accommodation and the housing of the staff. I do not propose to ask the railway company to build a hostel. It is a question for the Government. I find that the Allahabad University had a very large sum for building hostels for law students. It seems to me that engineering students are just as important as law students especially at the present time when engineering has turned out to be one of the essentials of the existence of a nation. I do not know whether you can say the same thing of the profession of law.

Q. Your proposal comes to this, that you want to establish a college close to the works?—A. Quite so.

Q. Do you think that if the number of students increases the railway company will have no objection to give them facilities for practical training?—A. I do not think so. I am not speaking of the Bengal-Nagpur Railway only. The State railways could do a great deal to assist in the matter.

Q. If one central thoroughly equipped first class mechanical engineering college is established near some railway works and provision is made for training a sufficient number of students would not that be useful?—A. That is not my proposal. My proposal is to establish a technical school at all important railway centres, such as Jamalpur, Kanchrapara, Lahore and so on.

Q. Does the standard of education that you have prescribed, namely the 5th standard, suffice?—A. Yes, so far as we have gone. He must have a good general education before any theoretical instruction is possible.

Q. When they come to you they have no training in drawing and manual work?—A. Not more than what they get in the ordinary schools. A certain amount of manual instruction is given.

Q. If they had a certain amount of manual instruction that would be better?—A. It should not be at the expense of general education. It should be in addition to the general education.

Hon'ble Sir R. N. Mookerjee.—Q. Under your proposal would you want any agreement that they must serve you for a certain period of time?—A. That would be part of the agreement. They must serve us for a certain period of time before they go out for themselves. That is our system at present.

Q. From what you have just said may I take it that the Bengal-Nagpur Railway would be prepared to take a certain number of students every year?—*A.* We have at present 148 apprentices of whom 125 are illiterate. We have got a night school where we teach elementary subjects, reading, elementary drawing and arithmetic and they are doing very well. Our attendance is 90 to 100. For this school we get nothing from Government.

Q. May I also take this as an authentic information to be used by me if necessary in moving the Government of Bengal to make some arrangements with your railway to send some boys from Bengal?—*A.* This is only my personal proposal. Our Agent, Mr. Godfrey, reminds me that our present scheme has the approval of the Home Board. The present suggestion has never been put before the Bengal-Nagpur Railway Board at all. I am not therefore in a position to say anything definitely about it. But from the sympathetic way in which the Home Board treats such questions I think they would support it.

President.—Q. You would only gain and not lose. You would be able to get the pick of the men for your work?—*A.* I put the matter not from the point of view of the Bengal-Nagpur Railway but from a much broader point of view. I am suggesting that it should be done in all the big railway centres.

Hon'ble Sir R. N. Mookerjee.—Q. If you train up a certain number of boys in Khargpur they would be available not only for your work but also for the engineering firms in Calcutta?—*Q.* That is quite so.

Q. And the surplus might find employment, say, in Lucknow and other places. If a boy gets training in your shops and he gets a certificate of competence he would value that certificate as a passport that would lead to his success in his future career?—*A.* Yes, but if there were more men trained in other parts of the country we might get the benefit of the men trained in other places also.

Q. It would be difficult to ask the Government to help if you are going to take them under your service?—*A.* That is only under certain limitations. That is for, say, two years. After that they can go away.

Mr. A. Chatterton.—Q. Assuming that your proposal is carried out would you advocate the abolition of the mechanical engineering classes in the various engineering colleges that have been started such as at Sibpur?—*A.* As regards the mechanical portion I cannot say very much about it. With the exception of a very few cases I have not been able to give lads from Sibpur work. They do not seem to have the training that we want. My proposal was that there should be some opening for higher education which will be available for lads who pass through these works.

Q. At the end of a course of, say, five years they might go to a larger college of university rank?—*A.* Yes.

Q. How long would it be necessary to be there?—*A.* I think about two years.

Q. You say that money spent on industrial schools and colleges is wasted. Can you tell me from what industrial schools these boys come?—*A.* I said with a view to provide handicraftsmen from a variety of places.

Q. Have you had any from Kalimpong?—*A.* I do not think so. We have had from Ranchi.

Q. I should like to know if the training the boys have had is adequate or whether they come with swollen heads and demand that they must be given so much pay?—*A.* That is the condition I generally find. The man comes with a certificate, and he wants to be put in charge at once. If we put him into a fitting shop and ask him to do a certain piece of work he knows very little about it and I cannot therefore employ him. A man who begins at the bottom is able to turn out much better work and he works on a much smaller pay than these men demand.

Q. What pay would you be prepared to pay these men from the industrial schools who come to learn as workmen?—*A.* I think 6 or 7 annas a day.

Q. Do these men want more?—*A.* Yes. But they are found useless. The training that they get is not of any use to us.

President.—Q. Have you got anything to say by way of supplementing your note?—*A.* I would like only to allude to what I say at the end of my note regarding the quarters for the workmen. If a new industrial settlement is laid out there is a chance of bustees springing up on the boundary line without any plan or control. If it is affected with any disease it is likely to threaten the settlement. I believe that at Sakchi the same trouble is starting. My proposal is that in connection with new settlements there should be an enactment which will prevent these bustees springing up in their own way. They should be laid out in a way as to make sanitary measures effective. I suggest that within a mile beyond the settlement no bustees should be allowed to spring up except with broad streets and with proper safeguards for their sanitary condition. I am referring only to settlements that may be built newly in future.

Q. You do not object to settlements being formed if there is proper supervision and sanitary arrangement?—*A.* At present there is no provision to enforce the observance of sanitary principles. My suggestion is that in the case of a new settlement there should be a zone in which people if they want to build bustees will have to do so having regard to broad streets and such other precautions as will make sanitation effective.

Q. Whose business will it be to look after this?—*A.* I presume the Collector of the district.

Q. Have you got a municipality at Khargpur?—*A.* We have got a station committee which is responsible for the administration of the place.

Q. Have you heard of other cases so that a general memorial may be made with a view to Government taking action?—A. I heard that at Sakehi there was very much the same condition.

Q. The area could be declared a municipal area beyond the actual settlement?—A. I do not think that would meet the case.

Hon'ble Pandit M. M. Malaviya.—Q. What is the population there?—A. I think about 22,000. If you declare it a municipal area that will only put off the evil day and the trouble is bound to recur again. That is my point. The municipality would have a boundary and beyond that boundary the whole trouble will start again. My point is that beyond the boundary of the municipality there should be a certain area in which villages would be built in a certain plan.

Q. You want a suburban area marked out for every municipality?—A. That is so.

WITNESS No. 166.

Mr. L. Gould.

MR. L. GOULD, General Manager, Kumardhubi Fireclay and Silica Works, Limited.

WRITTEN EVIDENCE.

Goods of silica, fireclay and magnesite.

I have pleasure in offering my views on matters with which I have had practical dealings in India during the past 11 years.

The manufacture of refractory goods of silica, fireclay and magnesite in this country has considerably improved during the past few years and this has been brought about chiefly by co-operation between supplier and consumer and also by improved manipulation by operatives due to practical demonstration and the introduction of up-to-date machinery and appliances.

Magnesite bricks were not made in India two years ago but to-day the Indian magnesite brick is of equal quality with the best brands formerly imported, considerable strides are also being made in the manufacture of silica goods, whilst in most cases the country firebrick has taken the place of those imported and have been proved to be equal to European firebricks.

India is now practically in a position to supply all the firebrick material required and considerable quantities are being shipped to Ceylon, Burma, etc., and the demand is increasing. The expansion of the fireclay industry depends to a large extent upon the further expansion of the iron and steel trade, mineral smelting works, bye-product coke ovens, and coal distillation plants, etc., and also to the discovery of new sources of raw material, because so far as has yet been proved India is not overburdened with refractory material.

I consider Indian labour in this particular industry capable of turning out just as good work as that of any other country although operatives are much slower, and attendance uncertain, there is a tendency for the Indian, as in other countries, to strike work when improvements are made such for instance, upon the introduction of mechanical installations, another difficulty with Indian labour is caste prejudice and the refusal of those with even a little education to soil their hands, consequently it often happens that a useful workman deserving advancement has to be retained at the bench because if raised to a foreman his practical services cease, he goes no further and expects to be allowed to look on.

Elementary education is very necessary for the improvement of native labour but this should not consist of mere writing and reading in English, good Hindusthani or Bengali education would be preferable if combined with some form of elementary practical technical instruction for the improvement of the handicraftsman as all operatives cannot be foreman and clerks.

The Government could give assistance by providing a central laboratory with complete appliances for analytical and physical research and testing of raw materials, but this would only be of use provided that such an institution is conducted by a specialist thoroughly acquainted with refractory materials and able to give sound practical advice, a purely theoretical institution would not help the industry very much.

I consider there is an opportunity in this country for the manufacture of glazed sanitary earthenware goods and the Indian potter will be capable of turning out ware of an equally good quality to the imported, provided that he receives the training usually available to workmen abroad. The introduction of new sanitary schemes for villages and towns, and improvements on existing installations, will in the near future offer extensive scope for sanitary pottery. I consider Government could select a suitable clay-bearing locality and erect a pottery school for the practical training of Indian labour, such training to be efficient would need be conducted by men capable of showing the Indian how to use his hands, drawings and oral instructions are all right after operatives have a fair knowledge of the business but practical training is the main and first consideration and absolutely necessary.

I consider that Government financial aid is not required in the brick, tile and pottery trade, there is ample money available and provided factories are properly constructed, equipped, and managed finance is available when there is confidence in the management and control.

ORAL EVIDENCE, 3RD JANUARY 1917.

President.—Q. You suggest that Government should provide a central laboratory for testing raw materials, and I suppose finished products also?—A. Yes.

Q. You want to get Government certificates for finished products?—A. I want expert advice.

Q. I don't suppose that any central laboratory established by Government could ever supersede your knowledge in the matter which you have specially studied, the manufacture of magnesite bricks?—A. We want analytical and physical tests to be done.

Q. But don't you make your own physical tests?—A. We have to get it done, but the test cannot be depended upon. Mr. Briggs does most. Messrs. Tata do their own tests, and outside of that Mr. Briggs does most of them.

Q. You really want some established authority so that you could get a certificate that you would issue with your materials?—A. For instance, a small variation in the case of magnesite and silica would render these bricks useless. Silica brick, if it goes below 91 silica, would be useless for us. I have known of cases where three different pieces of the same stone have been analysed by three different people and the analyses have been quite two per cent. different. That shows that the variation is too great and cannot be depended upon.

Q. There is no doubt that at present there are few facilities of that kind in India. I am asking you about this in order to ascertain whether it will not interfere with private enterprise if Government take up testing work in this way?—A. Do you think it would in the case of purely testing?

Q. We heard a good deal about it at first. If those people whose profession is to make chemical analyses and to undertake physical test could do this work, it seems all right. But you think that this is not sufficient?—A. It is sufficient so far but it would be a good thing if we could have men to say what sort of material was suitable and what sort not suitable. A private analyst is not in a position to know what brick will do in a furnace. We want men who have practical as well as theoretical knowledge.

Q. Surely the good name of your firm is worth more than any Government certificate?—A. Yes. It is more for development that I am speaking of. The resources of the country are not known so far, and there must be an enormous lot of work to be done to find out exactly what material is available; companies cannot really afford to do that.

Q. Have you tried with Mr. Fern of the Bombay School of Art?—A. I have never heard of him.

Q. You will have to get into touch with him because he has been testing different kinds of clay from different parts of India, that is, clays in different mixtures. He has produced very good results but they seem to be buried and nobody seems to know of his work. He may be able to give you useful information and he may be able to help you?—A. Thank you.

Hon'ble Pandit M. M. Malaviya.—Q. You say that the Indian labourer is capable of turning out just as good work as that of any other country, and you think that one pottery school in the country of a high class will suffice to impart the training that he needs?—A. To commence with.

Q. Where would you have it?—A. Preferably on a clay bed.

Q. You have no particular area in mind at present as regards its site?—A. I should think Ranigunge.

Q. Have you seen the Calcutta Pottery Works?—A. I have tried to.

Q. You say, "Drawings and oral instructions are all right after operatives have a fair knowledge of the business but practical training is the main and first consideration and absolutely necessary." Don't you think that operatives would be better able to acquire efficiency in their business if they had a previous knowledge of drawing and some oral instruction in the principles underlying the art?—A. I do not think it is possible to get a proper understanding without practical knowledge. My opinion is that everything must start from practical knowledge.

Sir F. H. Stewart.—Q. What labour do you use for the manufacture of magnesite and silica bricks?—A. Trained men, men whom I have trained.

Q. Drawn from the potter class?—A. There is really no potter class, but local men who work through the mill house as it were to the bench and they pick up knowledge as they go along from one to another and we have to teach them how to make these modern things.

President.—Q. Have you any supplementary remarks to make?—A. I should like to see Government do something in the way of giving information about silica, magnesite and fireclay. The knowledge on the subject is very scanty now. Mr. Hayden has given me some assistance.

Q. If one is to conduct practical tests in clay one must be an experienced potter because clay alone is no good, but clay mixed with various other things in different proportions and mixtures. That is exactly the kind of work that Mr. Fern is engaged in. He will be able to get from you clays which you actually use in practice and he will probably give you some suggestions as to mixtures that will improve your products. We cannot get the information required by an expert by an operation between practical people like yourself, the Director, and a few others. We must have a general knowledge of the distribution of clays, and an

WITNESS No. 167.

DR. N. ANNANDALE, B.A., D.Sc., F.L.S., F.A.S.B., *Director, Zoological Survey of India.*

WRITTEN EVIDENCE.

My personal experience and official work in India have had no direct connection with industries but I think it important that evidence on the indirect bearing of pure science on commercial and industrial questions should be laid before the Commission by one who has had considerable scientific experience both in India and other countries.

Technical aid to
industries.

Under this head I desire to tender evidence suggested by my experience in corresponding with specialists in India and abroad.

Research abroad.

Q. 21.—I have had no dealings with the Imperial Institute but, before the War, carried on, as Superintendent of the zoological section of the Indian Museum, a very extensive correspondence with zoological specialists both in England and other countries outside India. In arranging for the publication of the zoological results of the Abor Expedition, for example, I had to obtain assistance from no less than 43 specialists of whom 11 resided in India, 1 in Ceylon, 13 in Great Britain, 10 in other European countries, 4 in America, 1 in Egypt, 2 in the Malay Peninsula, and 1 in Java. This correspondence was carried on in an informal manner and was most beneficial at the time. Since the War it has been very greatly reduced and indeed, except so far as Japan and America are concerned, has almost ceased.

Q. 22.—I now find this cessation of correspondence almost as beneficial as was its growth. It has given me far more leisure for the organisation of the department and for original research and has, I think, by throwing all of us on our own resources, increased our sense of responsibility, and therefore our power of doing scientific work. Our work has of course been restricted in many directions but has as it were become intensified. The publications of the museum have certainly not suffered either in bulk or in quality. Indeed, I am personally of the impression that they have improved in quality, and it is perhaps not altogether surprising that the average length, and, I hope, weight of the papers has increased noticeably.

In correspondence of the kind I have insisted on one point, that the benefit should be mutual and that if we asked for assistance in one direction we ourselves were prepared to give assistance in others. This in my opinion has done a great deal for Indian zoology.

So far as biological subjects are concerned, I am firmly convinced that the more important part of Indian work should be done in India. This view is, in my opinion, endorsed by a comparison between the monographs in the "Memoirs" of the Indian Museum and the volumes recently published in the official "Fauna of British India" published under the authority of the Secretary of State in London. To compare, for example, the monograph on the Crustacea Stomatopoda which constitutes Volume IV of the "Memoirs" with the volume on the freshwater Mollusca in the "Fauna" is to compare original scientific work with hack-work. The "Fauna of India" is edited by two gentlemen one of whom is master of a Cambridge College and a zoologist of distinction, while the other is well-known as an entomologist, and is also an official of the Imperial Bureau of Entomology. Neither of these gentlemen has had any experience of India and I am unable to find in the recent volumes edited by them evidence that they have any conception of the special needs of zoologists working in this country. The only living example of the Indian "Fauna" that most of their authors have seen are the tigers, etc., in the Zoological Gardens.

So far as purely systematic zoology is concerned, it will always be necessary to call in the aid of specialists who live widely scattered in many countries. It is not uncommon to find that there is only one specialist in the world who is able and willing to name beetles, say, of a particular family. I have not experienced any great difficulty in obtaining the aid of such specialists on the lines already indicated. As a rule we further pay the specialists who help us by permitting them to retain duplicate specimens of the collections that they work out for us. There is, or there was before the War, an entirely informal but none the less very efficient international arrangement of the kind.

The Imperial Bureau of Entomology in London was, I understand, instituted in order to further entomological work of a directly practical nature throughout the British Empire. It does very useful service by publishing abstracts of all that is published anywhere on economic entomology, as well as original papers. It also receives and deposits in the British Museum collections from working entomologists in tropical countries. Papers on parts of these collections are published from time to time, but I am not quite sure precisely what obligations the bureau accepts in the matter of naming specimens. At the time of its institution, I corresponded with Professor Maxwell-Lefroy about the assistance that the bureau could give us. We agreed that the Indian Museum in Calcutta was in at least as good a position to arrange for the naming of insects by specialists as was the bureau in London. I prefer to correspond direct with specialists, both because it obviates delay and unnecessary intervention and is, therefore, more economical, and because it encourages a spirit of co-operation and in some cases almost of personal friendship between specialists in different lines who have little or no opportunity of meeting. Further, no question can well arise as to the identity of the person responsible for the information.

Q. 28.—I have been invited to give evidence as Secretary to the Trustees and Superintendent of the Indian Museum. The latter office (or rather designation) was abolished some months ago on the inauguration of the Zoological Survey of India, but I held it, together with the secretaryship, for ten years (1906 to 1916) and continued until a few days ago to act as Secretary to the Board. My chief work has, however, been, since 1906, that of officer in charge of the zoological and anthropological (formerly the natural history) section of the museum. I held the secretaryship and superintendentship *ex-officio* and without special emoluments except free quarters.

My duties as Superintendent were to maintain discipline among the servants on duty in the public parts of the museum and to supervise the museum buildings and compound. I have had no control over or right to interfere (except in cases of emergency) in the arrangement of the public galleries or in the laboratories or offices of any section except my own. I have, therefore, had no administrative experience in the industrial section of the museum, but merely that arising from long continued and close association.

The Trustees of the Indian Museum are incorporated by the Indian Museum Act of 1910 and are elected as follows:—

- (a) the six persons for the time being performing the duties of the following offices, namely:—
 - (i) the Accountant General of Bengal;
 - (ii) the Principal, Government School of Art, Calcutta;
 - (iii) the Director, Geological Survey of India;
 - (iv) the Superintendent of the zoological and anthropological section of the museum;
 - (v) the Director General of Archaeology; and
 - (vi) the officer in charge of the industrial section of the museum;
- (b) one other person to be nominated by the Governor General in Council;
- (c) three other persons to be nominated by the Lieutenant-Governor of Bengal;
- (d) one other person to be nominated by the Council of the Asiatic Society of Bengal;
- (e) one other person to be nominated by the Bengal Chamber of Commerce;
- (f) one other person to be nominated by the British Indian Association, Calcutta;
- (g) one other person to be nominated by the Syndicate of the Calcutta University; and
- (h) three other persons to be nominated by the trustees.

The present Governor of Bengal is a co-opted member and has been elected Chairman.

The Indian Museum has, since 1910, been divided into five sections, the archaeological, the art, the geological, the industrial, and the zoological and anthropological. The sections are loosely associated and the only one in which the trustees now exercise administrative control is the art section. The geological section has always been in the possession of the Director of the Geological Survey of India, while the archaeological, the industrial and the zoological and anthropological collections have been lent respectively to the Director General of Archaeology in India, the Director of the Botanical Survey of India and the Director of the Zoological Survey of India. In these sections and in the geological section the trustees now possess visiting powers in the public galleries, but they have no right to interfere in any of the offices or laboratories, except in the case of structural alterations in the buildings. The Secretary to the trustees was responsible to them for maintaining discipline in the public galleries but this arrangement was regarded as a temporary measure.

The industrial section of the Indian Museum dates from 1872 and was originally, as the Economic Museum, controlled by the Government of Bengal. In 1884, after the close of the Calcutta exhibition, arrangements were made for the transfer of the collections to the trustees of the Indian Museum. The specimens exhibited in the public galleries were at first of a very miscellaneous nature and included art objects as well as ethnological specimens. In 1910 these collections were separated into three parts, which were assigned to the zoological and anthropological, the art and the industrial sections, respectively. The Reporter on Economic Products to the Government of India, who was either a botanist or a chemist, was placed in charge of the industrial section as thus reconstituted, but shortly afterwards his post was abolished and he became Economic Botanist to the Botanical Survey of India. The Director of this Survey, therefore, assumed the position of officer in charge of the section, but the Economic Botanist remained to a large extent practically its administrative head.

As the Economic Botanist was the only expert attached to the section it has naturally become more and more exclusively a museum of economic botany. Many of the old exhibits (such as barrels supposed to contain beer), recognised by every one as worthless, have been eliminated from its galleries, while those illustrating botanical products, their uses and manufacture have been greatly increased in number and improved in quality. The foundation of the commercial museum in Calcutta has accelerated this process and I understand that the present Director of the Botanical Survey intends as soon as possible to get rid of all exhibits that are not of a botanical nature.

Under these circumstances the section has become primarily a museum for technical experts interested in vegetable products. The models of machines such as those employed in drying tea are interesting to the general public, but the real value of the galleries lies, in my opinion, in the opportunities that they afford persons interested in various classes of vegetable products to acquaint themselves with different varieties and classes of materials.

I do not think, in the circumstances, that these galleries can be made of much use to the ordinary commercial man, but this is rather a question for the commercial man himself.

With the commercial museum in Calcutta, I am acquainted merely as a member of the non-commercial public. I was consulted about the arrangements of the exhibits but not until after they had been arranged. It is perhaps unfortunate that no opportunity was, I understand, given for consultation between the officer in charge of the industrial section of the Indian Museum and the Director of the Commercial Museum before the latter was opened. In such matters it seems to me that a great deal might be effected by personal co-operation.

There is one further point in connection with commercial museums in India on which I offer my evidence, not as an expert, but merely as one who has had special opportunities recently of seeing what is being done in Japan. Every one is aware that Japan is now flooding India with goods a large proportion of which may be described as cheap and nasty. I was much struck when living last autumn in a small Japanese town in which there were no other Europeans to notice that goods of this kind were being produced almost exclusively for the foreign market and were very little used by the Japanese themselves. In the great Commercial Exhibition in Kyoto in connection with the Imperial Coronation last year goods of this kind were almost absent and the exhibits were mainly of materials such as the Japanese themselves employ in their own dresses, etc.—materials that they have learnt to make with almost unparalleled technical excellence through the experience of a thousand years, which are probably now just as good as they were in ancient times. In the little exhibitions of local products displayed in all the more important railway stations in Japan it is also better class goods to which a prominent place is given.

One danger seems to me to be inherent in an Indian commercial museum such as that recently founded in Calcutta, viz., that of producing a bad moral effect by spreading the belief in India that only inferior goods should be manufactured. I am bound to say, however, that the exhibits as at present arranged do not encourage this belief to anything like the same extent as those shown in the temporary exhibition got together at the beginning of the war.

Qs. 68-66, 69, 72, 73, 74.—I can best answer these questions together and in a general way.

I am convinced that the indirect value of pure scientific research must be recognised in technical matters, if applied science is to be developed to its full extent. It has struck me that in much recently published on matters technical the words "and scientific" are tacked on much in the same way as the phrase "whichever is the less" is used in financial regulations.

So far as pure zoological research is concerned, I can claim considerable experience. In addition to being for ten years in charge of the zoological and anthropological section of the Indian Museum, I have worked in the laboratories of one English, two Scottish and one Japanese University, in the last quite recently. I am a specialist in the systematic and geographical aspects of the fauna of Asiatic lakes, and in the course of my investigations have travelled in different parts of the Indian Empire and Ceylon, in Palestine, the Malay Peninsula, Siam, China and Japan. In the last-named country I recently made a special study of the status of zoological research.

I have not myself undertaken investigations in applied zoology, but have been in close touch with all that has been done in India in such lines for the last ten years. I make it a practice at least to glance through the current literature on all zoological subjects every week. My direct experience in technical science has been closest in reference to fisheries, for I was for a time a member of the now dormant fishery board organised by the Government of Bengal and the present Deputy Director of Fisheries, Bengal, Bihar and Orissa, has a place in my laboratory and ranks as an honorary assistant in the Indian Museum. He holds this honorary post not as a fishery expert but as an authority on certain internal parasites, but his place in the laboratory, for which the local Government pays a small annual rent, is assigned to him officially.

The scientific staff of the Zoological Survey, of which I am the first Director, consists of four scientific officers; all of whom are graduates and three of whom are doctors of science of British universities.

The great bulk of the published work of the members of the department is on taxonomic zoology, but (possibly with one exception) we regard such work as no more than a means to an end, which in our case is mainly the study of the geographical distribution of animals.

Q. 74.—The Board of Scientific Advice has in my opinion already obviated any serious danger of the overlapping of functions in the scientific departments.

In the present state of scientific organisation in India I find it necessary, for the protection of the officers of my department, to draw a line, which I recognise as entirely artificial, between pure and applied science. With the officers responsible for the maintenance of the Zoological Survey have been placed all zoologists without exception.

The duty of the Survey is to find out all it can, with a staff of four scientific men, about the animals of India; it is the duty of the various entomological and fishery experts under the Imperial Agricultural Department, or the local Governments and Native States, to apply all zoological knowledge to the practical problems with which they have to deal.

Two main defects seem to me to exist in the organisation of science in India; firstly the small number of workers, and secondly the inferior position and—though this is perhaps less important—the small salary assigned to the junior men. In my own department, in which the chances of promotion are naturally small, the two assistant superintendents have little chance of getting more than Rs. 700 per month until towards the end of their service. Some years ago I had occasion to call at the India Office in London and to interview one of the chief permanent officials. In the course of conversation I remarked that one could not expect competent men to come to India unless they were decently paid. His reply was—I think that his words were sufficiently striking even in those days to impress themselves on my memory; “Why don’t you get Germans? They’re cheap.” In my opinion there is nothing on earth more extravagant than “cheap” science.

Paucity of scientific men in a scientific department, whether “pure” or applied, tends towards charlatanism, waste of special knowledge and bad administration; when these few men are under separate local Governments the position is rendered still worse. The few zoologists employed in India as fishery experts are all under local Governments. At present we are ignorant of many of the most fundamental facts about the food-fishes of India; we know very little indeed about their life-history, feeding habits or enemies. The fishery experts, whose training is that of zoologists, are given no time to study such matters; their duty is to supply results. They are, therefore, employed to can sardines or to arrange for the sale of fish in the market. If a food-product that tickles the palate of an administrator is produced at a great cost, a technical triumph is claimed for the department—rightly enough not for the expert, who is never head of the department. It seems to me as ridiculous to expect a fishery expert to be an expert fishmonger as it would be to expect me, who have written papers on reptiles, to charm snakes. An attempt on the snakes would probably result in damage to myself; in the other case it is the revenues of the State and the credit of science that suffer. Scientific men in the present state of affairs are often accused of being impractical or of lack of administrative capacity. Would an official Member of Council ordered to open a butcher’s shop under a Director of Public Instruction necessarily prove an administrative success?

To show what kind of work a fishery expert* is expected to do in Bengal when he is not employed in selling fish or organizing co-operative societies of fishermen, I may quote a paragraph from bulletin no. 4 of the Department of Fisheries, Bengal, Bihar and Orissa (1914). This pamphlet is entitled “Some remarks on fishery questions in Bengal.”

“As a result of the investigations which were made during 1911 by the Superintendent of Fisheries, who had studied shad culture in America, it was thought that spawning grounds might be found near Monghyr in Bihar. Since no launch was available, no serious work could be attempted, and it was accordingly decided to establish a hatchery station at Monghyr in the hope that ripe hilsa would be obtained there. The absurdity of fixing a hatchery station anywhere, before the spawning grounds were known, and in the present state of our knowledge of the habits of this fish, was fully recognised. The experiments were only attempted because no other work on hilsa was possible without a launch. As expected the experiment failed. No ripe hilsa were caught, and consequently no fry were hatched.”

The absurdity of the experiment is duly recognised by the expert, but Government money must be wasted officially in order to grasp at results, even if it is only by placing the cart before the horse, that is to say by doing “practical” work on the basis of pure speculation. If science is to aid industrial development it must be as an investment.

I am anxious to make it quite clear that I am not criticizing the scientific officers concerned. They are in all cases junior officers of departments to which their loyal service is due. Even the conditions I have indicated have not prevented them from doing scientific work, at any rate in their spare time. So far as fisheries are concerned, there are three main items in work of the kind recently accomplished, namely Mr. Southwell’s (*Bengal, Bihar and Orissa*) papers on fish parasites, Mr. J. Hornell’s (*Madras*) account of variation in the chank shells of Southern India and Mr. Sundara Raj’s (*Madras*) notes on the freshwater fishes of the Madras municipal area. All of these investigations have been published by the Indian Museum under my own editorship. Mr. Sundara Raj’s notes were to a large extent completed while he was an assistant in the Madras Museum. I saw his manuscript before he joined the local fishery department.

Technical research in biology is, in my opinion, mere waste of time and money unless it is supported by an adequate body of men of the right type, including both practical and theoretical workers. By men of the right type I mean men who, starting with the necessary ability and character and having received an adequate training, are able under Indian conditions to do honest scientific work with a sense of proportion, without nursing grievances, without respect of persons, and without advertisement. So far as I am aware

* Mr. Sanyal is the Deputy Director of Fisheries, Bengal; to say that he has inspired no part of my estimate of the fishery department is a gross injustice.

no adequate training for such men at present exists in India and except in a few cases the official status and pay offered are insufficient to attract such men. By "adequate training" I mean one that teaches a man the necessary technical manipulation, how to use the literature on his subject and, above all, to think for himself.

Even if the existing zoological departments in India were to be very greatly enlarged, such defects would not be obviated unless the officers were chosen with the greatest care and candidates were assured that having been elected as trustworthy persons, they would be trusted. It is of the highest possible importance in the selection of candidates for any scientific post in India that a man who has had practical experience of Indian conditions and has proved himself under these conditions as a scientific worker, should have at any rate a large say in the selection. I consider also that travel in uncivilized countries should be taken as an important qualification so far as biological posts are concerned.

The ideal conditions for the organization of zoology in India would be a great zoological department combining both practical and theoretical workers under a director with a wide knowledge of and sympathy with the different branches of zoology, sufficiently broad-minded not to despise any branch and not to interfere unnecessarily in the work of his junior officers. He should be given the status proper to a head of a department scientific but not minor.

To investigate any technical problem properly, the expert sent to investigate it must be given a free hand, if he is an expert at all. He must not be limited as to time, if the head of his department is satisfied that he is doing sound work. Above all, the head of his department must be a man capable of appreciating in its broader aspects the subject that is being investigated.

Reference libraries.

Q. 78.—A minor defect, comparatively speaking, in the organisation of scientific work in India is the scarcity of research libraries. So far, however, as most branches of zoology are concerned, this difficulty has been exaggerated. There are in India at least two first class zoological libraries of broad scope, that of the Zoological Survey in Calcutta and the Connemara Library in Madras. The Entomological Library at Pusa is also first class. I have no personal knowledge of the libraries of the Forest Institute at Dehra Dun or of the Madras Agricultural Institute at Coimbatore, but I understand that they are also good entomologically. I have myself made use of the libraries of five British and two Japanese universities and am convinced that we in Calcutta are better off for zoological literature than we would be anywhere else in Asia and anywhere out of London in the British Isles. No zoological investigator working in Edinburgh or Dublin can avoid visiting London occasionally to look up literature. The real difficulty in India, so far as zoological research is concerned, lies not in the absence of books, but in the great distances apart of the different cities.

Two courses might be taken to obviate this—either facilities for visiting existing central libraries might be granted to workers or new libraries might be founded in other centres. In my opinion it would be more economical to bring the workers to the libraries. A great objection to this course, however, lies in the fact that it would prevent the majority of Indian students under training from acquiring any real knowledge of how to use literature in research. I am inclined to think that the lack of literature is at present a more serious matter to the students than to their professors or to the experts employed as such under Government. I have recently visited practically all the colleges in India in which zoological investigations are being undertaken and so far as I have been able to discover most of the professors have had no great difficulty in obtaining the special volumes they need for their own investigations. The students, however, have no experience in looking up references and no appreciation of how to use the references brought directly to their notice.

ORAL EVIDENCE, 4TH JANUARY 1917.

President.—Q. I understand that your position recently has been changed from that of Superintendent of the natural history section of the museum to Director of the Zoological Survey of India, the work of the museum being retained as before. I understand that the actual work being done by you and your colleagues is just the same to-day, but that you have a certain amount of greater freedom as head of the Imperial department. What officers have you got working with you?—A. I have one Superintendent and two Assistant Superintendents.

Q. So you are four altogether?—A. Yes.

Q. And what relation then do you bear to local zoologists like those engaged in teaching, in charge of the local museum, and the zoologists connected with the Fishery Department?—A. A certain number of the zoologists are honorary assistants in the museum, i.e., there has been no change made as yet. I presume later they will be connected with the Zoological Survey of India in the same way, but I have no administrative connection whatsoever with any of the local men.

Q. I understand that the policy that you have accepted for the department as it now stands might be roughly regarded as the purely scientific aspect of zoology drawing the lines within which the results begin to touch on practical and economic problems which you leave to these local officers?—A. Yes.

Q. You know there are several ways of classifying natural functions; one likes to find out generally the best for working under Indian conditions. You say that the "ideal conditions for the organization of zoology in India would be a great zoological department combining both practical and theoretical workers under a director with a wide knowledge of and sympathy with the different branches of zoology, sufficiently broad minded not to despise any branch and not to interfere unnecessarily in the work of his junior officers. He should be given the status proper to a head of a department, scientific but not minor." Then you refer to the case of an expert being deputed or appointed to investigate any technical problem locally. Presumably an expert of that kind, if employed by the local Government, would be under non-expert supervision and the local Government therefore would be dependent entirely on his views without check by any senior officer of similar qualifications. Don't you think that is likely to lead to a difficult position?—A. I don't think so. I don't think I have touched upon that point at all, so far as I remember. My idea would be that the officer, as regards administration, would have to be to some extent under the local Government, in the district or province in which he was working. When he went to the district or province, his first duty would be to make preliminary investigations and see what could be done in the particular subject. He would then make a report, on general lines, to the Director of his department directly, and the Director of the department would submit this report to the local Government with any recommendation he thought desirable, and that finally would be considered by the local Government in consultation with the Director. Once a programme had been accepted both by the Director and the local Government, the man should be given an absolutely free hand. Say once a year, or once in six months, or once a month, just as the magnitude of the investigation indicated, he should submit a report to the Director of the department, who would then advise the local Government at once whether he considered it was desirable to carry the matter further and if so whether any change in the ordinary programme was necessary.

Q. That is so far as concerns the deputation of officers in your department to assist the local Government in investigations, but there are eleven local Governments and there are only four of you, so that that is not going to work very efficiently in practice?—A. I have said so. I refer to ideal conditions, not to the present conditions.

Q. Take the case of the specialist, the zoologist, who is actually employed by the local Government and who is not a member of your department. He may be a fishery expert; he may be alone or one of two; that is the best we have ever seen in India yet. How is the local Government to appreciate that man's work when he is a good man, and how is the local Government to deal with that man when he is so otherwise?—A. I don't know; there is no organization at present to allow anything of the kind.

Q. Would it not be better to allow all these zoological officers to be members of the Zoological Survey?—A. Yes. They might be attached to the Zoological Survey.

Q. Are you then of opinion that these officers ought to be linked together into a larger Imperial Department?—A. Yes. I think so, certainly.

Q. That is what you mean when you refer to "ideal conditions"?—A. Yes. I think that at present there would be very great personal difficulty, because naturally each officer would consider that he should be above the officer in the same office attached to a small local Government, but we should not pay any serious consideration to that. I don't think that any personal question of the kind would result in permanent disorganization of the work in India, but it would need great tact to organize the department.

Q. Take the case of the fisheries; in matters of fishery activities you have problems that can be divided into two groups; first the scientific habits of the fishes must be ascertained as the foundation for any kind of practical work; secondly there is the practical work consisting of the formation of co-operative societies among fishermen, methods of improving their means of catching, development of the market, and, generally, questions that a zoologist ordinarily is not an expert at. Ordinarily a fishery expert would not be able to deal with both the scientific and commercial sides of fishery questions himself. If there were two of them, then the difficulty would arise as to who was to be "boss," and in a case of that kind there is likely to be friction. Would it not be better if all these scientific fishery experts were members of your department, leaving for further consideration the question whether the others should be under the local Government or under the Government of India?—A. That would lead to very considerable difficulties in practice, because it would almost inevitably bring about a situation of this kind,—the practical man would be practical on his own lines without consulting the scientific man at all, whereas the scientific man's work would be inclined to be entirely scientific without any reference whatsoever to the particular practical problems he was employed in working out.

Q. That would be the same if he was a member of the Imperial Government or employed by the local Government. In the case of his being employed by the Imperial Government he would be able to bring to the notice of his department the whole question. This rather increases the argument that the scientific member should be a member of the Imperial department?—A. Certainly. The difficulty is that in all scientific matters in India I have found lack of co-operation, and of course if you are having an Imperial department for the more scientific aspects of the technical work, there would have to be some corresponding department in the instance you give for the purely technical side.

Q. Supposing you had a superintendent of fisheries who was not necessarily a zoologist; would it not then be easier for you to lend an officer to assist him in the zoological aspects of his work; would you not be in a position to tell the local Government with some authority the importance of considering the habits and tricks of fishes before you begin to talk about organized methods of fishing?—A. I think it would in one way, but my point is this—that if you have an Imperial scientific department corresponding with a number of local practical men, there is much more likelihood of friction than if you had two Imperial departments, one dealing with the technical application of science and the other with the more purely scientific aspects of the question.

Q. The question of the application of science always involves a certain number of local problems more so than the purely scientific aspects of the problem?—A. I don't think that applies so much to zoology as to other sciences.

Q. It does apply to fishing. The conditions of Madras are certainly different to those of Bengal?—A. But not entirely different as long as the fisheries are combined with those of Bihar and Orissa.

Q. You can also get a case in which a fishing problem could not be studied within one local Government alone; so the officer who is employed by one local Government might find the best solution of his problems within the area of another province. In that case it would be more convenient for him to be a member of the Imperial department so as to have access to two provinces?—A. Exactly, but my point is, the scientific officer should certainly be a member of an Imperial department but the technical officer, in consultation with whom he had to work, should also be an officer of an Imperial department. In the case you instance, I remember there was a question some years ago of investigating the breeding habits of the hilsa and the hilsa did not restrict its habits to a certain province. It was believed that the hilsa went up beyond the limits of Bengal to breed and very great difficulty arose in allowing the officer who was investigating the question to go beyond Buxar. As a matter of fact there was only one fishery expert, so that the difficulty only applied to him; but supposing that a local technical officer had been working in consultation with him, would not the local technical officer have ceased to consult with him when he got beyond the limits of Bengal?

Q. He would have to consult two types of local technical officers?—A. Yes. Take fishery problems again. You have estuarine, marine and fresh water problems to consider in Bengal and Bihar and Orissa, and these are three different sets of problems. What would be true of all these three types combined would apply to the whole of India from the technical point just as much as from the scientific point.

Q. Have you got any possible hope within you of making any kind of impression on the zoological survey of India with four officers?—A. No, I regard the foundation of the new department purely as an opportunity for development.

Q. What, to your knowledge, has been done in India towards training young Indians to take up a work of this kind?—A. Very little. In Bengal nothing. In Lahore there are a certain number of Indian students of zoology who are receiving a good ordinary zoological training. So far as I know they are not being encouraged in any way to apply this training to practical results. At Pusa I understand that students are given some training for practising entomology. The difficulty there is that men cannot be found who have got a preliminary training in pure zoology. In Madras there is a certain amount of pure zoological training given and there they are perhaps more successful in getting men who will apply this work to fishery problems. In Allahabad there is a zoological school which, as far as I know, is becoming morphological. That is a fair statement of what is being done in zoological training in India. In Calcutta the only zoological training is that given to medical students. It is impossible for anyone who is not a medical student to get a zoological training.

Q. At present I suppose there are very few openings in sight for young Indians?—A. Not immediately in sight, but everybody realises that, especially in entomology and fisheries, there must be openings in the future before very long.

Q. Take the question of entomology separately. Is it correct to assume that entomological work is so bulky as to constitute a branch of its own and of a kind that barely trespasses on other parts of zoology?—A. I would not like to say that. I think it is very essential that a sound entomologist should have a sound general zoological training. Some years ago when we were appointing an extra staff for what is now the Zoological Survey of India, I think it was definitely laid down that we were not to try to get a man for the entomological section who already was an expert entomologist, but a man who had a good general training in zoology, and then send him afterwards to Ceylon, where the best entomologist in this part of the tropics was then stationed, to get a special training in entomological work. We found that worked far more satisfactorily. The difficulty about entomological experts is that the great majority of them specialise very early and become experts in one family of insects only. They have very little knowledge of the general principles which underlie the science.

Q. I suppose zoology to an entomologist is like mathematics to the physicist?—A. I do not know that I would agree to that so far as the study of habits is concerned. The study of habits is more important than purely systematic work and needs a broad outlook. It should

not be laid down that a man who studies the habits of moths, for instance, should not study the habits of beetles, because there are very broad general principles underlying both, and specialization would be harmful as much from the scientific as from the practical point of view.

Q. Why don't we find in this country people taking zoology like we find in other parts of the world? We have philological students in great numbers without any greater prospects from the worldly point of view than in the case of zoology?—*A.* I think it is this; in the old days in India I believe it was the custom for the man who had retired from daily life to retire to the jungle, whereas we find in a very large proportion of boys in European countries, especially in Great Britain, that their tendency is to go in to the woods when they are young and study animal life. In India it is almost unheard of to discover young boys who collect butterflies, or who are interested in plants and flowers, and no encouragement is given in the schools for the study of nature. There is no conception in the home life that any such things could be of interest at all, and therefore if scientific training is to be more successful in India it must be begun very much earlier.

Q. You want more natural history studied in school?—*A.* I don't think schools are enough. You want to get boys to take some interest in such things out of school hours.

Q. Are you of opinion that collections could be kept safely in this country as well as in London?—*A.* I think they can in Calcutta. Calcutta is peculiarly favourably situated for the preservation of organic matter, for this reason, that we have nothing very extreme in climate. I have talked over the question with private gentlemen who have collections of butterflies and they tell me that in Simla and Delhi, where you get extremes of moisture and temperature they find it impossible to keep their collections as we do in Calcutta. They get extremely brittle in dry weather and are likely to fall to pieces in wet weather.

Q. You don't think any advantage is to be gained in sending types for preservation to London?—*A.* None whatever, always provided that in India, there is a sufficient subordinate staff to look after specimens. In the Indian Museum, we have six men whose whole duty it is to go through the collections and see that the spirit does not dry up in the bottles, and that the insect cases are provided with antiseptics. Our old collections in Calcutta are in a very bad condition. That is entirely due to inevitable neglect, because there was formerly no staff to look after them.

Q. If your staff is increased do you think you could undertake the work of zoological teaching in connection with university colleges?—*A.* No, I don't think we could unless it was increased beyond all probability. In any increase we are likely to get, the difficulty would be in getting men who are real teachers.

Hon'ble Pandit M. M. Malaviya.—*Q.* You speak of an industrial section of the museum, and later on you speak of the commercial museum. Would you suggest that the two should be located in one and the same building?—*A.* No, I do not think it is necessary. I think they are catering at present for two entirely different classes of men, and the fact that the commercial museum was situated in a museum like the Indian Museum would perhaps rather tend to frighten commercial men away. It is better not to have them in the same building.

Q. If it was to be placed where information could be had of raw materials obtainable for different manufactures?—*A.* If it were to be that, I certainly think a commercial museum should be combined with the industrial section, provided it was placed where you could inquire about raw products. Of course at present the industrial section of the museum is becoming entirely botanical. The only reason is that there happens to be a botanist in charge, and no other expert available.

Q. You say that in Japan you noticed that goods of inferior kind would be produced almost exclusively for the foreign market, and you say that the goods they themselves use are superior in quality?—*A.* Yes.

Q. Are they produced in the same factory?—*A.* I think not. That is a point I cannot give precise information about, but I think not.

Q. Did you find these little exhibitions of local products at a very large number of railway stations?—In every large railway station; just a few cases in a prominent place with information as to the price and place. The information on the labels was entirely in Japanese but I understand that there was a statement as to the prices.

Q. Did you enquire of the conditions under which this was done?—*A.* No.

Q. Is any particular man in charge of these little exhibitions?—*A.* I cannot tell you that. It is extremely difficult in Japan to find out who is in charge of anything. Everything is done by committees.

Q. You have got four scientific officers who are all graduates; are any of these Indians?—*A.* One is.

Q. Where did he graduate?—*A.* Calcutta first, and Edinburgh afterwards.

Q. With reference to the last paragraph of your note would you recommend at least one library in every province?—*A.* Yes, I think so; every province or group of provinces. The question was recently discussed by a committee of the Board of Scientific Advice and we decided to recommend to Government that there should be one research library in each group of provinces.

President.—*Q.* Is that committee still at work?—*A.* Yes, its report is being considered.

Sir D. J. Tata.—*Q.* With reference to those commercial exhibitions in Japan do I understand that at these exhibitions only the superior kinds of goods which the Japanese themselves use are exhibited?—*A.* Practically, yes.

Q. The things they dump on foreign markets are not exhibited at all?—*A.* No. For example, Japanese have a great dislike for cheese; they cannot stand the smell of it, but they make cheese in large quantities for export.

Mr. A. Chatterton.—*Q.* You refer to the absence of any interest on the part of children in zoological collections. I suppose that is very largely due to the fact that in their early training they are taught that it is a sinful act to take life in any form?—*A.* I don't think that has very much to do with it, because what I say applies just as much to plants and natural phenomena generally as it does to animals. It may have something to do with it, but I don't think that it is really fundamentally at the bottom of it.

Q. Would it be possible to draw up a course of training in elementary schools, in botany, which would tend to cultivate their powers of observation?—*A.* Suitable teachers cannot be obtained. What I would like to see done is that there should be an educational section of the Indian Museum and in charge of this section there should be a man who would act as secretary to the trustees, a scientific man really keen on teaching. It is more difficult to get a man keen on teaching than a really scientific man. He should arrange for popular lectures and demonstrations. He should not only conduct school boys round the museum but should take them out on the maidan and demonstrate things living.

Q. I understand that something of that kind has been done by Dr. Henderson lately in the museum in Madras and that it has not proved very successful?—*A.* I don't think he regards it as a failure. I don't think he has been conducting people outside the museum. I know he has been conducting school boys and possibly girls round the galleries. He considers it rather an important movement, but not one from which one would expect immediate results.

Q. It would be possible to arrange courses, if you got suitable teachers, which would tend to cultivate their powers of observation to a greater extent than it has done up to now?—*A.* Certainly, but I don't think it would be the slightest good to start "nature study" classes, in which the nature taught was anything but natural.

Dr. E. Hopkinson.—*Q.* Supposing it is determined that primary education in India shall be directed towards developing the observational faculties of the children, what steps would you take to provide teachers capable of giving suitable instruction?—*A.* That of course is very difficult, because you would need teachers who are really interested in the subject themselves and that is just what one cannot get in India.

Q. You think that they cannot be got?—*A.* I have been making rather elaborate enquiries as to the students of zoology in India, and I have certainly failed to find them in anything like large numbers. There are a very few. I don't believe there are more than half a dozen Indians at present who are really interested in zoology of any kind.

Q. Then you consider that, before any progress can be made in that direction, it would be necessary to take steps to ensure suitable teachers?—*A.* Yes.

Q. That is a rather hopeless problem?—*A.* Not absolutely, but it means that you will have to get really first class men from Europe who would be so enthusiastic themselves, and teachers of such calibre, that they would encourage interest in natural history generally among young children and train them up in the way that they should go. Of course it would be a very, very slow process.

Q. You would not suggest that men brought from England should teach in village and man schools. You mean that they should have training classes?—*A.* Yes, and I would like to see a man attached to the Indian Museum in Calcutta whose duty would be to arouse an interest in natural history. Primarily it would have to be among small children, because it would be very difficult to get material which you could build upon in the case of teachers.

Q. That would have a very limited effect; it might influence the minds of a few hundred children?—*A.* Exactly, but that is all one could hope for at present. These would influence a few hundred more.

President.—*Q.* If the museum were in the zoological gardens would it then become a source of zoological information?—*A.* I don't think so.

Hon'ble Pandit M. M. Malaviya.—*Q.* Is zoology a part of the elementary course in England?—*A.* No.

Q. Do you know of any country in which it is?—*A.* Not the elementary course. I believe a great deal has been done in England and especially in America during the last few years in encouraging nature studies but exactly what place it takes in the ordinary school course I cannot tell you.

Q. We are familiar with nature studies in the ordinary way, but I want to know if regular instruction in zoology is given and whether it is part of the elementary course anywhere?—*A.* Possible it is in Japan. I was shown elementary text books for boys of seven years of age.

Q. It is one thing to have an elementary text book but my question is of the elementary course?—*A.* I think it is in Japan, but not in England.

WITNESS No. 168.

Mr. T. SOUTHWELL, A.R.C.S., F.Z.S., *Deputy Director of Fisheries, Bengal and Bihar and Orissa.*

WRITTEN EVIDENCE.

A short history of fishery enquiries in Bengal.

The beginning of fishery enquiries in India may be said to date back to the year 1867, when Sir Arthur Cotton (who was perhaps best known as an authority on the subject of irrigation in India) remarked, in a communication to the Secretary of State for India, that "he supposed that the injury to the coastal fisheries must be very great, since seven of the principal rivers on the East coast had been barred" by the then newly-constructed irrigation works. During the same year the Government of India initiated enquiries relative to the fisheries generally.

In 1868, the Secretary to the natural history section to the Asiatic Society of Bengal, in answer to an enquiry, replied "that the Council are fully aware of the great importance of the question at issue and they consider that the statement made by Sir Arthur Cotton, together with strong *a priori* arguments that may be adduced, render it in the highest degree probable that the effects of anicuts or weirs across large rivers lead to a rapid destruction of many kinds of fish, which may ultimately lead to their extermination, not only by interfering with their spawning in accustomed localities, but by leading to their accumulating in large numbers below weirs, where they are not only captured in large quantities by man but are exposed in an increased degree to the attacks of crocodiles and predacious fishes."

As a result, the Government of India, in 1868, appointed Surgeon Major Francis Day to investigate the question of the anicuts or weirs in the Madras Presidency. The enquiry was subsequently generalised and extended to Orissa and Lower Bengal, and afterwards to British Burma and the Andaman Islands. In the year 1871 the enquiries were further extended by Dr. Day into the North-Western Provinces and the Punjab, and finally into Sind. The excellent work done by the late Dr. Day was of a very extensive nature, and it marked a new era in the history of fishery investigation in this country. Had the investigations of Dr. Day been continued, and had the various recommendations which were elaborated by this officer as a result of the researches of a lifetime been given effect to, there can be no room for doubt that a very great and marked improvement in the fisheries of India, and of Bengal in particular would have resulted. Unfortunately, after the death of Dr. Day in the year 1889, the enquiries ceased, and so far as the Provinces of Bengal and Bihar and Orissa are concerned, no further work was done on the fisheries until the year 1906.

During this interval, however, considerable additions to our knowledge of the deep-sea fishes in the Bay of Bengal were made by Colonel Alcock, I.M.S., Surgeon Naturalist to the Indian Marine Survey, and, later, Superintendent of the Indian Museum. Extensive enquiries into the coastal and estuarine fisheries were also carried on by this officer, and in a short special report which he submitted respecting these fisheries he very strongly advocated their exploitation on commercial lines.

On 26th July 1906, Mr. K. G. Gupta, C.S.I., I.C.S. (now Sir K. G. Gupta), a Senior Member of the Board of Revenue, Bengal, was placed on special duty by the Government of Bengal, in order to enquire into the fisheries of this province, and its fish-supply. This enquiry was taken up in July 1906, and his report thereon was submitted to Government on the 20th of February 1907. In May 1907, Sir K. G. Gupta proceeded to America and conducted enquiries into the fisheries of the United States and Canada. Later on, he visited various centres on the Continent, and finally he conducted investigations at many of the principal fishing centres in the British Isles. His report on the above fisheries was placed before Government on the 27th of January 1908, and the two reports were subsequently published together by the Bengal Secretariat Press, Calcutta, in the same year, under the title, "Reports on the results of enquiry into the fisheries of Bengal and into fishery matters in Europe and America." In his report Sir K. G. Gupta set forth a mass of useful information with reference to the physical features of the province, the castes engaged in fishing, the great variety of nets and other fishing instruments in use. Certain details were also given relative to the consumption of fish, and the carriage of fish within the province. Methods of utilising waste products and of improving local methods of curing fish were indicated. The question of the general fish-supply, the cause of its decrease, and the possibility of adopting protective measures were also dealt with. Improvements in tank culture and in transport were also discussed. Finally he advocated the immediate establishment of a Fishery Department in Bengal, which should be combined with the Department of Agriculture, and he further advocated the formation of a Fishery Board for the control of the fisheries.

Two important results followed this enquiry:—

- (1) The recommendation made by Sir K. G. Gupta that a survey should be made of the fishery possibilities in the Bay of Bengal, was immediately acted upon by Government, and very shortly afterwards a typical steam trawler was actually at work in the bay.
- (2) The present Fishery Department owes its origin to the recommendations made in the reports referred to.

The enquiry by Sir K. G. Gupta terminated on January 27th, 1908.

From February 18th, 1908, Mr. A. Ahmed, as Commissioner of Fisheries, continued the work which had been begun by Sir K. G. Gupta.

On October 23rd, 1908, Government formally sanctioned the constitution of a Fishery Board, and also defined its functions. This Board consisted both of official and non-official members, and included a representative from each of the seven divisions of Bengal, the Bengal Chamber of Commerce, the National Chamber of Commerce, the Commissioners of the Port of Calcutta, the British Indian Association, and the Bihar Land Owners' Association. The Board met five times during the period in which Mr. Ahmed was Commissioner.

We have already noted that, as a result of the representations made by Sir K. G. Gupta, a steam trawler was obtained, by Government, without loss of time, and within six months was at work in the bay. This trawler, the "Golden Crown," started on her first trip on June 18th, 1908, and completed her last voyage on December 17th, 1909. The investigations made by the "Golden Crown" in the Bay of Bengal, and by the steam launch "Ila" in the Sunderbans, were carried out by Dr. J. Travis Jenkins of the Lancashire Sea Fisheries, whose services had been specially engaged by the Government of Bengal. The primary object of the investigations in the Bay of Bengal was not to supply the market with fish, or merely to attempt to prove that trawling operations in the bay could be made commercially successful, but to locate and chart the principal fishing grounds, to ascertain what kinds and quantities of fish were obtainable and where they were to be found at particular seasons, etc. The results obtained by Dr. Jenkins are of great importance. He showed that trawling could be carried on successfully right through the monsoon. He also located some of the best fishing grounds and prepared a chart shewing the area which had been trawled over, and the nature of the bottom. He further proved that sea fish could be landed in a fresh condition in Calcutta from places as distant as Akyab and Santapillai.

In connection with the estuarine fisheries Dr. Jenkins made three trips to the Sunderbans, in the steam launch "Ila", on the following dates :—August 20th to 30th ; November 10th to 21st ; and December 5th to 16th.

The launch was quite unsuitable for fishery enquiries ; and only 30 days were actually spent on the investigation although the area covered by these fisheries is over 5,700 square miles. The only equipment he had was a shrimp trawl, a few mackerel nets, and several herring nets. On the last trip the launch also carried a fish trawl provided with traps and pockets. These nets, like the boat, ultimately proved unsuitable. In spite of these serious difficulties, however, Dr. Jenkins obtained several interesting and important results.

II.—A comparison of the Fishery Department with other Fishery Departments in India and elsewhere.

The Fishery Department of Bengal and Bihar and Orissa conducts operations over the two provinces named above. In each province the Director of Agriculture has supreme control over the fisheries. Under the two Directors of Agriculture there is one Deputy Director of Fisheries, and two Superintendents of Fisheries, all of whom are gazetted officers. Lastly, there is a temporary zoological student who is learning the work.

At the invitation of the India Office I accepted the appointment of Deputy Director of Fisheries (for Bengal only) on the 5th December 1911. As a result of the administrative changes which took place in 1912, the department extended its operations over the new province of Bihar and Orissa, and over Eastern Bengal.

One Superintendent of Fisheries took a B. A. in physics in Calcutta University in 1900 and graduated as M. A. in 1903, taking light and acoustics as principal subjects. He continued research work in physics at Sibpur College, Calcutta, during 1904, and in 1907 was appointed demonstrator in physical science in the Presidency College, Calcutta. In May 1908, he was selected by Government to visit Europe for the purpose of studying carp-culture and fish-curing. He returned to India in October 1909, and immediately joined the Fishery Department being confirmed in that appointment at the expiration of the short period of three months. The other Superintendent of Fisheries was a student in Calcutta University, but failed to take his B. A. degree. In August 1908 he was appointed by Government to visit America in order to study *Shad* culture. He returned in November 1909 and at once joined the Fishery Department. In October 1910 he was confirmed in his appointment. It is decidedly unfortunate that neither of these officers had the advantage of any training in zoology or natural history either before, or since their appointment, as this fact had precluded the possibility of their taking a more intelligent and responsible part in the fishery enquiry in Bengal.

Such is the history and composition of the present Fishery Department. The area over which the department conducts operations and enquiries, together with the population according to the census of 1911, are summarised in the following table :—

Locality.	No. of Districts.	Area in square miles.	Population.
Bengal	27	84,002	44,305,643
Bihar and Orissa	21	111,829	22,435,298
Total	48	195,831	66,740,941

In the British Isles, fishery enquiries are conducted by the different bodies indicated below :—

- (1) *Fisheries Branch of the Department of Agriculture and Technical Instruction.*—This is in charge of a Chief Inspector, supported by two Inspectors, together with 3 or 4 temporary scientific assistants, all of whom are trained zoologists.
- (2) *Fishery Board for Scotland.*—Under this Board there is a scientific Superintendent, an Inspector of Salmon Fisheries and two Inspectors of Sea Fisheries, all of whom are trained zoologists. In addition, there are about 32 Fishery officers who have no special zoological training.
- (3) In England, the Fishery Division of the Board of Agriculture is in charge of an Assistant Secretary who is subordinate to the President of the Board of Agriculture. The expert staff is as follows :—
 - (a) Inspector of Fisheries.
 - (b) A Sub-Inspector.
 - (c) A temporary Inspector. All of whom are trained zoologists.

In addition, there are about 160 Collectors and Assistants engaged in subsidiary operations.

- (4) *Plymouth Marine Biological Association.*—The permanent staff consists of a Director, a Naturalist for Fishery Investigations, and an Assistant Naturalist—all trained men. During the International Fishery Investigation in which the Association took part, the expert staff was as follows :—

The Director, stationed at Plymouth.
 The Chief Naturalist, stationed at Lowestoft.
 The Assistant Naturalist for fishes, stationed at Lowestoft.
 The 1st Assistant Naturalist for invertebrates, stationed at Lowestoft.
 The 2nd Assistant Naturalist, stationed at Lowestoft.
 The Statistical Assistant, stationed at Lowestoft.
 The Hydrographer, stationed at Plymouth.
 The Assistant Naturalist for Plankton, stationed at Plymouth.

- (5) *The Lancashire and Western Sea Fisheries Committee.*

The expert staff is as follows :—

Professor Herdman, F.R.S., Director.
 Dr. Johnstone, in Liverpool.
 Mr. Andrew Scott, at the Piel Marine Laboratory.
 Dr. J. Travis Jenkins, Superintendent of Fisheries.
 There is also one temporary Assistant (a trained zoologist) with Professor Herdman.

- (6) *The Northumberland Sea Fisheries Committee—*

Director, Professor Meek, and two Fishery officers.

Besides the above, the following public bodies (amongst others) are engaged in fishery enquiries and administration :—

The Sussex Sea Fisheries Committee.
 The Kent and Essex Sea Fisheries Committee.
 The Suffolk and Essex Board of Conservators.
 The Devon Sea Fisheries Committee.
 The Eastern Sea Fisheries Committee.
 The South-Eastern Sea Fisheries Committee.
 The Severn Board of Conservators.

These bodies, for the most part, employ local officers. A remarkable feature of the work carried on by many of these Fishery Committees is the extent to which their operations are dependent on the munificence of private individuals. They also receive small grants from Government and are further assisted by local taxes.

In the Madras Presidency the fishery staff consists of an honorary Director who is a member of the Indian Civil Service (retired), a Superintendent of Pearl and Chank Fisheries who is a trained zoologist, and fresh-water fishery expert who has had a long experience in the artificial cultivation of fresh-water fishes. In addition, there are a large number of Indian assistants.

In the Punjab, the fisheries are in charge of a Warden who is assisted by a few Indians. A Fishery Department has just been initiated in Travancore. It is controlled by the Director of Agriculture. As far as I am aware there are no other Fishery Departments in India.

The following table indicates the approximate amounts spent by different countries on fishery work :—

India—	£	Year.
(a) Bengal, and Bihar and Orissa	4,000	1915-16
(b) Madras	16,917	1915-16
United Kingdom	86,000	1908
Norway	20,000	1908
Sweden	9,970	1908
Denmark	16,555	1908
Holland	15,170	1908
Belgium	920	1908
Canada	200,000	1908
Germany	27,750	1908
United States of America	140,879	1908

I have thought it necessary to detail the preceding particulars in order that the relation of the department to the work before it might be understood.

III.—Present condition of the fisheries in Bengal.

It is not possible in a short written statement of this kind to set forth fully and accurately the various problems facing the department, nor the manner in which the work is being attempted, but a brief consideration of the following points may help to elucidate the situation.

It is necessary in the first place to understand clearly that, so far as the Indian population is concerned, fish is an article of food second in importance only to rice. It is believed that at least 80 per cent. of the entire population in Bengal consume fish regularly. In certain parts of Bihar and Orissa where wheat, maize and other grains are preferred to rice, meat is consumed in place of fish.

Secondly, it is unfortunate that in Bengal the occupation of fishing or dealing in fish is regarded as a business to be carried on exclusively by the lower classes. The whole industry is thus left in the hands of people with no capital, no education, and no business capacity.

The price of fish is undoubtedly high at certain seasons but, it will be remembered that most commodities have increased in price during the last 20 years. Fish has apparently shared in this general increase. Apart from this fact, it may be true that a shortage of fish has also tended to enhance prices. It is, however, an established fact that the current high prices are due largely to the operations of middle-men. The Bengal fishermen are of course, not the only fishermen who are subject to exploitation, but in the principal fishing centres in Bengal, the process is carried on so thoroughly that the fishermen are reduced to such a degree of poverty that they are unable to purchase nets and boats to continue their occupation. Many have accordingly taken to agricultural pursuits.

The irregular supplies of fish in the market are due to two main causes :—

- (a) Seasonal distribution of fish. For this there is no remedy.
- (b) The fishermen do not work regularly even when weather conditions permit. Although poor, and subsisting on the mere necessities of life, the success of one day leaves the fisherman free to indulge in idleness the next. In this respect the Bengal fishermen stand in marked contrast to fishermen in western countries.

It is commonly believed that there is a growing scarcity of fish. In the absence of statistics it is difficult if not impossible to say to what extent this is true. Having regard to the manner in which fishing operations have been conducted in this province during the last 100 years, it would be astonishing if the supply kept pace with the demand. The late Sir Francis Day stated "that British rule appears to have had a most disastrous effect upon the fresh-water fisheries of the Indian Empire." His opinion was based on the belief that under native rule indiscriminate fishing was generally not allowed. "If persons may help themselves as they please, they will take those (fish) captured with the least trouble and thus breeding fish and fry are destroyed where they should be preserved. The people cannot be blamed for this; fishermen will do it whether in Europe or India if so permitted."

Fishery rights.—The following facts appear to obtain with reference to the fishery rights in general :—

I. The fisheries of the open sea (i.e., those situated beyond the three miles limit) are, of course, open to be exploited by any one.

II. At present, Government apparently prefers not to exercise control with reference to fisheries situated within the three miles limit. The foreshore fisheries at Balasore, over a length of about 15 miles are, however, administered by the Ordnance Department, and a further adjoining portion is, I believe, privately owned.

The foreshore fisheries in the vicinity of Dhamra belong to the Raja of Kanika. As far as I am aware, no steps have been taken by Government to control the remaining foreshore fisheries.

III. In tidal waters, the fishery rights belong to the public, Government being the public trustee.

In a very few instances, Government has leased out small portions of these fisheries. In other instances, Government has waived its claim to the fisheries. In the great majority of cases, however, proprietary rights are claimed, apparently as a result of the entire lack of administration over long periods of time.

Perhaps in some cases this circumstance has arisen owing to water-ways having changed their course, and commenced and continued to flow over permanently-settled estates.

Possibly in other cases the fisheries have been permanently settled, although no such case has come under my notice except perhaps the fisheries in the district of Jessore. In still other cases Government has apparently failed to protect the public right in allowing the fisheries to be gradually appropriated by private individuals. The result is that, whereas the fishery rights in tidal waters should belong to the public, they have, in large measure, become privately owned. Not only has a large potential revenue been lost to Government in this way, but the fisherman has lost his right to fish, for, where prescriptive rights are claimed, the fisherman has to pay rent.

The fishery rights in the main rivers are owned partly by Government and are partly settled permanently. In some districts, portions of Government fisheries are, for some reason or other, not farmed. In other cases, no one appears to know whether the rights belong to Government or not.

The question is a very difficult one. Under the circumstances it is only possible, at present, for the department to deal effectively with fisheries directly under Government control. Such fisheries are leased out to the highest bidder, by the Collector of the district in which they are situated.

Fishery regulations.—Bengal Act II of 1882 relates to laws regarding embankments and watercourses and is of no direct importance so far as the fisheries are concerned. Act IV of 1897 applies to the whole of India except Burma. This Act merely prohibits the dynamiting and poisoning of waters in order to kill fish. It further empowers local Governments, under certain conditions, to frame rules with reference to the following points:—

- (a) The erection and use of fixed engines.
- (b) The construction of weirs.
- (c) Kinds of nets to be used and the methods of using them.
- (d) Prohibiting all fishing in any specified water area for a period which may not exceed two years.

Up to the present, no rules have been framed under this Act either in Bengal or Bihar and Orissa.

It will be observed that this Act does not provide for close seasons for any species of fish, nor are any regulations laid down designed to prevent the indiscriminate capture and sale of fry or brood fish.

The entire absence of fishery regulations over long periods of time has undoubtedly had a deleterious effect on the fisheries. At the same time it will be obvious that specific regulations could not be adopted until their nature had been determined by scientific investigations. General measures could, however, have been initiated. No particular scientific knowledge is required to understand that the capture and sale of breeding fish, and fry, the ruthless methods of fishing in vogue, etc., have been, and continue to be, extremely harmful.

Last year, Government passed orders that Collectors shall consult the Fishery Department before settling fisheries. This has enabled us to initiate such protective measures as are indicated in the particular cases examined. Up to the present, owing to the restricted area covered by such fisheries, supervision has not been very difficult. That it will become so, is, I think, certain. The necessity of extending regulations, and perfecting them, so as to include all fisheries, will then occur, and steps will have to be taken to provide the machinery to enforce them. The Fishery Department, as at present constituted, could not possibly exercise control over the whole province, and if the improvements indicated have to be effected, the staff will of necessity have to be increased, unless the supervision can be undertaken by some other department.

Irrigation schemes.—Established irrigation works have reacted disastrously on the fisheries and the development of agriculture has, in a measure, taken place at the expense of fisheries. I need not perhaps explain fully the exact manner in which this has been brought about, but the following points may be noted:—

(I) *Weirs or anicuts*—

- (a) In the river Mahanadi. Here, the eggs and fry of fish, from the higher reaches of the river, are carried over the weir, probably before they are capable of any appreciable movement. Once over the anicut it is extremely difficult for the fish to return. The higher reaches of the river are thus being drained. Below the anicut, tidal water occurs within 60 miles. It is true that fish-ladders exist in this river (and in the Soane), but no fish-pass or passes can materially lessen the ill effects of the weir.

- (b) In the Sone, the fry, passing over the weir, have a reasonable chance of reaching the Ganges, the tendency here being to deplete the Sone fisheries.
- (c) In the Cossye, the fry or eggs passing over the weir find themselves in an area which dries up a few months after.

In all cases, the irrigation channels arising from the weirs carries and distributes eggs fry, and young fish into the paddy fields where they are entirely annihilated. The same thing happens in nature, during the rains, when the low-lying country becomes flooded. Working in co-operation with the Public Works Department steps are being taken to mitigate the evil results as far as this is possible.

Fishing areas :—

- (a) *Marine fisheries.*—Up to the present, the marine fisheries in the Bay of Bengal have not been exploited in spite of the fact that the experimental work done by Government in this area gave promise of results comparable with those obtained elsewhere. This circumstance may be due to the fact that capitalists regard the scheme as a new and experimental one, and prefer to invest in established concerns where profits are certain, and frequently high. I do not consider that the supply of fish in the province is likely to be adequate in future years unless the marine or the estuarine fisheries are tapped. The opening out of these fisheries would further provide opportunities which at present do not exist, for manufacturing fish-oil, manure and other bye-products. In addition, fish could be tinned, if desired.
- (b) *Estuarine fisheries.*—The Sunderbans fisheries cover an area of about 5,700 square miles and fishing over this area is totally unorganised. The railway taps certain portions such as Diamond Harbour, Canning, Khulna, etc., but much of the Sunderbans area is more or less inaccessible.
- The difficulty in this case is purely one of organisation and transport. It is true that steamers belonging to the India General Steam Navigation Company pass through the Sunderbans frequently. But fishermen cannot utilise this service, because the steamers as a rule do not stop, *en route* from Calcutta to Goalundo, and secondly, because the fishermen cannot themselves bring their fish to Calcutta, and they know of no one to consign it to. Here again, the exploitation of the fisheries depends principally on capitalists. It should not be difficult to purchase and collect fish from specified places, at a certain time daily.
- (c) *Fresh-water fisheries.*—Whilst the European section of the community prefers marine and estuarine fish such as Bhikti (*Lates calcarifer*), Topsi (*Polynemus paradiseus*), Hilsa (*Clupea ilisha*), and various species of the Pomfret and Sole, the Indian prefers, and depends upon, fresh-water species. Carps, such as Rohu (*Labeo rohita*), Catla (*Catla buehanani*), Mrigal (*Cirrhina mrigal*), and Calbasu (*Labeo calbasu*) are in great demand. They occur in rivers and are extensively cultivated in tanks.

In addition, there is in Bengal a valuable turtle fishery. Pearl-mussels also occur, yielding a fair harvest of pearls. Until recently the shells were utilised in the manufacture of lime, but lately the manufacture of buttons from the shells has been on the increase. There are, to my knowledge, 2 or 3 factories possessing machinery, but, owing to the scattered distribution of the shell, they have not been successful commercially. One such company applied to Government for financial assistance. The application was rightly refused, as there was no probability of the company operating successfully until sufficient shell was available. It will be early enough to begin with machinery when shell can be cultivated in sufficient quantities to justify such a proceeding. In the meantime, the home industry should be encouraged, for by this means the best use is being made of existing material.

Chanks (*Turbinella pyrum*) are imported from Southern India into Dacca and other districts, in large quantities, where the shell is worked into bangles, rings and other ornaments. There might be scope for a limited amount of machinery in this industry, but it is believed that machinery tends to make the finished article easy of fracture. Moreover, the advent of machinery in this particular case would mean that the whole trade could be absorbed by one firm, leaving hundreds of present workers out of employment.

Edible oysters occur scattered about along the Orissa coast, and in the Chilka lake, but their cultivation has not been attempted yet. Apparently the demand for them in Calcutta is very small.

Button manufacturers.—I have already remarked that, in Bengal, pearl buttons and pearl ornaments are extensively manufactured. The industry centres round Dacca, and is a typical home-industry. The products are bought by Dacca merchants and sold either wholesale or retail. They recently complained that, owing to the importation of large quantities of Japanese buttons (due to stoppage of imports from Austria and Germany) there was no market for the local product. Government was requested to assist the sale of Dacca buttons by procuring markets. On enquiry it was found that the local product was not available in the Calcutta market (or only in very small quantities). Firms were found in Calcutta who were willing to take large quantities. Applications for quotations were also received from London and Bombay and it is almost certain that the demand is at present in excess of the available supply.

Fishing companies.—There are 4 registered companies in Bengal dealing either partly or wholly in fish. In addition, there are a few unregistered companies. There is one registered company in Assam, and at least one unregistered company in Orissa. Except in the case of one company (not situated in Bengal or Bihar and Orissa) the advice of the Fishery Department has never been requested by these companies. I am not complaining about this. I am merely stating the fact. In certain instances which have come under my notice the proposals attempted are, in my opinion, impossible commercially. In other cases it is evident that the entire capital will be absorbed in paying salaries, before any result could possibly be achieved. Even in the best instances the schemes could be easily improved upon. In no case has any dividend ever been paid. The failure in *bona fide* cases has, I think, been due largely to proposals being attempted which did not admit of commercial success.

Co-operative fishery societies.—A few such societies have been formed in Bengal during the last two years. In order to understand clearly what our aims in this direction are, it is necessary to digress for a moment. Fishery rights, whether they belong to Government or to zamindars, are auctioned and sold to the highest bidder. Usually, there is not much competition, as this matter is commonly arranged amongst prospective lessees beforehand. The lessee, instead of working the fishery, often sub-lets it in smaller lots at a good profit, and this process goes on through several stages. The last lessee, often compels the fisherman to pay him a nominal sum for the privilege of fishing. He also takes half, or some such proportion, of the total catch and purchases the remaining half at whatever figure he determines—possibly 5 or 8 rupees per maund. The retail price of this fish ranges from Rs. 22 to Rs. 30 per maund. Our object was to induce fishermen to take leases direct, thus excluding the middlemen. We have been successful in doing this in a few cases. It was recognised, however, that unless we could arrange for the co-operative sale of their fish, the middleman would still be necessary. In one particular case, we recently arranged to place the fishermen's catches on the Calcutta market direct. It is too early yet to judge the possibilities of the methods adopted. Up to the present we have had great difficulty in disposing of the fish owing to the glut of fish in the market.

The present Fishery Department has been in existence for five years. More than three years were absorbed in enquiries of a general nature, and in ascertaining exactly what the problems were which we had to face. The fishery difficulties in Bengal are, in many respects, quite different in nature from those in other countries and even from those obtaining in, say the Madras Presidency. It was, I think, absolutely necessary to complete the general survey before taking up work of any special character. We now recognise fully the nature of the problems before us and their relation to each other.

The results of the work done to date are set forth in the following publication which have been issued by the department during the last four years :—

9 bulletins.

4 departmental records.

6 scientific papers published by the trustees of the Indian Museum.

It is, I think, hardly to be wondered at that the activities of the department are scarcely felt over such an enormous area as is covered by the Provinces of Bengal, and Bihar and Orissa, especially considering the fact that a considerable period of time has been occupied in the general enquiries already indicated. These enquiries have served to indicate the manner in which science can be applied, in a practical way, to the solution of fishery problems in Bengal.

In my opinion a constructive policy is required, based on an application and extension of the scientific methods indicated by the researches of the past few years. Up to the present, with the exception of the short enquiries conducted by Dr. Jenkins and myself no scientific investigation of the fisheries has yet been made. Having regard to the magnificent waterways found in Bengal, and the corresponding enormous potential food supplies contained therein, there is absolutely no reason why the supply of fish throughout the province should not be abundant, and the price cheap. This state of affairs can only be attained as a result of careful and long continued work on scientific lines but it is quite a mistake to assume that the appointment of scientific men will result in an immediate increase of the fish supply.

IV.—Recommendations.

It will, I hope, be clear that the department is lamentably understaffed, and utterly unable to cope with the work before it. No material progress will be possible until the staff is largely increased. I would invite a comparison of the staff of the Bengal Department with that of Madras, or with that of the present Agricultural Departments in Bengal and Bihar and Orissa. Having regard to the fact that I have had over five years experience of fishery work in Bengal and Bihar and Orissa, more than five years in Ceylon, and some experience at home, I do not consider it best, in the interest of all concerned, that my time should be so fully taken up with general work. I consider that I ought to be placed in such a position that I can devote practically my whole time to pure scientific work. At present, I have to deal with the settlement of fisheries, formation of co-operative fisheries, distribution of fry, agricultural exhibitions, protective measures, preparation of bulletins, general correspondence, the fish supply and the fish markets, fishery statistics, budget estimates, experimental operations, and a variety of other work too extensive

to detail here, all these matters having varying degrees of importance. Surveys of the fishery areas have to be undertaken as opportunity affords, and scientific work in the fisheries laboratory in the Indian Museum was, until recently, practicably confined to Sundays and public holidays. Owing to ill health I was reluctantly compelled to discontinue this practice. It is true that I could have devoted more time to the pure scientific work but this would have meant that the department, as at present established and recognised, would have ceased to exist.

The principal recommendation which I wish to make is an increase of staff. At present the department is little more than a name. If Government wish the department to be in a position to deal effectively with the problems before us, an efficient staff is absolutely necessary. It may not be possible at once to appoint a staff as large as the urgency and seriousness of the situation demands. But I consider that a beginning should be made immediately by appointing to each province two officers, one of whom should be a zoologist trained in a European school, and the other a man of business capacity. These officers, together with any subordinate staff who might be found necessary, should work under the direction of the present Deputy Director.

The scientific officer in each province would confine himself solely to pure scientific work, such for instance, as enquiries into (a) the general habits of the common edible and marketable fish, (b) breeding habits of the more important marketable fish, such as Rohu (*Labeo rohita*), Catla (*Catla buechanani*), Mrigal (*Cirrhina mrigal*), Calbasu (*Labeo calbasu*), Hilsa (*Clupea ilisha*), Bhekti (*Lates calcarifer*), Topsi (*Polynemus paradiseus*), etc.; (c) artificial cultivation of the principal food fish, (d) food, parasitic diseases, fattening, rates of growth of fishes, (e) life histories of the species of mussels utilised in the manufacture of buttons, with a view to developing the industry, (f) breeding habits of turtles and oysters, (g) investigations into the breeding habits of Window-pane Pearl oysters (*Placuna placenta*), round Chittagong, (h) formulation of protective measures in accordance with the results of their enquiries, etc.

It would be necessary in the first instance to select Europeans for these posts, because no facilities at present exist in India for suitably training Indians.

The proposed non-scientific officer in each province would, amongst other things, undertake the following:—

- (a) Distribution of fry.
- (b) Development and supervision of co-operative credit societies as applied to fisheries.
- (c) Supervise experimental work.
- (d) Conduct general enquiries and continue propaganda work, throughout the province.
- (e) Enquire into the possibilities of better organising the trade in fish, etc.

I consider a European necessary for such a post as this, and I am of opinion that a soldier discharged from the army for reasons which would not unfit him for the above work, would be specially suitable, because such an individual, carefully selected, would be accustomed to discipline, hard work, and method.

I am further of opinion that the staff suggested represents the absolute minimum required. I am aware that after the War, Government contemplate appointing to the department a second trained European zoologist. It is proposed that after a probation of say five years, the individual appointed, if found suitable, shall be placed in entire charge of fisheries in Bihar and Orissa. This I consider satisfactory as far as it goes, but quite inadequate. Further, since the same fishery problems are common to both provinces I am not convinced that the separation proposed is in the best interest of either local Government. Hilsa migrate up the Bengal rivers and apparently breed in Bihar. The same, in a limited way, is true of carp. If fishery administration in the two provinces was separated, we in Bengal should be more or less debarred from prosecuting enquiries in Bihar and Orissa. An artificial demarkation of this kind is, I think, undesirable.

I would call attention to the excellent facilities which exist in Calcutta for zoological and fishery research. I have already referred to the fact that, through the kindness of Dr. Annandale, Director of the Zoological Survey of India, and Superintendent of the Indian Museum, the department has been extremely fortunate in obtaining a laboratory in the Indian Museum—the centre and headquarters of pure zoology in India. The museum library is by far the best in the East, and meets the requirements not only of general zoologists, but of specialists in particular subjects. For instance, with reference to a group of animal parasites known as Cestodes (in which I am particularly interested) I have found that all the literature necessary for a thorough systematic and anatomical survey was available in the library. Similarly, with reference to fish and fisheries, the available literature is singularly extensive. So far as scientific fishery enquiries are concerned, this circumstance is of the utmost importance. Soon after my arrival in India I had the honour to be appointed an honorary assistant of the museum staff, and I record with pleasure the great assistance I have received from time to time from officers of the museum (now the Zoological Survey of India) who, throughout my service in India, have been anxious to assist me and to co-operate with me, in any manner possible. Naturally, I have taken advantage repeatedly of this circumstance, even though the Fishery Department is in no way connected officially with the museum, or with the Survey. One body is concerned with pure zoology, the other with the application of scientific methods. The Fishery Department stands to gain immensely

by the advice and assistance of the Zoological Survey and it is most desirable that such co-operation should continue and extend.

In Bengal, the Fishery Department is controlled by the Agricultural Department, and the Director of Agriculture is also the Director of Fisheries.

In a communication from the Secretary of State I was recently confirmed in my appointment. The Secretary of State created a post of Director of Fisheries and appointed me thereto. As the local Governments, and the Government of India, had only requested my confirmation as Deputy Director of Fisheries it was believed that a clerical error had occurred in the communication from the Secretary of State. The local Governments have since approached the Government of India requesting that I be definitely appointed Director. If the Government of India agree to this proposal it is understood that the sanction of the Secretary of State will be required. At present I am acting as Deputy Director. From the time I joined the department I have had control over, and been responsible for, the work of the department. My experience has shewn, clearly, that no advantage has been gained by the department being subordinate to the Director of Agriculture. On the other hand it has often caused unnecessary delays. In Madras, there is a Director of Fisheries who deals directly with Government. I believe the same is true of the Warden of Fisheries in the Punjab. As far as I know, there is no reason why the Fishery Department in Bengal should be controlled by the Agricultural Department. It must be definitely understood, however, that the relations of the two departments to each other have always been of a satisfactory and cordial nature. The ground on which I assert that the departments should be separated is principally for reasons of efficient and easy administration. In addition, both local Governments concerned recognise that, since I am, and have always been, in executive charge of the department, it is only reasonable that this fact should be officially recognised. On this matter both the local Governments concerned and the Directors of Agriculture in each province, are agreed.

V.—An Imperial Fishery Department.

Fishery investigations in India are lacking in uniformity. Fishery Departments exist in the Madras Presidency, in the Punjab, in Bengal, and in Bihar and Orissa. There is no Fishery Department in the Bombay Presidency, in the Central Provinces, or in the United Provinces. Where Fishery Departments exist, there is some danger of overlapping. Thus, in the Madras Presidency and in Bengal, investigations into the breeding habits of Hilsa have been in progress for some time. Similarly in Bengal and in the Punjab, enquiries are continuing with reference to the breeding habits of Indian Carp. Whilst there is no particular harm in this overlapping, it is, I think, unnecessary and undesirable, and could be obviated if the work of one presidency was co-ordinated with that of another. Thus, the experiments made, and the results obtained, by Sir F. W. Nicholson in the Madras Presidency with reference to curing and salting fish, etc., have rendered it unnecessary to repeat these experiments anywhere in India. Similarly it ought to be possible to obviate overlapping in other investigations. I am not here attempting to make out a case for the establishment of an Imperial department. I merely wish to state that, in my opinion, such a department is necessary at the present time, and will become increasingly so as years go by. If such an Imperial department is ever established the Director should be a scientific fishery expert of established repute. Fishery Departments should be initiated on the lines suggested for Bengal, and Bihar and Orissa, in provinces where at present none exist. The Director would supervise, co-ordinate, and assist in developing, the work in each province. The local fishery experts would submit programmes of work. If these were found satisfactory, the local official would be free to prosecute his enquiries without further undue interference. I have, of course, merely indicated, broadly, the type of Imperial department which I consider desirable. It would differ from, say, the Zoological or Geological Survey, in having officials stationed permanently in each province.

ORAL EVIDENCE, 4TH JANUARY 1917.

President.—Q. Your note is very detailed and clear but there is one point about which I should like to ask, and that is with reference to what you say in one part of your printed note. You say that the foreshore fisheries at Balasore over a length of about 15 miles are administered by the Ordnance Department. What Ordnance Department do you refer to? You mean of the Army?—*A.* Yes.

Q. With reference to what you say about the effects of irrigation schemes on the fisheries, can you think of any remedy that can be devised so as to combine both the value of irrigation and the development of fisheries?—*A.* The Fisheries Department are at present working in conjunction with the Public Works Department to mitigate the evil effects that have so far occurred, but the difficulty is the enormous area over which observations have to be conducted. It is at present impossible to supervise carefully 30 or 40 miles of canal irrigation, and the chief difficulty in carrying out improvements as regards the Public Works Department fisheries is the shortage of men. Hence recommendations made cannot be carried out.

Q. From the point of view of the fisheries providing a great source of food supply you think that a much greater outlay on staff is justified?—*A.* Most certainly.

Q. You point out in your note that the study of fishes will extend beyond provincial limits and therefore it would be a matter for an Imperial department to take it up. Accepting that conclusion for the time being, do you think it will be practicable to divide fishery operations into two great groups, the scientific side, taken up by an extension of the Zoological Survey, and the practical side, taken up by some other department which may be imperial or local?—A. That is a difficult question to decide. My view is that fishery work can be divided into three great groups. First of all there is the purely scientific work. At the present time we know very little about the habits of the common fishes. If we wish to protect the fisheries we must know the life histories of the fish, when they breed, where they breed, how long it takes them to develop, etc. In other words, we must know the habits of the fish before we can protect them. The second part is the question of protecting the fisheries, and then there is the question of marketing the fish. All these questions are being investigated by the Fisheries Department. It is essential that they should be considered together. Up to the present I have been engaged in general surveys of the above questions.

Q. What is the third that you have mentioned?—A. First of all there is scientific investigation. The second division comprises what I have already detailed. It may be considered under two heads, the actual marketing of fish, and the organization of the fisheries.

Q. Is it in your opinion practicable for the scientific officer to be a member of the Zoological Survey and to have the members of the Fisheries Department composed largely of practical men who understand the organisation of fisheries, the marketing of fish and the formation of co-operative societies among fisherman?—A. I think the scientific officer ought to be a member of the Zoological Survey,—by this I mean an honorary member of the Survey.

Q. If you bring into the service two dissimilar kinds of men, *viz.*, scientific zoologists and practical organisers, would this not introduce difficulties in the matter of promotion?—A. I do not propose that. For instance a man might be in charge of fisheries in a particular province and he might also be a member of the Zoological Survey of India, still being in charge of the Fisheries Department. I think it will be a great mistake in any province to have officers who went along two parallel lines. It is desirable that a department should have a separate head and that whoever happens to be the head of a department should see that unity and harmony in the work is secured.

Q. What I am trying to find out is whether the scientific officers devoted to fishery work should be members of the Zoological Survey or whether you like to have a separate Imperial Fisheries Department including a certain number of the scientific zoologists?—A. My opinion is that an Imperial Fisheries Department should be formed.

Q. How is it to be composed?—A. At the head there should be a scientific officer, and he would determine what assistance he required. The staff might be small. It would increase as time went on. He would be the Imperial head of fisheries in India. In provinces where there is no Fisheries Department he would appoint, along with the local Governments concerned, a fishery officer for that province, or more if thought necessary. These, in the first instance, would be scientific officers.

Q. These scientific officers would be members of the Zoological Survey?—A. They might be members of the Zoological Survey in the same way that I happen to be an honorary assistant to the Indian Museum.

Q. They might be lent to the Fisheries Department?—A. Not necessarily specially connected with the Zoological Survey of India. The Fisheries Department is not connected with the museum or with the Zoological Survey of India but I am an honorary assistant in the museum. The same relationship could exist between the Zoological Survey and the proposed Imperial Fisheries Department. My point is that the Zoological Survey in India is not in a position to take up the question of fisheries in India.

Q. I never suggested that. I do not say that the Zoological Survey would be in a position to develop the business side of fisheries. Should these scientific officers who are attached to the Fisheries Department be members of the Zoological Department or should they be on a separate list altogether?—A. My personal opinion is that it would be desirable to have an Imperial Fisheries Department that was quite distinct from the Zoological Survey, with zoological officers entirely of its own.

Q. What arrangement would you make for their promotion? How many would you employ?—A. That all depends upon the type of officers. For instance, in Bengal there is room for half a dozen expert officers. I would have as many as the necessities demanded.

Q. Can you give us any idea for the whole of India?—A. I am not in a position to speak for the whole of India because I have not seen the Central Provinces or the United Provinces. But in Bengal I would point out that the problem is more acute than in any other province. The Bengali people are greater fish eaters than people in any other province.

Mr. C. E. Low.—Q. Speaking about the appointment of a Fishery Board do you mean that it is not working?—A. It is dormant. It has never met since 1908.

President.—Q. But doing no harm?—A. I was not here when it met but from the reports I have read I should think its sphere of usefulness was extremely limited.

Mr. C. E. Low.—Q. You say that up to the present the marine fisheries in the Bay of Bengal have not been exploited in spite of the fact that the experimental work gave promising

results. What do you attribute this to?—*A.* I attribute it to the fact that in Bengal capitalists are not prepared to initiate a new industry of this kind.

Q. Have not any firms nibbled at it?—*A.* They have smelt at it. They have enquired about it. Monopolies have been asked for in case they are taken up. Enquiries of that sort have come to hand, but nobody has ever done anything.

Q. I have seen statements in the press that the "Golden Crown" was an unsuitable boat and could not get as much fish as might be got in a more suitable boat. I should like your opinion as to whether these facts are correct. Would its failure account for the reluctance of private capital?—*A.* I never saw the boat. I believe she was old fashioned. I am not certain that that fact seriously reduced the catches or stood materially in the way of the ship catching as many fish as a more modern boat might have done.

Q. I saw it stated that she could only do half of what other more suitable boats could?—*A.* I believe that is true to some extent, but to what extent I cannot say.

Q. The whole point of the enquiry is this, whether it is not the case that, if a more suitable boat had been used, and if better results had been obtained in the way of fishing, then private capital would come in?—*A.* Perhaps it might. I did not think that the original object of the survey had anything to do with the marketing of fish. It was a purely scientific investigation. It is a fact that the "Golden Crown" fish were sold in the Bazaar, but it was only to realise what money was possible rather than throw the fish away. That is what I understood.

Q. You say then that the two things are different. Supposing Government had gone on with the experiment to a further stage and shown it to be a marketable proposition then private capital could have been induced to come in?—*A.* It is likely, if the experiment had included that sort of thing. I understand that Government were hardly prepared to consider that side of the proposal.

Q. Do you think it would have been a good thing if they had done it?—*A.* Probably it would have been. I do not think the whole operation was managed as well as it might have been. A great deal of misunderstanding exists among the public. People, whom I have spoken to, say that the "Golden Crown" made a mess of it. This was not the case. The scientific results were first class. The management in other respects was certainly capable of being improved upon. What I say is that the general public understand that the ship went into the Bay of Bengal to obtain and market fish. That idea is, I understand, totally wrong.

Q. You say that 'it is decidedly unfortunate that neither of the officers under the Fisheries Department had any training in zoology or natural history.' Was there no means available of giving them such training?—*A.* It would have been very very difficult. I do not say that it was impossible.

Q. With reference to future recruitment how would you try to get the right kind of man?—*A.* My opinion is that in India you cannot get the type of man wanted. At the present time there are practically no facilities for training Indians in zoological work.

Q. Has any action been taken by the Bengal Government under Act IV of 1897?—*A.* The Bengal Government have not considered the subject. We cannot very well initiate a scheme for the protection of fish when we are not sufficiently familiar with their habits and until then I cannot see how we can enforce extensive regulations for the protection of fish.

President.—Q. The whole thing turns on the scientific problem, that is knowing more about the science of fishes?—*A.* Although the scientific enquiry into the habits of fishes is of the utmost importance, the actual-application, later on, will be a subject of the greatest difficulty. The difficulty is much greater here than in any other country I know of. The manipulation of the market is a big question and even if we had solved the life histories of the principal food fishes we should only then be at the beginning of the real problem.

Mr. C. E. Low.—Q. You know something about the Agricultural Department as you come into contact with it. Take Bengal. Do you think that a similar organisation would be suitable in the case of fisheries?—*A.* My connection with the Agricultural Department is largely confined to formalities, such as budget estimates and so on.

President.—Q. Mr. Low wants your opinion as to whether such a system would be suitable. There, they have the scientific work divided between a set of officers, and the results are translated into practice through the agency of the local Deputy Directors?—*A.* It all depends upon the Deputy Directors themselves. The selection of the individual is everything. At the present time we control an area twice as large as the British Isles.

Mr. C. E. Low.—Q. These scientific officers of the Agricultural Department are engaged in advising what crops can be grown under commercial conditions, which corresponds in your case to the catching and protection of fish, and there are the co-operative societies for the distribution of seed which corresponds in your case to the marketing of fish. That is a fairly close analogy. These scientific officers are under the Director of Agriculture. Would that kind of thing suit you?—*A.* That is what we want for the Fisheries Department. But the titles do not matter much. My opinion is that we want men to deal with the scientific side of the problem exactly as is done in the Agricultural Department.

Q. The Deputy Directors of Agriculture are men who have scientific training and are specialists, and men who have had direct experience in farming at home, preferably the sons

of farmers. Are there any men of that sort who would be available for the Fisheries Department? Is it not the case that in pitching the recommendations rather low you are afraid that Government will not be able to take up any big schemes such as that I have suggested?—*A.* No. All I mean is that at the present time we cannot deal with the work. I recommend an increase of the scientific staff and we require more men to do general work. I have indicated the manner in which that could be brought about.

Q. What should be the qualifications of the administrative officer?—*A.* The man who is to administer the department must know something about fishery work. Government could easily decide who would be a suitable man. If the fisheries are going to be the slightest use we want two types of officers, men to undertake the general work and men to undertake the scientific enquiries.

President.—Q. Could you get a man of the officer class with special training?—*A.* I think so.

Mr. C. E. Low.—Q. What share would the Co-operative Registrar take in connection with work in the case of the co-operative fisheries?—*A.* The limits are not defined, because the whole thing is in an experimental stage. We are at present working conjointly. There are 48 districts and the waterways are immense. We are to consider whether it is possible to have co-operative fisheries established. If co-operation is to be extended it is utterly impossible for the Co-operative Registrar and myself to extend beyond a certain limit.

Q. Would the number of fisheries be very large?—*A.* I should estimate that about one-tenth of the fisheries in Bengal belong to Government. This includes fisheries that are administered by Collectors, and also by the Public Works Department officials.

Q. Apart from the inherent right of Government to waters, private rights have been claimed in fisheries in tidal waters. Has the Government undertaken any general enquiry into the matter?—*A.* I do not think so. Particular cases have arisen for the orders of Government. But up to the present the general question has not been taken up by Government. I can indicate a type of case. The Sunderbans area is leased out by Government in lots. Most of these lands are surrounded by rivers. The idea is to cultivate the land for paddy. Instead of so doing, in some cases a bund is erected round the area. During high water the rivers are tapped. The cultivatable lands thus become small fisheries. That happens during the rains. In the dry weather all the water is run off and the fish caught. A case like that is now before Government and the question is whether the lessee has the right thus to tap the rivers. But the general question of the fishery rights in the Sunderbans has not been considered by Government.

Q. Do you think that can be taken up as a general question and definite conclusions come to?—*A.* I think it is much better not to take it up at present.

President.—Q. Would you tell us shortly your own history? Are you a man of university training, trained in one of the fisheries at home?—*A.* I was trained more or less privately until I was 15 years of age. I then took up zoology and natural history in a secondary school in Lancashire. About four or five years afterwards I won a Government national scholarship tenable in the Royal College of Science, London. I was there for three years and took my diploma in 1905. The same year I was appointed demonstrator in zoology in the college (*i.e.*, in 1905). Owing to the illness of the assistant professor I had charge of zoology under Professor Dundy for one term. I then went to Liverpool to work as private or personal assistant to Professor Herdman who, at the invitation of the Colonial Office, had been investigating the pearl fisheries of Ceylon. He brought back a large quantity of material and I assisted the Professor in sorting out and examining the material. I also wrote portions of the report under my own name. In the meantime the Ceylon pearl fisheries had been leased out to a syndicate, the chairman being the late Governor of Ceylon. I was selected to have charge of the scientific enquiries in Ceylon under a manager. Shortly after my arrival in Ceylon the manager left the company and I was appointed to take charge both of the executive operations and the scientific investigations on the Pearl Banks. In 1911, at the invitation of the India Office, I came to Bengal. I have carried out fishery investigations in the Bay of Biscay. I have also studied fisheries in Holland.

Q. You really commenced as a scientific zoologist?—*A.* Yes.

Q. This training might be equivalent to the training of a Deputy Director?—*A.* Yes. I have been engaged in fishery work for over 12 years now.

Sir F. H. Stewart.—Q. You say in your written statement that the marine fisheries have not been exploited although they gave promising results. Have you got any suggestions to put forward as to the way in which Government could help?—*A.* That is a difficult question. If the marine fisheries could be opened out, I think they could be made to pay.

Q. Have you any suggestions as to what Government can do in the way of facilities or concessions?—*A.* I do not think any concessions have been asked for. It is quite clear what machinery is required for opening out the fisheries. It is also known what amount of capital would be required. I have not thought out the specific manner in which Government could help any particular firms or private individuals. I have gone very carefully into the kind of boats that would be required, the organisation necessary, etc., and I even went so far as to submit to the Chamber of Commerce, through the Government of Bengal, a definite scheme to which the Chamber paid no attention.

Q. Did you place your information at the disposal of responsible people?—**A.** Yes. No one has even asked me for any information.

Q. Supposing private enterprise takes up the business, would it have to introduce modern methods of fishing?—**A.** Yes. Whilst in Ceylon I had experience trawling in an area similar to that of the Bay of Bengal and I feel that, in this matter, I can speak with a certain amount of experience. What would be required in the Bay of Bengal would be at least a couple of steam trawlers similar to, but much larger than the "Golden Crown," and a couple of carrier boats. The idea would be to have the trawlers always at work. The smaller boats would bring the fish up the river.

Q. Would you require to introduce modern methods there?—**A.** Yes. The Chilka lake, on the other hand, is an instance of an area difficult to exploit. There you have changing conditions. The lake is salty in the dry season and practically fresh in the rains. In addition, the manipulation of the fishermen is far from being a simple matter.

Q. Supposing it was the question of the development of the Chilka lake, what would be the best way of setting about it? Would you have to work the fisheries on up-to-date lines or would it be better to leave the fishing to be done in the present old fashioned methods?—**A.** It is difficult to explain precisely. Any action in regard to the Chilka lake is very difficult for a variety of reasons which it would take me a long time to explain. In the particular case of the Chilka lake I think the local methods of fishing leave nothing to be desired. The difficulty comes in in organising the local trade. Another difficulty occurs in determining the lines of demarcation between Government fisheries and other fisheries, whilst the actual sale and purchase of fish is likely to present quite a number of difficulties one never anticipated.

Q. You say that in one particular case you arranged to place the fishermen's catches on the Calcutta market?—**A.** What happened was this. There is a fishery in the Ganges extending from Malda to Rajmahal. The length is 55 miles. Two years ago this particular fishery was leased for about Rs. 4,000. When inspecting the fishery I was informed from a reliable source that the lessee was making a profit of about Rs. 30,000. He had sublet it in small lots to other people.—The Collector of Malda, the Registrar of the Co-operative Societies, Bengal, and myself went there and persuaded the fishermen to take the lease direct from Government. This they did. We recognised at the time that although we had eliminated the middleman from the lease he was still a necessary agent for marketing the catches. We thought it premature at that time to try to market the fish as the fisherman did not grasp clearly the principles of co-operation. Eventually they asked us to market the fish. They consigned the fish to me direct in Calcutta. I tried to sell it retail and failed owing to a glut of fish in the market. I found no difficulty in selling the fish wholesale through an auctioneer who charged about an anna per rupee on the sale.

Q. Have you had any difficulty in arranging it?—**A.** We had very great difficulty. The fishermen are very unreliable.

Q. Have you been able to go into the question of the bye-products?—**A.** I should estimate that 40 to 50 per cent. of the catches in the Bay of Bengal would be fish that would not be suitable for the Bengal markets. These could be used for the manufacture of fish oil, fish manure and a variety of other things.

Q. And fish curing?—**A.** That could also be done.

Q. All these could be worked up by private enterprise?—**A.** The success of fishing operations in the Bay of Bengal would not depend absolutely on the catches of edible fish. The value of the various subsidiary industries would be great.

President.—Q. Would that be continuous?—**A.** Yes.

Q. What would be the capital required?—**A.** I have dealt with it in a paper here, which I could show the Commission.

Sir D. J. Tata.—Q. With reference to the "Golden Crown" was its work confined only to finding out the banks?—**A.** It was only a sort of survey to find out what kinds of fish could be found.

Q. There was no attempt made to find the banks?—**A.** That was part of the scientific work and fishing banks were found and charted.

Q. Has any attempt been made to chart the western coasts?—**A.** It has been attempted round the coast of Ceylon with a view to the discovery of pearl oysters.

Q. Twenty-five years ago we made some enquiries on the Bombay side and there was no information available?—**A.** I may say that in the Madras Presidency, on the Calicut coast, the proposal is to have two small boats in order to carry on the type of work that was carried on here by the "Golden Crown."

Sir F. H. Stewart.—Q. Do you know whether there is any prejudice against eating dried fish or cured fish?—**A.** I think there is some prejudice. There is also prejudice against eating sea fish. Dried prawns are exported to Burma from Bengal.

President.—Q. If there is a prejudice against eating sea fish, how are you going to get any return?—**A.** It will still give you 5 or 6 per cent.

Q. Then the commercial men will not look upon the trade with certainty?—**A.** In any case the question requires very careful consideration. I am interested in what fish can be

caught, the quantities that can be caught, etc. I do not pretend to be an expert in the business side of the proposal.

Q. Then how do you say 5 or 6 per cent.?—A. I am merely quoting from memory. I am not sure of the details, set forth in my paper referred to previously.

Q. So far as your memory goes the proposition from the business side leaves you with only 5 or 6 per cent.; and this being a new line, do you think there is any hope of getting a business firm to take it up?—A. I should imagine that in Calcutta, under present conditions, it is not likely that the fisheries will be taken up.

Q. Is it not necessary for the Government to show it as a commercial proposition beginning where the "Golden Crown" left off?—A. I think it would be a very good thing to do.

Q. Is it not obvious that 5 or 6 per cent. is not going to attract people?—A. When I said 5 or 6 per cent. I was speaking from memory. What I meant was that I think the business would be profitable.

WITNESS No. 169.

Dr. M. Mitra.

DR. M. MITRA, Surgeon, Proprietor, Lister Antiseptic Dressing Company, Calcutta.

WRITTEN EVIDENCE.

From a long time I have been taking an interest in the manufacture of various kinds of surgical dressings prepared from raw materials available in India. I thought articles thus manufactured ought to be cheaper than imported ones, and at the same time contribute on a small scale towards the industrial development of the country. I had no doubt in my mind that these dressings would be equal to the imported articles from a surgical point of view. From time to time I made experiments on a small scale which proved successful so far as their quality was concerned. Soon after the war with Germany had been declared the prices of all surgical dressings became very high, and to me the opportune moment seemed to have arrived for venturing into the manufacture of dressings on a large scale.

pital.

In the beginning of 1915 I started a factory under the name of the "Lister Antiseptic Dressing Company" with a small capital found by myself. I did not intend the company to be a joint stock one at the start as the fate of a number of joint stock companies recently started in Bengal was not very encouraging and as this concern required a certain amount of medical knowledge.

her difficulties.

I have experienced several difficulties in the course of my work, and as they affect not only my industry, but most of the new industries started by Indians, I should like to mention them—

- (1) The machinery required could not be had in this country and considerable difficulty was experienced in getting it out. The price which we had to pay was very high on account of the War and the freight and other incidentals also came to a very high figure.
- (2) As a large part of the capital was absorbed in capital expenditure on land, building and the machinery, we experienced some difficulty about our working capital. I did not approach any of the banks, as from information received I came to understand that they would not advance money to an Indian concern on such security as I had to offer.
- (3) There was also a difficulty because there was no scientific or technical department of the Government equipped with analytical laboratories and a staff of experts to whom problems arising during the course of manufacture could be referred.
- (4) The absence of works of reference in the Imperial Library bearing on technical subjects also caused some difficulty. This could be remedied by technical libraries, which would have a classified collection on technology, under trained librarians who know something and can help in matters requiring guidance for industrialists.
- (5) The price we had to pay for chemicals was very high, and even then the supply could not be relied upon in all cases. The success of all industries like mine would depend upon this facility and unless greater attention is paid to such a key-industry as the manufacture of chemicals in this country, our dependance on foreign supplies would be complete and the chances of final and permanent success small.
- (6) The American medicated and absorbent cotton is valued because of the long-stapled cotton used in it. My desire is to manufacture an article which will beat this stuff. Our production already equals all imported varieties except the American. But we are handicapped by the absence of long-stapled cotton free from other matter in this country. When we buy the imported American or Egyptian cotton, we have to pay very high prices because we buy in small quantities and cannot afford to buy in large quantities and store them. If the Government could let us have cheap long-stapled cotton in small quantities from their experimental farms it would help us very much.

- (7) The largest purchaser of medicated cotton in this country are the Government Medical Stores, from whom I have not received any such encouragement as the quality of cotton and jute prepared by me deserved.

I approached His Excellency the Viceroy through his Private Secretary and the Director-General to the Government of India. I was given to understand that the surgical dressings required by the Government are manufactured in Government factories and it would not be possible for the Government to help us in this matter. The medical public and those dealing in these articles are not aware of such factories owned by Government. It would be an advantage and would avoid much miscalculation on our part if the Government could publish their total output and other particulars of such factories. Nor is it easy to understand their purchasing outside if they have such factories working. Although I had approached the Surgeon-General in 1915, I understand that since then the Medical Stores Department have been buying cotton absorbent and medicated from the Elgin Mills and Messrs. Andrew, Yule & Co. No question has been raised, nor can be raised as regards the quality (absorbent power and perfect sterilization) of my cotton as certified by Sir Leonard Rogers (copy below).

From my experience of this industry as well as from my general observation of industrial conditions of Bengal, I think that the industries started by Indians suffer from many disadvantages and the Government must assist them in various ways against foreign competition. The help required to be given in each industry would depend upon local circumstances and conditions of the industry. But in general the following are the various forms in which I would recommend action to be taken by the State.

- (1) Subsidy by way of preliminary expenses should be given to some new industries. Bounties should be given when it is desired to encourage large production or special development for export purposes.
- (2) Loans with low rates of interest should be available to industrialists on such security as they can generally offer, viz., mortgage of the factory and plant. As private banks cannot and will not do this, the State should finance or otherwise assist the starting of special institutions known as industrial banks or by some departmental machinery make available for the industries some part of the State funds.
- (3) Import duties on machinery, low as they are, form still a burden and for all industries started with a small capital, there should be a total exemption.
- (4) The freights on machinery imported tell even more heavily on industries than the duties. With lines profiting from the Government in the mail contract or otherwise, there should be a reduction in freights for *bond fide* small concerns on their machinery and plant imported from abroad. This will be very good for the English manufacturers of machinery as it will be an inducement to people to buy their machinery from the United Kingdom.
- (5) Whenever any goods are required for a Government department or a municipality or the railways, the products of Indian concerns should be taken. And in such cases a guarantee of purchase of such produce for a number of years should be given.
- (6) The cost of sending boys abroad for study is very high. So that by spending much money we get only a few trained men. Imported experts are so costly that only the very promising industries can afford them. Then these students returned from abroad do not know for some time Indian conditions and requirements. All these difficulties could be got over by proper organisation of technical education in this country. This expenditure would be very economical in the long run. And to give our men a finishing touch, they may be sent abroad after they have worked here and known our wants and difficulties.
- (6) Railway rates are, in this country, based on purely commercial basis so as to get maximum revenue for the railways. But if there is a strong opinion for industrial growth in the country—in response to which this costly Commission is appointed—it implies that the temporary loss of a fraction of railway revenue is a matter of small consequence when by some favourable rates the end in view can be achieved. The Government should appoint a special official or charge the Director of Industries in each province to look into the matter and recommend such concessions as he thinks are necessary.

In my opinion Government should establish both pioneering and demonstration factories. Government should at first select such industries which require large capital or for which there are sufficient raw materials available in this country, then open pioneering factories and these when successful should be handed over to private capitalists or companies. I would not advocate the conversion of successful pioneering experiments into permanent Government enterprises as that will lead to undesirable competition with private enterprises.

In this country there is practically no means by which one can discriminate bad or good quality of articles manufactured in India or imported from abroad. Consequently many quality articles of inferior quality are passed off and charged for as superior ones. I consider, a system of Government certificates of quality will encourage manufacturers to do their best.

This will lead to a healthy competition amongst the manufacturers and greatly benefit the public. This should be made absolutely compulsory in case of drugs and surgical dressings whether they are manufactured in India or imported from abroad.

A committee of experts should be organized by the Government whose duty it would be to report as to the quality of articles for which a certificate has been asked.

Prevention of
adulteration.

An Act for the prevention of adulteration of food and drugs similar to that prevailing in England is greatly needed in this country.

*Report by Lieutenant-Colonel Sir Leonard Rogers, Kt., C.I.E., M.D., F.R.C.P., I.M.S.,
Professor of Pathology and Bacteriologist to the Government of Bengal, dated 21st
August 1915.*

I have examined bacteriologically two packets of boracic wool sent by the Lister Antiseptic Dressing Company, Calcutta. It was carefully packed and proved to be highly absorbent. It was quite sterile as regards bacteria, nothing growing in broth inoculated with portions of the wool.

ORAL EVIDENCE, 4TH JANUARY 1917.

President.—Q. I understand that a good deal of antiseptic cotton wool has been manufactured by the Bengal Chemical and Pharmaceutical Company?—*A.* They do not make any. They have it made somewhere else.

Q. You want to tackle the problem a little more deeply in order to make medicated cotton wool?—*A.* Yes.

Q. You find it difficult to get long stapled cotton?—*A.* That is one difficulty.

Q. How are we going to help you in that matter?—*A.* I was suggesting that if the Government could give us some cotton which they grew in their experimental farms, we could get some good cotton. The American cottons are the best, but we can compete with American cotton on account of our low price.

Q. You can compete with American cotton if in India there is long stapled cotton on the market?—*A.* Exactly so.

Q. Would it be of advantage to the public if the Government gave you this particular long stapled cotton for the manufacture of antiseptic dressings?—*A.* Antiseptic dressings forms one of the important items of surgery and medicine. We do want only small quantities.

Q. Are they making this cotton in the Medical Stores Department?—*A.* As far as I know they are not making. I am not quite sure.

Q. They are importing?—*A.* Yes, so far as my information goes.

Q. You mean they are importing in a medicated condition?—*A.* Yes.

Q. They are not importing the raw cotton itself?—*A.* No. Only medicated and absorbent cotton.

Q. Is your factory still running?—*A.* Yes.

Q. Are you importing long stapled cotton?—*A.* No. We are buying as much long stapled cotton as we can get here.

Q. Are you importing it also?—*A.* I am not importing it from outside.

Q. You are buying it all in India?—*A.* Yes.

Q. And get here all you want?—*A.* Yes.

Q. At good prices?—*A.* That depends entirely on how much we can sell. If we can sell our entire output, it will be a successful business.

Q. Are you selling it to the Medical Stores Department?—*A.* No.

Q. You have given them samples?—*A.* Yes.

Q. And the samples are satisfactory so far as Sir Leonard Rogers's certificate is concerned?—*A.* Yes.

Q. Did Sir Leonard Rogers give the certificate on your behalf?—*A.* Yes. We sent him samples and asked him to certify whether they were good.

Q. Did it go direct to Sir Leonard Rogers or through the Medical Stores Department?—*A.* I think it went to Sir Leonard Rogers. It forms part of his private practice.

Q. And he charges you a fee for giving you this certificate which he allows you to use?—*A.* Yes.

Q. Is this frequently done?—*A.* I think so. In the Medical Department they always do that. The Chemical Examiner gets certain things from outside for chemical examination and gets his fee for that.

Q. Of course, you do not know whether Sir Leonard Rogers got the sanction of Government for making this examination and allowing you to use this certificate?—*A.* I am not quite sure about it. He was asked whether I could publish this certificate and he said "yes."

Hon'ble Sir R. N. Mookerjee.—Q. Can you give us any reason why the Government preferred Messrs. Andrew, Yule and Co.'s cotton to yours?—A. I cannot say. It is not possible for me to know why they gave preference to Messrs. Andrew, Yule & Co.'s cotton. When there are European firms, they generally get the better of it.

Q. Messrs. Andrew, Yule & Co. make them here.—A. Yes.

Q. They have got a similar factory?—A. They make it as a side show of theirs.

Q. Why did not the Medical Stores Department take it from you? They are quite independent of European and Indian?—A. That depends upon the heads of the departments. If the Director General does not order they cannot take.

Q. Have you addressed the Government of Bengal?—A. Yes.

Q. Had Mr. Lindsay been to your factory?—A. Yes. He saw our cotton and gave us a very good certificate and he said that he would try what he could do. That was only recently, about a fortnight ago.

Q. What is your capital outlay?—A. About Rs. 56,000.

Q. Are you paying any dividend on that capital?—A. I do not think we are paying yet.

Q. Have you any prospect of giving a dividend in the future?—A. Yes.

Q. You want Government to buy your cotton as they are buying from others?—A. Yes. A certain proportion of orders they might give to us.

Q. You were a Government servant?—A. Yes.

Q. And when you were transferred you resigned?—A. Yes.

Q. And you were in bad graces with the Government?—A. I do not think so.

Q. They won't reinstate you again?—A. No.

Q. They did not like you to resign?—A. No.

Q. And there was some correspondence about it?—A. Yes.

Q. And that gentleman is the Director General now to whom you are writing?—A. Yes. But the Director General had nothing to do in the matter of my appointment. It was the Government of Bengal that dealt with my case and the Government of India would not interfere in the matter.

President.—Q. Can you give us the correspondence on which you base this statement. "Although I had approached the Surgeon General in 1915, I understand that since then the Medical Stores Department have been purchasing cotton absorbant and medicated from the Elgin Mills and Messrs. Andrew, Yule and Co."?—A. I have got it. (Witness produces one letter from the Private Secretary to His Excellency the Governor of Bengal to him.) The Surgeon never replied to our applications or did anything.

Q. This letter does not help you or us any further with regard to where the Government depôts get their boric wool from?—A. Prepared under Government supervision, that is what they say.

Q. And yet you say that they are buying from outside?—A. Yes.

Q. You wrote in 1915 and got no reply?—A. Yes.

Q. Have you sent any reminders?—A. We have approached them recently again. We have not got any reply to that yet. It was in October last that we wrote to them and I have had no reply.

Q. You offered boric wool at definite prices and in constant quantities?—A. Yes.

Q. You do not mind our writing to the Director General of the Indian Medical Service asking him whether he has received your letter and whether he could tell us confidentially his reasons for not taking any action on it?—A. No.

Mr. C. E. Low.—Q. What long stapled cotton do you want?—A. Messrs. Johnson and Johnson have the largest sale of medicated cotton in India. They sell cotton worth about 2½ lakhs of rupees every year, and their cotton, as far as I know, is made from Sea Island cotton, which is very long stapled. We tried as far as we could, but we could not get it anywhere in India. The next best thing we should like to have wherever we could get it. We may not be able to make an equally good stuff like Messrs. Johnson and Johnson's, but we could make good ones.

Q. What part of India do you get your long stapled cotton from at present?—A. We get it from the Central Provinces.

Q. In the Punjab American cotton is grown?—A. That is what I really mean when I say that I should get cotton from Government.

Q. Did you write to the Punjab Agricultural Department?—A. Mr. Lindsay has promised to do that for me.

Hon'ble Sir R. N. Mookerjee.—Q. What are the total requirements?—A. About 10,000 lbs. a month.

Q. That would be more than all the Government firms put together could supply you?—A. We sell about 5,000 lbs. and we ought to have a sale of 10,000 lbs. per month. We

know that it is sold in large quantities. I saw the figures about the imported articles, and I found that about five lakhs worth of medicated cotton are sold in India every year.

President.—*Q.* You have a fairly good market?—*A.* We are getting on fairly well.

Dr. E. Hopkinson.—*Q.* To whom do you sell?—*A.* We are selling to the medical shops and dispensaries. Some civil surgeons are ordering things from us. I want the Government to buy something from us as it will give us a status.

Q. Do you know what cotton the Elgin Mills use?—*A.* I do not know. I believe they make it from cotton waste entirely, and not long stapled. It would be better if long stapled were used.

Q. There is an enormous difference in price between long stapled and short stapled?—*A.* So, there is a good deal of difference between Messrs. Johnson and Johnson's price and our price. Ours is almost fifty per cent. less.

President.—*Q.* Do you make your own boric acid?—*A.* Yes.

Q. From borax obtained locally?—*A.* We are getting it locally and we are trying to get it from the Punjab.

Mr. C. E. Low.—*Q.* Is it really necessary for you to use long stapled cotton?—*A.* Not absolutely necessary, but only to compete with Messrs. Johnson and Johnson.

Q. You do not mean to use it largely?—*A.* Hospitals would not be able to afford to buy such kind of cotton.

Q. Your demand for long stapled would be quite limited?—*A.* Yes.

Q. Do you get your cotton from the Agricultural Department in the Central Provinces or here?—*A.* I buy it from merchants here.

President.—*Q.* Do you know where the Medical Stores Department are getting their cotton from?—*A.* I believe they get from Messrs. Robinson & Co. in England.

Q. And they medicate the cotton?—*A.* I do not think so.

Q. It has not been actually done in the Medical Stores Department?—*A.* No. They are all medicated in England and brought here. They get all their medicated cotton prepared in England, but of course, I understand that they are getting it from Messrs. Andrew, Yule & Co. and the Elgin Mills also.

Q. Boric wool is obtained from Government Medical depôts which seems to suggest that it was prepared there?—*A.* It has not been prepared by them, as far as I could gather from the information I have got.

WITNESS No. 170.

*Mr. J.
MacGlashan.*

MR. J. MACGLASHAN, Central Provinces Sugar Syndicate, Co., Ltd.

WRITTEN EVIDENCE.

Capital.

My only experience in raising capital has been for a Syndicate in the Central Provinces to test lands for cane growing possibilities. It looked a good proposition and there was no difficulty about that part of the capital to be supplied by Europeans. With the small amount set aside for Indians there was difficulty and little of it was taken up. This Syndicate was prepared, when information on manures, cane varieties and yields had been obtained, to proceed with the development of the lands and put down plant, and, though pioneering in the matter of growing cane in the Central Provinces on a large scale; had obtained no assistance in the way of special terms from Government.

That being so one cannot see why, in Assam, Government should give assistance to carry on experimental work of a somewhat similar nature. Cane growing tests have been carried out there and those in charge should now be able to give costs, cane yields per acre and cane analyses. It would seem that all that is required is that results be published and, if good, the rest left entirely to private enterprise. If bad then the scheme should be dropped.

In other parts where sugar manufacture has been established for years and it is simply a matter of following what others have done loans have been given.

When a loan has been given Government ought to retain the right to supervise the manner in which it is spent, otherwise one may have people practically ignorant of anything concerning the industry they propose to go into with Government money, spending that money on unsuitable plant or being induced to waste money needlessly on what they may be told are special processes.

In the case of sugar, Government have a sugar expert in their employ and it should be part of his duty to go over and compare specifications of machinery it is proposed to buy with Government money. This does not always seem to have been the case. The expert should also have returns of factory results, sales and such for his consideration, otherwise, Government may at any time be given into the hands of unscrupulous persons who may work for failure to buy in a plant at auction prices.

Industries are being started in India in comparatively small scale factories. Already, for example, there is sugar manufacture and refining and oil seed pressing and, in cases like these, it would be of great assistance to have a Government expert to advise on plant to be purchased, check results and explain where losses may be stopped. Most of these factories are too small to pay for highly skilled technical management, and as a result, work blindly and wastefully.

Industries in India, for the most part, must be based for many years on forest products, agricultural products, and such, and a board should be constituted capable of advising on these matters with a Director of Industries to carry on detail work. As so much would depend on the man chosen as director it is not easy to say if he should be a business man or have other training, but speaking generally, the man with a training, in chemistry and some engineering, and with a knowledge of industrial processes, would seem most suitable as he has the knowledge that should enable him to pick out the weak points of a proposition, work out probable costs, and know in what direction research is likely to be of value.

Any industrial research institution should be Imperial and take over work that is at present scattered among different departments.

It is the intention that this note should be confined to sugar and cane, chiefly in the United Provinces and that part of Bihar and Orissa north of the Ganges, and without going into lengthy detail, elaborating afterwards any part on which further information may be required. Note on sugar production.

Living in the jungles, it is not easy to get statistics and figures must of necessity be largely left out.

With the development of railways, alterations in the distribution of crops have taken place and one finds that districts are no longer self-contained in the matter of crops grown but tend to produce those that suit them best and import from outside materials that can be grown cheaper elsewhere. This is markedly the case in districts to the south of the United Provinces, and in the Central Provinces so far as sugar products are concerned.

With the completion of the Bengal and North-Western Railway the movement of gur—a sugar made by concentrating cane juice until it solidifies—became pronounced. For a time after the completion of the Gogra Bridge a sugar refinery in Cawnpore could depend on getting large quantities of a dry hard gur made up in the form of balls about three inches in diameter.

This ball gur came from Fyzabad, Busti and other parts of the country between Gorakhpur and Gondia, and about twenty years ago could be bought in Cawnpore at from Rs. 1-14-0 to Rs. 2-4-0 per imperial maund in normal years. Carters from the south got to know this hard gur and appreciated it for its keeping qualities in the rains and on storage. It also packed conveniently into bags, and, for small retailers in local bazars, the ball form was suitable as each ball was of approximately the same weight, so, when hawking gur about from one place to another the owner did not require to trouble about weights, knowing how many balls he had got for his money.

Carts coming in with cotton and grain to Cawnpore began to load this gur for their return journey, and for 15 years or thereabouts refiners have been unable to touch it; the price had risen to about Rs. 4 per maund. Even in years when there has been a glut of other gurs this ball gur has kept up in price.

In the country immediately to the east of the town of Gorakhpur, where formerly a soft gur, suited to the small country refineries, was produced, the making of ball gur has started because of the high price obtainable for it and because of the lack of demand for soft gur, many country process refineries having closed. This soft gur was made soft and of high water content because it had not to be carried any distance to the country refineries, of which there were at one time many and situated all over the area where this gur was made, also, in making it destruction of sugar was less, in that the rapid rise of temperature towards the finish of the juice concentration did not take place to the same extent as in a boiling to make a harder gur.

Towards Meerut and the north a clean light coloured gur is made with the sugar crystals in it very small and "smeary", not gritty. This brings a high price in the United Provinces as a food gur. It is fairly acid, and to get juice suited to making it, unripe cane is generally crushed—a wasteful process.

From a sugar making point of view this gur and the cane it is made from are of little interest. The yield of refined sugar from this gur could not be great and the country refineries using it were the first to feel the pinch of competition from refineries and factories working on western lines and making sugar that Hindus could take without prejudice to caste.

One result of the decay of the country refining industry was that molasses increased in a few years from about Rs. 0-9-6, per imperial maund to about three times that price, giving Java a market in India for molasses which, till then, had practically been a waste product.

In the east of the United Provinces and in Behar and Orissa north of the Ganges, most of the gur made is dirty and little care is taken in its manufacture, so its reputation from the point of view of the person who eats gur is low. It may easily average a content of from 5 to 7 per cent of cane chips and mud, and individual pieces may consist of a dry clay centre smeared with gur on the outside. It has a high water content and consequently

is soft, and being soft, does not stand handling and does not store well. On storage it breaks up, molasses drains out, and generally, for direct consumption, it is a most unsatisfactory gur.

Markets like Cawnpore will not take it for eating purposes but picked lots go to the Bombay side of India and to the east of Central Provinces. In the east of the Central Provinces it is taken because of its low price and by poor people, and it is probable that that which goes to the Bombay side of the country is also sold to the poorest classes.

Why this low quality gur should be made in these districts is not easily explained, but probably it is because a fair proportion of the gur of these parts has always gone to refiners and as the refiner does not eat it and in any case has to extract the mud, the cultivator probably got into the way of not being too particular and so helped out the weight and worked off his advances. The refiner, in turn, might not be too particular about accurate weighments.

These gurs, though dirty, have the highest sugar content of Northern India gurs, and so the machine using refiner—the successor to the country refiner—draws his supply of raw sugar from the districts producing them.

Their dirtiness prevents them from bringing good prices as food gurs, and so the refiner profits by the carelessness of the cultivator, who is, at the same time, the gur maker.

In turn, as the gurs do not bring the highest prices, cane is cheap, and partly because of this cheap cane and partly because it is obtainable in quantity and of good sugar content within reasonable distances, sugar factories have established themselves chiefly in the dirty gur districts.

In Gorakhpur district there were in 1914-15, 115,561 acres of cane in a total cropped area of 2,124,909 acres or 5.4 per cent. Of this cane, 52.6 per cent. was lightly irrigated from wells.

In this district there is one sugar factory at work capable of crushing about 350 tons of cane per day.

In Saran there were in 1915-16, 46,200 acres under cane out of a cropped area of 1,132,700 acres, or 4.07 per cent.

In Saran there are two factories capable of crushing, jointly, about 500 tons of cane per day.

In Champaran in 1915-16, 14,800 acres of a total cropped area of 14,01,500 acres were under cane or 1.05 per cent.

There are three factories in Champaran capable of jointly crushing about 750 tons of cane per day. One of these, however, usually works in the day time only.

In Darbhanga in 1915-16, 14,300 acres of a total cropped area of 19,06,500 acres were under cane or 0.74 per cent.

Here there are two factories close together in a tract in which cane is concentrated. They probably could crush 700 to 750 tons of cane per day.

In Gorakhpur district probably not more than $\frac{1}{10}$ th or $\frac{1}{8}$ th of the cane grown goes to modern factories, the remainder being worked up into gur.

Part of this gur is hard ball gur which finds a ready market and some is worked up into desi or country refined sugar. The refineries using machinery also draw most of their supplies from this district.

In Saran the two factories there probably take about $\frac{1}{10}$ th, or less, of the cane grown, the remainder going to make gur which is mainly in demand for refining and for export to cheap gur consuming areas.

In Champaran it would appear that from $\frac{1}{4}$ to $\frac{1}{2}$ of the cane grown goes to factories and here, with the exception of part of the north, cane growing has been concentrated and developed to some extent in the neighbourhood of the factories. In Darbhanga the factories seem to take about the same proportion of the cane as in Champaran.

In Darbhanga and Champaran any cane in excess of that taken by factories goes to gur making and small country refiners.

In the main, machine made sugar depends on Gorakhpur and Saran Districts for its supplies of raw material.

The cane grown in these districts ripens well and develops a good sugar content compared with other parts of the north of India, and, as the cane ripens, so the gurs made from it have a good sugar content compared with some gurs which at times, bring prices nearly equal to imported sugar. Thus, the cultivator who makes a clean gur from an acid, unripe cane and gets Rs. 5 per maund for it with a 10 per cent. extraction, is much better off than he would be if he attempted to make sugar for which he would probably get at times only Rs. 2 per maund, or less, on an extraction from his low quality cane of about 4 per cent. of sugar or thereabouts.

At present the areas in Northern India which grow cane suitable for sugar making are limited, and this is forgotten or not known to the journalists who bring out a stock paragraph each year, on the publication of the sugar import figures, commenting on the degeneracy of the Indian sugar maker and his antiquated factories.

*The desi, or country sugar industry has had to go because of its small sugar extraction and high costs of production, together with the fact that caste prejudices could not resist cheap imported sugar, Indian factory and machine refinery sugar when crushed to resemble country sugar. The crushing of the sugar was an anaesthetic to the consumer's prejudices in the first place, but now he is getting used to taking foreign and machine made sugar and crushing is being reduced each year.

There are in India some as efficient factories as are to be found anywhere except that they might be better with more extended trains of mills.

It is difficult to see how India at present could make all the sugar it requires. Gur is the sugar for which there is the great demand in India. Refined sugar is, comparatively speaking, a luxury; gur is the food sugar of the country and this must be so from the manner in which the Indians take their sugar. Conditions are different from Europe. In Europe refined sugar is a necessity because it is seldom eaten as sugar pure and simple. It is used in jams, confections, baking, etc., and for these purposes a pure sweetness is required without any other admixture of flavours. In India sugar is taken to some extent in sweetmeats—that is where the country refined, factory, and imported sugars go to, but gur is taken as a finished article and the strong pleasant flavour of cane products fills the part which vanilla, or other flavours may take towards sugar in Europe.

To return to these areas in which the sugar maker may thrive alongside of the gur maker.

After deducting cane taken by the factories the production of gur for Gorakhpur and Saran districts combined should be approximately 170,000 tons per season, and, with the machine gur refineries which draw their supplies from these districts in full-operation these 170,000 tons would be reduced by 70,000 tons, leaving only 100,000 tons for country refiners, for hard ball gur which refiners cannot afford to buy, and for such markets as take low quality gur. There is at present no large margin in Northern India for the extension of the industry to supply India's refined sugar requirements. All the cane grown in Gorakhpur and Saran districts, about 1,800,000 tons, could quite easily be worked off each season by two companies such as the Cuban Chappara, and, from it, they would probably make about 122,000 tons of sugar. What sugar industry there is in Northern India is, it might be thought, in a precarious condition if it is dependent on the production of dirty gur in certain districts.

In case of the machine gur refiner this is the case, and it is into this industry that Indians have put the capital they have invested in sugar machinery solely because the first sugar refinery in Northern India refining sugar by a process not prejudicial to caste made a success of it. A moderately extensive movement for the improvement of Gorakhpur and Saran gurs might well put them beyond the reach of refiners as they only get the equivalent of from 4·4 per cent. to about 6 per cent. of sugar on cane—the amount depending on the efficiency with which the factory is managed. A factory working from cane may average 7 per cent. to 8 per cent. extraction.

The refiner gets a lower quality of sugar than the average of factory sugar made directly from cane, also, the sugar factory uses the crushed cane as fuel whereas the refiner has to use coal. In other ways the factory scores over the refiner. Starting with the cane juice the factory can treat it to best advantage. Gur cannot be brought back to juice conditions after the treatment it gets from the gur maker.

By storing gur the refiner can work all the year if he wishes to and so reduce costs, but a small additional expenditure on plant would allow of a factory working as a refinery as well as a factory and be capable of working with a higher efficiency than the average gur refinery.

The refineries, including one factory which works for some months each year as a refinery, are all small. The seven of them in existence have only a total capacity of about 70,000 tons of raw sugar per annum. This total would, in Europe, be regarded as an amount for a comparatively small plant to treat.

The sugar factories are also small compared with some in other parts of the world and it is questionable if the largest of them could crush, on an average, much over 375 tons of cane per day throughout the season.

They have been erected chiefly where there is some concentration of cane cultivation and in several cases at some distance from a railway.

The capacities of the factories situated at a distance from a railway are limited by the amount of cane in their neighbourhood and the land capable of growing it satisfactory, also by the carting capacities of the districts they are situated in.

It is improbable that in any district, and with due economy of carts, the carting facilities would allow of cane being brought in for more than seven or eight miles, so that, assuming that conditions are favourable, it is improbable that more than 300 to 350 tons of cane per day could be brought in.

In an extensive cane area the factory capacity might be increased by running out tramways and collecting to centres by carts but any such scheme would require that a careful survey of the carting power of the neighbourhood be first made and the tram lines arranged to utilise the available carts to the best advantage.

There is no cane area with cane plots of such an extent in Northern India that it would be worth laying a line in movable sections to the edge of the cane and only using carts for short collecting trips.

Cane lands are scattered, patches come in that are too low and flood in the rains, while other parts again are too high and do not hold sufficient moisture.

The cultivators also have small holdings of land and cane is one of their crops grown in rotation with others. Their cane is not grown intensively nor can a factory look to getting all the cane in a given area. The gur buyer also competes for it and comes early into the market, forcing the factories to start on unripe cane that they may get a season of reasonable length.

In the case of a factory situated on the railway the limiting factor is the cost of the cane and with careful and intelligent arrangements for cane supplies a factory should, if economically worked, be able to draw cane from about 40 miles on each side in a year when Java sugar, which rules the Indian market, is at bottom prices. In such a year sugar prices would be too low for the gur refiner to work profitably with gur at normal rates. If gur was below normal rates then cane would be obtainable at lower rates than has been taken for calculating purposes.

If the percentage of area under cane averaged the same as Gorakhpur district along a stretch of railway 40 miles on each side of a given point and three miles to each side of stations, and, if all this cane was sold to a factory, then, a plant to crush about 1,200 tons per day could be kept at work for 100 days.

It is improbable that all the cane could be bought, so that a factory to crush from 500 to 600 tons per day would probably be the most convenient size. If financial provision were made for bad seasons then the factory might be made bigger but possibly the railway company might have something to say on this point regarding wagon supply.

It has already been stated in this note that factories start in the beginning of the season on unripe cane. Much might be done to minimise this objectionable factor.

Towards March and April it is nothing unusual to have $\frac{1}{2}$ more sugar extraction on cane over that of the beginning of the season in December, with the same or lower working charges because of the increased purity of the cane juice. Every effort should be made to extend factory seasons into, or through, April. In well-grown canes, with the open trucks now supplied by the Bengal and North-Western Railway Company, there would be little deterioration in getting the cane from the fields to the factory. It is, in short, in ill grown cane that the heaviest deterioration takes place because of the undue proportion of cut ends to cane, and these short canes also dry out first in the field.

In Indian sugar factories three systems of sugar making are in operation, viz., the defecation process, the carbonatation process, and the sulphitation process.

In the defecation process the juice is lightly treated with sulphur dioxide gas, milk of lime added to neutrality to litmus then heated to boiling, but not boiled, in "defecators"—vessels that are cylindrical in shape with a hemispherical double bottom for steam heating. By this treatment a thick scum of impurities is thrown up and floats on the hot juice by reason of its containing many small air bubbles. Technically this scum is called the "blanket" and the tendency of the "blanket" to break up as the juice comes to the boiling point, thus indicating that it has been heated sufficiently, is termed "cracking." These are old terms that go back to the beginning of Britain's connection with the cane sugar industry. The "blanket" contains the most of the precipitated impurities but some fall to the bottom of the defecator, on subsidence, after the steam by which the juice is heated is shut off.

In some countries phosphoric acid under various names is used to assist precipitation by the collecting action of the precipitated tri-basic phosphate of lime on light particles of impurities suspended in the juice, the lime being supplied by that added in neutralizing, or, by a little extra given to counteract the acidity produced by the addition of phosphoric acid.

In India the use of phosphoric acid is not admissible because of its possible derivation from bones.

Incidentally, be it noted that there is no particular prejudice against foreign sugar on which phosphoric acid has been used, as one Baniya said—"we don't see that, but if you use phosphoric acid we will see it."

After subsidence in the defecators a cock or plug is opened in the bottom of the vessel and the muddy juice allowed to run into a gutter set apart for it and conducting it to tanks in which a further subsidence takes place after heating. As soon as the defecated juice runs clear it is turned into another gutter and taken to the clear juice tanks, and, when it begins to run dirty again, owing to the "blanket" coming down, the juice, with the "blanket", is turned again to the dirty juice tanks.

The clear juice obtained on subsiding the dirty juice is mixed with the clear defecator juice and the muddy residue forced through filter presses.

The collected clear juice is again heated and boiled and any impurities rising as scum removed.

In Indian defecation factories Taylor filters are used to further clean the juice. In these filters it is passed through cotton bags enclosed in linen or hemp sheaths but this is by no means a satisfactory proceeding, because, to get efficient filtration large numbers of bags are required and they are an expensive item. Also, the juice is exposed to air in a thin film

over their outside and over a large area, and with this and the heating, the juice goes acid with consequent loss of sugar.

The clear juice from the filters is concentrated in a triple effect, boiled to a mixture of sugar and molasses in a vacuum pan and the sugar in this mixture separated and washed with water or steam in centrifugal machines.

The final separation of the sugar remaining in the molasses is made by "jellying." That is, the molasses is concentrated in a vacuum pan then dropped into tanks in which the sugar is allowed to crystalize. This "jellying" is not a satisfactory process as it cannot be regulated.

It also produces a sugar for which there is little or no market, and so it has to be re-melted and worked up again, this involves a further loss.

In the carbonatation process the juice as it comes from the mill is made alkaline with lime, heated slightly only, and sent to tanks in which gases from a lime kiln are blown through it. The carbon dioxide contained in these gases precipitates lime as carbonate.

The action of the lime is partly chemical, but the main action is mechanical in that the carbonate of lime, produced from the excess of lime and the lime kiln gases, entangles gelatinous organic matter in the juice and permits of its ready filtration through filter presses.

The treatment with lime kiln gases is continued until the juice is only faintly alkaline, not neutral, else some impurities redissolve.

After pumping through filter presses to separate the carbonate of lime with its contained impurities, the clear juice is again treated with kiln gases, heated to decompose bicarbonate of lime, pumped through a second set of press filters then concentrated in a triple effect.

After concentration the juice is carefully but lightly treated with sulphur dioxide gas to decompose, or partly decompose, lime salts of certain organic acids which might otherwise give trouble in the vacuum pan owing to an objectionable property they have of being less soluble at a high temperature than a low temperature and so deposit on the steam coils and, without sulphur dioxide, these salts may stop the pan from boiling.

The carbonatation factories produce all their sugar in such a condition that it finds a ready market and no remelting is done. This is partly due to the clear juices given by carbonatation and also because of the use of a different sugar boiling system from that of "jellying" and in which crystallization takes place in the vacuum pan where it is under control.

The drawback to carbonatation is the cost of limestone and coke at the sugar districts. These are required for the lime kiln.

An attempt is being made to reduce these costs, and should it succeed there would be no doubt about carbonatation being the process best suited to India.

In the sulphitation process the juice is made alkaline with lime but not to the same extent as in the carbonatation process. The cold limed juice, or slightly warmed juice, is treated with sulphur dioxide gas from burning sulphur until neutral, heated to boiling, and the impurities allowed to settle out in subsiding tanks. The neutral sulphite of lime precipitated assists in carrying down the insoluble organic matters in the juice.

The clear juice is concentrated as in the other processes. Only one factory uses this process, and in their first two seasons they had troubles. Last season sugars were made without remelting which sold readily.

In the United Provinces determined attempts have been made to modernise the country sugar making industry by the introduction of improved boiling methods and centrifugal machines.

The attempt made by Mr. Hadi was the first, but before he started his work the country process was doomed and in Cawnpore bazaar only single bags of country sugar were being sold where formerly a hundred were sold.

Mr. Hadi's work showed the state of affairs and the hold cheap, clean sugar had got, but nevertheless, a small factory was set up at Allahabad Exhibition which contained no features that would assist to solve the small factory problem.

Again a small factory has been set up in Bareilly district and in it there does not seem to be much to lead one to expect that the problem is on the way to solution. It requires as much skill to extract the maximum of sugar from cane on the small as on the large scale and that has to be paid for, and it seems reasonable to suppose that if sugar factories could have got along with open evaporators, as in the Bareilly district factory, the old West Indian "copperwall" should have held its own, needless to say it did not.

So far the Bareilly district plant appears to have done an actual extraction of 8.61 per cent. of sugar on cane, but a balance sheet is shown based on a 6 per cent. extraction, the difference between the 8.61 per cent. and 6 per cent. being calculated on losses which it is hoped to obviate.

This calculated sugar yield is set down as selling at Rs. 13 per maund which looks like a fair price. Factory sugars have touched 7-8 and 8 per maund in Cawnpore and it remains to be seen if they may not come down to this rate again when beetroot sugar re-enters the market in quantity and the increased production of other countries has to be disposed of. Cuba, for

example, had increased its output by about 500,000 tons at the end of 1915 from its pre-war output.

There seems little room for work in the direction of miniature factories.

There is scope for the small gur factory and this is a field that has scarcely been touched. A good cleaning process is desirable for the juice of small variety canes as these do not yield treatment so readily as juices of well grown canes of the large varieties. Methods of gur storage would also require consideration, because, to get good prices gur must go on the market in an unbroken condition and dry.

The processes of clarification used in sugar factories are not admissible on juice to be used for gur making as the consumer is particular about taste and a certain amount of any materials added for clarification must remain in the gur. In sugar making, lime and such solving in the juice becomes concentrated in the molasses and do not affect the sugar.

The canes from which gur and sugar are made in Northern India are almost entirely thin or moderately thick hardy canes, but of late a Java cane has been tried in the United Provinces which has given good results.

Foreign canes should, however, be introduced with care and thoroughly tried under varying conditions of soil, moisture and climate. Experience in the Chanda district of the Central Provinces, where there is an intense dry hot weather—an extreme of Northern India conditions, has shown that many canes, though they may get an excellent start in February–March, get such a set back in May that in the end they give poor yields and become liable to disease. The wax on a cane seems to give some indication as to how it will resist a dry, hot climate. Red Mauritius cane, which has little wax on it, does very badly in the hot dry climate of Chanda and it is only by plentiful watering that any of it can be brought through May and this is not economical. It either dries completely, starting at the ends of the leaves, or becomes liable to the attacks of white ants, a sure indication that something is wrong. Pounda, with a little more wax on it, with care, goes through the hot weather and has the advantage of recovering rapidly in the rains, making a strong growth and tillering out in a remarkable manner.

Java 247, a cane with a heavy wax coating and a fair and even amount on the new leaves where protected by leaves seems to stand hot weather best of all and with the minimum irrigation water, but again, in the rains, and particularly in porous soils, it does not do well with long continued spells of cloudy, wet weather. In such weather the wet bulb thermometer in Chanda may range from 72° to 80°F and this gives a fair indication of soil temperatures in porous soils.

There is room for selection in seedlings and seedlings from crosses of indigenous canes. Climatic conditions for cane are not easy in most of India and the indigenous canes having survived though being best fitted to conditions, seem to offer a field of search for resistant canes rather than the offspring of foreign canes many of which, so far as seedlings are concerned, owe their existence to weakness in one parent.

There is a call from sugar makers in Northern India for an earlier ripening cane than the Hemja and Bhurli canes which they crush, but this condition might be difficult to obtain.

Cane in non-irrigated areas in the sugar districts does comparatively little growth in the hot weather, then comes away rapidly when the rains set in. It is open to question if the process of sugar building in the cane can be forced by selection beyond its present limits.

Something might be done by the careful cultivation of ratoons of canes at present dropped. Ratoons are canes that grow in the second year from roots that have already produced one crop.

Much could be done to improve cane and cane yields by a system of supplying manure to ryots if one could get over the difficulty of dealing with many small cultivators.

It is not uncommon to see cart loads of cane at an Indian sugar factory varying from 6 inches to 8 inches to 2 feet long and some of it little thicker than a lead pencil. Such cane is fibrous and contain little juice, giving sugar returns of perhaps only 4 per cent. to 5 per cent. with heavy maceration in the mill. The same variety of cane, well grown, would go to 6 or 7 feet long and 1 inch to 1½" thick. In a factory in the cane districts there was an example of possibilities last season. The sugar extraction on ordinary average cane was coming out at about 7 per cent. to 7½ per cent. on weekly averages, then, as well grown cane of the same variety came in increasing quantities from an indigo concern the sugar extraction gradually mounted up until it stood at 10.1 per cent. on cane, declining again as the indigo concern cane decreased. Heavy manuring and intensive cultivation are not required, soil water conditions are not suited to these, but it should be carefully worked out on cultivators' lands what manure, and how much, is required to give cane crops of from 400 to 500 maunds per acre, and assistance given to the cultivators to help them to attain these yields. Something other than cattle manure is required as there is not enough to go round; oil cake seems a likely substitute.

Mr. Macdonald of Barah concern has got as high as 800 maunds of Hemja cane per acre on a small area without irrigation, and again without irrigation, has averaged 476 maunds per acre over 600 acres. A fairly good crop for cultivators may be taken at 250 to 300 maunds per acre, all on small areas.

In principle the ryot's system of cultivation is suited to cane requirements though improvements in detail might be possible.

There seems little to be gained by attempts to introduce planting systems borrowed from countries in which climatic conditions are entirely different to those of India.

Planting in trenches, for example, leaves a block of packed earth between each trench which acts like a wick and dissipates soil moisture from its sides and top. The evaporation from packed earth in places must be great as it is not uncommon to see, in certain districts, areas of packed earth that remain moist on the surface throughout the hot weather. Excessive evaporation also tends to "usur" formation.

The cultivators' system of planting cane on the flat gives the least area for water losses to take place from, and these water losses the cultivator minimises by making the soil surface into a dust mulch.

In the Central Provinces some experimental work on cane growing has been carried out by a small syndicate in connection with a proposal of the Government of the Central Provinces.

Land was given on ryotwari terms and it was stated that water was available for 1,000 acres of cane.

The idea was that with a considerable area of land under the control of a factory, and with a good supply of irrigation water available, intensive cultivation could be resorted to. Experiments have been carried out on manures. These were found to be necessary as land, such as this was, which had been a forest grazing area, did not behave under crops like land that had been in cultivation for a time.

Cane varieties were tested for their suitability to the climate, and contour systems of planting, to allow of efficient and economical irrigation, were worked out. Work in the meantime is practically suspended as the syndicate sees no prospect of development at present through the failure of the irrigation canals which water the lands. Needless to say a failure in the water supply was the last thing expected by the syndicate in a scheme that had been brought forward by Government. Though the tank has been in operation for several years, even now there seems to be no reliable data on leakage.

The fermentation and distillation of molasses for alcohol is regarded in most sugar-producing countries as the chief means of disposing of what is sometimes a troublesome product. In some countries, in which it has not suited to produce alcohol, molasses has been burnt or allowed to run into streams.

In Northern India there is a large demand for molasses for mixing with tobacco, and with the decay of the country sugar refining industry there has been a steady rise in molasses' prices, and now, with molasses at about Rs. 2 per maund, Indian distilleries have little chance of competing with Java spirit in the open market as in Java molasses is a product of low value. The Indian distilleries in existence all depend on Government contracts to supply spirit for shops. These contracts put them on a better footing than they would be if left to the conditions of an open market, yet they do not make much of it owing to the high cost of raw materials. Several of the distilleries in Northern India use the Hansen pure yeast system for their fermentation and their yields are good. Distilling has little interest at the present high molasses' prices and beyond the demand for alcohol for consumption as country spirit, or for making up whiskies and such and also a little for methylating, there is little scope for alcohol production in India. There are no industries that use it to any extent.

Megass or crushed cane, as a paper making material has been tried in several countries but without any great amount of success. Processes for making paper material from megass have, so far, been based on boiling the megass with caustic soda solution. This is a drawback as in no cane-growing country is caustic soda obtainable cheaply.

Another disadvantage is that cane fibre is not a uniform material, consisting as it does of hard rind, fibre and pith and in treatment suited to the rind the pith is over treated and yields are small.

The cane mostly crushed by Northern India factories is a pithy, rather than a fibrous cane, which makes it even less suitable for paper material than canes crushed in some other country in which paper making has failed.

ORAL EVIDENCE, 4TH JANUARY 1917.

Mr. C. E. Low.—Q. What is your view of these small power mills for crushing cane without reference to sugar, to deal with the cultivators' cane and make gur of it?—A. I think the introduction of small power mills would be a good thing.

Q. What effect would it have on the location of the cane?—A. I think it would probably have a tendency to concentrate in the neighbourhood of small power mills.

Q. And that would help the introduction of cane factories afterwards if it was thought advisable to do so?—A. It would assist in that direction.

Q. Is the establishment of cane factories known to you in Bihar which are using sugar cane and not gur; has that tended to concentrate cane round those factories?—A. In the case of the Champaran Company it has. In the case of Marhowrah it has resulted in an increase of cane cultivation. In the case of other factories, such as Pussa, they replaced the old gur industry which was worked round about, and the arrival of such factories tended to stop crushing

of cane in cattle mills. Large factories could give probably better terms for cane than what the small crusher could do.

Q. What prices are usually paid for cane in the United Provinces factories, prior to the War, and within what limits?—A. From 8½ annas per maund up to 5 and 6 annas per maund. The general price would probably be about 4 annas per maund.

Q. The differences were due to what—competition from other factories or the price of gur?—A. Regarding the higher prices, the 5 annas and 6 annas per maund in the case of one factory, it was under a contract made to supply cane. The factory does not deal direct with ryot. In the case of another factory, which at times paid fairly high prices, they cannot get full supplies locally, and have to go outside for some distance. Supplies are obtained through contractors and agents.

Q. Practically the cost of carriage?—A. No. They have to go to districts, in which they are not in direct touch with the ryot and work through contractors and agents, and coming in without previous arrangement and when gur crushing is going on have to offer higher prices to induce cultivators to stop gur making and sell cane.

Q. Has any attempt been made in any of the United Provinces factories to buy on analysis?—A. Gur is bought on analysis.

Q. Not for sugarcane?—A. I once put forward such a proposal in Champaran, but the planters who supplied the cane in this particular case refused to have anything to do with such an arrangement. They thought that what they would rather have was a definite fixed increase of price for their cane, not on analysis and extraction.

Q. Do you know if the Rosa factory ever bought on analysis?—A. I don't know.

Q. Do you get any trouble in the eastern districts of the United Provinces and Bihar from pig?—A. A little, not very great; not to anything like the same extent as in the Central Provinces.

Q. Do you think if soft cane were put out pretty freely in the United Provinces that you will get trouble from pig?—A. I think you would.

Q. There are plenty of pig about?—A. There are pig about in fair numbers but not to the same extent as in the jungle part of the Central Provinces. A good lot would depend upon the cane. In the Central Provinces my fencing has been broken down once or twice. I found that pig came in and attacked the soft cane but left the harder cane. A pig's opinion of the cane indicates the quality of the juice and is almost as good as an analysis at times.

Q. Do the cultivators in Bihar or the United Provinces grow their cane in blocks?—A. No, not to any great extent.

Q. Perhaps not rigidly in blocks but fairly well in one part of the village with reference to the possibility of fencing?—A. It is scattered, as lands suit or individual cultivators think it would be, a crop to put in. They don't combine as the villagers in the Central Provinces do.

Q. Fencing would be a very doubtful proposition in the United Provinces?—A. Yes. In the United Provinces it would be a comparatively easy matter in the cultivating district to clear out pig almost entirely. Conditions are different in the Central Provinces. There is a certain tendency to preserve pigs in places in the United Provinces and Bihar which one does not have in the Central Provinces.

Q. How far is wire fencing efficient?—A. Barbed wire, single wire, has little efficiency. Ordinary wire fencing has little efficiency. Wire fencing with vertical stiffening wire is efficient, but a great lot depends on the fixing of the vertical wire. In one type of fencing I have had, the vertical wire is just brought down and given a hitch round, and a twist like that (the witness indicates with his hands). The pig forces his head between the horizontal wires which are about 1-8 inch in diameter. This opens the vertical wire knot and he can then spread the horizontal wire and push through. In another type of fencing, where it is a piece of wire wrapped round the vertical and horizontal and twisted, that holds fairly well. I should think that the new fencing that has been put on the market, in which the vertical wire is fused on the horizontal wire would be most efficient.

Q. What does it cost per acre to give a fairly efficient fencing?—A. Before the War you could reckon on fencing averaging about 5 to 8 annas a yard. You have very considerable variations in the prices according to height, make, etc.

Q. At what price could Java sugar be delivered in Calcutta before the War?—A. I think you might take as a safe figure for the ordinary Java Raws about 5 Rs. a maund and still allow of the average Java factory paying at least about 5 per cent. interest on capital.

Q. What sugar is that for?—A. For the ordinary 16.

Q. Of course it is generally considered that for sometime after the War freights will remain fairly high?—A. I think so.

Q. Will that continue to afford a reasonable amount of protection or could Java reduce her prices so as to make up for that?—A. I don't think so. The cost of production in Java is on the increase; the land rents are going up and the labour rate is going up as everywhere. Before the War the tendency was towards an increase of price.

Q. In a place like the United Provinces or Bihar, supposing Government could only keep a single expert, do you think they should keep an expert to advise the existing large factories,

or do you think they should concentrate to help the small ones, supposing they could afford only one man?—A. With the large and the small factory the principle is the same, and I should think that it would be possible for the expert to assist both. The small man, the refiner, is at present losing in that. He cannot afford to pay a well trained man to manage his factory, so he has a man who has a certain smattering of knowledge and who can put sugar through in a way. He may not be in a position to do accounts work, and check his own yields. These are the people most in need of assistance. In the matter of plant it really wants advice or a report to be given once, and that sets thing right once for all so far as plant is concerned. Any lapse in methods of working can be at once got at if returns are sent in. I had a case where I did some consulting work for a Mahomedan who had got a small sugar factory. His returns were not good, 35 to 40 per cent. of sugar on jaggery, and his plant was fairly good. He was not limited by inefficient centrifugal machines. The mistake was entirely in the method in which he was boiling his sugar in the vacuum pans and on altering the system of boiling, he got up to 50 per cent. sugar on gur. Since then he has had trouble with his men and the new arrivals require selling right. An expert could arrange to train men so that a supply of men knowing the best methods would always be available.

Q. Is much done by the Government expert in the United Provinces in advising the small refiners?—A. The Government expert has done, I believe, some work for a factory in the United Provinces, not so far as I know for refineries. I have not heard of his giving advice to other factories.

Q. Do you think that it is worth Government's while to devote much attention to these small refineries, or do you think that they are likely to disappear?—A. I think the position of the refinery may become precarious, but it would be a good thing, I think, to keep them going on as long as possible, because it has brought a certain amount of Indian capital into the industry, and, by and by, I think, possibly after the War, as they have accumulated a little spare capital, you may find a tendency among them to go in for cane crushing.

Q. How can Government help them best—by having some body to look over their plants?—A. I think by giving them advice in working, looking over the plant and checking their output.

Q. You take this position as regards the small refiner; you would help him with expert advice and pave the way for the bigger man buying the small cane crushing factory?—A. Yes.

Q. Is there anything else that could be done in regard to the bigger concerns, or are they able to look after themselves?—A. I think some of the larger concerns would be glad of expert advice; for example, last season the factory which I was in charge of averaged a little over 5 per cent. of sugar on the cane, and our nearest neighbours working practically the same cane got under 6 per cent. of sugar extraction. They gave out no definite figure, however, for extraction. It is a factory crushing about two hundred tons of cane a day. They, I think, have been in fear of some of their neighbours. They had been doubtful about what is the right plant, the right processes, and about being able to work on the right process when found. They grudge the paying of a man perhaps 8 or 12 hundred rupees a month to run their factory as it is a heavy burden on a little place to pay such a salary. A Government expert would be of great assistance to such places, and there are 3 at least in the United Provinces and Bihar. In the case of the larger factories, of course, they made a very good start, as for instance the Champaran factory and Marhowrah factory. The matter of processes for these factories was thoroughly gone into in the laboratory and experience obtained on boiling and treating low quality raw sugars taken full advantage of and applied to cane juices which, at times, are not good.

Q. Suppose small factories were given the help of competent advisers to tell them how to start and see them once or twice when they were going on; do you think that a small factory like the one at Bareilly would prove a success?—A. What amount of cane does it put through a day? I suppose about 150 tons. In any case, quite apart from quantity crushed by putting in suitable plant you could get the same percentage extraction of sugar as any of the larger factories with equal quality cane. The larger the quantity of cane crushed the more working costs would be reduced.

Q. Referring to the Government experiment, that is not an economic proposition?—A. No.

Q. What do you think is the smallest economic proposition?—A. At least 200 to 250 tons of cane a day.

Q. That means about a lakh of rupees?—A. Considerably more than that. To put in a plant that would give you good extraction it would mean that such a plant would probably cost before the War at least 2½ lakhs.

Q. But that is not what I meant by a small factory?—A. The very small factory is not an economic proposition.

Q. That is for making sugar from cane?—A. Yes. The 3,600 maunds of sugar proposition would not pay on account of the cost of supervision, do you mean on itself?—Not altogether on account of supervision, but of the difficulty of arranging any plant on such a small scale. When you come down to a toy plant, almost laboratory plant, it means that the cost of the

plant per unit of sugar goes up enormously as compared with big plant. Supervision and skilled labour charges would also tell heavily even with a government expert to assist free of charge.

Q. What is your view of the future of gur in this country; do you think people will continue to eat a good deal of it? Would it continue to be in good demand?—A. I think so. I think that the demand for gur will continue.

Q. How far is the price of gur affected by the price of sugar?—A. It is little affected in normal times.

Q. The price of gur is more affected by the nature of the season?—A. Yes. Much more.

Q. I sent you privately certain figures showing the way in which the sugar companies were run. Up to 1910 or 1911 they were doing quite badly for 4 or 5 years, and since then before the War, they were doing a good deal better. Have you formed any opinion as to what the change was due to, whether it was improved administrative management, or improved technical management, or the price of sugar, or the price of gur?—A. There has been little alteration in the technical management and little alteration in the plant. The variations were due to a series of lean cane years and good cane years and to sugar prices (not gur) taken along with these.

Q. They did not get enough cane?—A. They did not get enough cane at times and the gur manufacturer competes with all those sugar factories for cane.

Q. He could afford to pay as high a price as the sugar manufacturer?—A. Yes. In a short crop the price of the gur will go up; it is not necessarily so in the case of sugar. You might have a short supply of cane and sugar from Java and run sugar prices down to 1 or 8 rupees a maund up-country.

Q. There was a very short beet crop in 1911-12. The price of sugar rose very little, yet apparently the factories made bigger profits?—A. I think if you got the full figures you would probably find that towards the end of that year there was a substantial rise in the price of sugar. Until the failure was known in August or September, sugar prices kept down, and also in that year I recollect there was an extraordinary cane crop; in fact the cane was burnt on the fields. One factory worked right up to the end of May in the following year Jaggery was down to about 2 Rs. a maund or less. The failure of the beet crop coincided with an extraordinary cane crop in northern India.

Q. Is cane grown with irrigation in the Eastern United Provinces and Bihar?—A. There is a little irrigation from wells.

Q. Is it general?—A. No. In the Gorakhpur district about half the cane is irrigated from wells. That only means perhaps one, two or three waterings in the whole season.

Q. Do you know anything about the cane grown by irrigation in other parts of the United Provinces further north?—A. In Cawnpore and round towns a considerable amount of big cane is grown under heavy irrigation for chewing.

Q. The kind for gur or sugar making is not grown much under irrigation?—A. Not much not to the same extent as in the east of the United Provinces where there are no canals.

Q. You have not seen any part of the United Provinces where it is?—A. I don't know the western districts of the United Provinces well. It is grown on the Ganges canals. But again, it is not heavy irrigation that is used for cane grown for gur making. The cane that is grown for gur making is invariably a small hardy cane and it probably is given some irrigation before the rains set in. The big cane grown for chewing is irrigated thoroughly.

Q. You don't know whether the United Provinces Irrigation Department are prepared to give much more water?—A. I understand that the Ganges canal water is pretty well utilised.

Q. The very important thing is to improve the quality of the cane; what prospect is there of doing that without much irrigation?—A. I think there are good prospects of doing so.

Q. The present yield is about 9 tons; do you think you could see your way to 15 or 20 without any more irrigation than at present?—A. 20 would probably be difficult and only attainable locally. I think 15 is possible.

Q. Does that mean more manure?—A. Perhaps an expenditure of about Rs. 30 per acre on manure.

Q. Better cultivation as well?—A. Similar cultivation to what the ryots do at present. I think the cultivation is well suited to the conditions.

Q. What extraction do you think small power mills for gur would give under United Provinces conditions in terms of weight of juice and weight of cane?—A. With the three roller mill with the ordinary gur making canes I do not think you could look for very much more than perhaps 55 to 65 per cent.

Q. And say with the six or nine roller?—A. Then you would go up considerably. You might go up might to 65 or 70 with maceration.

Q. I refer to present United Provinces conditions. How much would a six roller mill and an engine to run it cost?—A. To do how much, 10 tons a day or 20 tons a day?

Q. I was thinking more of keeping the cost of the plant within economic limits from the difficulty that people would find in financing it?—A. I have had no large experience in

small units but I think a six-roller mill might be put down for perhaps Rs. 9,000—Rs. 10,000 with engine and boiler which would do 20 tons of cane per day.

Q. The point is if you can get something costing between 5 and 10 thousand rupees it would not give you a very much bigger percentage of extraction, but you would turn out a proportionately large quantity. Is that not to the man's advantage?—A. It is, and to do away with bullock mills would be an advantage as they are hard on cattle. Then, the bullock mill at work on experimental farms, with strong well-fed cattle is a very different affair from even a similar mill in the ryot's hands. His cattle are often small and his mill is opened out to fit the strength of his bullocks—his bullock power compelling him to disregard juice extraction.

Q. Do any concerns which you know about grow their own cane to any extent?—A. Not to any great extent. Japaha, I understand, grows a fair amount.

Q. What proportion?—A. I have no idea.

Q. Besides Japaha there are more concerns running in connection with indigo concerns where these factories supply cane?—A. In Barah factory, which is in the neighbourhood of a sugar factory, I imagine that the cane cultivation is about 5 or 6 hundred acres. Also at Purtabpore, Bubnowlie and Pursa cane is grown for sugar factories with which the indigo concern is connected.

Q. Is it usually found advantageous for sugar factories to do that?—A. It has this advantage that if a sugar factory has sufficient land for growing a reasonable amount of cane, they are not so liable to get caught by combinations of cultivators against them.

Q. What do you suppose an indigo concern ought to be able to grow per acre of cane in Bihar?—A. Mr. George Macdonald, who is a very careful planter, gave me some figures of his cane. It was 476 maunds per acre that he averaged over a 600 acre cultivation.

Q. The United Provinces conditions were not quite so favourable?—A. In the United Provinces, so far as the established sugar factories are concerned, the conditions are approximately similar, to those of Saran and Champaran.

Q. Turning to the question of starting cane factories and plantations in new areas, of course conditions vary a good deal. But what does it amount to for labour, per acre, for the first, second and third year, until you get it going and after you get it going?—A. Cane requires a varying labour force. From the end of the planting until the next season, one does not require a cooly per acre, perhaps a cooly per 5 acres per day will do. But when it comes to the cane being ripe, one is cutting, manufacturing and planting, all at the same time, so that for 4 or 5 months one wants a very big force, which will vary very much stripping for instance in the Central Provinces where they are unused to that work requires 3 or 4 times as many coolies, for a given amount of work, as would be required in Gorakhpur or Saran districts.

Q. You have had some experience of sulphate of ammonia for manure; have you tried it in the United Provinces or only in the Central Provinces?—A. In the Central Provinces. I tried it in the United Provinces a number of years ago.

Q. Under what circumstances can it replace bulky organic manures?—A. In soils in which organic matters have been concentrated and well brought up. Under such conditions sulphate of ammonia would probably be a useful manure. The use of sulphate of ammonia, on some of the soils in Central Provinces, as we have also to use superphosphates, would have to be watched as it has a tendency to create acidity in the soil.

Q. What about the United Provinces and Bihar?—A. As far as I recollect, our trial with sulphate of ammonia gave little advantage.

Q. Did you try that with cattle dung and oil cake?—A. We tried it against oil cake and filter press cake containing $\frac{1}{2}$ per cent. of nitrogen. The press cake and oil cake gave better results.

Q. Did you try it in combination with it?—A. Not in the United Provinces. In the Central Provinces I have tried it with oil cake. In the Central Provinces we have dropped sulphate of ammonia and also dropped nitrate of soda, because oil cake is so much cheaper per unit of nitrogen. It also contains valuable organic matters and phosphates.

Q. You don't think that sulphate of ammonia would come in much until you had thoroughly cultivated land?—A. I don't think so.

Q. These conditions do not exist in Bombay?—A. Beyond a visit now and again I have no experience of Bombay. They appear to use heavy dressings of organic manures at times on cane and with this sulphate of ammonia probably would give good result also in the United Provinces if organic matters were used in quantity. You have considerable differences in the soils of Bombay and the United Provinces. In soils with much carbonate of lime as in the United Provinces there is a tendency for organic matters to go out rapidly. If you could work a system like what is being done in some indigo concerns where they grow green manures and work your ammonia sulphate along with that then there are possibilities. The Indian cultivator uses no sulphate in the United Provinces. The European cultivator is, you might say, experimenting with it.

Q. Do you think it would be advantageous to get them to use oil cake in the United Provinces?—A. I think it would be of great advantage.

Q. In order to get them to do so do you think any assistance from Government is desirable?—A. Yes, assistance and demonstration.

Q. I mean apart from the ordinary methods of the Agricultural Department, such as demonstrations, and a certain amount of *takavi* leading up to assistance from co-operative societies; do you know what the Japanese did about artificials; they gave a free grant of a certain amount of artificials to the cultivator who was growing cane, provided he spent so much himself, and they saw that he did it?—A. The Japanese use high-handed methods at times.

Q. You mean there might be some difficulty, supposing you gave the fellow free artificials, in securing that he spent his share of it?—A. In India one should give them the manure, not the cash, and show them how to put it in the soil.

Q. That would be done in any case?—A. Also you would have to be fairly sure that the cultivator would not use the cake for cattle feeding, if you supplied him with castor cake or a castor cake mixture this would ensure it being used as manure.

Q. Supposing you gave the fellow so much cake per acre, on the condition that he bought so much more from you?—A. All those men are very small cultivators; they are mostly in debt and they are conservative in their ways, and it would be difficult to get them to put down money. If you gave the oil cake as an advance, that would be safer.

Q. You could give him so much manure per acre, and he would pay you back whatever portion was represented by *takavi*?—A. Yes.

Q. What is the rotation of cane usually practised in the United Provinces and Bihar by the cultivators?—A. I do not know that there is any particular rotation.

Q. He does not put in cane two years running?—A. No. They allow about 3 or 4 years between cane crops.

Q. Cawnpore runs a distillery plant?—A. Cawnpore runs a distillery plant and at Marhowrah there is also a distillery. The Cawnpore plant in part was originally designed to remove the invert sugar from molasses. Both distilleries work on the Hansen pure yeast system.

President.—Q. In regard to the kind of Government help that should be given to encourage the sugar industry in the country, so far as I can judge, in order to deal with sugar problems we have to take into account agricultural conditions, use of fertilisers, nature of soil, the disease of [sugar-cane, etc., so that in problems of that kind a certain knowledge of local agriculture will be necessary. Botanical problems, selection of breeds suitable for different areas and soils, question of sugar engineering, methods of manufacture, questions of utilisation of alcohol and bye-products require a good deal of chemical knowledge; these will all be taken into account with local knowledge of holdings, methods of labour, etc. Taking all those problems into consideration, we have scientific questions like those of agriculture, botany, engineering and chemistry. I understand at present there is one Sugar Engineer for the United Provinces. He cannot be an agriculturist, botanist, chemist and engineer. I don't know what a sugar expert is in fact. It is quite obvious that no one person in one province can tackle all the problems in that province much less in India. What we want to know is what kind of Government organization is necessary and would pay the country to maintain for the purpose of improving the development of the sugar industry in India. I should like you to turn over these ideas in your mind and give us some idea as to what Government organization is required to tackle all these problems?—A. I shall do so.*

Hon'ble Pandit M. M. Malaviya.—Q. You say that "one result of the decay of the country refining industry was that molasses increased in a few years from about Rs. 0-9-6 per imperial maund to about three times that price, giving Java a market in India for molasses which, till then, had practically been a waste product." Do you think if permission were given to make alcohol, these refineries would have done better?—A. I don't think there would have been a market for all the alcohol that the molasses would have produced. The market for alcohol in India is limited.

Q. For what purpose is the molasses imported from Java used?—A. Mostly for mixing with tobacco; some for distillery.

Q. Don't you think there is need for industrial alcohol to a large extent in this country?—A. There are so few processes at work in this country in which industrial alcohol is used, that it is difficult to say. There are no industries that I can think of that use alcohol to any extent in India.

Q. Do you know how much we import in the shape of cements?—A. I don't know the figures.

Q. Don't you think that we can use all the industrial alcohol we might produce for making our own cements, paints and varnishes and for other purposes, both industrial and domestic?—A. I take it that by cements you mean those cements used for sticking things together, not Portland cements. For varnishes there is a certain amount consumed but it is only with the spirit varnishes, lac and such like, that alcohol is used and usually if a carpenter makes a door he buys some shellac in the bazar and mixes it with spirit and uses that as a varnish. For

the higher qualities of varnish fusel oil is used, because some of the resins used in the higher qualities of varnish are more readily soluble in fusel oil than in alcohol. For paints one does not have alcohol coming in to any large extent.

Q. Putting aside the question whether it could be consumed in one direction or in another, do you think that if permission were given to these refineries to make alcohol, that would help the industry to compete with Java?—A. I don't think so, because Java is sending in alcohol. Molasses is a product of much less value per maund in Java than what it is in India.

Q. Alcohol coming from Java is consumed, yet you don't think there is much scope for the consumption of alcohol which might be made here?—A. I think if one put the distillery here and in Java on the same basis, and do not give the Indian or Java distillery any special advantage one would find that the Java distillery gets its raw material and molasses so cheaply that it would be able to kill the Indian distillery. Before this molasses market came along, with an increase in the price in India, Java had difficulty in disposing of molasses. In India there is a demand for molasses at a good price, which puts the distillery here at a disadvantage as against the Java distillery which gets its molasses at a low rate.

Q. You say that the areas in northern India which grow cane profitably for sugar making are limited. Don't you think that the area could be increased profitably?—A. A considerable increase could be brought about on lands at present under cane by manuring.

Q. In your opinion that is the only thing that can be done in the way of increasing the production of cane?—A. That would increase the yield per acre. In all cane districts consideration must be given to the area necessary for growing food crops. These are things that will balance each other.

Q. Without extending the area, you think that there is a room for increasing the yield per acre by manuring?—A. I think there is room.

Q. All over northern India?—A. Yes. Increase of yield per acre is the important consideration and the improvement of gur making. In Northern India there is gur sold which is made from unripe cane. The question of gur has been neglected. To make this jaggery sold so largely in Northern India, unripe cane is cut. By cutting unripe cane it has not come to its full development in sugar and there is loss. But, if the cane were allowed to ripen, they could not make this "smeary" jaggery. It would crystallise. The jaggery question deserves serious consideration, and we should not look upon it as of no account, because it might be possible to allow canes in northern India to become fully ripe and develop the maximum of sugar and still make this "smeary" jaggery the markets require by altering the process.

Q. You don't think there is much room for bringing a larger area under cane cultivation without entrenching upon the area which should be left for food crops?—A. I don't think there is much room.

Q. If manure is applied to sugarcane why not apply it to other crops as well?—A. Then the food crop yields are increased. It is then a matter for the cultivator to consider how much more land he can give to cane profitably. Manuring for cane and good cultivation would favourably effect crops following.

Q. You say that the desi or country sugar industry has had to go because of its small sugar extraction and high cost of production? Have you any remedies to suggest for these two?—A. I am afraid it is in the position of small industries everywhere. It is not only in India that small industries have had to go.

Q. Just think of the situation. The people who grow cane want to convert it into gur or sugar and they consume it; therefore they produce the article and have a ready market at home. Don't you think that they should be able with a little more expert advice to produce cheap and good sugar and compete with foreign sugar?—A. I think it would be difficult because of the matter of plant for sugar making. The taking out of the first 5 or 6 per cent of the sugar on cane is a simple matter. The real skill in running a sugar factory comes in when the last possible sugar is to be extracted. It is really a matter of the plant and one can hardly conceive of vacuum pans and such being designed to produce a few maunds of sugar per day economically.

Q. You say that "when beetroot sugar re-enters the market in quantity and the increased production of other countries has to be disposed of, it remains to be seen whether factory sugars may not come down to Rs 7-8-0 and Rs 8 per maund." Have you any remedy to suggest to meet that situation?—A. The improvement of the factories, the improvement of cultivation and in time improved varieties of cane.

Q. Those are a variety of conditions which would not be easy to establish at once, but you think that with those conditions established, Indian sugar could compete with foreign sugar?—A. Certainly, I think so. In another part of my note I have gone into that broadly, but not in great detail. Indian sugar could hold its own against Java.

Q. While the conditions that you have recommended are being established, would you give some artificial help to the Indian industry against foreign competition?—A. Artificial help in what way?

Q. Any other artificial help?—A. In what direction? Unless with advice and with checking of the work, suggesting improvements in plant, I don't see what else could be done.

Q. You say there is scope for the small gur factory and that this is a field which has scarcely been touched. You are quite clear in your mind that the gur factory can survive this foreign competition?—A. There is no foreign competition with gur.

Q. There is no competition with gur?—A. No. Java had considered it at one time but the difficulty was the question of exportation. To get it here in good condition is not easy.

Q. You say "there is no large margin in northern India for the extension of the industry to supply India's refined sugar requirements." Of course subject to the modification you have made, do you know if there is room for extension in parts other than northern India?—A. In northern India there is a possibility of extension in the Terai. While in Cawnpore we did a certain amount of experimental work in the Terai. The climate is a difficulty there. Very fair cane can be grown in the Terai but there is a certain amount of rough rice cultivation, for which water is held up in the rains. When this water is held up for rice it floods cane. That is a matter of arrangement and selection of suitable lands. There are possibilities for cane growing in the Terai.

Q. Apart from northern India do you know of any other portions of India where there is room for more extension?—A. I have tried in the Central Provinces. I believe there are possibilities in Assam.

Q. And Madras?—A. Madras, I don't know. I have never been there except on the West Coast. There might be some small openings on the West Coast, but the labour conditions are bad. The room for advance is the increased yield per acre to be obtained by growing larger crops and better extraction of the sugar in the cane.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. Don't you think if large refineries were started it would be very difficult for them to get their raw materials, because the land is in so many small holdings by cultivators?—A. There is difficulty in getting the cane. It is grown in small patches. It is largely a matter of organization.

Q. Don't you think that if large factories were started, the cultivator finding that he would have to take the sugar from them, would charge exorbitant rates so that the factories would not be able to work with profit?—A. There is always a possibility of that, and that is why some factories safeguard themselves by putting a certain amount of land under cane.

Q. Do you think that if the Government under the Land Acquisition Act acquired some land, say 500 acres, and allowed a factory to take up that land and to have their own cultivation, that would prove more successful?—A. It would require about 1,000 acres before one could work a factory economically and then only by good cultivation and scientific manuring.

Q. That would be a very small factory. The output would be so small that the cost would be higher?—A. In the Central Provinces we were reckoning on growing up to 40 tons per acre of cane, 1,000 acres giving 40,000 tons of cane. With 1,000 acres at 40 tons per acre, that gives us 400 tons of cane a day for 100 days. This would be a fair sized factory.

Q. Do you think that labour here is costlier than in Java and Formosa?—A. I don't know Java and Formosa.

Sir D. J. Tata.—Q. Can you tell us what are the possibilities of date sugar as against cane sugar? Have you given date sugar any consideration?—A. About 15 or 16 years ago I had a certain amount to do with date sugar. It, I think, is a small man's industry on account of the difficulty of collecting the juice for large factories.

Q. Was there not in Eastern Bengal a date sugar industry at one time which was a fairly flourishing one?—A. Yes, in looking through some papers I came across a note which had been made out by the late Mr. Noel Paton. Date sugar production according to this note has been a diminishing quantity. In 1902-03 it was 143,000 tons. In 1910-11 it was 66,900 tons. That, I imagine, is due to foreign sugar competition.

Q. Could it not be better developed as a small industry?—A. I think in date sugar there is a possibility of improving the extraction, and Mr. Annett has done work in heating the juice in the same way that they do in southern India with Palmyra juice. All that is in the direction of improvement. The processes that were in use in Jessore for extracting sugar were very crude even in the factories owned by Europeans.

Q. You mean to say the manufacture of date sugar has not been studied as much as cane sugar?—A. No, because it was a small industry.

Q. Does not beet sugar, weight for weight, contain less sucrose than cane sugar?—A. In the case of a well refined beet and cane sugar one cannot by any chemical test tell the difference, but a semi-refined beet sugar is objectionable because it smells, unpleasantly. Semi-refined cane sugar, on the other hand, has a pleasant smell and the action of the invert sugar and salts contained in it on the palate give it an exaggerated sweetness, so that it is apparently much sweeter than a completely refined sugar either cane or beet.

Q. Is beet sugar very injurious to health as compared to cane sugar?—A. An agitation on this point was conducted in England by some doctors. Certain diseases, they said, were intensified by beet sugar, but I don't think this was demonstrated.

Mr. A. Chatterton.—Q. Can you say from your own experience that sugar is replacing gur or merely supplementing the supply?—A. Supplementing the supply.

Q. If we could increase production of gur should we be able to drive back the import of sugar?—A. The difference in gur and sugar consumption is gur is taken as a food stuff, sugar

is a luxury taken on special occasions or by the richer classes. Increasing prosperity of the community might be expected to result in an increased consumption of both gur and sugar.

Q. In attacking the Indian sugar problem is it not advisable to turn our attention more to the improvement of the indigenous process for making gur, rather than to attempt to introduce large factories for the manufacture of sugar?—A. I think so far as northern India is concerned gur and sugar are fairly well separated. In the districts where factories are sugar was formerly made to a certain extent. In other parts of India, further north, I think gur has always been more the product and by improvements there you can increase gur. There is a certain amount of division between the jaggery and sugar making parts of northern India.

Q. Would you be prepared to subscribe to a statement like this, that the Indian cultivator burns one third of his sugar to make the other two-thirds into gur?—A. I quite believe that he does though it is a difficult thing to get accurate estimates. The cane comes out of cultivator's mills partly crushed and he has to dry the megass before burning so that he does not even utilise the contained sugar to boil his gur. It is lost by fermentation in the process of drying the megass.

Q. Have you any experience of gur in the United Provinces?—A. I have watched the process in the United Provinces and have made it in the Central Provinces.

Q. At present the cultivator makes his own jaggery; do you think it would be a sound system to separate the manufacture of the sugar from the cultivation of it?—A. That is putting the gur factory into the same position as the sugar factory. There is no reason why it should not be done. If it can be demonstrated that a small central gur factory can be put up and made a paying proposition, capital would come in.

Q. Have you any knowledge of the factory which has been erected near Gorakhpur recently for the manufacture of gur on a fairly large scale with modern appliances by steam heating?—A. I saw the plant. It was not working. It was in process of erection when I saw it.

Q. The problem that we have got to tackle is somewhat in this way. The cultivator grows very small patches of cane and it is difficult to collect enough cane to establish a big sugar mill. It is possible in a great many places to collect enough cane to establish a small gur factory. When you establish the small gur factories there is a tendency to concentrate on cane growing in the neighbourhood, and the necessity to burn crops of cane in a good season does not occur. Formerly in the south of India they had to burn whole crops. That is a not uncommon occurrence in any good season. It is possible then by methods such as have been adopted by these people who put up improved gur factories, to get a better class of jaggery manufactured than is ordinarily manufactured by the ryot. Directly the cane crop comes on the market the price of jaggery drops, because the ryot having made his jaggery in a form that would not keep for any length of time, has to get rid of it?—A. We have considered these points in the Central Provinces because we had thought of going on there and making jaggery on a fairly large scale. Some very close consideration would have to be given to the methods of storage, because jaggery, in order to fetch its best price, must go on to the market in perfect condition. When packed or stored in bulk it breaks up, and the value falls. Also in the rains it absorbs moisture and gets damp and thought and consideration must be given to the problem of both making and storing by any one who hopes to make a satisfactory jaggery on a large scale and market it to best advantage. Too little attention has been given to these points.

Q. Is it practicable to make jaggery that will keep hard throughout the year?—A. No. Any jaggery will deliquesce during the rains if exposed to a rainy season atmosphere; even pure sugar will get moist during the rains. Much might be done by considering methods of storage. I have known jaggery selling in Bombay in September at a better price than Cawnpore sugar.

Q. Then it is not at all uncommon that the price of jaggery should be as high or higher than sugar?—A. Good quality jaggery. Before the War there was an industry going down Bombay way of mixing Java sugar with molasses to make jaggery.

Q. You agree in any scheme we have for improving the manufacture of jaggery that these arrangements for storing jaggery should be very carefully gone into, so as to hold the crop for a longer time?—A. Yes, also the methods of clarification of the juice, if one is after big extraction by increasing milling power.

Q. As regards machinery for the small factories, would it not be better to use five-roller mills instead of six?—A. A well arranged five-roller mill considering cost would probably be better than a six roller mill. An eight-roller mill would be better still. Cane put through might be practically the same in quantity but the milling would be more efficient. The suggested increase of roller capacity in mills is not so much with the idea of getting a bigger amount through the mills but to get increased extraction.

Q. For a gur factory, a 12"/18" roller is about as large as it is convenient to go into. Would you advocate using an eight-roller mill for that size?—A. Yes. My experience of cane milling with the horizontal mill is that the first set of rollers is largely preparatory.

Q. Is it possible in the north to extend the length of the planting season, so as to get a longer season for milling your cane afterwards?—A. The season from climatic conditions is

limited, but with more cane available than is usually the case and good means of treating it, the season could be extended beyond that usually worked. The season might be extended in factories by giving cultivators special terms for cane kept late, otherwise they would want to clear their lands.

Q. Have you formulated any reason why cane cultivation is so scattered?—A. Cane is grown with many other crops, and by men who control only small areas of land. Each man has his own idea of what crop it will suit him to grow. All lands are not suitable for cane.

Q. Ordinarily, is not the cane crop rather more profitable than other crops?—A. It is usually a profitable crop but much depends on the cultivation and manure the cultivator can give it. Another advantage is that cane is in the ground where there are few other crops and the cultivator can get money advances on it to carry on with.

Q. There is considerable reluctance in Southern India to the ryot growing a considerable amount of cane; is it due to the difficulty in financing the crops?—A. It is possibly due to the market conditions. If they increase, jaggery falls to a price which they would lose money at. The fact that they burn cane in Madras shows that they have grown cane to the utmost market capacity for its products.

Hon'ble Pandit M. M. Malaviya.—Q. Do you know if the sugar imported is used by all classes of the people? It is not confined to the upper classes?—A. It is used by all classes. Some strict Hindus do not take imported sugar.

Q. Sugar is eaten as part of their food by the people?—A. It is taken as food stuff. Jaggery is food stuff. The sugar of the people is jaggery. Sugar is a luxury to the poorer people.

Q. With the upper middle classes it has been a food stuff from ages past?—A. Yes.

Q. You have said in answer to one of your questions that you advocate the separation of the production of sugarcane from the manufacture of jaggery. How do you mean it should be done; it can only be done by legislation. Do you recommend that people should be prevented from manufacturing jaggery out of their sugar cane?—A. Separating the manufacture, i.e., instead of having small mills in villages, which are wasteful, one-third being wasted by burning, come to an arrangement with the cultivator "you give me this cane and I will give you so much money, or an agreed percentage of jaggery, and I will look for my profits in the additional jaggery that I will extract with my better mill and the possibly better quality of jaggery made."

Q. You do not contemplate anything but a voluntary arrangement?—A. Entirely a voluntary arrangement.

Q. Don't you think that the best course would be for the Government to help the growers of sugar cane to establish factories for manufacturing gur on co-operative principles? If Government helps, as you have suggested in your note, and the producers of sugar cane are encouraged to establish co-operative factories in central places for manufacturing jaggery, don't you think that would be the best arrangement for their welfare?—A. Yes. So long as you have some one under Government whose special province it is to control those factories, and advise. So long as Government give advances I think it is advisable that all loans should be under some control, and if you have a sugar expert, or a sugar department, he or they should be able to control those loans along with other work. It would bring the sugar industry into disrepute should money be thrown about recklessly and lost. Type of factory and method of working should be first carefully determined experimentally, then with full information Government would be in a position to encourage co-operative societies, or, if Government saw fit give assistance. The small gur central factory is, to be worked to advantage, not quite the simple proposition it looks.

Q. Suppose co-operative credit societies were established, and even without advancing money, Government encouraged the growers of cane with advice and in other ways to start gur factories, don't you think that they could improve the production of gur, and make larger profits than at present?—A. It could be done, but the problem of gur making so far as I know has not yet been tried on suitable lines for making it on a scale of even 50 or 100 maunds per day. The tendency has been to depend on old open, boiling systems introduced under what were quite different conditions from those required for high class gur.

ADDITIONAL WRITTEN EVIDENCE.

Note on the sugar industry submitted after oral examination.

Sugar production throughout India could be best benefited and improved by the establishment of a Government department which should be educational and at the same time conduct research on methods of sugar, and gur-making-manufacturing difficulties, canes, and their cultivation to best advantage, sugar yielding palms and their cultivation and products. This department should also be in a position to deal with questions relating to the advantageous disposal of the bye-products of sugar manufacture, such as the fermentation of molasses for different products, sugar recovery from molasses, etc. All this should be contained in one central department. Throughout India cane is grown under varying conditions as to climate, so that at first it would seem that different departments or centres must be established over the country.

This is not so as cane grown resolves itself into two classes:

- (1) that grown on dry cultivation or light irrigation, and
- (2) that grown on irrigation.

The largest areas of cane grown on dry cultivation are found in Northern India, and there also cane is grown on irrigation; and whether cane is grown on dry cultivation or irrigation in Northern or Southern India the agricultural operations are the same.

Local variations of cultivation on one system or another may be advisable—for example in the Central Provinces a system of contour-line planting has had to be worked out to economise irrigation water and prevent soil washing—but these are details that could be taken up by a centralized department and work done on any such system as contour planting would apply to any hilly part of India.

Irrigation of flat lands is the same all the world over.

The question of suitable canes for varying climates is more complex, but it is simply a matter of trial and observation and could be carried out by an assistant deputed from the main station and under the directors' supervision. Once the most suitable canes for any given area have been determined, the work is done and the selected canes may be left to cultivators to choose from according to individual tastes. Should a new and likely cane appear then it would only be necessary again to make a series of tests of the new cane against the existing selected canes. It would not be necessary to test every new cane over every area as it could be foretold with fair accuracy from the period of growth what would suit Northern India or what would suit Southern India, and for physical characteristics, what might be expected to suit a fiercely hot climate like that of the Central Provinces in April.

A sugar department should be, for many years, partly educational and this part of its duties could best and most economically be carried on at one centre. As the greatest scope for educational work in sugar making and the advancement of sugar generally lies in Northern India any sugar department or institute should be established there, preferably in the cane-growing area north of the Ganges about Basti, Gorakhpur or Saran Districts.

Here it would be immediately in touch with the large cane-growing areas of the country and with dry cane cultivation in which most might be done in the way of improvement.

The problems of gur-making in Northern India alone would well repay investigation, as much of it is turned out of such low quality and so dirty that it sells at a price out of all proportion to its gur value.

The juices of Northern India are not as good as those of some other parts of India. But there are advantages that outweigh this and with the right way of doing things it is possible to make gur from Gorakhpur district cane to compete with the high quality gurs of Poona which sell at Rs. 5 to 6 per maund, while Gorakhpur District gur may sell from Rs. 2-8 to Rs. 3 per maund in local bazaars in normal seasons, and that, simply because of their unattractive appearance and qualities.

By varying the method of manufacture, gur can be made to suit the trans-Jumna markets which require a dry hard gur, or, soft buttery light coloured gur can be made to suit markets in the United Provinces and Punjab.

Gur-making seems a simple operation but there are points that a sugar department might well investigate.

With the introduction of the vacuum pan, triple effect, and the advance of engineering, sugar production advanced with a leap. Primitive processes, such as jaggery or gur-making, which were general 100 years ago, have become obsolete except in some Eastern countries with special markets, such as India. There it has been nobody's concern to take any particular interest in what is collectively a huge industry, and gur-making has been left as it was in the beginning except for the introduction of small iron cattle mills which are usually inefficient, or, if set so as to be efficient, are beyond the strength of the average cultivator's bullocks to drive them.

This is not as it should be, because in India jaggery (gur) is the form in which by far the bulk of the sugar consumed is taken.

A sugar department situated as indicated would also be in direct touch with the chief cane crushing factories of India which make sugar from the cane and from gur.

With the conditions under which cane is grown in India sugar factories working on modern lines can never be very large.

That being so, these factories work at a disadvantage compared with large factories elsewhere, in that the small factory cannot afford to pay for highly-trained Europeans, and trained men are not available to any extent among Indians.

To train men, both for sugar and gur-making, a small but complete sugar-making plant should be laid down in which different processes and their working could be taught. With this machinery all grades of men from the prospective factory manager to departmental foremen could be given the knowledge necessary for them to carry on the work of other factories.

Along with the sugar factory there should be a distillery and a factory laboratory with accommodation for students, a factory accounts department and an engineer's drawing office with some room for students.

With this arrangement, advanced chemistry students who intended to specialise in the sugar industry could be trained as factory superintendents and managers, and engineering students could be familiarised with sugar machinery.

Everything about this factory should be conducted as in a factory built to earn dividends so that the students may get the serious commercial atmosphere and careful accounts should be kept of the cost of all operations.

Higher grade students during their course would be put through each department.

This educational factory should preferably have enough land about it, under control, to grow its own cane or the larger part of it, and this land should also be used for experimental purposes.

Of the land for cane growing only a small area of, say, 20 to 30 acres should be permanently under factory cultivation. The remainder, except for special work, such as ratoon cropping, should, if possible, be arranged so that after a cane crop it may be leased to cultivators for three or four years for crops other than cane, coming back in rotation to the factory. In this way the factory area would be kept representative of cultivators' lands in the neighbourhood.

The railed-in experimental farm in India, in time, tends to have its lands manured and worked up until it no longer resembles cultivators' lands. The cultivator tends to look upon work done on these lands as impractical.

Costs of all operations on these lands should be carefully kept, also manure costs and costs of irrigation systems.

All cane should be weighed and irrigation water measured.

Records of rainfall, maximum and minimum temperatures, wet and dry thermometers and sunshine hours should also be kept and from all this much valuable information could be gained.

Such a sugar factory and distillery would be largely self-supporting and the products should be sold, under supervision, by a reliable commercial firm interested in the articles to be sold.

All articles should bear the educational factory brand so that dealers and manufacturers would see what is turned out and so be kept interested in the factory work.

After the factory had started work, posts such as agricultural assistant, factory superintendent, assistant engineer, factory chemist, foremen, etc., should be reserved for students who had gone through their course satisfactorily and were waiting for outside employment. These would be paid posts. When a student had taken up outside employment he should be encouraged to retain some connection with sugar school so that he may keep his knowledge up-to-date and have his difficulties explained.

Such a factory would cover all manufacturing operations no matter whether raw sugars from cane or palms, or cane or palm juices were to be treated.

The operations are in all cases substantially the same. Apart from the educational side there should be a good laboratory, adapted for analytical work, research and technological research, in connection with sugar (including agricultural matters) fermentation, and alcohol. The laboratory section devoted to ferments could be adapted to work on cane diseases due to fungi.

Cane diseases in India have, so far, been mostly confined to common diseases and can usually be overcome by suitable manuring, care in selecting cane sets for planting, and by eliminating cane varieties unsuited to a given climate. Should occasion arise assistance in cane disease research could be obtained from Pusa.

The work of the department should include advising and assisting sugar factories and refineries.

It should also deal with agricultural matters connected with cane growing and experimental work on new canes, together with manures and the methods of application, and, when any point has been determined in connection with cane or manures that it is desirable should be demonstrated generally these demonstrations should be carried out on village lands.

Should a system of manure advances to cultivators be evolved the department would assist in promoting it and in determining on suitable manures. The proposals mean, with the educational side, a fairly large programme, but in India, more than other countries, is this necessary.

In sugar-producing countries where the industry is in the hands of trained and educated men the problem is simple. From sugar journals they see what is being done elsewhere and can apply anything that they think may suit them. As often as not they can investigate and rectify their own troubles and for special work may have a central laboratory or experimental station.

They have capital and know manures and how to apply them.

India is at that stage when only a few sugar-cane growers or sugar factories do any experimental work and they would often be glad of assistance.

To carry on the work of a sugar department there should be first, the Director; and it is important that the first Director should be a man who would introduce the right traditions into the department.

He should be a man who has had a training in chemistry and who has specialised in sugar. He should know factory and refinery work thoroughly and have a knowledge of cane and its cultivation.

By a training in chemistry is meant such a training as would have enabled this man to take his place in any other industry requiring such a training had he determined to specialise otherwise than in sugar at the end of his school of chemistry career.

Sugar schools are turning out what are sometimes called "sugar chemists." They are useful enough in factory routine for doing analyses of sugar and its products but they are not chemists. Chemistry cannot be divided into compartments and problems arise in sugar that require good chemists for their solution.

In a Director, Indian experience would be a decided advantage as the conditions are different from those of other sugar-producing countries.

The Director should also have a knowledge of the methods of disposal of bye-products from sugar manufacture and be able to direct research both in sugar production and the treatment of bye-products.

In short, the man required should have factory and field experience based on a chemist's training and should possess knowledge of bacteria, yeasts, and allied fungi. The latter should be included in the training of all chemists who specialise in sugar and particularly of those who have to work in cane growing countries.

There should also be an Assistant Director, preferably a chemist with some knowledge of factory work, but the latter is not essential.

Chemistry should be his strong point. The first duties of the Director and his assistant would be to select and train an adequate staff to conduct the educational side of the department, under the supervision of the Director and assistant Directors, and conduct research and demonstration work. There is already a sugar engineer in India. He would be included in the department.

A Farm Superintendent would be necessary to supervise agricultural work and here again assistants would have to be trained for experimental and outside demonstration work.

For outside work they would require careful drilling on the factory lands that outside work might be correctly done.

A botanical section to a sugar department is necessary, but seedling cane work cannot be carried out in Northern India.

Such a section has already been established under Dr. Barber in Southern India.

Though the botanical section and the centre of the proposed sugar department must be widely separated, so far as distance is concerned, it would be advantageous that they should work together in close co-operation. There are points in which experience in Northern India would be useful to a cane experimental station in Southern India and the central department would have all the means of testing canes for milling qualities, juice peculiarities and such like.

Entomological research is important, but this could probably all be undertaken at Pusa. If so, it would be spending money needlessly to establish a section in a sugar department.

At first the duties of a sugar department would be largely educational. Later, as the industry developed the education side might be made of less importance.

Sugar-yielding palms would also come within the scope of a sugar department and their cultivation might repay investigation. It has been said that palmyra juices contain percentages of sugar varying from 11 per cent to 20 per cent but anything like 20 per cent I have never seen; still, variations are worth investigating.

What might prove to be the weak part of this scheme would possibly be the control of cane experimental work at a distance.

This might be got over by making a soil and climate survey and dividing the country into zones or representative areas.

In these areas having a sufficiently large cane cultivation, or which show prospects of increasing to a sufficient area, an experimental station dealing with cane might be established with a small but efficient gur plant.

Such a station would be under an agricultural assistant who would work under the Director's instructions. When necessary an assistant chemist could be deputed to do analyses, and, with a carefully kept system of accounts, all necessary information could be obtained. It is probable, that if gur manufacture and cane growing in the large cane areas of the North were conducted rationally and due attention given to markets, districts which now grow cane at a heavy cost might find it better to turn to other crops, so that a few of these isolated stations would serve to do all the work necessary.

This suggestion of putting the cane crop under one department might be considered with regard to other crops. Instead of agricultural departments spreading themselves over all sorts of crops why not specialise and create a cotton department, rice department, etc.? Throughout provinces duplicate work goes on in all directions and men spread their energies too much to become really expert in any one branch unless they break away from the established system.

With some re-arrangement it might be done without undue increase of staff and should result in increased efficiency.

WITNESS No. 171.

Mr. C. T. Ambler. MR. C. T. AMBLER, Messrs. Ambler & Co., Managing Agents, Ambler's Slate and Stone Co., Ltd., Dharhara.

WRITTEN EVIDENCE.

Capital.

Q. 1.—My own experience has been, in connection with the slate company now worked for many years, failure to obtain needful outlay from any of the Calcutta banks, who decline to do any business with moribund concerns or to accept as security a lien on slate stocks, machinery or landed security, goodwill, etc. This is a concern of many years' standing and established solvency; the material worked is unaffected by exposure and is not subject to any fluctuations in value, the selling rates being fixed by myself, and there is no competition as the only other slate concern is in the far north-west and the heavy freight charges limit the area of their working.

I keep accounts with the Alliance Bank of Simla, my drawings being covered by long term fixed deposits in their custody—their own paper. It is a limited company and they will not advance against the scrip though accounts filed with the Registrar of Joint Stock Companies show 10 to 15 per cent. profit on a Rs2,00,000 capital.

Unless a company is floated by a Calcutta agency house, banks will not advance against its scrips. I have no use for an agency house and am not disposed to pay commission, etc., as I trade direct with the users of the material for cash and local delivery and so have no bad debts.

The other slate company had for its director the manager of the Punjab bank now amalgamated with the Alliance Bank of Simla, Limited, which financed it in its early days till it had prospered to such an extent as not to need advances; it has now a large reserve to draw upon. The original shares of Rs100 each are now valued at Rs235 and for some years past the company have been paying 22 per cent. dividends.

If similar conditions existed for my slate business, it would have greatly helped me to expand my output and meet a demand that has been and is in excess of it.

Q. 2.—The sources from which capital is obtained for industrial enterprises in the moribund are Indian bankers but their rates of interest are very high and unless good profits are immediately made it is a hard struggle for existence, and in some cases dismal failure results. Presidency Banks will not finance or accept mortgages on landed property except on Calcutta property.

Q. 3.—Coal companies and to a less extent tea gardens, for want of labour generally.

Government assistance.

Q. 4.—One instance of useful Government aid was the present Bengal Iron and Steel Company, Limited. The original company failed and the Government took it over and put it in charge of an Austrian engineer, Ritter von Schwatz, who developed the working in pig iron, cast iron pipes and mains, and East Indian Railway standard iron sleepers. A company was formed, with a guarantee from Government to purchase a specified quantity every year. Of its present successful operations I have no need to speak. Another instance is that of the Darjeeling-Himalayan Railway, by a subsidy.

Q. 5.—Sub-paragraphs (2), (4), (6) and (7). According to special needs.

Of (2) there is the example just given of the Darjeeling-Himalayan Railway and to restrain foreign competition.

(4) Loans at fairly low interest, not without.

(6) Provision of share capital would materially help me in my own case.

(7) A direction to engineers to purchase locally in preference to importing the same material or substitutes for their requirements. No other guarantee necessary.

Q. 6.—The control should be on the lines in force for guaranteed railways with access to accounts.

Pioneer factories.

Q. 7.—I do not know of any pioneer factories run either directly or indirectly by Government.

Q. 8.—To start pioneer factories, proper working conditions should be established, and for working mines or quarries long term leases should be secured with a minimum rent or royalty for the first term of years, with option to the lessee to continue on at a certain defined increase in the original lease; the shortest term for such mining or quarrying lease should be 50 years in two terms say of 25 years each, the first term on the lower rate, and the second at an enhanced rate, with option to the lessee to surrender the lease at any time at short notice if the working from any cause is unprofitable.

* Such pioneer factories should be handed over to private capitalists or companies at such a stage as was done in the case of the Bengal Iron and Steel Company, Limited, referred to above.

Q. 9.—All concerns are hampered by heavy contributions to managing agencies, who in many cases have no technical knowledge. Unless a business makes a good progress in spite of this heavy handicap, many cannot sustain the burden and the company's shares go down in value. Financing agencies.

Q. 10.—New mofussil banking agencies could render assistance in financing local concerns at a moderate rate of interest and dealing with security offered as was for the Kangra Valley Slate Company, Limited, by the Punjab bank.

Q. 11.—I do not know of any industry developed or assisted by the formation of co-operative societies. The co-operative societies deal entirely with agricultural work and have had a fair measure of success on their present lines but are not in a position to deal with industrial concerns on banking lines. Co-operative societies.

Q. 13.—Necessary safeguards to prevent this occurring. The assistance given should be rendered to develop an industry and no more; it should then be able to carry on unaided. Limit of Government assistance.

Q. 14.—Government is directly concerned in developing local industries and should take into account the heavy land freights as compared with sea freights. This difference must be compensated for to prevent external trade swamping the local industries by dumping down cheap inferior goods at rates that would be impossible to compete against even with cheap Indian labour. It will take time before machinery to lessen cost of production can be set up. Under these circumstances it will require all the aid Government can give and any question of limitation should not be now dealt with until a good start is made, which will not be in the immediate future.

(Note.—Witness did not give oral evidence.)

WITNESS NO. 172.

MR. R. L. B. GALL, *Chairman, European Jute Dealers' Association, Calcutta.*

Mr. R. L. B. Gall.

WRITTEN EVIDENCE.

Qs. 1, 2 and 3.—Consideration must be given to enterprises other than those in Calcutta. Capital. The supply of jute to jute mills, wheat to flour mills, etc., is an essential part of the industry. A great deal of the capital used in financing the marketing of these raw products is from non-European sources. The handling, baling, etc., of loose and baled jute is largely financed from non-European sources. Amongst the difficulties to be noted is the slow return of this capital from the interior owing to hoarding, and the necessity for large movements of specie until growers are willing to accept notes or begin to understand the cheque system.

Q. 9.—The seed industry should be amongst the pioneering work of Government. The policy should be gradual relinquishment, as was done in the case of the Aligarh dairy, but there should be Government supervision for a number of years to insure that the business is being run on sound lines, as distinct from purely profit-earning lines. Pioneer factories.

Qs. 11 and 12.—There has been an extension both in production and consumption of imports by this agency. While the ryot saw only debt ahead of him, his outturn was limited to necessity. Once free, a larger outturn follows under the stimulus of wealth, with a wider demand for what to him have hitherto been luxuries—e.g., salt, cigarettes, woollen goods, etc. Co-operative societies.

Q. 22.—Research should be made regarding an extended use for resources—e.g., jute can be made to replace cotton, wool, etc. in many special trades. Research abroad.

Q. 25.—These are required. As an agricultural country more intensive farming is required. This is only possible by diverting animal manure back to soil. This postulates a cheap smokeless fuel to replace manure. Surveys for industrial purposes.

Q. 34.—These should be appointed. They should be business men with wide a knowledge as possible of Indian imports and exports. They will be necessary if any system of control of exports is decided on after the War. It is unwise to define duties beyond the furnishing, collecting and tabulating of all commercial data; reporting on markets, contracts, etc.; and bringing possible buyers and sellers in touch with each other. Trade representatives.

Q. 39.—Banking facilities should be increased, so far as the mofussil is concerned, by the development of co-operative societies into local banks. The present object is to give loans, and receive deposits. The larger object to be kept in view is the creation of current accounts with a view to minimising the risk and loss of hoarding. Banking facilities.

Q. 41.—Where land is under the Court of Wards, even where a co-sharer is willing to give a permanent lease, the officer under the Court of Ward refuses. This is bad policy since the taking up of land for marketing produce is for the permanent benefit of the estate. Land policy.

As a general proposition all land law should be simplified especially as regards partition of Hindu estates. The law as it at present stands makes the acquisition of land even where the seller is willing to sell, difficult, tedious and expensive.

Q. 42.—The system of granting surplus railway lands for pioneer industries is beneficial both to the railways and to the pioneering individuals or firms. The leases are, however, only granted from year to year without fixity of tenure. Tenures should be given for a fixed term.

of years with power to raise to neighbouring values at the end of the period. Lessees should have power to acquire outright at a fixed basis at same period.

Technical and
scientific depart-
ments.

Q. 63.—*Appropos* of the activities of the Department of Agriculture and the recent efforts to get into closer touch with the firms in the jute industry as also to take fuller advantage of their willingness to help, steady development on these lines should be urged. Fuller research is required into such processes as retting the fibre, effects of moisture, etc. A great deterioration of fibre and actual loss in jute is caused by haphazard methods of steeping. A careful study of this problem by Government might very much minimise these factors, say by the provision of suitable steeping tanks, etc. Imperial departments are preferable to local and provincial and funds should come from Imperial resources.

Statistics, etc.

Q. 82.—The statistics were formerly published in too voluminous a form for general trade purposes. Recently they have been more specialised for the jute trade and there has been manifested a more earnest desire to get at the figures required by the trade. Further developments on these lines is desirable; arrangements might be made that any statistics required by a particular trade can be supplied on payment. Such statistics, *e.g.*, as the monthly imports of jute into Calcutta and exports from Calcutta might with advantage be supplied by the Department of Statistics if it is willing to issue them in the forms which the trade find most useful. The same remarks generally apply to commercial intelligence and the "Indian Trade Journal." A change in attitude is indicated. In place of publishing matter in the forms selected by Government an effort is necessary to ascertain in what forms information is most useful to the various trades and an endeavour should be made to supply the demand.

Prevention of
adulteration.

Q. 91.—It is held by many that the adulteration of jute by water should be penalised. So far a working proposition has not been evolved but it is certainly in the interests of the trade that this should not be lost sight of.

Registration of
partnerships.
Roads, railways and
waterways.

Q. 96.—This question should be strongly pressed in the affirmative.

Q. 97.—This question very deeply affects the jute trade.

- (a) Roads are an urgent necessity.
- (b) Rivers are being allowed to deteriorate.
- (c) Rail facilities are inadequate.

Q. 98.—The question of enforced freighting of goods by higher rated routes requires to be dealt with. For example, jute from Mymensingh to Calcutta can at present be freighted by three routes,

via Naraingunge and Khulna,
via Juggernathgunge and Goalundo,
via Fulchhari and Sara.

All rates should either be made equal or when booking is suspended or curtailed in any way by the cheapest route, booking at the same rate by an alternative route should be compulsory. The present system makes it an advantage to the railway to give reduced carriage facilities by the cheapest routes.

The question of alteration of rates also requires attention. A minimum notice of any enhancement of freights should be compulsory.

The question of traders tickets should also receive attention. Where firms or individuals book large quantities of goods by rail, facilities for visiting and inspecting branches or despatching centres should be granted.

Q. 99.—The most pressing need for the jute trade is the extension of the broad gauge to Siliguri.

Q. 100.—Generally this Association would support any representation of the steamer companies regarding Bengal and Assam waterways in this connection as benefiting the jute trade.

Q. 110.—The Association on broad lines believes that a larger share of the trade in jute can be carried on with advantage within the British Empire. It would support any workable scheme which would tend to reduce the manufacture of jute outside the British Empire especially in enemy countries provided it could be ascertained that the decrease in the demand for the raw material from these outside countries would be made good by the increased demand for British made manufactured goods.

ORAL EVIDENCE, 5TH JANUARY 1917.

President. Q. In answer to questions 1 to 3 you say that the handling and baling of jute is financed by non-European sources? What do you mean by non-European sources?—A. Indian sources.

Q. In what way is it financed?—A. The Marwari bankers to a large extent and the Bengali arathdars also provide a large portion of the funds which are necessary for handling jute up-country.

Q. These are the people that complain that the slow return of this money is due to hoarding?—A. We hear complaints and there is no doubt that the jute trade is the biggest culprit in that way, in Bengal.

Q. Do you think that some of this will disappear as people realise the value of using cheques and paper money?—A. I think it will, but it will be a very slow process.

Q. There is no other way of financing through any local banks or branches of banks?—A. The thing that has occurred to me in this connection is that the co-operative societies might go a step further and teach the people the value of leaving money with them instead of hoarding it and burying it in the ground.

Q. Do you think that the real difficulty is want of confidence and that people need to be educated?—A. I think the man up-country does not want it to be known that he has money. He does not like that idea.

Q. Do you think it is due to some form of nervousness?—A. That is so.

Q. Have you noticed any appreciable increase of hoarding in consequence of failure of the swadeshi companies?—A. I do not think so but I think that hoarding in Bengal has appreciably increased since the beginning of the War.

Q. On account of a vague fear as to the war conditions?—A. I think it has been due principally to the fact that there has not been the same opportunity given to the ryot and the man up-country to send money back to Calcutta by the purchase of goods. It was most marked in 1913 to notice the way in which the native up-country was beginning to indulge in luxuries. He was buying woollen goods which he had never thought of before. He was buying cheap German walking sticks and such things simply because he had the money and did not know what to do with it. The result was that the money came back to us eventually here. He bought corrugated iron in very large quantities using it in place of thatch. All these things that he was buying had to be paid for in Calcutta and therefore the money we sent for jute was being returned to us. Since the War there has not been that opportunity. He has not had the opportunity to buy.

Q. You think that this is a distinct result of the War?—A. It is only since the War that this has occurred. The ryot would buy the goods still but there are less goods for him to buy and he is now hoarding more than ever.

Q. Is it not a more satisfactory way to see his money put in some bank where it could be used in a satisfactory way?—A. At the present stage I am inclined to argue the other way. I think myself that at the present stage it would pay the jute trade to educate the ryot and the man who deals in jute to become more luxurious because as he acquires these tastes for "luxuries," as he calls them, he would be induced to grow more jute; to pay more attention to his crops. We will get a larger jute crop, a much better result from the land than we are getting at the present moment. Later on it might be bad but at the present stage it might be good. I think we can give the ryot a taste for luxury quicker than a sense of security in a bank.

Q. Assuming that this is a correct conclusion, how are we to take action on your suggestion?—A. I think you cannot certainly do anything until the termination of the War, because you would not be able to bring in the necessary goods. After the War is over and imports are again free, it might be possible, through these co-operative societies, which are the only agency we have at the present moment for getting near him, to provide displays of goods and give him an idea of how to spend the money, in other words, to do for him what the large shop does for the European.

Q. Are the co-operative societies doing anything by way of propagating and distributing information that will open up the mind of the ryot?—A. I think to a certain extent they are. I saw a note in the annual report of the Fibre Expert about some work that they were doing, and which was outside of their ordinary work, in the way of helping the ryot and I dare say they could do more under stimulus. I think myself that we could do a certain amount if Government asked us to. We could in many places up-country give displays of goods and so on. We have done that to a limited extent in the way of providing food shops.

Q. Government could not ask you unless it pays you and you would not do it if it does not pay?—A. I think we want encouraging. Last year we were asked by the Agricultural Department to help them in some of their experiments and when they indicated their desire we did it.

Q. That is quite a different matter from encouraging people to buy walking sticks and gramophones?—A. So long as the trade is encouraged we might even do that. We want Government to ask us to help. I think the Marwari will eventually do it because he is the man that looks after that sort of thing.

Q. What seed industry do you refer to?—A. The improvement of the seed for jute and distribution of it.

Q. Is that not being done by the Agricultural Department?—A. They have done a certain amount. They agree that more could be done. Such a thing could be done better, I believe, jointly with us than by the department alone.

Q. Speaking of trade representatives you say that they will be necessary if any system of control of exports is decided on after the War. Had you in mind the possibility of any kind

of fiscal control being adopted, for as one knows if you once interfere with the natural course of trade you have to provide artificial means for discovering rapidly and promptly the effect of any change in fiscal policy?—*A.* That is so and I had also more particularly in mind the difficulty which we had discussed in the event of it being thought advisable after the War to give preference to neutrals and allies as against enemy countries.

Q. In your answer to question 98 you refer to the fact that railways have a temptation to provide insufficient accommodation by the cheapest route so as to force transport to take the more expensive route. You do not mean that the Eastern Bengal State Railway artificially goes out of the way to provide insufficient accommodation?—*A.* On one occasion they did and we strongly protested but as a matter of fact during the last two years speaking for the jute trade generally we have been getting on very much better with the railways. They have been more willing to meet and assist us.

Q. In a matter of this kind we might leave it confidently to your association to bring the matter to the notice of the railway itself, or if necessary to the Railway Board, and presumably they will be willing to help. In a case of this kind it might not be advantageous for the railway to force you to go to the more expensive route because in effect the railway company would be reducing their own traffic?—*A.* I think all the same it would be an advantage to have from this Commission an expression of opinion that the railways are more or less to help trade and not to hinder it. I think that individual cases might be dealt with by an association, but I think that this Commission might make it clear that the railway is not a purely profit-earning concern and that the railways ought to go further than that and assist in the development of the country. They should be content to take an increased profit in later years rather than an immediate profit to the detriment of trade.

Mr. C. E. Low.—*Q.* Where do these Marwaris who finance the jute trade up to a certain point get their money?—*A.* It represents accumulated profits over a very large number of years.

Q. Don't they ultimately get a good deal of finance from the banks in Calcutta?—*A.* I think it is a very very small proportion. The tendency is rather the other way. When the banks get into trouble they draw money out of the local bazaars.

Q. By increasing their rate of interest?—*A.* Yes.

Q. The co-operative societies do not use the money all the year round but only in certain seasons?—*A.* That is so, I believe.

Q. Do you know what time of the year?—*A.* After the marketing of the crop and before the commencement of the next seed time.

Q. Is that the time when their money would be useful to the jute trade?—*A.* It might be utilised in financing those imports of which I spoke. They could be utilised in that way.

Q. I suppose you contemplate a provincial bank holding a good deal of funds so as to be able to deal with them when wanted by these co-operative societies?—*A.* That would undoubtedly be a good scheme. I cannot say I have thought of it.

Q. At present as you know the central and district banks invite local deposits and so far they have an educative effect. But they do not make the money available for other purposes than co-operative societies. It would be easy to make co-operative money available for ordinary trade and industry?—*A.* Not at the present stage but I think it would come in due course.

Q. Do you think that the co-operative society is educative, teaching the people thrift and up-to-date ideas?—*A.* I think so.

Q. Have you any views on the subject of the jute markets. Do you know if the ryot up-country gets a fair price for his jute or whether too much is being taken by the middleman?—*A.* On that point there is no doubt whatever that the ryot has got his full share of the prices paid for jute.

Q. It was said that the difference between what the ryot got and what the jute was sold for in the Calcutta market was so much, but no attempt was made to analyse how much was profit and how much was cost of transport?—*A.* I think there is no article marketed really on a less margin of profit proportionately than jute. Speaking from our own experience I should say that the actual margin between the amount paid by the man who buys up-country and eventually sells in Calcutta works out at not over 4 annas a maund from which he has to pay charges of establishment and so on. That is 4 annas on an article costing Rs10 which, I think, is a very small margin of profit.

Q. Another point is that it passes through several other hands before it gets to that man and is it not a fact that there is an increasing tendency for the mills to buy jute direct from the ryot?—*A.* That, I think, the trade has done less than it used to. The proportion is undoubtedly less than it was some years ago.

Q. I have had it said to me that the mills especially in the north of Calcutta actually buy the jute from the ryots themselves. Would you support that statement? These ryots who grow the jute for the mills bring the jute themselves?—*A.* That is quite correct, but the proportion is infinitesimal.

Q. It does not show any signs of increasing?—*A.* No.

Q. Have you considered the idea of co-operative sale of jute by the ryots?—*A.* No. I do not think it is possible.

Q. Supposing a number of ryots put up three or four hundred maunds between them, would it be possible for them to sort and grade it themselves?—*A.* Impossible.

Q. You think they have not got sufficient technical skill to make right selections?—*A.* They would have no knowledge of what the mill's requirements were. In any case the quantity that the ryot could bring would be so trifling.

Q. Supposing you have got a number of ryots co-operating together to put up a marketable article?—*A.* At one time in the Jessore and Khulna districts it was common for a number of ryots when they could not sell otherwise to put their jute in a boat and come down by water to Calcutta and hand it over here for sale. Since we have pushed up into those districts they very much prefer to sell to us direct in the district.

Q. In other provinces with articles less difficult to deal with than jute a substantial amount has been collected and marketed. Is it not the case that people in Bengal especially in a very highly organised trade like jute in contact with a very unorganised community like the Bengal ryots is rather inclined to pitch their standard too low?—*A.* I do not myself see how the ryot or even a number of ryots joining together are going to get any very great advantage out of coming to us direct or through a co-operative society. I believe myself that he would be able to market his produce just as well under the present system.

Q. Would you or the members of your Association be prepared to give the system a trial?—*A.* We would be quite willing to try it.

Q. You speak of the desirability of making Government statistics more useful and you make a suggestion about the figures of monthly imports of jute and exports from Calcutta. Is it not published in some form or other?—*A.* The Bengal Chamber of Commerce took over that monthly record and is now making it.

Q. Since when?—*A.* They have been doing it for quite a number of years—for the past 8 or 9 years, I think.

Q. Is there anything gained by Government doing it as well?—*A.* My suggestion was that the Government might as a matter of fact do that and that the Bengal Chamber of Commerce might give it up and it might take the place of certain statistics which are at present compiled by the Department of Statistics and which frankly speaking are of no earthly use to anybody. They issue them in a form which is of no use to us.

Q. What you suggest is a sort of round table talk for overhauling the whole thing and modifying the form of the statistics?—*A.* I think an exchange of views between us and the Department of Statistics would enable them to understand what we want and what would be useful to us.

Q. Does it include the railway and river-borne trade?—*A.* I believe it includes all that. We do know that as a matter of fact these figures represent or are supposed to represent the quantity of jute which comes into the Calcutta trade circle. That trade circle excludes mills up the river and down the river. Since these mills take the bulk of the jute which comes in the figure given is no use at all.

Q. Are not those things represented from time to time by your Association?—*A.* What we generally do is to make an arrangement to get the figures ourselves. I think an exchange of views between the department and ourselves would remove a lot of anomalies.

President.—Q. Is the Director-General of Commercial Intelligence ever a member of the Chamber of Commerce?—*A.* I do not think so.

Q. The trade generally have confidence in the Chamber's figures?—*A.* I think so.

Sir F. H. Stewart.—Q. Would people have equal confidence if this is transferred to the Statistics Department? Would they get it equally quickly?—*A.* I do not see any reason why they should not do so. It is only a question of painstaking. The Department of Statistics would undoubtedly take the pains.

Mr. C. E. Low.—Q. I take it that you people actually collect the statistics and supply figures. The Department of Statistics does not collect statistics in the strict sense of the word. It compiles the statistics that have been collected by other people. I think this is a point to remember when certain statements are objected to as unsatisfactory or inaccurate. In cases like this your Association can take action at once. The Director of Statistics cannot do that?—*A.* That is quite correct. But on the other hand if we were closer in touch with the Director I dare say that any little difficulties could be talked out and got over. At the same time our statistics are not kept for general purposes. If they were handed over to the Department of Statistics they would be available for every one and it would be an advantage to the whole country.

President.—Q. The ideal condition is to have a specialist for each natural group of figures?—*A.* That would be impossible in practice.

Mr. C. E. Low.—Q. It is also the case that statistics compiled by the different associations are what you may call partial. They cover some portion of the trade which the association is directly interested in and when it is necessary to know something else there is a difficulty from the Government point of view. Since the War began that has been found to be

the case by the Government of India. The Director of Statistics would be useful if he could get two sets of figures compiled on a common basis, which is not being done at present?—A. That is so. That is a case of mutual help with direct gain to both.

Q. A good deal may be done by discussion of the position between the associations and the Director of Statistics?—A. If the Director were a member of the Chamber of Commerce he would be constantly in touch with the association and that would be a direct advantage.

Q. With reference to what you say about the larger jute trade within the British Empire do you think that if you restricted exports of jute to European powers that substitutes might be encouraged?—A. There would be such a tendency even with a fairly big tariff against her. I think it probable Germany would continue to buy raw jute. Her textiles are a necessity.

Q. Do you think that fibre pulp is likely to get cheaper?—A. I should think not. So far as one can judge at the present moment, so long as we are able to turn out the requisite amount of jute here in Bengal under Rs. 10, I think we can control the trade of the world. I mean Rs. 10 per maund landed here in Calcutta and Rs. 50 per bale f. o. b. for export.

Q. If the Central European powers make substitutes they would make it at a loss?—A. I believe so.

• Hon'ble Pandit M. M. Malaviya.—Q. How many jute mills are there here?—A. I think about 40, but I am not sure.

Q. How many more would you require to manufacture the rest of the jute that you export?—A. Out of a total crop of about 83 lakhs of bales the present mills will consume some 60 lakhs. In order to cover the whole jute crop you would require another 33½ per cent.

Q. You have no doubt that you can find a market for all the jute that you would manufacture?—A. So long as freight is available there would be a market for every bale.

Q. Even if substitutes are found, the natural advantages which you have will probably enable you to hold your own against artificial substitutes?—A. I think so.

Q. You say that your Association would support any workable scheme which would tend to increase the manufacture of jute inside the British Empire provided it could be ascertained that the decrease in the demand for the raw material from these outside countries would be made good by the increased demand for British made manufactured goods. Why should this be necessary if you can find a market for every bale that you can make?—A. I do not think we should commit ourselves to a proposition for all time. It is always possible that some day or another some country might find a cheaper substitute. There is no chance of that at the present moment but one never knows what may happen in the future.

Q. You would not to avert that contingency let enemy countries enjoy a share of the trade?—A. I would legislate when the time came.

Q. And if necessary you would protect your own industry by other means?—A. In any way that was necessary.

Q. You do not think there is any difficulty in manufacturing the entire raw material in this country. It is only a question of supplying more mills?—A. I do not think it could all be manufactured in this country. I was talking of trade within the British Empire. There are a large number of uses for the fibre which cannot be met by this country at the present stage.

Q. For instance?—A. In Dundee, for instance, they turn out all sorts of beautiful carpet from jute. Austria before the War was turning out tapestries and nursery curtains and hangings. I do not think that at the present moment we could do that with advantage here. But I am quite certain that inside the British Empire it could be done.

Q. Do you know of any place inside the British Empire where this is being done?—A. In Dundee they are undoubtedly turning out very beautiful carpets out of jute. In Italy I saw wall paper which had been made by the Italian mills and they had been very beautifully turned out. It is only a question of giving attention to the dyeing part. The manufacturing would offer no difficulties. It is the turning out of the finished product.

Q. Does not your Association look forward to the time when you will do that here instead of sending the jute to Dundee?—A. Our Association really deals only with the raw material although we know the manufacturing side of it. It is quite possible in time to do this here, but it requires very highly skilled labour, and it also requires special chemicals for dyeing and bleaching which at present are not available here.

Q. What proportion of the jute would be used for manufacturing specialities?—A. I should think that before the War probably from 10 to 15 per cent. was being used for purposes outside the ordinary carrying trade of the world.

Q. 10 to 15 per cent. of the quantity exported?—A. Probably 20 to 25 per cent. of the quantity exported.

Q. Excepting that could you manufacture the rest of it in India without trouble?—A. I think myself that there are local requirements in Great Britain which it would pay very much better to make there. What pays India is the large order for a particularly uniform type of production and not specialities. It has not paid us to make specialities.

Q. Is your Association entirely composed of European jute dealers?—A. Yes.

• Q. You say that consideration must be given to enterprises other than those in Calcutta. Do they not receive sufficient accommodation at present?—A. I merely suggested that in

considering the question of capital it was necessary to remember that there are enterprises outside Calcutta. Very large quantities of capital are used outside of Calcutta.

Q. Has there been any insufficiency of accommodation for these enterprises?—*A.* Not with reference to the jute trade. We have had ample funds for jute enterprises in Bengal.

Q. You say that co-operative societies should be developed into local banks. Don't you think that you want a provincial bank, a larger and a more central bank?—*A.* Undoubtedly you want a larger bank.

Q. What would you wish that bank to advance money on?—*A.* I am afraid I have not given any consideration to the subject.

Q. In answer to question 41 you say: 'It is bad policy since the taking up of land for marketing produce is for the permanent benefit of the estate.' Do you lack facilities for marketing produce?—*A.* I was talking there purely from the Association's point of view. We find that it is very difficult when we are opening up places up-country to get a permanent lease, no matter what we are willing to pay. One hesitates to put down the best type of building in such a case.

Q. You mean for godowns?—*A.* For assorting premises, for the pressing and baling of jute. If we had a permanent title and know that our tenure was fixed, we could put down a better type of building. In the Court of Wards, it is immaterial what you are willing to pay. They simply will not give you a permanent lease.

Q. You suggest that adulteration of jute by water should be penalised. You would require to penalise many other things if you started on this course?—*A.* My own personal opinion is that it is impossible to evolve a practical scheme.

Q. *Re* railways, is no notice given of the enhancement of freight?—*A.* The other day the Assam-Bengal Railway enhanced rates without the slightest notice.

Q. Did you make any representation?—*A.* We did and were met at once. It would however be an advantage if some arrangement could be made by which the rates could only be altered after due notice to the trade. Such notice gives time for discussion whether the enhancement would act as a detriment to the trade or not.

Q. Have you made any representation to the Railway Board?—*A.* We have not done so as to the general principle.

Q. You speak of traders' tickets, what are they?—*A.* In view of what the railway position generally is at present, I do not think it is worthwhile urging the matter. I had the idea of something that they do at home in order to give special facilities to traders for inspection, etc. of branches. There is no doubt that it would be an advantage but it is a trifling point really.

Sir F. H. Stewart.—*Q.* What proportion of the capital used in the jute trade is non-European?—*A.* In the earlier stages I should say about 80 per cent., that is, before the jute comes to the up-country station where it is dealt with. After that I should consider that 50 to 60 per cent. is still non-European.

Q. Is that all in specie?—*A.* All in specie except in one district where we have begun to use notes. It is very difficult to get the people to accept anything except rupees.

Q. It is a matter in which improvement must come gradually?—*A.* I think so.

Q. With regard to what you say in answer to question 100 regarding steamship companies and the waterways, is your Association represented on the Inland Waterways Board?—*A.* No. We are not.

Q. Are you consulted at all with reference to these questions?—*A.* We have now a promise that we will be consulted, whenever any special points come up, such as the bridging of an important waterway.

Q. Do you think that the demands of the steamship companies are sometimes a little unreasonable?—*A.* I would answer the question if I may in the other way by saying that undoubtedly in the past the railways have been allowed to do things which they had no business to. One of the most glaring cases is the Akhamah-Ashuganj extension of the Assam-Bengal Railway where they have been allowed to cross the river Teesta by means of a low bridge which practically stopped the whole of the boat traffic on that most important river.

Q. And it was an existing boat traffic?—*A.* It had been in existence for years before and the real object was to divert the traffic on to the railway and so kill the boat traffic.

Q. Can you suggest any other possible centres in the British Empire for the jute industry besides Calcutta and Dundee?—*A.* I certainly think they are the two best. I do not think that there is any doubt that with the growth of population the manufacture could be carried on in Australia and elsewhere. It is only a question of labour.

Hon'ble Sir Fazulbhoy Currimbhoy.—*Q.* Are the members of your Association exporters or consumers?—*A.* We are neither. We are simply dealers, merchants who buy jute in the mofussil and then sell it in Calcutta. Our Association represents this branch of the trade.

Q. They have their own presses?—*A.* Yes, in the interior.

Q. How many presses belong to Europeans and how many to Indians?—*A.* As a matter of fact all the selling in Calcutta is done through Europeans through members of our Association and while the Association does not actually control the whole of the up-country part they actually act as agents for practically the whole of the up-country business.

Q. They buy up-country and then they sell it to the mills?—A. There are two different parts of the business represented in our Association. One is people like ourselves who have our own agents up-country and sell jute to the mills and pucca balers here. The other is the broker or agent who represents the native up-country. He does not actually do the baling.

Q. Are the European dealers who sell to the mills financed by the banks here?—A. They are.

Q. Has the Bank of Bengal any branches up-country for financing?—A. They have.

Q. How many?—A. In the jute districts they have 6 or 7.

Q. The financing is all right?—A. There is no difficulty as regards financing.

Q. The up-country purchases are mostly financed by Indians?—A. Yes, 80 per cent. of the finance is done by the natives.

Q. How is the jute sold, is it brought to a market place by the ryots or do they sell it in lots to some middleman?—A. The custom varies largely according to the district. In some places the Bepari goes to the ryots' houses and buys one or two maunds and so on till he fills his boat and then he brings it in. In other part as in Northern Bengal the ryot takes it in his cart and brings it to the market place.

Q. Do the cultivators get any news from the big jute centres whether the jute prices are up or down?—A. Our experience is that when there is a rise they know it as soon as we do. When there is a fall they profess ignorance about it for a month.

Q. With reference to what you say in answer to question 110, suppose there is an export duty or something of that kind and that the jute was restricted to the British Empire, don't you think that a country like America will be able to substitute cotton and that consequently the jute trade will go down?—A. The price of cotton is so high that they could not do so for some time to come. It would be a question of what the export duty was.

Q. But India will not be able to consume all the jute?—A. I think we could always protect our trade so as to compel America to buy what she wants from us.

Hon'ble Sir R. N. Mookerjee.—Q. Your Association is 118 months old?—A. About 15 months.

Q. Are you aware of the facts and figures of the headways of bridges on all the railways?—A. I have been connected with the trade for the last 25 to 30 years.

Q. You do not represent the steamer company in any way?—A. I am not interested in the steamer companies in any way.

Q. You are aware that the steamer companies made complaints and after arbitration they gave way and admitted that they were wrong?—A. I am aware that it was held by those who arbitrated in the matter that the headway for railway bridges as asked for by the steamer companies was too high. The railway companies wanted to make it too low and the steamer companies wanted to make it too high.

Q. Has the steamer or the railway helped the jute industry more?—A. I think they have both helped us.

WITNESS No. 173.

Mr. J. B. Lloyd.

MR. J. B. LLOYD, of Messrs. Shaw, Wallace & Co., Calcutta.

WRITTEN EVIDENCE.

Government assistance.

Q. 5.—I am in favour of methods (1), (2), (3), (4) and (7), but more particularly of (4) and (7). Different methods are suited to different industries and circumstances, and I consider that if Government are to assist industries financially, the wider their powers are, the better.

Q. 6.—I think that there should be Government control under methods (3), (4) and (6), and that this control should take the form of Government Directors who would have the power of veto.

Pioneer factories.

Q. 8.—I consider that in all industries, Government should only pioneer, provided that private capitalists will not do the pioneering work. In cases where Government do pioneer industries, I think that the first opportunity should be taken of handing over the pioneer factory to private capitalists.

Co-operative societies.

Q. 12.—I consider that co-operative societies would be most useful in the distribution of the following commodities:—Coal and coke, tea, agricultural seeds, agricultural implements and manures. One great difficulty in most industries in India, is the proper organisation of adequate distributing facilities, and few industries can afford to establish selling agencies all over the country, for the one particular commodity produced. By the establishment of co-operative societies which would distribute many commodities, this difficulty would be overcome. Messrs. Shaw Wallace & Co. have experienced considerable difficulty and, in fact, failure, in their attempts to retail fuel to the native populace in the North-

West Provinces. We sent up exhibits of Bengal and Pench coal, to the Lahore Exhibition, and ran a stall at the exhibition, in charge of an European assistant, and for several months, ran an experimental depôt for the sale of coal in Lahore. No real progress was made, and as the experiment was running at a loss, it was discontinued. I suggest that co-operative societies might usefully take up the retailing of coal to the populace of the North-West Provinces, and other provinces in which wood and dung fuel are now being used.

It can hardly be doubted that, when a serious effort is made to increase the agricultural production of India, the question of distribution of fertilisers must arise. Without the aid of Government machinery or a distributing agency, such as co-operative societies, which are in contact with the cultivator, distribution on a large scale would be almost impossible.

Qs. 15 & 16.—The Government Agricultural Research Institute at Pusa has produced a much superior class of wheat to the usual Indian quality, and has demonstrated that it can be successfully grown in India. We have milled at our flour mills a quantity of this wheat and proved its excellence from a miller's point of view. Its value, from actual results obtained, is about four annas per maund above the value of the Cawnpore quality of wheat. I also consider that countries which import wheat from India would pay the above extra value for this Pusa quality. If, therefore, the ryot can be induced to grow this quality, the value of the Indian wheat crop will be greatly increased. Detailed information is given in bulletin 67, Agricultural Research Institute, Pusa, page 32. Technical aid.

The Indian tea industry benefited very largely, from the work of Government officials, such as Sir George Watt and Mr. Lefroy. Indeed I understand that the establishment of the scientific department of the Indian Tea Association was founded on the original researches made by Sir George Watt and Everard Cotes. Meantime the scientific department is subsidised by the Governments of India, Bengal and Assam. The work of the department has been incalculably beneficial to the industry.

Q. 20.—I consider that Government should erect a tanning factory in Bengal, worked on the most modern methods, and run by first class experts. It would however, in my opinion, be useless to establish such a factory, unless Government is prepared to protect the industry, to foster which this experimental factory would be established, by the imposition of an export duty on hides and skins. It is possible that when the tanning industry was established, the need for the export duty would not exist, and it might be withdrawn. Demonstration factories.

Qs. 32 & 33.—I am of opinion that periodical exhibitions in the chief ports and commercial centres of India, would confer great benefits on Indian trade. These exhibitions should be popular in character, and organised to attract as many visitors as possible. Exhibition.

Qs. 25 & 26.—*Witness gave confidential evidence.*

Q. 34.—I consider that India should have trade representatives in all the principal foreign countries and colonies. These trade representatives should be attached to the British Consuls, and their duties should be purely advisory. Surveys for industrial purposes.
Trade representative.

I consider that men with similar training to that given in the Board of Trade in England should be selected as trade representatives abroad. The question of trade representatives in Great Britain should be dealt with separately, and care would have to be taken not to interfere with existing channels of trade.

Q. 35.—I consider that temporary Commissions for special enquiries are useful, when occasion arises.

Qs. 37 & 38.—Besides publication of lists of imported articles with prices, I would advocate the more general distribution, amongst officials, of information in regard to firms who are specially well placed to supply Government requirements. I am of opinion that the want of such information is the cause of petty general contractors buying from direct importers to fulfil the Government indents placed with them. I attach an example (Appendix A) showing the form in which I would suggest the list be issued. This, of course, is not put forward as a complete list. If such a list was circulated periodically, say monthly, to all Government officials, including store supervisors, I think it would be of considerable benefit to all concerned. Government patronage.

Q. 41.—In Bengal and Bihar and Orissa, the question of title forms a serious check at present imposed on industrial development. In many cases, good coal cannot be opened out, as exploiters are unwilling to take the risk attaching to titles, which no solicitors will pass as being sound. I believe it is a fact that no solicitor in Calcutta will pass a Bengal and Bihar and Orissa coal title as absolutely sound. The utmost extent they will go to is to pass it as marketable. The remedy I suggest is that all titles to minerals should be registered with Government, so that parties wishing to exploit the minerals may be able to ascertain to whom the minerals rightfully belong. The difficulty as regards titles is not confined to coal lands, but it exists also in Calcutta and its neighbourhood. Messrs. Shaw, Wallace & Co. have been endeavouring, without success, for the last two years, to purchase or lease a plot of land near Calcutta, for the erection of fertiliser works. We have on several occasions been obliged to drop consideration of a likely piece of land owing to the difficulty of getting a good title. A still greater difficulty has been the opposition of municipalities, from whom licence to trade has to be obtained. Fertilisers are classed as an offensive trade, and are consequently regarded with suspicion, but while the opposition is mainly due to religious

scruples, it is much accentuated by ignorance of the conditions of the fertiliser trade. Apparently no appeal exists from the decision of the municipalities.

Training of labour.

Q. 45.—I consider that the best steps to take to improve the labourers' efficiency are to improve the conditions of housing and sanitation, and generally to take more care of the health of the labourers. I understand that the Mining Association is now offering a large prize for the best design of lines for the labourers. On many collieries where malaria is prevalent it is now the custom to give hot tea to the labourers every morning, and quinine twice a week, and this system has had very good results.

Mechanical engineers.

Q. 54.—There is a want of uniformity in the procedure with regard to the use of prime-movers. In the Central Provinces certificated engineers must be placed in charge of prime-movers, whereas in Bengal and Bihar and Orissa no such arrangement is necessary. In the latter two provinces every boiler is inspected and passed for use, and a certificate of working pressure given by an inspector under the Boiler Commission. The boiler is then allowed to be worked at that pressure while such certificate is in force, by the persons owning the boiler. In the Central Provinces a person described as an engineer, who has passed an examination and been given a certificate, is placed in charge of boilers. This class of person is recruited mostly from firemen who, notwithstanding the examination they pass and the certificate given them, possess little or no education and a very small amount of training. The collieries are all in charge of mine managers who have undergone an arduous apprenticeship and who are highly trained and responsible men. They hold certificates usually from Government Boards of Examiners in Great Britain, and in all cases hold certificates granted by the Indian Government. Of the two foregoing systems, the experience of Shaw, Wallace & Co., which extends over 20 years in Bengal and 6 years in the Central Provinces, inclines us to give decided preference to the working of the system in force in Bengal and Bihar and Orissa.

Q. 55.—If it be deemed that certificates are necessary for people in charge of prime-movers then I suggest that Government grant certificates to the colliery managers for all boilers on their collieries, in preference to giving certificates to persons of the stoker class.

Official organisation.

Q. 58.—If an Advisory Board of Industries is constituted, I think that commercial men, appointed by the Chambers of Commerce, should be attached, and that the Collector of Customs should be an *ex-officio* member.

Reference libraries.

Q. 79.—I consider that a library of technical and scientific works of reference should be instituted and that it should be attached to the commercial museum.

Government publications.

Q. 87.—The Ranigunj and Jherria coal fields have been opened out in a large measure on information obtained from Blanford's and Hughes' maps, and other areas have been opened out on publications like those of the Geological Department. The Nazira coal field is being opened out mostly on information obtained from Mr. R. R. Simpson's reports and maps, and Mr. E. H. Pascoe's monograph. The measure I advise in order to increase the usefulness of these publications is to print and publish the monographs in larger number, and reprint further editions of monographs and maps of important areas when the original editions have been sold out.

Certificates of quality.

Qs. 89 to 92.—It would undoubtedly facilitate the business of shippers if Government certificates of quality and weights were enforced and had to be accepted by buyers. When claims are made at buyers' ports, the shippers have to pay on the *c. i. f.* price of the goods, which in certain cases is very considerably greater than local value. Also the shippers have to wait for some considerable time before they know if there is any claim on their shipments which in some cases, may prevent them from entertaining further business in the meantime. Government certificates could probably, with advantage, be enforced for the commodities which are shipped in large quantities from Calcutta, such as jute, gunnies, rice, wheat and linseed, but I doubt whether it would be possible for Government to arrange to grant certificates for the two latter commodities, unless some system of bulking the stuff could be arranged in Calcutta. It would be necessary for such certificates to be compulsory, or some shippers would continue to offer buyers on the old terms, and this would tend to oust shippers who might only be willing to do business on Government certificates.

In regard to these questions, the supply of fertilisers requires some form of control and an enactment, on somewhat the same lines as the British Fertilisers and Feeding Stuffs Act, would answer the purpose. The fertiliser trade is at present in its infancy and no great scope for adulteration exists. As the business expands, other firms, not so scrupulous, may enter the trade, and if adulteration is practised even on a small scale, the general adoption of fertilisers would be greatly hampered, and considerable injury to trade would result. *Witness here gave confidential evidence also.*

Registration of partnerships.

Q. 96.—I am strongly in favour of introducing a system of registration of partnerships. It would undoubtedly tend to promote greater confidence in dealings between European and Indian firms.

Mining and Prospecting Rules.

Q. 103.—*Witness gave confidential evidence.*

Q. 104.—The Government of India has begun to extract on a small scale, quantities of potash salts from the Jhelum salt range, and reports giving full particulars on the subject, have been published. It seems that so far the geological survey of the potash deposits, has not as yet enabled Government to give an accurate estimate of the quantities available. Until such information is to hand it is, of course, impossible for any business concern to take up mining and working of the potash deposits on a commercial scale. The quality so far extracted

is a potash salt of the Kainit type, analysing from 10 to 12 per cent. K₂O. The use of potash as a manure in crops in India has only shown little development up-to-date. Most of the quantities imported before the war from Germany, have been utilised on tea. There is no doubt that potash has a tremendous future in agriculture in India, and a rough estimate based on the requirements of the three crops tea, sugarcane, and cotton, shows that these crops alone could consume 225,000 tons of potash salt.

Q. 105.—Rules are applicable to all cases. Discretion—or less arbitrary application of Forest Department the rules—would greatly assist development. To take an instance of a case where modification of a rule would benefit both State and individual, I would refer to the present system of the payment of the royalty to the Forest Department on timber on lands acquired under the special cultivation rules. Here a royalty is required to be paid to the Forest Department, but of course the relation of the royalty to the actual sale value of the timber varies with the accessibility of the site where the timber is felled. The timber which is felled is at the disposal of the owner of the grant of land for his own use only. In clearing large areas, however, it is quite impossible to conserve such timber as has a value, and quite 90 per cent. of it, has, at great cost, to be cut up and burnt. Some modification of the present rules might enable this timber to be released for the use of the State, or utilised for the benefit of the individual. In one case in my knowledge, timber contractors offered to clear the land, if they were permitted to take away such timber as they required. But this concession to the lessee of the land was refused by Government, with the result that wood worth many thousands of rupees had to be destroyed.

Q. 110.—The production of sulphur in this country, from whatever source available, General. would enable the manufacture of superphosphates to be engaged in. This question is very intricate, and can only be properly dealt with by experts, and I am not competent to deal with it in this answer. I recommend, however, that Government should institute enquiries into the available resources of India, for the supply of ingredients necessary for the manufacture of superphosphates, and the possible outlet for the principal and bye-products obtained in the course of manufacture.

ORAL EVIDENCE, 5TH JANUARY 1917.

President.—Q. There are one or two points that I should like to ask you about, and the first is about geological maps. You refer in two or three places in your confidential evidence to comprehensive maps having been prepared of Ranigunj and Jherria coal fields but insufficient maps of other fields?—**A.** I had more particularly in view the Central Provinces.

Q. That has been surveyed by Mr. E. J. Goodwin?—**A.** There are occurrences of coal in various places and we often have had people coming to us with reports that coal had been found and we either found no record of the occurrence at all, or if we had a record, it was not quite accurate.

Q. That map is published on a small scale?—**A.** Yes.

Q. And so also most of the coal maps, perhaps because no topographical maps on a larger scale were then obtainable. Mr. Hayden tells me that he is making an attempt to do all further work on the scale of 1" to the mile, but topographical maps are not obtainable in all cases. For that reason a survey of the Feudatory States of Orissa and certain other areas has been necessarily neglected?—**A.** Of course, there are areas north-west of the present Jherria field across the Jumoni river towards Bokaro-Ramgarh field. The Geological Survey have done all they could, but they are under-staffed. They have always given us all the assistance that they could give.

Q. Of course, a certain amount of work could be done by improving the staff and concentrating on problems of more immediate importance, and for that reason remarks of the kind that you have made are useful indeed. You say: "Frequently people have approached us with samples of various minerals, such as corundum, graphite, chromite and garnets, but we had no means of ascertaining whether the given location of the occurrence had any probability of correctness or otherwise." In a case of that kind do you always refer to the Director of the Geological Survey?—**A.** If the case is sufficiently promising.

Q. And do you find that the Geological Survey are in possession of sufficient information to give a decided answer?—**A.** Yes.

Q. It is a question of merely extending the staff and carrying on the work?—**A.** Yes.

Q. About the question of certificates required for engineers, you suggest that in the Central Provinces it might be well if the managers of mines were regarded as sufficient to control the subordinate staff that may not have certificates. You also say that the certificate granted to a subordinate is not necessarily of much value. Don't you think that it is some protection to the manager to have certificated subordinates?—**A.** I do not think we find it of any assistance.

Q. We have been told that the absence of certificates in Bengal has been of no disadvantage to anybody and that accidents have been very few in number and that the granting of certificates would not improve matters very much. Is that your opinion too?—**A.** We are very much in favour of the Bengal system, that is, the absence of certificates. A boiler certificate is given in Bengal.

Q. Is it correct that there is no reference library in the Commercial Museum here?—**A.** I do not say that there is no library at present. I think there is. I do not think there is any organised library, that is to say, a public library.

Q. What you would like then is a sort of public library with periodicals as well as book of reference to which the public could go without worrying the Director of Commercial Intelligence?—**A.** It would be a convenience.

Q. This question of the leaving of coal for railway support, I suppose, is taken up by the Indian Mining Association?—**A.** The question of railway supports has been taken up and there has been a conference on the point, but I do not think the further point which I have called attention to has been taken up at all, that is, the question of taking out pillars and the admitting of water.

Q. Would not the Indian Mining Association take up that too?—**A.** I think they will eventually.

Q. I am only putting this question to you, because it is not necessary for us to dabble in questions that are being already taken up by an efficient body and represented to the Government of India?—**A.** The question of railway support is important and any help that we could get would be very welcome. (*Witness here gave confidential evidence also.*)

Q. It is very difficult to tackle this problem of support. There is another side to it which is very important?—**A.** It is.

Mr. C. E. Low.—Q. You speak of your having sent up exhibits to the Lahore Exhibition and of your failure to retail fuel to the native populace. What steps did you exactly take?—**A.** As a matter of fact, I cannot speak from personal experience as I was at home at the time. But I understand what was done was that we were represented at the Exhibition at Lahore and afterwards that we kept an European assistant up there to try and sell coal in more or less retail quantities up in the north-west. We carried it on for some time and found that we were not selling very much and the expense was very heavy and therefore we gave it up.]

Q. Why did you select Lahore? Was there not a considerable handicap in the shape of freight?—**A.** There would be more local consumption up there than there would be in the lower part of India where the climate is hotter.

Q. But it would be difficult to make a beginning unless you could compete as regards price with cow dung? Were you able as a matter of fact to sell cheaper than cow dung?—A. I could not tell you that.

Q. Did the Agricultural Department take any hand in that in order to encourage the use of coal and coke?—A. No. I do not pretend that it was carried on on a big experimental scale. As far as I know, the Agricultural Department were not consulted.

Q. Would you mind letting us have your figures* at which it was sold there?—A. I have not got them here. I can get them for you.

Q. As compared with the cost of cow dung?—A. Yes.

Q. You speak about the idea of co-operative societies dealing in the distribution of coal and coke. Have you in mind any particular area in Bengal or the United Provinces?—A. Only generally.

President.—Q. I think the domestic use of coal would take a new life altogether when we produce a low temperature coal and coke?—A. It is all a question of getting at the ryot.

Mr. C. E. Low.—Q. In answer to questions 37 and 38 you say, "I would advocate the more general distribution amongst officials of information in regard to firms who are specially well placed to supply Government requirements." That would put the Government rather in an awkward position in judging whose name it should publish and whose name it should not?—A. You can do it through the Chambers of Commerce. What I really state is that they should get the names of direct importers and that would not put Government in an awkward position.

Q. In answer to question 34 you say, "The question of trade representatives in Great Britain should be dealt with separately and care would have to be taken not to interfere with existing channels of trade." It has been suggested in certain provinces that there should be a Stores Department in India for Indian articles?—A. Undoubtedly it would be a very great improvement, if the idea is to have one Stores Department in the same way as the Railway Board buy coal for all railways.

Q. I think that was in the mind of the witnesses when this suggestion was put before us. Do you think it would be a good thing?—A. I think it would undoubtedly be a good thing.

Q. With regard to the difficulty about titles, how do you suggest that Government should arrange to guarantee titles?—A. My idea was that if possible all titles should be registered.

Q. There is not only the question of actual possession of the soil which exists in the documents containing the revenue survey but as to which of these proprietors have got mineral rights. Is that your difficulty?—A. It is not only that, but you are never quite certain that when you have bought a place on the titles which are produced somebody else would not come along later and produce another title, and you have got either to buy them out or vacate your property.

Q. This is a very important question and there must certainly have been discussions about it. Could you refer to any representations made to Government or discussions on the subject previously?—A. No.

Witness here gave confidential evidence.

President.—Q. These engineers who are certificated in the Central Provinces, you say, are mostly recruited from firemen?—A. Yes. They have a certificate and when they have it they demand more pay and there is very little work for them to do and one has to pay them Rs. 50 a month. I am referring to the Ponch coal fields which have been opened up more or less piecemeal. It means a lot of boilers and a very considerable increase in the cost of staff. When the work is more concentrated the difficulty to some extent disappears.

Q. We have had several people in the Central Provinces, claiming that this system of certificate should be brought into force elsewhere, and in Bihar and Orissa we had evidence that this system should be enforced because they thought it undesirable that men should be placed in charge not only of prime movers but of machinery without any guarantee that they would not spoil it. There is some guarantee provided from the existence of the certificate that the men would not ruin the machinery. The tendency of the evidence elsewhere has been in favour of extending the certificate system while your evidence is in favour of removing the certificate. It came from people who were concerned with machinery. Is there anything essentially different between the boilers used on mines and boilers used in other industries?—A. Take for instance cotton gins. Cotton gins must vary considerably.

Q. The general run of cotton gins is about 50 H. P.?—A. And vertical boilers can be only 20 H. P. It is up to the manager of any factory to see that he engages competent persons. If the manager is responsible he will engage competent persons.

Q. Is this a correct interpretation of what you say?—In the case of a mine you have a qualified man as manager and therefore a man in charge of a 20 H. P. boiler without a certificate is sufficient, but in the case of ginning factories where the manager himself is not certificated, this system of granting certificates for the engineers is really necessary. You discriminate between the two classes of industries in that way?—A. There is that difference. But I think that it is up to the manager of the ginning factory to see that he gets a competent man.

Q. He may not be, of course, a qualified engineer in the same way as your mine manager is, so that a Government regulation might be desirable in that case and it might be relaxed in the case of a mine where there are a large number of small boilers?—*A.* I am referring to mines. Of course, a certificate is not necessary in Bengal for any industry.

Q. We have been told in Bengal by a witness who ought to be an authority—the Inspector of Factories himself—that these certificates are not necessary and would never do any good even if they were instituted. He was quite satisfied with the present system, that is, the absence of certificates?—*A.* Apparently the examination is so perfunctory that a certificate is of little value.

Q. I am not prepared to accept your argument that you have to pay higher wage for the man in charge of a boiler because he has got a certificate?—*A.* I am not objecting to paying him the wage, but to having to engage many men with nothing to do. We may have eight boilers in a mine and one man may be perfectly competent to look after the whole lot, but we have to engage six or seven.

Dr. E. Hopkinson.—*Q.* I understand that in Bihar and Orissa every boiler is inspected and passed for use, and a certificate of working pressure given by an inspector under the Boiler Commission. That is the system that you recommend?—*A.* We have found it very satisfactory in our collieries in Bengal.

Q. That is the system that obtains at home?—*A.* I am not aware.

Q. In Bengal the boiler and not the attendant is certified?—*A.* Yes.

Q. In the Central Provinces both are certified?—*A.* Yes.

Q. And the system you advocate is that the boilers should be certified but not the attendant?—*A.* Yes.

Q. Is insurance of boilers against explosion common in Bengal?—*A.* I do not think so.

Mr. A. Chatterton.—*Q.* The manager of the colliery or factory is responsible regarding the working and maintenance of the thing in a safe condition?—*A.* I take it that it is so.

Mr. C. E. Low.—*Q.* You say in answer to questions 89 to 92, "It would undoubtedly facilitate the business of shippers if Government certificates of quality and weights were enforced and had to be accepted by buyers." How can it be enforced in foreign countries?—*A.* If they want to buy from India and India can only sell on one system, they have to buy. If you want to buy Australian wheat you have got to accept their certificate of quality. In Australia samples are taken before shipment.

Q. It could be done effectively only in regard to things in which India would have a monopoly?—*A.* Australia has not got a monopoly of wheat. It is also the case with Rangoon rice. It has not got a Government certificate, but all Rangoon rice is sold on a certificate granted in Rangoon.

Q. Have there been complaints in Calcutta regarding jute?—*A.* I am not interested in jute.

Q. You know about wheat?—*A.* Yes.

Q. Is there any objection taken in India or Calcutta to the arbitration of the London Corn Association?—*A.* No.

Q. Any other business in which you are familiar—Lac?—*A.* No.

Q. Seeds?—*A.* I have pointed out that there would probably be a difficulty about wheat and linseed because you have got to have some system of bulking before granting certificates. Each of the shippers would have to clean and bulk their wheat.

Q. You talk of Government certificates of quality? Is the Australian one a Government certificate?—*A.* Yes. Nearly all timber is sold on that principle. If you buy Australian timber you have to take their Government certificate.

Q. Do you know what the governing body is? Is it a sort of committee between the Government and the trade?—*A.* I cannot tell you that.

Q. Can you get information * on the subject?—*A.* Yes.

Q. As regards your answer to question 104, you consider that sugarcane and cotton require potash manure as well as tea. What are your reasons for thinking so?—*A.* We have, as you know, a manure department and we have an expert in that department and my information was got from him.

Q. Has he been recommending potash as a manure for sugarcane and cotton?—*A.* Yes. He said that they required a certain amount.

Q. In what parts of India?—*A.* He said, speaking generally, that they required a certain amount of potash. As a matter of fact, tea does not take a great deal of potash.

Q. We have been told as a general rule that potash is not of much use on Indian soils?—*A.* The figure which I give, that is 225,000 tons for all the three crops of tea, sugarcane, and cotton, shows that it is nothing very great.

Q. The Agricultural Department is frequently confronted with recommendations of experts with no extra-Indian experience, as to the manurial requirements of crops, which experience is

* *Fig.* Additional written evidence printed after oral examination.

this country shows to be entirely unfounded as far as the Indian conditions go. If the people find after paying a big price for potash that they are not getting any extra return from their crops they condemn all artificial manures as useless?—A. No artificial manures or potash ought to be used until they are proved to be suitable to a particular crop.

Q. Did you consult the local Agricultural Department whether they were of any use?—A. I am only talking of the possibilities of the future. So far, the fertiliser trade is confined to tea. We do a little for sugar.

Q. With reference to your answer to question 105, the special cultivation rules are for Assam?—A. Yes.

Hon'ble Pandit M. M. Malaviya.—Q. You say, "It would, however, in my opinion, be useless to establish such a factory, unless Government is prepared to protect the industry, to foster which this experimental factory would be established, by the imposition of an export duty on hides and skins." Suppose an export duty is not imposed, do you think that in that case the industry which you want to be developed will not be able to stand competition?—A. I do not think it will be started.

Q. Such protection then is a *sine qua non* for the development of this industry?—A. Yes.

Q. With regard to the improvement of labourer's efficiency, you suggest the improving of the conditions of housing and sanitation and generally taking more care of the health of the labourers. Do you not think that better wages also will help?—A. I do not know that, that came into the particular question.

Q. You suggest means for improving the labourer's efficiency?—A. It does not necessarily follow that increase of wages will help, but I have several times come across instances where when wages were increased the effect was the reduction of the number of days of attendance.

Q. Would you provide any education for these labourers with a view to improve their efficiency?—A. That is a question for the Government.

Q. Apart from any action that the Government might take, don't you think that when you engage a large number of labourers, it would improve their efficiency if they had a little general education?—A. It might, if you employ a large number of labourers at one particular place, but in some cases, for instance, in the tea gardens, collieries, or mills the number of labourers is not sufficient to provide a system of education.

Q. Would it be anywhere under 50 or 100 in any of the cases that you have in view?—A. I do not think that what you suggest would be of any use unless you were employing in one place 2,000 or 3,000.

Q. Even if you have 50 or 100 labourers at one place, don't you think that it would improve them if you provide some education for them?—A. I think the scheme would be impracticable. In many cases the children are not there.

Q. Even the adult labourers could have evening classes to attend?—A. I do not think it would be good.

Q. You say, in answer to question 105, "In one case in my knowledge timber contractors offered to clear the land if they were permitted to take away such timber as they required. But this concession to the lessee of the land was refused by Government, with the result that wood worth many thousands of rupees had to be destroyed." Where was that case?—A. That was a case in Assam. Government were not allowed to grant permission under the rules. There is no injustice about the case, but simply the rules did not provide for that permission.

Sir F. H. Stewart.—Q. About the Advisory Board of Industries do you recommend the formation of such a Board in Bengal for instance? If one is constituted do you think that you would get merchants of position and experience to serve on it?—A. Yes. They would be attached to it. You would find it very difficult to get them as wholetime men.

Q. The heads of large firms are very busy men, and do you think that they will spare the time to help?—A. I think so.

Q. With regard to your answer to questions 89 to 92, was your evidence addressed directly to the Commission, or did it go through the Chambers of Commerce?—A. This evidence was given also in a letter addressed to the Bengal Chamber of Commerce.

Q. Can you develop that a little more? Have you gone into the question with other shippers at all?—A. No.

Q. Have you any notion whether such a scheme would be acceptable to them?—A. Opinions will vary very considerably.

Q. Assuming that it was regarded generally as desirable, how could the Government grant these certificates, what would be the machinery?—A. The same kind of machinery as the Licensed Measures Department.

Q. At present, dealing with the question of weights, you get your licensed measures certificates already through the Chamber of Commerce?—A. Yes.

Q. Do you propose that the licensed measures' department should be taken over by the Government for the purpose of your proposal?—A. It could be done. As a matter of fact, the licensed measures will take your samples now,

Q. How far does the licensed measures' certificate carry you with regard to weight?—*A.* It all depends on the terms on which you sell. You can sell on licensed measures' certificate if buyers agree. There is no compulsion about it.

Q. Take gunnies. Most of the sales are made on terms of arbitration in Calcutta?—*A.* Yes.

Q. Others sell on arbitration in Liverpool or New York, etc., as the case may be?—*A.* Yes.

Q. Is it not a question of shippers getting together, and agreeing on what terms they will sell. You know, for instance, in the case of gunnies—the chamber war bags—the Government have asked to survey them before they are shipped. Government cannot do these surveys themselves?—*A.* Government cannot at present. They have got to do the work through the Chambers of Commerce, or have a department of their own.

Q. But do you think that it is in any way practicable that they should have a department of their own to do this?—*A.* I believe that in other places they have employed commercial people to give certificates.

Q. Do you refer to the Rangoon rice certificate? Do you know what form it takes? Does it deal with quality at all?—*A.* Yes.

Q. Dividing rice into different grades?—*A.* I think they certify that it is representative of the quality as which it is sold.

Dr. E. Hopkinson.—*Q.* Mr. Low asked you about the suggested establishment of a Stores Department in India. Supposing such a department were established, would you suggest that the department should purchase from importing agencies and from home firms who have their offices in India, instead of indenting home?—*A.* I thought you said that the department was to be established for purchasing articles made in India.

Q. Partly so. But I gathered from your evidence that you have an idea that Government might purchase from agents in India?—*A.* What I really wanted to say in my reply was this, that Government, instead of buying direct from the importer, purchases through middlemen, I can tell you that on more than one occasion we have tendered in certain cases to Government departments direct. We have tendered at the same rate to the middlemen and he has tendered at a higher rate and he has got the contract and we have not.

Q. The point I want to put is a new one. Take the care of a manufacturer at home, who has an office in India representing him. Do you think that it is preferable for the purchasing department of Government to make their contract with the office in India or to indent from home in the usual way?—*A.* I should think as a rule that it would be better if they were to purchase in India.

Q. That would be quite a new departure from the present system?—*A.* No. Not quite. We import from home and we very often sell to Government departments out here. In the instance you name the firm out here would hold stock.

Q. The advantage would be that the representatives out in India are more likely to know what is required and to obtain information from Government as to what is necessary?—*A.* Yes.

Q. And you think that the system of buying in India from the representatives of firms at home may be extended?—*A.* Yes. We cannot buy everything in India. You will have to keep a Stores Department at home and the India Office will have to buy.

Q. It will involve a proper system of inspection? Take a piece of machinery that Government wants to purchase. It must be inspected. If purchased here it would be sent out and inspected here?—*A.* It would be delivered, and if it is defective in any way, Government would not pay for it.

Q. To determine whether it is up to specification, you would require proper inspection?—*A.* When Government buy in India they do not inspect before delivery. For instance, we sell drills and drilling tools to Government departments in the Punjab. Sometimes we have them in stock and send them up direct, and at other times we order by telegram from home and they come to Karachi and go up to the Punjab where they are inspected. If there is any mistake or any fault we have to make an allowance or take them back.

Q. Take another example—a pump. Now if ordered at home it is inspected at home at the maker's works. If it is ordered from the representatives of the same firm in India, it will have to be inspected on arrival in India by an Inspector of the Government Purchasing Department?—*A.* You could have a system of inspection undoubtedly. I should think that the system of inspection will be welcomed by the suppliers, because they would have no risk in sending their goods away. The supplier will only be pleased to have inspection before he despatches the goods. For instance, if we get a contract at Cawnpore for some machinery which is made at Calcutta, it would suit us very much better to have inspection in Calcutta before the machinery is despatched than have it at Cawnpore after it is delivered.

Q. That is not my point. I am assuming plant that comes out from home. It must be inspected either at home by a consulting engineer, or in India after arrival by a new department?—*A.* If it is purchased from home it ought to be inspected at home.

Q. In that case, to a certain extent you lose the advantage of the local knowledge of the Indian representatives of the firm at home?—*A.* But you admit that a large number of purchases will have to be made at home too.

President.—*Q.* If this system were developed in India on a scale that we have not so far attempted, we should in fact reduce the requirements of the home inspection and the whole of the inspection might be concentrated in India and there would be only a few things left of a special kind that could not be got in India for some years, but the other things might very well be inspected here and the local stores purchasing department here would make it its business to keep in touch with the representatives of outside firms?—*A.* Yes.

Dr. E. Hopkinson.—*Q.* You suggest that co-operative societies ought to be established to aid the distribution of such commodities as coal and coke and tea. These are consumable commodities?—*A.* Yes.

Q. That appears to be an entirely new development in the co-operative credit system?—*A.* I refer to the difficulty of distribution of any article in India by itself. The tea industry is doing it to a very large extent, but it cannot do it all over India.

Q. It is a new proposition?—*A.* What I was suggesting was that co-operative societies might help in distribution which is a great difficulty at present.

Q. The object of co-operative societies is to provide credit which is necessary in the case of, say, agricultural seeds or manures?—*A.* The ordinary shopkeeper is rather reluctant to take up some new article which is not at present consumed by the ryot and he has not got the incentive to push it.

Q. You cannot say that coal and coke and tea are new articles?—*A.* So far as the ryot is concerned, they are.

Q. You speak of the steps taken to improve the labourer's efficiency by better housing and sanitation. Would you subscribe to this proposition that, so far as the jute mills are concerned which is a very highly developed industry, the mill-owner has found that improved sanitation and better housing actually pays him?—*A.* I am not interested in jute industry at all and I cannot speak about it. For instance, in the tea industry the improvement in the conditions there has been enormous in the last ten to fifteen years and undoubtedly the greater attention paid to this question has been of very great advantage indeed to the industry.

Mr. A. Chatterton.—*Q.* You say, "Government should erect a tanning factory in Bengal, worked on the most modern methods, and run by first class experts." Would that be for the manufacture of leather to meet the requirements of the country or for export?—*A.* For both. You will have to manufacture leather required for the country at first, but you want to take the business hitherto done by Germany.

Q. Have you seen the Bengal National Tannery?—*A.* No.

Q. You say, "It would, however, in my opinion, be useless to establish such a factory, unless Government is prepared to protect the industry by the imposition of an export duty on hides and skins." Is that because the price of hides is too high?—*A.* I do not think that unless it was protected in that way you would get capital to start the industry on a large scale.

Q. What is the object of the export duty—to reduce the price of raw materials?—*A.* You will be able to turn out leather cheaper than Germany who would have to pay more for the hides exported.

Q. Is the hide trade in Calcutta or India of sufficient importance in the markets of the world so that you can, by the imposition of duties here, raise the price outside the country?—*A.* It would undoubtedly affect the price. Supposing you put on a duty of 20 per cent. or some fixed amount which is equivalent to about 20 per cent. you might raise the price by five per cent.

Q. Don't you think that the establishment of a demonstration factory by Government in this case would be an undue interference with the two existing tanneries which have been started?—*A.* It would be quite easy not to interfere.

Q. One of them is turning out good leather?—*A.* It would be extremely easy to avoid any injury to them.

ADDITIONAL WRITTEN EVIDENCE (submitted after oral examination).

Supplementary Answers to Questions.

(1) *Fuel at Lahore.*—The price at which we were able to supply soft coke at Lahore in pre-war times, i.e., before the increase in railway freight rates and the inflated values of fuel was Rs. 15-12-0 per ton or 9 annas 4 pies per maund. The price of cow dung at Lahore varies from 5 to 6 annas per maund.

(2) *Government certificates for produce in Australia.*—I beg to forward to the Members of the Industrial Commission for their information copies of letters from a leading firm in Melbourne and Perth, together with a letter from the Director of Agriculture in Victoria to the Melbourne firm. These letters give full information as regards the methods adopted in Australia for the granting of Government certificates for produce exported, and for the selection of Inspectors of Produce.

Copy of letter, dated 1st March 1917, from Messrs.

Melbourne, to Messrs.

Shaw, Wallace & Co., Calcutta.

We are in receipt of your favour of 5th January with reference to the official Government inspection of products exported from Australia.

We enclose herewith copy of letter from our Victorian Department of Agriculture which will explain to you the methods of inspection and appointment of inspectors in connection with shipments of agricultural produce.

The inspection and appointment of inspectors for timber export is on the same lines, but in the case of timber each piece inspected is branded with Government stamp. In agricultural produce the individual packages or bags are not marked by the Government, and a certificate is given for the whole quantity shipped under a certain brand in the vessel.

In wheat the inspection is made at the ship's side, but in other commodities, such as potatoes, inspection is made while the produce is being prepared for shipment in seller's store or at railway siding adjacent to wharf.

If there is any further information we can give you, please let us know.

Copy of letter, dated 28th February 1917, from the Director of Agriculture (Victoria)
Melbourne, to Messrs. *Melbourne.*

In reply to your letter of the 17th February 1917, I beg to inform you that grain and other farm products for which Government certificates for quality only or quality and weight are issued, are first examined by expert Government officials and the method of examination in the case of wheat or other grain is to draw a sample from each individual sack and by it judge the contents. The inspectors are also instructed to see that the bags are "sound and fit for shipment" unless stipulated that bags must be new.

The examination is made either at the vessel's side while loading or at the store while loading into truck or lorry for conveyance to vessels; in the latter case, ship's receipts are taken as proof that the contents of these particular trucks or lorries have been discharged into the vessel.

Weights shown on the Government certificates are taken from Government Railway Weighbridge certificates.

When examining chaff, etc., only a percentage of the bags are tested, number being left to the inspectors' discretion, a proportionately greater quantity are usually tried in a small parcel than in a large one.

In making appointments to the staff of Government inspectors of farm products applicants' previous experience as grain buyers or handling produce and their knowledge of the various farm products and quantities of same, together with a knowledge of fungus diseases, insect and weed pests relating thereto, is taken into consideration in connection with their suitability in other respects.

Applicants have to submit to an examination, and if their knowledge and experience are found to be up to the required standard, they are eligible for appointment.

Herewith is a copy of the syllabus of the subject of the last examination. This Department does not issue certificates for timber exported.

EXAMINATION FOR INSPECTORS OF GRAIN AND FARM PRODUCE.

Syllabus.

1. *Subjects* for examination will include written, oral and practical tests and candidates will require to have a knowledge of—

- (1) Farm produce in all forms.
- (2) Structure of plants, roots, stem, flower, fruit seed.
- (3) Identification of the more common varieties of the usually grown cereal grains, and a knowledge of their characteristics.
- (4) Identification of seeds and plants of wheat, barley, oats, maize, sorghum, amaranth, millet, beans, peas, clovers, lucerne, rape, turnips, onions, potatoes, flax.
- (5) Identification of the seeds and plants of the commoner weeds.
- (6) Grading and judging; and methods of marketing seeds and farm produce.
- (7) The relative nutritive and commercial values of food-stuffs.
- (8) Quality and characteristics of fodders—hay, chaff, grain, meal, flour, bran, and the common adulterants of these.
- (9) Diseases of farm crops, e.g., smut, bunt, rust, mildew, dodder.
- (10) The Pure Seeds Act and Chaff and Stock Foods Act, and the regulations thereunder.

2. *Evidence of ability* to verbally expound details of the above matters and to carry on inspectorial duties in a tactful and educational manner will receive special recommendation.

3. *Text books*.—No special text books are prescribed, but candidates may consult the following with profit:—

- (1) Year Book of Agriculture.
- (2) Journal of Agriculture.
- (3) Fream's Agriculture.

Copy of letter, dated 12th March 1917, from Messrs.

Perth, to—

Messrs. Shaw, Wallace & Co., Calcutta.

Inspection of Australian Wheat.—Replying to yours of the 5th January. As you know, all wheat exported from Australia at the present time is controlled by what is known as the Wheat Marketing Committee. Now, in West Australia the Wheat Marketing Committee is entirely a different body to the Department of Agriculture, although both are under Government control. The Wheat Marketing Committee does the shipping, and the inspectors attached to the Department of Agriculture survey and issue certificates of wheat for export.

This wheat is really examined twice; when the farmers deliver the wheat to the agents for the Wheat Marketing Scheme in the country, each bag is sampled by the agents' inspectors and if the appearance is up to the f. a. q. standard, it is then sent down to the port for shipment; as the wheat is being loaded into the ship, an inspector appointed by the Department of Agriculture stands by and examines with a grain trier about one in every six bags, and the samples so drawn are retained, and at the end of the loading period these samples are all mixed together, and the weight is ascertained to see if it comes up to the f.a.q. standard.

The Government officials who do this have undergone no prescribed training to fit them for these duties, although in most cases, these men received their knowledge of their work in private employment sampling wheat on behalf of local flour mills. No surveying for shipment is done by private persons.

Trusting this is the information you require.

WITNESS No. 174.

Mr. D. Meik.

MR. D. MEIK, Assistant, Messrs. Graham & Co., Calcutta.

WRITTEN EVIDENCE.

Agricultural Department of Bengal:—

Staff—

- 1 Director
- 2 Deputy Directors
- 1 Fibre Expert
- 1 Economic Botanist
- 1 Agricultural Chemist

Of this number there are absent at present, one Deputy Director on military service, the Chemist whose services have been placed at the disposal of the United Provinces Government as Opium Expert, and the Botanist who is away on leave. Of the total staff three are executive officers and three are specialists.

This staff is altogether inadequate to grapple effectively with the agricultural situation in Bengal. We have here an extraordinary situation, in that the gigantic task of reforming and improving the agricultural condition of a province of 84,000 square miles, of varying soils and conditions, supporting a population of over 46,000,000, is left under ordinary circumstances to three men. At present this work is being carried on by two. These gentlemen are sound practical agriculturists and in every way fitted for the positions they hold, but these two men are required to do the work of a dozen and it is impossible for them to accomplish the task successfully, however good they may be. The only highly trained help they are allowed are three specialists, two engaged in important purely scientific branches and the third on work specially required by the conditions of the country. These specialists have no share in the administration of the department so that on the shoulders of two men falls the entire burden of coping with a situation bristling with difficulties urgently requiring solution.

Besides the above men the Director and Deputy Director have to help them a staff of Indians, trained for the most part in agricultural institutions or on experimental farms in this country and many of whom are quite unfit to render the effective aid that men in their position should. The training these men have received is not of a high order. Many of the agricultural colleges in this country are giving a training that is very deficient theoretically and more so practically, whereas the training obtained on experimental farms is of a very low

order indeed. These men certainly fulfil requirements as far as routine is concerned but the majority of the Indian staff cannot bring to bear on their work a technical and practical knowledge of a standard required in men of their position. Their training does not allow of this.

The Agricultural Department can be said to be divided into two branches, (1) the executive (2) the specialist. The specialists are confined within limits, each working along his own special line. The results obtained by their researches are handed over to the executive branch whose duty it then becomes to apply these results practically and, if successful, to demonstrate and spread the knowledge of them among the people. The existing channels for disseminating this knowledge are two large farms at Chinsurah (210 acres) and Dacca (353 acres), and five small farms ranging in size from 20 to 63 acres and situated at Kalimpong, Burdwan, Rajshahi, Burihat and Rangpur. There are also Agricultural Associations consisting of a few members on whose lands demonstrations are carried out. A few demonstrations are made at "melas" and to members of co-operative societies.

Each of these demonstration farms is surrounded by an enormous territory, so large as to make it impossible for it to serve as a place for demonstrating improved methods of agriculture to the agricultural population of the territory. Of these farms four are in the Rajshahi Division serving an area of 18,000 square miles and a population of about 10,000,000, two are in the Burdwan Division serving an area of 14,000 square miles and a population of about 9,000,000 and one is in the Dacca Division serving an area of 16,000 square miles and a population of about 11,000,000. This means that 30,000,000 of the people of Bengal have meagre facilities for gaining agricultural knowledge while the remaining 16,000,000 have practically none.

From the foregoing we see that Bengal has a small Agricultural Department spread over an enormous province with its centres of activity surrounded by territories far too large to be dealt with effectively by each centre, with a consequent lack of proper supervision of the work carried out, resulting in the department not being able to reach the people it should and in its usefulness being greatly impaired. This state of affairs has resulted on many occasions in failure in adapting its recommendations to local conditions thereby bringing its recommendations into disrepute. Its experimental work has often been of only local application and being understaffed and with insufficient means results obtained have often been pigeon-holed instead of being brought into practice. It has certainly made progress and done some good work but having had to work at a great disadvantage the net results attained have been very small indeed. These difficulties must be overcome or the department as such prove a miserable failure.

To deal successfully with the agricultural problem there are two classes of people, the Agricultural Department must reach by direct means, (1) the zaminder, (2) the rayat. It is out of the question to think of dealing with one class only and of hoping to improve the situation as one is entirely dependent on the other. To reach these two classes and to deal effectively with the problem the Government must be prepared—

- (1) to increase their staff of highly trained scientific agriculturists ;
- (2) to place sufficient means at the disposal of the department to carry on its work properly ;
- (3) to establish an agricultural college on up-to-date modern lines ;
- (4) to give elementary agricultural education in schools ;
- (5) to increase the number of farms so that the population of each district in the province has the opportunity of taking full advantage of the demonstration work carried out ;
- (6) to work in closer union with the co-operative societies.

Of these recommendations No. 1 should be attended to first and the deplorable lack of properly trained scientific agriculturists made good. Without them it will be hopeless to attempt any improvement. Having got these properly qualified men the department must not be starved but supplied by Government with the means to carry out the policy that may be deemed best for the country.

There should be an agricultural college properly equipped and staffed to give men of the domiciled and Indian communities a thorough scientific and practical training in agriculture. It would be possible to get from an institution conducted on sound lines trained men capable of doing justice to the positions they hold in the department, and men who could work their own or others estates and be missionaries of better agriculture throughout the province. In addition to the college there should be a main experimental and demonstration farm, on the scale of the Dacca farm, in every division where the initial trials of all new improvements and results of researches should be made. There should also be demonstration farms in every district where trials should be made on a scale that will demonstrate to the people the practical adaptability of improvements and methods. These farms should be for purely demonstration purposes and not experimental.

It is very important that in an agricultural country like India, where the majority of the pupils in schools in the country are of the cultivator class, the young should get a training that will better fit them to work their lands in the future. A course of simple elementary agriculture would not only help to spread knowledge but would pave the way to accepting improvements that are rejected at present through ignorance and prejudice.

The idea of co-operation is making headway in Bengal and co-operative societies are springing up all over the country. At present there is no provision made for the proper supervision of aid given or improvements in agriculture recommended by the societies. In this matter there should be closer union between the Agricultural Department and the co-operative societies and the department should aid the societies by allowing their officers to superintend their agricultural activities. If they don't and the agricultural work of the societies is carried out by untrained men the chances are that great harm will be done and progress in agriculture retarded.

If the activities of the Agricultural Department were extended as suggested above, enormous benefit would not only be derived by the primary industry of India but also by industries allied to agriculture. There are mills manufacturing oil cake and bone-meal that are shipping these commodities out of India (27,320 tons in 1915-16 from Bengal and a total of 210,800 tons from British India) because the Indian agriculturist has practically no knowledge of their use. For the same reason there are mineral deposits left practically untouched. There were also 9,000 tons of other manures exported from India in 1915-16. If an improvement was made in Agriculture it would mean the development of these industries and others that would be brought to light by research and the retainment in India of valuable products that would enrich her soil instead of being shipped away to her loss. Commercial firms can do a lot towards helping Government in connection with the development of agriculture but as they have not the facilities at their disposal that Government has, it is impossible for them to undertake the education of the agricultural population or the demonstration of improved methods throughout the province. The scientific departments of commercial firms dealing in agricultural requirements are specialists in their own lines and it is possible that from time to time they will obtain results from their researches that would be of value to the country and should be known. These firms have not set out with the sole object of making enormous profits and if the Government would take this view and invite their co-operation great progress would be made in the development of agriculture and its allied industries.

ORAL EVIDENCE, 5TH JANUARY 1917.

Mr. C. E. Low.—*Q.* You have taken special interest in the work of the Agricultural Department. Is there any special reason to bring you in contact with that department?—*A.* I am running the Fertiliser Department of Messrs. Graham and Company and in that connection I come into contact with the Agricultural Department.

Q. What special manures are you interested in?—*A.* Bone manures, oil manures and basic phosphates and artificial manures from different parts of the world.

Q. Your sales are at present limited to planters of tea gardens?—*A.* Principally, yes.

Q. Do you get a large demand for ordinary cultivation in Bengal?—*A.* The demand has not been great but a number of enquiries have been coming in from not only parts of Bengal but also from the United Provinces, Punjab and other places, and it seems to me that the demand will grow.

Q. They show signs of increasing?—*A.* Yes.

Q. The criticisms which you make on the Agricultural Department refer more particularly to Bengal. Don't you think that since Mr. Milligan took up the post of Director things are on a better basis? Do you know any thing of Mr. Milligan's plans?—*A.* I had an interview with Mr. Milligan during the week, the first time that I have been able to discuss the subject with him. I know now more of his plans than I did before.

Q. Have you any ideas as to how you would get the people to take up fertilisers? Would you rely mainly on the Agricultural Department or would you work with them?—*A.* I should work with them.

Q. Have you any idea as to the method?—*A.* Of course it is impossible for us as a commercial firm to go direct to the ryot throughout the country and we will have to rely on the Agricultural Departments spreading the knowledge of the use of fertilisers. We could also help them to a certain extent in that and then, as far as getting to the people is concerned, I think the best way to do it is through the co-operative societies.

Q. Has anything been done in connection with the co-operative societies or is it only in the region of discussion?—*A.* As far as we are concerned we have taken definite action in one case so far.

Q. What were the arrangements in that case?—*A.* I undertook to supply this co-operative society with fertilisers. I gave them six months credit. They distributed it among the more intelligent ryots who were likely to use them properly, and who were to pay the money back when the crop was in. I undertook to give as much help as possible from the agricultural point of view to the members of the society. The fertilisers used were nitrate of soda and basic phosphates.

Q. For what crop?—*A.* They were trying it on both jute and paddy.

Q. There was nothing done so far as you know by way of co-operative finance?—*A.* I do not know anything about that.

Q. With reference to what you say about demonstrations do you see any objection to men of the labouring classes, fairly intelligent labourers, being given short courses in

particular subjects and then put under the orders of superior officers to help the cultivators in places which the superior officer has visited?—A. I think that would be a very useful scheme indeed.

Q. What fertiliser do you think has the biggest future before it?—A. I think bone meal.

Q. Is saltpetre being used?—A. As far as I know this is being supplied only to tea gardens. Not much outside of them. A certain quantity of it is being used by general cultivators.

Q. Have you gone into the question of the Indian basic slag at all?—A. Yes. I am not prepared to make a definite statement about it. I have only had one Indian basic slag submitted to me and that was very poor.

Q. Very low in phosphorus?—A. Yes. That will have to be put right.

Q. When you sell these things through the Agricultural Department do they take any steps to see that the stuff is up to the proper standard?—A. They protect themselves in that respect.

Q. And what about the tea planters? Have you any arrangement with the Indian Tea Association or the scientific officer?—A. In selling the fertilisers I say that the contents are so and so. The planters have their own scientific department to refer to.

Q. They are in a position to protect themselves?—A. Yes.

Q. Do you believe in the system of Government certificates of quality?—A. Yes. In this country there is absolutely no legislation whatever to prevent any dealer in fertilisers from placing on the market whatever he pleases. There is nothing here on the lines of what we have at home. So far as the Agricultural Department and Indian Tea Association are concerned, they are able to protect themselves and if the co-operative societies are properly organised they can protect themselves, but the small landholders and zaminders are left open to be swindled by unscrupulous people.

Q. The cultivators are beginning to know the value of fertilisers and there will be an increasing demand with the result that there will be great adulteration if the trade is left to Marwaris and the ordinary shopkeepers. Do you think that some Government precaution ought to be taken?—A. I do.

Q. If it is taken in the present state of the trade, would it cause inconvenience to anybody?—A. Not that I know of.

Q. How does the English Act work? Is it an offence to sell without a certificate?—

A. The man has to make a declaration that the fertiliser contains certain percentages of this and that and then they have got a table of standards and the man has to come within those limits. I think it is left to the consumer to bring the matter up.

Q. The mere selling of fertilisers without a certificate is not a misdemeanour in itself?—

A. I am not quite certain. I sent home for a copy of the Act and have only just received it and have not had time to examine it carefully.

Q. As an outsider to both departments, namely, the Co-operative Department and the Agricultural Department, have you formed any idea as to whether they should work in closer contact?—A. I have said that they should work closer.

Q. You say that things are much better now in that respect?—A. I expect great improvements in the future.

President.—Q. About the certificates of quality we had this point before us of a fertiliser being sold in the form of a mixture, the mixture being of a kind that was self-contradictory. That is to say, a mixture applicable to one soil would be mixed up with a fertiliser of another kind leading to a waste of money in the case of a particular crop. Do you think that legislation would be necessary compelling a seller of a fertiliser to observe rules in this matter?—A. I would much prefer it. Those are the lines which we are following.

Q. That would not interfere with the trade if Government insisted on clean fertilisers being sold and not mixtures?—A. I think it would be to our advantage.

Q. It would be necessary for the seller to guarantee certain contents and if the material were found otherwise it would be a misdemeanour?—A. That is what they do in Australia. They have to come up to a certain standard fixed by Government and the seller has to put on each bag of fertiliser a declaration that it contains so much of this and so much of that.

Sir F. H. Stewart.—Q. It would be for the purchaser to find out what would be suitable for his particular soil?—A. Yes.

Q. The certificate of quality would only be a statement of the contents. It would not be in any sense a testimonial?—A. Oh, no.

Hon'ble Pandit M. M. Malaviya.—Q. Where did you acquire your knowledge of agriculture?—A. In Australia.

Q. How long have you been connected with agriculture?—A. For about 10 years.

Q. For how many years have you been connected with this firm which is dealing in fertilisers?—A. A few months. I was before that in Allahabad at the Agricultural College there.

Q. Have you had any experience of these trained Indians who are working in the Agricultural Department?—**A.** Since I have been out here I have had a good deal to do with them.

Q. What is the kind of education that they have received? Are they University men?—**A.** They are mostly men who have gone up to the entrance standard and then had their training in one of the agricultural colleges.

Q. And in other agricultural institutions?—**A.** Some of them.

Q. Have you seen any of the Pusa trained men?—**A.** Yes, I have come across them. I cannot specifically point to any of them at the present moment.

Q. You suggest that there should be much better provision for imparting agricultural education, and you want colleges not so much for research work as for imparting a knowledge of scientific agriculture as far as it is known?—**A.** Yes.

Q. Do these co-operative societies actually recommend any improvements in agriculture?—**A.** They refer to the Agricultural Department and the Agricultural Department makes the recommendations. But though the recommendations are simple, there is no supervision to see that the instructions are properly carried out. The co-operative society men are not men trained in agriculture. That needs looking into.

Q. You would have a trained inspector going out to advise as to the use of the fertilisers?—**A.** There should be somebody to look after that part of the society's work, to see that the agricultural part of the scheme is carried out properly so as to benefit people.

Q. Do you know of any institution in the country from which you could get men trained for this purpose?—**A.** It is difficult to answer that.

Q. So far as you are aware?—**A.** It is possible that you can get a few men from any of the institutions who will be capable of taking up that position. They are few and far between.

Q. What is the system of agricultural education in Australia? Can you tell us briefly?—**A.** It is part of the general course up to a certain standard. They have what they call Agricultural High Schools. They are connected with the ordinary schools but they form a separate department where students who show a particular aptitude for agriculture are selected and sent.

Q. Are farms attached to them?—**A.** Yes, and then they have agricultural colleges in the States. Some have two and some three, according to the size of the State, and the Universities have agricultural departments so that a boy can be connected with agricultural studies from his early years right up to the end of his University career.

Q. Are there a large number of farmers attracted to the schools?—**A.** Nearly all the agricultural schools have a large proportion of farmers' sons.

Sir F. H. Stewart.—**Q.** Do you think it would be advisable to place any restriction on the exports of fertilisers, such as bone meal, oil cake, etc., with a view to popularise their use in India?—**A.** You cannot gain your point in that way. The point is that if the people were educated in the use of them they would be utilised here instead of being shipped away to the country's loss.

Q. Would that not be a lengthy process? Would you not say in Japan people know the value of bone meal and that they will pay very much higher prices than people in this country will do for many years to come?—**A.** I do not think the difference is so great. We have shipped stuff to Japan ourselves. We are getting practically the same price in this country.

Q. Could you tell us something more about the Government certificates of quality in Australia?—**A.** I can say something regarding wheat. I do not know if the Federal Government has taken that up now but in Victoria the Agricultural Department has fixed a f. a. q. standard. They get sample lots from all over the State. In Melbourne the Government Department officers empty the whole lot and they go through an elaborate process of mixing and this particular mixture is taken as the standard. The bushel was measured out from that and the standard was determined according to the amount that was in that bushel.

Q. Were certificates granted in all cases where there were shipments from Australia?—**A.** Yes.

Q. If the certificates were granted was that the end of the whole matter? No claims could then be made?—**A.** I do not know sufficiently about that.

Q. What about the wheat that did not attain to a certain standard? It was made up again?—**A.** They have got various grades such as f. a. q., good, seconds, and so on.

President.—**Q.** Is that the only standard the weight per bushel?—**A.** They have samples of different qualities. The experts would be able to tell the grade from them.

Sir F. H. Stewart.—**Q.** Is this standard fixed by Government or are the dealers represented also?—**A.** They have one or two representatives.

Q. You mean the shippers themselves?—**A.** There is a sort of Board. Government does not do anything independently. These people work with the Government.

Q. Do you think that a similar system would work here?—**A.** I cannot say. It would be a very much more difficult business here than in Australia. I have thought of it a number of times but there are difficulties in the way. It would not be such a simple matter to work here.

Mr. A. Chatterton.—Q. Are there any Indian firms engaged in the fertiliser trade?—A. I know of a couple of firms.

Q. How many European firms?—A. They are practically four.

WITNESS No. 175.

Mr. G. D. Hope.

Mr. G. D. HOPE, Ph.D., B.Sc., F.C.S., Chief Scientific Officer, Indian Tea Association, Calcutta.

WRITTEN EVIDENCE.

The scientific department of the Indian Tea Association has now been in existence for Technical aid. 16 years but during that time the staff has never been large enough to cope adequately with the twofold activities—namely, advisory work and research—which are almost inevitably forthwith demanded of such a department, from the moment it is established (and which has been demanded in this particular case) when it is supported largely by funds subscribed by commercial concerns.

The tendency has been, in practice, to devote by far the greater part of the time at the disposal of the officers of the department to advisory work, and the time put aside for research has always been of necessity largely interfered with by routine work of an advisory character, which cannot possibly be avoided when this character has once been given to the work.

It is firmly my opinion that since the inception of the department the material benefit to the tea industry which has been derived by making use of the officers of the department in an advisory capacity, has been very much greater than is ever likely to have been obtained from the results of research work alone, by a staff of the same numbers.

Although individual planters are with few exceptions ready to listen to the personal advice and suggestions of European officers of the department, they are not usually so susceptible to information imparted through the medium of publications. Consequently the advisory work of the department, which consists in touring and lecturing in the planting districts, interviewing representatives of agency firms and others in Calcutta, keeping up a large correspondence with planters, and publishing information not necessarily derived from original research, should not be curtailed to make time for research, but should unquestionably form an essential separate activity of the department, which, to suit its particular needs, should be also adequately equipped with a staff capable of carrying out research into the various branches of the industry; and this research should go on without the discontinuity which is inevitable when each officer has to act in a dual capacity. This necessity for advisory and research work is similar to that for demonstration and experiment respectively in the case of ryot's crops, and progress is best effected by confining the work of each officer to one branch.

At the present moment the staff of the scientific department of the Indian Tea Association is not large enough to cope satisfactorily with both branches of work. If it were to act in an advisory capacity only its value would be quickly lessened owing to lack of material with which to advise; if in a research capacity only, the large immediate monetary value of such advisory work as it is carrying on now and of that which it could carry on much more effectively in the future, if it were adequately staffed for both activities, would be lost.

In the present condition of the tea industry, when the price of tea has been high for several years, and money has been forthcoming for all operations which conduce to increases in the size of crops, the Association would not have been justified, in my opinion, in doing otherwise, with the pre-war staff of five European officers, than directing them to act chiefly in an advisory capacity; but the industry as a whole would be well advised to spend in the future a much larger sum in obtaining scientific aid, and the necessity for more research work is now more than ever evident.

Witness here gave confidential evidence.

ORAL EVIDENCE, 5TH JANUARY 1917.

Research abroad.

Witness here gave confidential evidence.

Mr. C. E. Low.—Q. Have you an experimental station?—A. Yes.

Q. What do you do with regard to the sale of fertilisers to planters? Do you advise them?—A. I advise them as to the choice of fertilisers.

Q. With reference to the soil and climate?—A. With reference to the soil and climate of the tea districts of North-East India.

Q. Your work extends to the Doars and Assam?—A. Darjeeling, Cachar, Sylhet, Assam and the Doars and Terai.

Q. Do you get fertilisers sent to you for analyses by planters?—A. For a short time our department undertook analyses of fertilisers and soils for a fee but the idea of our doing so was given up because our staff is small and the time so occupied can more profitably be devoted to research.

Q. It could be done just as well in Calcutta?—A. Yes.

Q. Supposing a fertiliser was sent by a planter to Messrs. Smith, Stanistreet & Co. for analysis, would you check the analysis?—A. If I doubted the accuracy of an analysis submitted to me as a guide to the choice of manures, or for any other reason, I would, in the first instance, probably draw the attention of the particular planter or a proprietor who had sent me the analysis, to the matter, and would ask him to have it re-analysed and if necessary I would, with his consent, take up the matter with the Indian Tea Association. A sub-committee of this Association deals with the work of the scientific department.

Q. What are the fertilisers which are mostly used by tea planters?—A. Besides cattle and lime manures obtained locally, lime, superphosphate, basic slag, sulphate of ammonia, sulphate of potash, oilcakes, animal and fish manures are used very largely; nitrate and sulphate of potash in smaller quantities. The use of other artificial manures is restricted to very small quantities.

Q. Do you find, as a matter of fact, that these have produced satisfactory results?—A. When used judiciously and in the proper connection with other field operations manures in most cases give excellent results.

Q. Do you find that fertilisers are recommended in a way that leads the planter to use them in unsuitable conditions?—A. About two or three years ago at a time when more extended use of fertilisers was taking place rapidly there was a determined effort on the part of several suppliers to sell mixtures of manures often described by such names as "standard mixtures" and the like, and my department was against any proposal to use such mixtures on a large scale, our reason being that with such differences of soil and climate as obtain in the tea districts of North-East India individual planters were not likely to get the best results by buying in that way. Mixtures said to have the special merits of improving quality, and crop, of producing special development of the frames of bushes, and so on, were actually advertised by those who could have known nothing in detail about the soil and climate of individual estates nor did they make reference to them in their advertisements.

Q. Has that now been dropped or is it still carried on?—A. It is still carried on to a small extent, but it has largely been dropped.

Q. Have you any experience of certificates of quality for manures under the authority of Government?—A. I have no experience of that.

Q. Do you know what the law is in the United Kingdom?—A. Not in detail. I had very little experience of agriculture in England before I came here.

Q. What is your idea as to the action that might advantageously be taken by Government in this country?—A. I think that suppliers should be permitted only to sell under a license granted by Government.

Q. Including not only importers or manufactures, but up-country agents, small cultivators, small bazar men?—A. I see no particular difficulty in arranging that they should only be allowed to sell if they have a license.

Q. Like poisons or fireworks?—A. If there is any charge connected with it, it might be nominal in the case of the small seller.

Q. How would you use this license with reference to the purity of the stuff sold?—A. If any case of impurity occurred that license will be liable to be taken away.

Q. And who do you think is a suitable authority for inspecting it?—A. I think a whole-time officer would have to do it, if it refers to the whole of India.

President.—Q. In that case, would it not be better, if it does not interfere with private enterprise, to arrange for fertilisers to be distributed through the Agricultural Department? The Agricultural Department would actually become the purveyors of fertilisers of known qualities; they would be in touch with co-operative societies; the people would have greater confidence in the fertilisers; and the extension of fertilisers would be developed. On the other hand, there would be a certain amount of interference with private enterprise which, so far as can be seen, has not established itself sufficiently well?—A. At present the use of large quantities of certain classes of fertilisers is practically confined to estates under European management. Under your arrangement would planters be prevented from buying manures otherwise than through the Agricultural Department?

Q. There would be recognition of your department's certificate as equivalent to Government's. In the case of the ordinary ryot, who is the man that we want to use fertilisers on a very large scale, he will always be slow and timid about using fertilisers; he will have no confidence; and there will be a set-back if he thinks that a fertiliser is fraudulent or deceptive?—A. My work brings me in no manner of way in contact with the question of dealing with the ryot.

Q. You could not form a mental picture of what the conditions would be?—A. I can imagine that an arrangement such as you suggest would be helpful to ryots.

Q. Am I correct in assuming that fertilisers if properly applied are going to alter the whole phase of agriculture in India and that we are going to solve the agricultural problem of production in that way very largely?—A. I think so personally. I believe that fertilisers are going to play a very important part in the agriculture of India.

Q. Big enough to take it up as a serious proposition?—A. Certainly. In regard to tea, I was very much struck in Ceylon by what appeared to me to be the case, that the suppliers of

fertilisers had got things more into their own hands than was necessary or desirable. I think this is less so now than it was some years previously. This is a thing to be avoided if possible in India.

Q. In the case of planters, they would naturally consult you in the matter of using a new fertiliser and at the meetings of the Association you would be in a position to give them a general warning as to their effect, but the ryots are not so easily gathered together and taught?—*A.* Yes. Exactly.

Mr. C. B. Low.—Q. Have you seen anything of cultivators on the land of planters?—Have they shown any sign of using fertilisers?—*A.* Such experience as I have had shows that they have done but little.

Q. Do you notice if the Indian tea gardens use artificial manures?—*A.* Comparatively little. But I think they do so to some extent in copy of their European neighbours.

Sir F. H. Stewart.—Q. Are the committee of the Indian Tea Association in possession of your views about advisory and research work?—*A.* Yes.

Q. Do you think they are going to increase your staff?—*A.* I think their attitude will be one tending that way, as soon as the War is over.

Q. It is on the research side especially that you want an increase of establishment?—*A.* Yes. When one officer is acting in two capacities, and the department, as a whole, is short-handed, the research work is the first to suffer.

Q. If the research side of your staff is strengthened you could continue to superintend both the advisory work and research work?—*A.* I think it would be possible, if the staff were increased for the head of the department to attend to both.

Q. You are entirely under the Tea Association?—*A.* Yes.

Q. There is no Government connection or Government control?—*A.* No. There is a subsidy from the Government of India, and from the Governments of Bengal and Assam. The Indian Tea Association and the branch and the affiliated Associations provide funds which make up the balance. No money is provided from the Tea Cess Funds.

WITNESS NO. 176.

Mr. F. A. A.
Cowley.

HON'BLE MR. F. A. A. COWLEY, *Secretary and Chief Engineer, Public Works Department, Bengal.*

WRITTEN EVIDENCE.

Note on the waterways committee.

Mr. Cowley was examined orally on this note prepared by Mr. G. H. W. Davies, I.C.S

Qs. 97-100.—In 1906 a Standing Committee was appointed "periodically to inspect the natural and artificial waterways between Calcutta and East Bengal and to suggest measures of improvement."

The Committee consisted of three official and one non-official member (nominated by steamer company). Its scope was limited to the channels from Calcutta as far east as Barisal and Madaripore.

The Committee was to suggest to Government measures of construction and maintenance for giving greater facilities to traffic and measures to control and regulate traffic.

In 1911 the following additions were made to the Committee:—

- (1) Representative nominated by Bengal Chamber of Commerce.
- (2) Representative of East Bengal Commerce.
- (3) East Bengal Official (Chief Engineer).
- (4) Vice-Chairman of Port Commissioners.

The object of the change was to give fuller representation to commerce and to change the body from a departmental committee constituted for inspection purposes and for the determination of professional questions into a general advisory body which could be consulted by Government on all questions connected with the utilisation and the improvement of the waterways of the two provinces.

In February 1912 the Committee recommended to Government the formation of a permanent "Waterways Department." Proposals were made in the Press about the same time for the formation of a "Waterways Trust."

Pending decision on these questions, Government decided to enlarge the Standing Waterways Committee, which was to be composed of—

PRESIDENT:

Member of Executive Council in charge of Public Works Department portfolio.

MEMBERS :

Chief Engineer to Government of Bengal.

An official member to be nominated by Government to advise on financial matters.

The Superintending Engineer, South-Western Circle.

A representative of railway interests to be nominated by Government.

Vice-Chairman, Port Commissioners, Calcutta.

A member to be nominated by Calcutta Chamber of Commerce.

A member to be nominated by Bengal National Chamber of Commerce.

A member to be nominated by Narainganj Chamber of Commerce.

A member to be nominated by two steamer companies.

Bihar and Orissa and Assam were to be asked to depute their Chief Engineers to advise on matters in which they were concerned.

Subsequently a special sub-committee was appointed to examine the probable costs of maintenance and revenues of waterways with a view to the formation of a Trust.

After several discussions this special sub-committee decided in March 1914 that the formation of a waterways trust was not possible until the new Grand Trunk Canal had been sanctioned and funds provided for its construction.

The local Government favour the establishment of a waterways trust, but consider that it should not be created until it is justified by the financial position of the Grand Trunk Canal.

The chambers of commerce, on the other hand, desire that the trust should be created at once and that it should carry out the construction of the canal.

Meantime the Standing Waterways Committee continues as an advisory body to Government. It considers new projects and schemes, opening new waterways, maintenance of existing waterways, levy of tolls, dredging operations, etc. Since the war its operations have been curtailed by lack of funds.

It may be asserted that with a committee thus constituted commerce and trade is not likely to suffer through neglect of the waterways of Bengal.

ORAL EVIDENCE, 10TH JANUARY 1917.

President.—Q. You know the question from the point of view of Government, and we should like to know whether there is anything that we can do, whether it is necessary, in fact, for us to take the matter in any way beyond what has been taken up by your Government. We have had what I suppose it is your note?—A. I fancy that has been prepared by Mr. Davies.

Q. It seems to be a historical sketch of what has taken place. It says, "In February 1912, the Committee recommended to Government the formation of a permanent Waterways Department. Pending decision on these questions, Government decided to enlarge the Standing Waterways Committee." Which Government?—A. The Bengal Government.

Q. But I understand that the Trust proposed was intended to operate over Eastern Bengal and Assam and in the west over Bihar and Orissa and even to the United Provinces?—A. The Trust proposed was to control the waterways of both the provinces. It would not go very far into the United Provinces but up to the limit of steam navigation on the Ganges, that is, I believe about the boundary of Bengal and the United Provinces.

Q. There will be a good many difficulties about bank rights of way, that is, riparian rights in passing through these different districts?—A. Yes. I believe I am correct in stating that accretions belong to the zamindar who owns the land alongside.

Q. Would that require legislation?—A. Yes. But I presume that the Trust if it was interested in navigation would not permit of accretions where it was necessary to stop them.

Q. But it will have to get power by legislation?—A. I do not think so.

Q. Had this question been before the Government of India?—A. No. We had a sub-committee and I was President of that sub-committee. A unanimous report to Government was submitted by us in which we stated that it was impossible for a Trust to be formed until such time as the Trust had some assets. The assets we proposed were, of course, the Grand Trunk Canal. When that had been completed the formation of a Trust could be more reasonably thought out. At the present time the formation of a Trust is impossible because there are no assets.

Q. The Chambers of Commerce are in favour of forming the Trust at once?—A. The proposal would simply mean that this Local Government and the Imperial Government and every other Local Government concerned would have to subscribe very largely, in fact, nearly the whole cost.

Q. Is there anything against it on the score of principle? You and your sub-committee think that it is desirable?—A. Undoubtedly, I think. Of course, my ideas on the question of the Trust may not be quite in accordance with the ideas of the chambers of commerce or

the representatives of the steamer companies. I do not see how the Trust is to be formed without the Government having a paramount interest for some period of years.

Sir F. H. Stewart.—*Q.* Who were on the sub-committee?—*A.* The report of the sub-committee was signed by myself, Mr. Pointon as representing the steamer companies, Mr. Gerard nominated by the Bengal Chamber of Commerce and Mr. Hilary.

President.—*Q.* Where does the Waterways Committee get its funds from?—*A.* It has no funds. It is a purely advisory committee.

Q. The note says, "Since the war, its operations have been curtailed by lack of funds"?—*A.* That is, of course, to a certain extent true in this respect, that for the improvement of waterways we have, since this Standing Waterways Committee was formed, submitted to the Government of India certain proposals for the purchase of a dredging plant. The Government of India have sanctioned certain estimates and we have purchased one dredger at a cost of four or five lakhs, I forget the exact figure now and several other things in the shape of barges, steam tugs and that sort of thing. That has now in part gone to Mesopotamia.

Q. You are still of opinion, in spite of what the chambers of commerce say, that it is impossible to form a Waterways Trust?—*A.* I do not say that it is impossible to form it. I say that it is impossible to form a Waterways Trust on the lines of the Port Trust, because you have nothing in the way of funds.

Q. The Government could guarantee a loan for the purpose surely? There must be no difficulty about that? The Government need not provide money but may guarantee interest on loans raised for the purpose?—*A.* Yes. That would be one way of solving the difficulty.

Q. I am asking you this question because if the financial objection is the only objection?—*A.* I do not think it is the only objection.

Q. Have you any others?—*A.* Yes. Several. Out of India you won't find engineers with the necessary experience for this particular class of work. You have, first of all, got to get your men here and train them to the conditions which exist. There are a few engineers in this country outside the Public Works Department who have any experience in this, so far as I am aware—I may be wrong.

Q. The conditions that we have to deal with in the Sunderbans are most peculiar, and therefore if the whole of the Waterways Engineering Department is to be recruited from the Public Works Department, I fail to see how the Government should not have a large interest in the matter.

Q. I suppose Government would have a large interest in it in any case?—*A.* Yes, as an Imperial asset.

Q. I do not know if I am correct; I do not look upon the Port Trust or any of these things as anything in the way of private enterprise, but as a matter of Government handing over for administration a sum of money or guaranteed funds. The Trust is formed so that all the interests concerned should be properly represented and that the objects of the Trust should be worked in the interests of local people. It is a way really of forming a small local Government. The difficulty then in your way is the difficulty of getting engineers?—*A.* In the first instance, it will be very hard to get engineers with the necessary knowledge of local conditions to carry out what the Trust would require them to carry out. There is, no doubt, a very large body of practical men who have received their training in the service of the inland steamer companies who have a great deal of practical knowledge of what goes on in the way of silting, etc., and they are now of considerable use to us in the department in maintaining the routes. But their knowledge is not highly skilled knowledge and they have more practical experience in the way of overcoming small difficulties than anything else.

Q. I suppose the class of engineer you will get will be men like the engineers experienced on the Mississippi?—*A.* I do not know of the exact conditions of the Mississippi, but men who have had experience there would do equally well here.

Q. Do you think there will be any difficulty of men in that kind being obtainable, and if they are not obtainable could we not get one or two men and make a start and train others?—*A.* I do not say that it is impossible. I say that it will take years and I say that in the first instance you must have funds.

Q. If the Government financed the Trust and then handed over the administration of the Trust to a body, that body could set to work in the way the Port Commissioners do?—*A.* Yes. I do not mean to say that the thing is impossible. In my opinion, if you form a Trust to carry out the scheme for the improvement of these waterways, you must, I think, in the original instance, rely upon Government to do the work and provide funds. I think it will be unfair to the Public Works Department to have this scheme carried out by the Trust.

Q. I do not quite follow that point why it should be unfair to Public Works Department officers. Somebody who is efficient should do the work and if they are Public Works officers so much the better, but in the absence of officers experienced in this class of work there would be no harm in importing an outside engineer and placing him under the orders of the Trust?—*A.* None whatever. I do not object to that at all.

Q. I think the main point for us to consider, first of all, is whether this development of waterways will be in the interests of commercial and industrial development?—*A.* Yes.

Q. If that is admitted, and I take it for granted from the recommendation of your sub-committee, then the question of ways and means arises. The first one is that of finance. You think there is no difficulty in Government guaranteeing a sum of money raised from the public and placing it at the disposal of a properly constituted Trust?—A. I see no objection to it myself.

Q. That gets over the financial difficulty so far as we can judge? Next follows the question whether you can get engineers to undertake the work, and I understand you to say that at present you could not put your hand on men who have the right kind of experience in the Public Works Department, but do you object to introducing river experts from outside?—A. I do not think I said that. We have men in the Public Works Department with sufficient experience at the present time.

Q. You have?—A. Some. I see no objection to getting men from outside with similar experience.

Q. But if you have experienced officers in the Public Works Department, so much the better?—A. I say that we have at the present time a certain number of Public Works Department officers with the necessary experience to start work, not on a very large scale but on a small scale.

Q. Then the question of engineers presents no difficulty? You have men?—A. The difficulty that I was suggesting was not that there were no engineers available, but you would have to indent on the Public Works Department in the original instance for starting work. That is the point.

Q. There is no difficulty in that, I suppose?—A. I suppose there is no difficulty in that.

Q. The Public Works Department officers will be as glad to work for this Trust as to work in any other capacity for the Government?—A. Yes.

Q. Are those difficulties removed so far as we can judge this morning—the financial question and the question of engineers?—A. Yes; the difficulties are, in my opinion, removed if you can obtain the necessary financial assistance and the engineers with the necessary qualifications to carry on the work.

Q. I understand you to say that these engineers do exist to begin with?—A. Yes. Some exist, of course, I dare say, in Burma and elsewhere where similar conditions exist.

Q. Are there any other difficulties that we ought to take into account before making any recommendation on this point?—A. None whatever. The only difficulty which the committee of which I was the President pointed out was that if the Trust was formed it would have no assets.

Q. Are you of opinion that we should be justified in urging this on Government as a matter of public importance when finances permit?—A. I think to a certain extent it is of very great importance. In my opinion we must have the Grand Trunk Canal. This is purely my own personal opinion. Otherwise inland steamer companies in time will be up against a very big problem.

Q. Whatever you form, a Waterways Department, or a Waterways Trust, or a Standing Waterways Committee, its first work would be the construction of the Grand Trunk Canal?—A. Yes.

Q. It seems to me that the difficulties are not great so far as they are visible?—A. The difficulties are not great if the money is forthcoming.

Mr. C. E. Low.—Q. Was there any idea of getting any more funds from any of the interests concerned, not only from the Governments but from the interests concerned?—A. Yes. The whole thing was threshed out. May I quote from my note on the formation of a Waterways Trust, dated the 6th April 1916. The proposals were that the Trust should take over and maintain and manage groups 1 and 2, we group the waterways into groups, and receive therefrom all tolls and revenue derivable paying to the Government of India an annual sum of Rs 90,000 for the canals included in group 2. A further subsidy shall be paid by the Imperial and the Provincial Government for the maintenance of all the rivers included in group 3. Mr. Pointon's proposal was that the Government of India should pay a subsidy of six lakhs of rupees per annum, the Government of Bengal a similar sum and the Governments of Bihar and Assam should pay a subsidy of one lakh. The District Boards should pay subsidies for work done.

Q. That is supposed to be enough to cover the estimates of expenditure?—A. No.

Hon'ble Pandit M. M. Malaviya.—Q. What would be the total receipts so estimated?—A. 15 lakhs is the total of the subsidies. Subsidies to the extent of 14 lakhs would be required to carry out the programme of work annually. That is the general calculation.

Mr. C. E. Low.—Q. The class of receipts was from the Imperial and Provincial Governments and the District Boards?—A. Yes.

Q. And also the tolls leviable were to be made over to the fund?—A. Yes.

Q. It does not seem to me on that showing that the steamer companies concerned were to contribute one iota to the funds for the greatly increased facilities which they would presumably enjoy? Is that correct? Was there any reason for it, such as inability to pay or difficulty of collection?—A. At the present time the steamer companies pay Rs. 5 per trip through the Sunderbans and an additional toll passing through the Madaripore bill. The

Government gets that amount at present. The Madaripore bhill route is worked in itself and the amount of toll is credited to that particular work. We keep a capital and revenue account for it. As regards your question about tolls, I am afraid I cannot give you a very clear answer. The idea was that the tolls should be given over to the Trust and with regard to the existing locked canals the Government of Bengal was to receive Rs. 90,000 annually from those tolls on account of their outlay in construction. In the Madaripore bhill route tolls are now paid and Mr. Pointon's note says that it is not necessary to raise the toll. As regards the use of the other channels I presume that the same rate of tolls as at present exists would not continue but would have to be increased.

Q. You see my point. The body is constituted for the purpose of improving the facilities which those interests enjoy?—A. Yes.

Q. You are making them pay a substantial increase for a specific work, namely, the Grand Trunk Canal, but it is not clear whether you make them pay any more for the improved facilities which they will enjoy on the rest of the system?—A. The question of the increase of tolls is not one which should be lost sight of at all.

Q. Turning to the question of the Grand Trunk Canal Project, you speak of it as an asset?—A. Yes.

Q. It is, of course, also a liability? Is it clear that it would pay?—A. It gives you 8 per cent. This estimate is very complete and very reliable. The former estimate which was made was, in some respects, deficient, as various difficulties were not thought of. This estimate prepared by Mr. Addams-Williams is a complete and accurate forecast of what, I believe, is going to happen if the Grand Trunk Canal is constructed.

Q. With reference to estimates on productive works generally, there is a certain amount of experience and you could fix some figure of interest which they would pay. Has there been experience of works of this kind?—A. Yes. We have the Madaripore bhill route at the present moment.

Q. Have they been constructed?—A. That has been constructed. The estimates in that case were largely under-estimated, but with the works which we have recently carried out, I think that eventually we will get 4 or 5 per cent. out of the Madaripore bhill route as a permanency.

Q. An under-estimate in one case is, of course, a valuable guide to future probabilities in others?—A. Yes. The under-estimate of Madaripore bhill route was very largely due to the fact that it was not thought that it would fulfil its purpose to such a large extent as it does now. The conditions have changed and we have to contend with varying conditions and we have had to extend our works to prevent silt deposit and that sort of thing with the result that at the present moment this year we have a very large excess of toll over that of any previous year.

Q. Is there any other instance besides the Madaripore bhill bearing on the point?—A. We have many instances—the navigation canals of Midnapur, the Orissa coast canal. These are all losing concerns. The navigation has been very largely stopped by the railways. The loss is due to the increase of railways in the immediate neighbourhood.

Q. You have reason to think that you have got a sufficient basis?—A. Yes.

Sir F. H. Stewart.—Q. Your Standing Waterways Committee is a purely advisory committee?—A. Yes.

Q. Who is the executive officer of it?—A. For instance, at the last meeting a Member of the Executive Council, Bengal, the Hon'ble Mr. Beatson Bell, was the President and there were ten ordinary members with the Secretary.

Q. Executive action is taken through the Public Works Department?—Yes.

Q. How often does this Standing Committee meet?—A. Whenever necessary. For instance, we should have a Standing Committee meeting to consider this report immediately after it has been issued to the public bodies.

President.—Q. Have you got any further remarks to make?—A. I should like you to consider that paragraph in Mr. Addams-Williams' report which refers to the necessity of putting through this work. You will see there that he shows very clearly that unless a canal of this kind is shortly constructed the steamer routes of the Eastern Bengal will be, to a certain extent, put to a very considerable extra expense and trouble. The difficulty is that you have to move from west to east to get to Eastern Bengal and east and west channels present a difficult problem. The north and south channels maintain themselves to a very great extent and the difficulty is the maintenance of these east and west channels. The Sunderbans area is now to a certain extent in parts reclaimed and the east and west channels are drying and difficulties will increase, so that a canal of this description which will avoid the worst part of the Sunderbans is eminently desirable, and in the interests of the steamer services and trade with the Eastern Bengal by river, very necessary.

Q. We ought to urge it with or without the bigger question of forming a Waterways Trust?—A. Yes.

(Witness subsequently forwarded the following supplementary written evidence.)

On reading the evidence through I believe the impression might arise that I am of opinion that it would be possible to ask Government to guarantee interest on loans raised for

the purpose of a Waterways Trust. I have said in my evidence that this would be one way of solving the financial difficulty but as I have more than once stated in my evidence, the difficulty is that a Trust if formed at once on the lines of the Calcutta Port Trust would have no assets, and I am of opinion that the time has not arrived when such a proposition could be laid before the Government of India with any chance of success. I shall be glad if this opinion be recorded.

WITNESS No. 177.

Mr. J. C. K.
Peterson.

MR. J. C. K. PETERSON, I.C.S., *First Land Acquisition Officer, Bengal.*

WRITTEN EVIDENCE.

Account of the Trade in raw hides in Calcutta.

The trade in raw hides before the war, so far as Calcutta was concerned, was almost entirely in the hands of German firms or firms the controlling interest of which was largely German. These firms formed a combine of shippers and worked in connection with a similar combine of buyers at Hamburg, to which port the great majority of the hides were exported. On two occasions at least two firms endeavoured to break through this combine; both attempts were entirely unsuccessful. Various suggestions have been made as to the causes of this combine which undoubtedly existed. It has been suggested that the shippers and buyers were backed by the German Government who desired for military reasons to get the control of the trade into their hands. Personally I do not believe that this was the origin of the combine, though I think the German Government made use of it during the period immediately before the war to retain the control of the supplies of leather required for military purposes. But in its origin the combine was economic rather than political. The hide trade has always been looked down on. It is not a particularly savoury business. It has had in the past a bad reputation. There is often much dishonesty in the method of curing the hides in the mofussil, the fleshers and skimmers often adding earth and other substances to the salt used for curing, or skinning the hides badly in order to increase the weight. There have also been many complaints of a grave nature brought against the collectors of the hides in the districts. I may refer to the agitation as to the practice of skinning goats alive in order to procure larger skins and to the outbreak of cattle-poisoning that occurred some years ago in Bihar. For these reasons the ordinary English firms in this country would not touch the trade, and it was consequently left for any persons who wished to take it up. After the Franco-German war there was a very great development of the tanning industry in Germany and Austria and to a large extent the tanners in those countries deprived the English tanners of this business. In order to meet their demands for raw materials, the purchases of the raw hides on behalf of Germany and Austria increased very largely, until shortly before the war these countries were taking 60 to 70 per cent. of the total hides exported from Calcutta. These hides were shipped direct to Hamburg and Trieste which ports were the principal buyers. This fact alone sufficiently explains the German control of the trade. It is obvious that if Germany and her allies purchase seven-tenths of the total produce, they will make their own arrangement for the selection and shipment of the goods purchased. The trade fell naturally into German hands. The firms who had taken it up found it extremely profitable, and as in any other business, when they found that new firms, attracted by the profits, were endeavouring to enter the business, they naturally proceeded to freeze them out. This was the chief reason for the combine. At the same time the trade is obviously of great military value, and I do not think there is much doubt that the German Government were aware of this in the years immediately preceding the war and that they encouraged it.

The following is a brief account of the organization of the trade.

Raw hides, after being dried or salted in the mofussil, are despatched in the first instance by the collectors to the arathdars or commission agents in Calcutta. These hides come from all over the North-Western Provinces, Bihar and Orissa, and Eastern Bengal and Assam. The hides coming from the west are usually dried hides, those from the east are usually salted hides. The arathdars deal with all classes and descriptions of collectors. Their biggest customers are the big butchers of Cawnpore, Lucknow, Patna, and such towns; parcels of hides despatched to them may vary from 10,000 to 160 hides. But the arathdar is merely a commission agent. He receives the hides, stores them in his godown and sells them to the shippers. He does not actually purchase the hides himself and they do not at any time become his own property.

His commission is realized when the hides are sold and is generally fixed at so much per 100 pieces. The commission does not depend on the price obtained. The arathdar's success will, however, depend on his obtaining good prices. At the same time the arathdar is largely responsible for financing the collectors. According to the custom of the trade, he advances 75 per cent. of the value of the hides despatched to him on receipt of the railway receipt; and, when competition is keen, he may even advance as much as 100 per cent. He gets no interest on these advances. When despatching the hides the collector fixes a minimum price below which the arathdar may not sell without his consent. On receiving the hides the arathdar selects and classifies them and then informs the shippers that he has a parcel of such and such hides for sale. The arathdar's selection is of no practical importance.

and is merely used for his own information in deciding what price the parcels of hides should fetch, the real classification of the hides for the purpose of export being made by the shippers.

The shippers visit the arathdar's godown, examine and select the parcels of hides offered for sale, and according to their own selection offer a certain price for them "all-round." The arathdar takes the best price obtainable and this concludes his part in the business, the shippers being entirely responsible for the removal of the hides. By the custom of the trade cow hides are sold by the "pound," the "pound" being equal to 20 pounds (Avoirdupois). They are also sold "all-round." This means that the buyer must accept a parcel containing a certain proportion of all classes and that he is not entitled to include the better classes and to reject the worse. The reason for this is that unless the hides are lumped together in this way, it would be impossible to find a market for the worse classes of hides at all and these would be unsaleable. The success of the German firms was largely due to the fact that they were willing to purchase "all-round," whereas Ispahani and Sons and other firms only desired to purchase the better qualities. An "all-round" parcel of hides might, for instance, contain the following qualities:—

80 per cent. slaughtered.	4 per cent. rejected.
12 ditto dead.	4 ditto double rejected.

After the sale the shipper removes the hides to his own godown. They are here first trimmed, that is to say, the claws, earth, etc., are removed, and are then arsenicated in order to preserve them. The cost of this is infinitesimal. The hides are immersed for 24 hours in a weak solution of arsenic and then spread out to dry in the sun. This process is not necessary in the case of salted hides. After this the shipper makes his selection and classifies the hides for export.

A great deal has been made of this classification. In the correspondence sent to me it is represented as being extremely intricate and difficult and requiring great experience. And it is also said that it is extremely difficult to understand the marks. It is really, however, a very simple matter. By the custom of the trade hides are divided into the following classes:—

1. *Agras*—Well cleaned hides of a good yellow colour.
2. *Purneas*—Darker and not so well cleaned.
3. *Darbhanga*—Fairly cleaned.
4. *Patnas*—Badly cleaned hides with flesh and sinews adhering.
5. *Bazar*—Very badly cleaned and rotten in places.

This classification refers to dried hides only. The names used do not necessarily mean that the hides in question come from these places. They are merely used as trade names to describe a particular class of hides and might as well be replaced by Nos. 1, 2, 3, etc. They only denote quality.

Salted hides are similarly classed as *Dacca*, *Meherpur*, etc. A similar classification according to districts is used in Madras and I believe in Bombay also. But the selector in classifying the hides makes no enquiries as to the place of origin and simply assigns each hide to each class according to its condition when he sees it. Most of the best dried hides do, of course, come from *Agra* and the neighbourhood. But if a hide of this quality was produced and cured in Calcutta or anywhere else, it would still be classed as *Agra*.

These classes are again subdivided into the following qualities by the selectors:—

- (1) Commissariat.
- (2) Slaughtered.
- (3) Dead.
- (4) Rejected.
- (5) Double rejected.

Here again these terms merely denote quality and there is nothing really abstruse about the classification. The selector makes no enquiry as to whether the hide that he is classifying actually comes from slaughtered cattle or not. He judges solely by the appearance.

- (1) *Commissariat* hides are the best possible hides in their class. They are not very common and practically only occur in *Agras*. The name was obviously given because the best hides come from Commissariat slaughter houses.
- (2) *Slaughtered*.—These are average first-class hides without defect or blemish.
- (3) *Dead*.—These are the same hides with one defect, such as a cut or a brand mark.
- (4) *Rejected*.—These are hides badly cut or marked or branded.
- (5) *Double rejected*.—These are the worst class of hides, rotten in places and very badly marked or branded.

The classification having been made, the hides are again divided into heavy, middle and light in each quality of each class.

As I have said, there is nothing really abstruse about this classification, and as a matter of fact all the shipping firms, including the German firms, rely entirely upon their

Indian establishment for the classification and selection of the hides. It would be quite impossible for the shipper to select the hides himself, although he may occasionally check the selection. The hides are always selected by two independent establishments, once in the arathdar's godown when they are purchased and again in the shipper's godown for export. One selection is checked by the other and it seldom happens that there is much difference between the two. The selectors are usually Muhammadans who have been brought up to the trade and they are paid on an average Rs. 50 a month.

The shippers inform me that the tanners in England and elsewhere are perfectly aware of the meaning of their marks, and that no tanner would make a mistake as to the meaning of an "Agra heavy slaughtered" or a "Purnea light rejected." Most of the double and treble rejected were before the war sent to the Levant. There is at present no very good market for these classes. The shipper's classification of the hides is tested as in any other business by the amount of satisfaction which he gives to his buyers. It is very important to him that he should maintain a definite standard, as if his buyer is dissatisfied with one consignment and considers that it contains too many classified as say, "slaughtered," i.e., first class which should have been classified as "dead," i.e., second class, he would go elsewhere for his next consignment. The classification therefore adjusts itself.

Suggested measures for removing the German control.

The first question is what measures should be taken for destroying the German control of this trade. It is, in my opinion, impossible to do this unless either England or India is prepared to take the hides and tan them before export. So long as Germany and Austria continue to take three-fourths of the total exports, it is obvious that they must ultimately control the market. And it would be a mere waste of time to endeavour to devise measures to prevent this. I do not think it could be done. Any prohibitory legislation would principally affect the dealers in the raw material, with whom we are chiefly concerned in India, and could not have the effect of removing the control naturally exercised by so large a purchaser. It must be remembered that the German firms used to pay very good prices for the hides. This was one of the chief reasons for their control of the market.

The only practical suggestions that have been made as to the means to be adopted to prevent their recovering this control are :—

- (i) The appointment of an agent in this country by the English buyers.

The idea, as I understand it, is that an agent should be sent from England. Several of the larger agency houses in this country made an attempt in past years to enter this business. They found however that great loss and delay was caused by disputes as to the quality of the hides shipped by them on their receipt in England. This difficulty might be overcome if the English buyers would consent to send out an agent to this country who should be responsible for the quality and selection of the hides shipped, the agency houses in India being responsible for financing the business only and not for the quality of the goods supplied. If any demand in India arises for these hides, such an arrangement might be made. I may point out however that English and other tanners are already perfectly conversant with the marks used by the shippers in Calcutta. They know exactly what they are buying, for instance when they buy a "Heavy Agra Slaughtered." Apart from this the English tanners apparently do not want these raw hides. Even if after the war the demand increases, I doubt if there would be any great advantage in appointing the proposed agent. The idea is that he should select these hides for his principals, and that he would deal with the Indian firms, by which, I suppose, is meant the arathdars, on the spot, the idea being that English buyers are distrustful of Indian firms. The proposal seems to ignore the fact that it is not usually the arathdars who make the selection for export, but the shippers. As I have already shown, the hides are at present really selected by the shippers and they are very thoroughly selected. This work is done entirely by Indian establishment. It would be physically impossible for any shipper or agent to select the hides himself. If the proposed agent were appointed, he would, therefore, merely be competing with the shippers and it would take him several years to get together a staff that would enable him to select these hides with any success. He would probably in the end simply buy his consignments from the shippers, relying upon their selection, and would thus introduce a fresh link in a business which is already in my opinion overweighed with middlemen.

- (ii) That the export of raw hides in other than British ships should be prohibited.

The second proposal would entail special legislation, and, as I have already pointed out, I do not think that it would have any real effect in removing the German control. If assistance of this nature is to be given by Government, the aim should be to protect the tanning industry in this country and not the interest of the selectors or shippers. Protection of the latter would benefit a small class, and would probably injure the class which at present deals in hides. Protection of the former might build up a very important industry. The real solution of the question is to be found in the development of an indigenous tanning industry which will convert these hides into either half-finished or finished leather before they leave the country.

Possibility of creating a tanning industry in Bengal.

There are already several tanneries in Bengal, three or four in Calcutta, one at Berhampore and, I believe, one or two at Baku. The tannery at Berhampore has been

recently established. There is also a certain amount of tanning done in the villages, but not on any large scale. I do not think it is possible to draw any inference from the success or failure of such tanneries. They are small enterprises, and although their experience is of great value on technical points, they are not working on a sufficiently large commercial scale to affect the issues raised. Before the war they were, I believe, in a somewhat precarious condition financially. They are now making a fair profit—at least those which I have seen are making a fair profit—but this is largely due to war conditions. The success of these small tanneries has, however, shown that the climate of Bengal in general and of Calcutta in particular is not unsuitable to the tanning of leather. The conclusion I have arrived at, therefore, is that there is no reason why a very important industry in tanning should not be developed and that the most suitable place for this would be Calcutta.

If tanning on a large scale is to be a commercial success, the following conditions must exist:—

- (1) There must be a large and constant supply of the raw material and experts must be available to make the necessary purchases of the raw material for the factories. The jute trade is a case in point. Here Calcutta has an obvious advantage over any town or place in India. The factories would be at the centre of one of the biggest hide markets in the world and would be able to purchase the raw material at the cheapest rates. There is already in existence a very large and well financed organisation which is constantly collecting these hides and pouring them into the arathdars' godowns in the town. There is also a large organisation occupied in selecting, classifying and purchasing these hides for shipment. The shippers would naturally select and buy for the factories if these came into existence, in the same way as jute brokers buy jute and sell it to the mills. It would make no difference to their business if the hides were tanned or half-tanned before shipment.

If the industry is to be successful on a really large scale, it is essential that the material used should be the dried and salted hides at present exported from Calcutta. For this reason the experience of the tanners at present working in Calcutta is not so valuable as it might have been otherwise. These tanners work almost entirely with freshly skinned hides obtained from the municipal slaughter houses.

There must be a plentiful supply of water which is suitable for tanning. Here also Calcutta has an obvious advantage. So far as I know, no analysis of the water-supply from the tanners' point of view has been made. But the success of Dr. Nilratan Sirkar's tannery, which uses this water, shows that it is suitable and there is a plentiful supply. Another point in favour of Calcutta is that electrical power can be obtained. I do not know if the electrical system of tannage has any future. Experts seem to be rather doubtful about it. But the advantages of an electric supply are in any case obvious.

- (3) There must be good banking facilities. The German firms depended very largely on the banks who used to advance money against the hides as these were brought into their godowns. The Chartered Bank, I believe, did a good deal of this business. Such facilities are even more necessary in the case of tanneries. In tanning a very large amount of capital is always locked up for one to five months in the shape of hides lying in the vats. Here also Calcutta has an obvious advantage.
- (4) A constant supply of suitable tanning materials. For bark tanning a very plentiful supply is already available. The bark chiefly used by the Bengal tanners is babul. In Madras, avaram or tarward bark is much used, especially for the half-tanned hides which are exported in large quantities. But avaram (*cassia auriculata*) possesses no advantages over babul and is probably inferior as a tanning material. There is also a plentiful supply of myrobalams. Personally I do not think that there is much future for bark tanning and very soon most of this will be replaced by chrome tannage or tannage with bark extract. There is already a myrobalam extract factory at Banara near Raniganj, which exports most of its production. As to the chemicals required for chrome tanning, these are chiefly chrome alum or bichromate of potassium and the aniline dyes required for colouring the leather. Chrome is, I understand, to be obtained near Quetta, in the Central Provinces and in Singhbhum. In any case, however, Calcutta is as favourably situated as any other place in India in this respect.
- (5) There must be a large and constant demand for the manufactured article. There is apparently no very great demand for dressed leather within India. There must, however, be a very large demand outside. The statement attached showing the imports into and exports from the Calcutta trade block shows this very clearly. I may say at once that without protection it would be impossible for the Bengal or Indian tanner for the first few years to compete with foreign countries. In almost every country a prohibitive duty has been placed upon the import of leather and it would be impossible for them to find a market. But apart from this, there can be no doubt that the demand exists.

The world must have leather. The continually increasing exports of the raw hides proves this and the ever spreading search for new sources of supply of the raw material. The demand, and in fact the actual necessity, outside India for the leather manufactured from the hides which we export is, therefore, clear enough. India here is in a very sound position. She controls one of the largest sources of supply of the raw material. I think she is quite able to treat this with materials which can be procured within the country, and if she likes to insist that it should be treated before it leaves the country, the consumers of the actual finished leather will be compelled to take it from her. The world must have the leather in some shape or other. If India insists that the hides shall be tanned in this country and that no raw hides shall be exported except under prohibitive duties, the consumers must take it in the finished shape. They cannot do without it. If in retaliation they put on duties against it, they will be merely fining themselves. But it will probably take them several years to discover this, and unless the industry is protected it would be ruined before it was fairly started.

India is also in a very good position to ask for protection of this nature from England. The English tanners will not take these hides and will not tan them at present. It is extremely likely that after the war protection of some kind will be introduced in England, the Colonies, and India. Any measures of this kind must to some extent harm Indian consumers in respect of the articles protected. India will expect something in return, and if she does not ask for too much, will probably get it. The tanning industry holds out extraordinary prospects of development for the reasons I have given. It is also of the greatest military importance. There is, therefore, a very good chance that England may agree to its protection even though the effect may be to raise the price of leather in England. India should, therefore, press very strongly for protection in this shape, and if it is obtained a very large industry in tanning will develop. Apart from this, no more effective method of doing away with the German control of the trade could be devised. In a nutshell the position is as follows:—

Raw hides averaging 1,164,000 maunds a year pass through Calcutta in their raw state to be tanned in some other country. I see no reason why we should not tan or half tan them first before we export them.

Any proposals for Government assistance that I have to make are therefore based on the assumption that the industry will be protected. There are several ways in which assistance might be given.

1. A school of tannery might be established. The object would be to deal practically with the difficulties that might be felt by the tanners. Throughout my enquiry I have found it impossible to obtain any real scientific assistance. I know of no expert tanner in Bengal who could supply this. There are many questions connected with the industry which it is impossible to answer without scientific advice and experiment. The institution would concern itself with such matters as the following:—

- (1) The production and suitability of the various tanning materials and chemicals required.
- (2) The correct proportions of these to give the most profitable result.
- (3) The proper treatment of the hides in the mofussil.
- (4) The advantages of chrome tanning as compared with bark tanning.
- (5) Whether it would be more profitable to Bengal to turn out half-tanned hides as in Madras or to finish the leather in this country.

I am told, for instance, by one tanner that the worse varieties of dried and salted hides cannot be chrome-tanned profitably. Another tells me that this is not correct. I do not think either opinion is based upon actual experience or, if it is, that the experience really affords sufficient data. The experimental tannery or school of tanning which I suggest would deal with such questions by actual experiment. Again, I am told that it is impossible to provide a half-tanned hide such as those required by the War Office at present by babul tanning or by chrome tanning. But another tanner tells me that chrome crust leather has possibly a great future before it, and yet another says that there would be a great demand in England for leather which had been half-tanned with babul bark. This again is a matter for actual experiment.

2. Government might assist in the organisation of new tanneries, either by guaranteeing the interest on the capital raised or by providing a certain amount of this at a low rate of interest, or by agreeing to purchase a definite percentage of the outturn, provided this were up to sample, or by providing land. Here also there is a good opportunity to assist in the development of the industry. Government has much spare land in Calcutta that might be used more profitably than it is used at present.

3. Assistance might also be given by supplying the tanning materials required or by granting specially low rates of freight for these on the various railways by which they are brought into Calcutta. In this direction there is a great deal to be done, one of the principal needs being a cheap and constant supply of the various chemicals wanted for chrome tanning.

4. All these methods might be combined by the creation of an experimental tannery under a qualified expert. I should float this as a company at a return of 5 per cent. I would ensure this return by agreeing to purchase either the whole outturn or a proportion of this at a fixed price provided it were up to sample. I do not think there would be the least difficulty in procuring the capital required from the arathdars, the shippers, the tanners, and the various firms interested in the trade. The Government expert would be the manager and there should be a Government director on the board. It should be distinctly understood that the work of the tannery would be chiefly experimental and that one of its principal objects would be the training of labour in the work. All profits in excess of 5 per cent. would be devoted to experiment, the debenture holders being entitled to their 5 per cent. and to no more. The profits would almost certainly exceed that if protection were introduced, and with this example before them other companies would not be long in coming forward. If the outturn was unsatisfactory and the tannery was unsuccessful, I would reserve the right to Government to close it on return of any capital invested in it.

5. I cannot advise as to the experts. But if a sufficient salary is offered, there should be no difficulty about getting one or more. What is wanted is a practical tanner and an expert chemist. A factory that would suit very well for such a purpose could probably be purchased in return for a certain number of shares in the company or for cash. If Government are at all inclined to consider this scheme formal and exact proposals could be worked out after negotiating with the various persons interested.

6. A still better arrangement, but one that is very much more expensive, is connected with the proposals made by the Corporation for the removal of the hide trade from Calcutta itself to the fringe area. The Corporation have resolved that all the arathdars' godowns are to be removed to an area lying to the south of Sealdah station and to the east of the Eastern Bengal State Railway line. This resolution has been suspended during the war, but will be enforced at its close. The present is obviously a very suitable time to move the godowns, as the trade is dull. The scheme that I would suggest is that the arathdars should now be persuaded or forced to remove to a certain definite area in the area set aside by the Corporation, and that the experimental tannery should be set up there. If the railway allow a siding, other factories would come into existence as near the market as possible, and the result would be that the hide and tanning trade would be confined to one part of the town where it would have ample facilities for its business and where it would not annoy the other inhabitants. The great difficulty here is to persuade the arathdars to move. They will not themselves combine except under pressure and their chief objection is that they cannot obtain the land. I am assured that there is any quantity of land, but, as I have said, they will not combine. If land were placed at their disposal, I think they could be compelled to move. The Corporation and the Improvement Trust, however, both take the view that it is not within their proper functions to provide land for such a purpose. Here they are probably right, and I doubt if Government would have any power to acquire for such a purpose or to spend public money on it, even if the arathdars formed a company for the purchase of such land as they need. But if Government offered to put down an experimental tannery as a nucleus and they understood that the supplies of raw material required by the tannery would be taken from their stocks, I have no doubt that they would sooner or later group their godowns round it. If such a scheme were ultimately contemplated it would probably be possible to lease a factory until the new buildings were ready.

Imports into and exports from Calcutta trade block of hides (raw and dressed or tanned) carried by rail, road, country boats, inland steamers and sea (coasting and foreign) during the four years ending 1915-16.

YEARS.	IMPORTS.		EXPORTS.

1914-15	924,194	3,756	873,947	650
1915-16	1,126,418	5,116	1,075,514	769

ORAL EVIDENCE, 10TH JANUARY 1917.

Mr. C. E. Low.—Q. You say that in Madras avaram bark is much used and that the supply of this bark comes mainly from the Central Provinces. Is that *cassia auriculata*?—A. I should like to correct that statement. I have been trying to get avaram bark in Calcutta and I cannot do so except at prohibitive prices.

Q. With reference to the export tax on hides the tanning facilities that might be provided would cover only a very small proportion of the available supply and in that case you would be hitting the trade rather too much?—A. The way in which I understood it is this. I think that if you are going to make a success of tanning it would require a great deal of capital. I do not think there is any chance of procuring this unless you guarantee a monopoly.

Q. You have not heard of any firms in Calcutta who are proposing to start any new arrangements of this sort?—A. No firms of any size have taken up the matter. I have papers here from one firm. They did try to start but they gave it up as a failure.

Q. I have personally had confidential opinions from one or two very important firms who are considering the matter?—A. If it will be possible to establish a tanning industry without putting on any tax or any kind of prohibition so much the better, but I do not think it could be done.

Q. Don't you think that in the case of the imposition of a tax the trade would be hit and be disorganised?—A. I think it would unless you arrange that the tannery should start work simultaneously with the putting on of the tax. You must find some outlet for the raw hides in the godowns.

Q. If they could make arrangements to tan a considerable percentage of the hides by, say, three or four years from now, you would with effect from that date put on an export tax?—A. That will meet my point.

Q. It is difficult for Government to promise any such thing because policies change?—A. The whole thing is extremely difficult.

Q. What would you do with the money that you get from this tax. Have you any idea of ear-marking it for any particular purpose?—A. I would use it for a technical institute or for anything else that might be useful to the tanning industry.

Q. If you put on a comparatively light tax on export trade you could then use it as a very effective subsidy for the tanning industry. Have you considered that position?—A. That could be done. But the same difficulty would arise as existed before the war. Several firms did try tanning on a small scale before the war. They found that the German firms were prepared to pay a higher prize for the untanned hides than they could get for their tanned hides. It seems extraordinary on the face of it but I am assured that that was so.

Q. That state of affairs did not exist in Madras where there has been extensive hett-tanning?—A. It is the finished leather that I am talking about.

Q. What you apprehend is that either the exporters of hides would close the market against the tanners and put up prices to an extent which would be prohibitive or that they would arrange to get leather imported and undersell them in this country?—A. If we start tanning in this country we will have to depend on the same market for the sale of our leather as Germany and Austria depended on before the war, and if the Germans are willing to pay more for the raw hide and can sell the leather cheaper than we can they will capture the markets and we shall lose them.

Q. But surely if you have the proper tanning processes and the hides and the tanning materials and organisation you should be able to knock out any proposition for the exporting of untanned hides?—A. I think for the first three or four years it would require a certain amount of assistance before it was started and organised.

Q. It comes to this then that you want to start with an organisation which is either organically very strong or which is strengthened by some help from Government?—A. I think it should be strengthened by Government.

Q. Do you mean that Government should strengthen it very materially by guaranteeing purchase?—A. I think that as a matter of fact that is the best method but I doubt whether Government would be willing to do it. It would mean taking a very large quantity. I never contemplated that Government would regard such a proposal at all favourably. I thought they would have very much more objection to this than to an export tax. It would amount to two or three millions a year if it is to be of any value. Government will have to buy and resell. They could not use it themselves.

Q. Is that the lowest figure of output?—A. The raw hides and skins passing through Calcutta before the war were valued at five to six millions sterling. I suppose the value would increase very much more when the hides are finished and dressed. I suppose it would be very nearly doubled. At least 25 per cent. of it would have to be taken over if you are to afford the trade any encouragement.

Q. If Government purchased a fair proportion of the output, say between one and two millions sterling it would put the tanners in an impregnable position?—A. Personally I think it would be easy to work out a scheme on those lines but I think that Government would object to it more than to proposals for a tax.

Hon'ble Pandit M. M. Malaviya.—Q. You refer in your note to the agitation against the practice of skinning goats alive. Has that been put an end to?—A. There was as a matter of fact considerable agitation some 13 years ago. I am speaking from memory. I think it has been put a stop to. I cannot really say. I dare say that it still exists in some parts of the country.

Q. You say that without protection it would be impossible for the Bengal or the Indian tanner for the first few years to compete with foreign countries. Don't you think that with all the facilities in India you should be able to find a market locally for the manufactured goods and that you should be able to do without protection?—A. I do not think there is a very large home demand in India at present.

Q. Is not much of the hides which is exported brought back to the country in a manufactured condition?—A. I do not think there is a great demand for the dressed leather in India. I think a big demand will develop. I do not think that any very great demand exists at present. It is developing now in Calcutta in the case of small tanneries.

Q. As the demand develops the industry will be able to hold its own?—A. If it is assisted in the first few years of its creation.

Q. You say in your note that Government might assist in the organisation of new tanneries either by guaranteeing the interest on the capital raised or by providing a certain amount of this at a low rate of interest or by agreeing to purchase a definite percentage of the outturn. Why do you think this necessary if the trade is a very profitable one? Why do you think that Government help is needed?—A. I do not think it would attract capital. I would not put my own money into it.

Q. For fear that the industry would suffer through foreign competition?—A. Yes.

Q. If that fear were removed then you think that without any Government assistance private capital would be coming forward?—A. I doubt whether private companies will attract capital unless they had some promise of assistance. I doubt very much whether they will come forward.

Q. You think that unless there is an export duty or some other kind of help from Government this industry is not likely to develop to any extent?—A. I think it will develop. It will develop much more quickly if assistance is given. Ordinarily it might take 50 years to develop, but with aid and encouragement from Government you might build up a very large tanning industry in 10 or 15 years.

Q. Do you suggest that Government should guarantee the purchase of the products of the tanneries?—A. I think that is a much more satisfactory way of assisting an industry than guaranteeing interest.

Q. The Government at present patronise Cooper, Allen & Co. at Cawnpore. Do you think that in addition to that Government should purchase a certain quantity from other tanneries?—A. I am looking at it merely from the point of view of Government assisting the industry. They would have to resell it after having bought it. If you guarantee them 5 per cent. on their capital they have no incentive to turn out good stuff. They know that their 5 per cent. is safe. In that case the profits do not depend on their work.

Q. Even if the Government did not require the products for their own purposes they should purchase and resell?—A. I suggest that as a means of encouraging the tanning industry.

Q. Have you any instance in mind in which such a thing has been done?—A. I cannot say that I know of any.

Q. Do you suggest that they should purchase in addition to guaranteeing the interest?—A. No. I only said 'instead of'.

Q. You say that all the methods might be combined by the creation of an experimental tannery under a qualified expert and that you would float this as a company at a return of 5 per cent. and that you would increase the return by agreeing to purchase either the whole outturn or a proportion of this at a fixed price?—A. That is a mistake in the note as printed. The word should be "ensure" not "increase". The idea is that this should be more a technical school than a private company.

President.—Q. One of the chief objections is that we are not justified in recommending Government help except in an absolutely new and pioneer industry?—A. I regard this as such.

Hon'ble Pandit M. M. Malaviya.—Q. You cannot say that this is a new industry? It is only a question of capital coming in?—A. The existing tanneries here are on a very, very small scale and but for the war all these tanners would have been bankrupt already.

Q. Without war conditions these experimental factories would be at the same disadvantage?—A. I suppose they might be.

Q. Do you think that a trade which requires help in so many ways both by way of interest guaranteed and the imposition of export duty deserves to be fostered?—A. That is really on account of the military importance of the trade. I think it would be a very good thing to develop the industry by any means.

Q. If the Government started a school of tanners and made the facts connected with his trade known, don't you think that it will attract private capital in time?—A. I think it would take a very long time.

Q. If in addition to establishing the tannery school Government put on an export duty on hides then the trade would develop better?—A. Then you would have a very large development of the tanning industry at once.

Hon'ble Sir Fauslaboy Currimbhoy.—Q. Do you think that the raw hides secure better prices than the finished article?—A. As a matter of fact that is what happened. The Germans used to pay higher prices for the raw hides than the tanners could get for the finished article.

Q. Do you think that if the Government sells the articles it could do so at a profit?—A. I could not say what exactly the profits will be.

Q. You say that there is no large market here?—A. You might create one.

Q. Don't you think that if the Government takes up the thing and if it is not able to sell the stuff it would lose heavily?—A. What I say is that Government must be prepared

to lose a certain amount of money. I do not say that it will be a profitable proposition. The actual details will have to be worked out and the whole thing will have to be done very carefully. You cannot say anything definitely until the actual details are settled.

Dr. E. Hopkinson.—Q. If tanneries were established in India, would shippers buy hides and tan them here or would they continue their present business in shipping raw hides?—A. They may do either. They may send them away as raw hides or have them tanned here and then ship them.

Q. In the latter case the tanners would buy the hides?—A. Yes.

Q. Would not that require a large amount of capital?—A. Yes, unless you can get the banks to make advances. I do not know if the shippers have enough capital. Most of the shippers work on a system of advances. They purchase hides and the banks advance against them.

Q. You suggest that it would be impossible for the tanner to select the hides himself?—A. It would be an advantage if they had experience in doing this. As a matter of fact it does not very much matter. There are only two or three firms that are of any great importance as shippers.

Q. In what way does it not matter?—A. They would be as pleased to take the tanned hides for shipment as the raw hides. I do not think it will affect them at all.

Q. How are hides sold in the market?—A. I do not know. At present they are selling them "all round" to America in one or two instances.

Q. Are they sold by auction?—A. In Hamburg I believe they were sold by auction.

Mr. C. E. Low.—Q. We had information from the Board of Trade that the tanners in Germany dare not buy except through these exporters in India and that the shippers in India did not sell to anybody except the Hamburg people. It was proposed by certain firms in London to the Board of Trade that the auction system should be held in London. They said that the auction system is the only way in which you could do it successfully in competition with Germany?—A. That was exactly the position with regard to the trade here. Practically all the dealers were in the hands of the importers in Hamburg. They would not sell to anybody else.

Dr. E. Hopkinson.—Q. Do you make these suggestions for the establishment of tanneries in India simply in order to create a new industry in India or is it with a view to provide better means for getting hold of the English market?—A. What I was really considering was the letter from the Government of India in which they asked for suggestions that could be made towards removing the control of the trade in German hands. It seems to me that the only way of doing this is to develop a large tanning industry. I believe the tanning industry has been very successful in Germany and Austria. I do not see why we should not do the same thing here. I do not know of any other way of doing it.

Q. You mean to say that English tanners will not take Indian hides?—A. Practically that is the position. I do not know if the position has changed since. The Board of Trade was asked if the English tanners would take these hides and they replied that they would not. In England they used to take the tanned leather from Germany and work it up.

Q. From your own experience you have found that the English tanner has not taken Indian hides?—A. At present he has not. The idea was rather that he should be persuaded to do so. I think it would be more economical and much more to the benefit of this country if we took up the tanning here. My idea was that we should turn out leather in precisely the same state in which it was received in England from Germany before the war. Most of the hides went to Germany and Austria and the leather was taken from them after it had been tanned. My idea is simply that we should cut out Germany and Austria and send the leather straight from here. None of the English tanners appear to be anxious to take the matter up.

Q. Are we to understand that the Germans did not buy their hides in the mofussil but from the godowns?—A. I believe they had selectors in the mofussil but the great majority of them bought straight from the godowns. Some of the shippers have branches at places like Dacca. I do not know very much about that. There are some agents up-country. They buy on the system of advances I think.

Q. But the bulk is bought at the port?—A. Mostly they were bought here in Calcutta. At the time I came to know about them the German firms were not working. I cannot say from personal experience what their methods were. They were all closed by the time I began my enquiries.

Mr. A. Chatterton.—Q. There has been a considerable increase in the price of hides recently?—A. I believe so.

Q. Is that due to competition of German buyers or is it due to other causes such as the shortage of hides in the markets of the world?—A. I am not competent to say. I think it is due to competition.

Q. You say that the hide trade is mostly in German hands and that the German firms find it very profitable. Is it due to the fact that in Germany not only the manufacture of leather has been greatly advanced as a technical industry but the Germans have also paid a very large amount of attention to the utilisation of very inferior materials?—A. I believe they have carried the tanning of inferior materials to a very high point.

Q. If we are to establish tanneries here and if we are to make the same amount of profits we must be prepared to carry the development to the same high pitch?—A. I think we must.

Q. It is not merely a question of setting up tanneries but we have also to get the subsidiary establishment?—A. I think we should have to finish the leather completely.

Q. Have you any information regarding the imports of leather into India?—A. I have not got the figures here. I do not think they are very large.

Q. If we want to do anything here we must go a good deal further than the mere establishment of tanneries?—A. My idea is that we must go as far as Germany.

Q. You know that there are a certain number of tanneries in Bengal, such as the National Tannery in Calcutta and so on?—A. They are very small.

Q. The National Tannery, for instance, is turning out very good class of leather?—A. Quite a good class of leather.

Q. And there are other tanneries in various other parts of India doing the same thing?—A. The Berhampore Tannery is also turning out a very good class of leather.

Q. There are several good tanneries in the south of India and altogether the trade in these tanneries amounts to 20 lakhs a year?—A. The trade in Bengal is very small.

Q. This Berhampore Tannery is turning out half a lakh worth of leather a month?—A. It has just started.

Q. I am given to understand that it will be turning out a lakh a month and it would be rather difficult to set up Government tanneries in competition with tanneries of this kind. There are several difficulties in the way. First of all you want trained labour for running the tannery and it would take considerable time to train the men. During the process of training a considerable quantity of leather and hides will be spoiled. Then the other difficulty which the people in the hide trade experience is that if they train people they will have to lock up a very large amount of capital during the process of tanning?—A. I think that would be the case.

Q. They are asking that some special facilities should be given for providing this capital on practically non-commercial terms at a very low rate of interest. They want a permanent advance against the stocks. They want to get the advance from Government at a very low rate of interest, a lower rate at the outset than a bank could possibly accept. Their contention is a fair one. They would have to spend a very large amount of money in training their labour and they practically ask that Government should give them a grant for the purposes of training this labour. Is that a way in which Government might assist?—A. If the labour was going to be trained Government might assist. I tried to import some labour from Madras and the cost was prohibitive.

Q. If Government contemplate doing anything in this direction, they will have to put a specialist on to the work?—A. I think they must put on an expert in order to work it out.

Q. The third difficulty that is suggested in this connection is that at the present time tanneries like the National Tannery and the Berhampore Tannery and the Mysore Tannery are making high class leather for export?—A. I do not think the National Tannery exports much. It makes most of it into boots.

Q. Whether they are exporting or not the development of the industry will involve the introduction of a new system of sorting and classifying hides for the export trade as all the best hides will be retained by the tanners?—A. I do not think it would work satisfactorily unless the tanners were prepared to take all kinds of hides.

Q. In that case it means that we have got to find out new methods of utilising the inferior kinds?—A. That is why I suggested that a technical institute should be instituted to work out the question.

Q. It is a matter for a company to start experiments with a view to creating a market for these things and that is where possibly Government help in the form of a subsidy, would prove useful to meet the initially non-remunerative expenditure. There is no doubt that whatever is done there will be a large amount of pioneer work. You want to find out what the German trade was doing?—A. I think it is necessary to find out what their processes were.

Q. Their processes are fairly well known and what they do with their products is not so easily determined?—A. One difficulty I found was that I could not get any information as to the processes that would be suitable for a place like Calcutta for instance.

Q. You suggest that the probability is that the whole industry will have to go to chrome tanning?—A. I think it would be more profitable so far as I can see Chrome tanning is very quick.

Q. It is only suitable for the better class of hide?—A. You know much more about these matters than I do.

Q. Your suggestion is that the imposition of an export duty is a necessity during this period of experimental work. Have you contemplated the amount of raw material?—A. I have not worked that out at all.

Q. There are two points which are mentioned in the correspondence with the Director-General of Commercial Intelligence which have not been touched upon. One was a suggestion regarding the correspondence from the English tanners. The correspondence showed that the

English tanners wanted to have the hides from India secured to them on cheaper terms than the Germans paid for them and they suggested that in order to effect this an export duty should be put on the hides with a rebate to those who exported?—A. I do not think I have that in the papers which I have. The two suggestions made were that the export of these hides should only be allowed to particular firms and that they should be sold by public auction and that the carrying trade should be reserved to British vessels. I have not got anything here about the rebate.

Hon'ble Pandit M. M. Malaviya.—Q. That was a suggestion from individual firms?—A. That was a suggestion from one of the firms.

Q. Do you think you can support that proposal?—A. The whole of my note has been written from the point of view of India and not that of England.

Q. Do you think that an export duty with rebate would not work?—A. I think India would object to it.

WITNESS No. 178.

Hon. Mr. W. A.
Lee.

THE HON'BLE MR. W. A. LEE, *Messrs. W. A. Lee & Co., Calcutta.*

WRITTEN EVIDENCE.

Financing of
industries.

The form in which Government assistance should be given should be separately considered for each project, as these will present so many new features from time to time as to make it difficult to lay down rigid rules. The only rule which should never in any circumstances be departed from is that it should always be a condition of Government assistance that it should be of the kind that will best foster private enterprise. It would be a misfortune if the first order if the result of Government help were to make the people more dependent on the Government and unable to carry on the enterprise that the Government had initiated.

Regarding the methods of giving Government aid mentioned in the list of questions :—

- (1) Money grants in aid should generally be given only for—
 - (a) preliminary investigations in connection with an industry,
 - (b) experimental work,
 - (c) starting a pioneer or experimental factory.
- (2) Bounties or subsidies may be given for a definite period when it is doubtful whether a factory will be profitable, and capital is not otherwise forthcoming to start it. They should be continued only if the sum paid in wages exceeds the subsidy, or if the industry subsidised is one of a related cycle of industries, and is necessary to the existence of one or more other industries, but cannot be profitably conducted without the subsidy.
- (3) Guaranteed dividends are undesirable. It is undesirable that the Government should guarantee the results of trading. It is putting the State in the position of an ordinary trader, taking all the risks while everybody else concerned simply accepts the Government guaranteed results. This tends to destroy and eliminate private effort.
- (4) Loans should always be *with* interest, and in most cases this will be the most desirable way of assisting in the establishment of new factories.
- (5) The supply of machinery, etc., on the hire purchase system is generally not desirable. It is equivalent to a loan of money repayable in a stated period, which is a simpler transaction.
- (6) The provision by the Government of part of the share capital is not desirable. It would make the Government permanently a trader, instead of leading and directing private trading.
- (7) Government purchase of the products of a new factory should always be guaranteed if the Government is a purchaser of the products, but the Government should never guarantee purchase of products not required by the Government.

Government control.

Whenever Government assistance is given in forms (1), (2), or (4), there should be Government control of the enterprise, either by complete Government management where practicable if the Government is paying the whole cost, or, if the Government only provides part of the cost, then preferably by the appointment of a Government director on the Board of Directors of the joint stock company owning the enterprise. The Government director should have a complete power of veto of all financial transactions of the Board of Directors of the company.

Pioneer factories.

Generally speaking, Government should only undertake pioneer factories experimentally, for the purpose of demonstrating whether a given factory process can be successfully worked commercially, and should be on the smallest scale compatible with the need for the demonstration to be commercial and not of the nature of a laboratory experiment. When the demonstration is complete, if unsuccessful the factory should be closed; if successful the necessary steps should be taken for the formation of a factory under the management of a joint stock company, either by enlargement of the pioneer factory or by the construction of a new factory of the necessary dimensions to ensure economic success.

Private capital is readily obtainable for an industry which is well established, chiefly from Europeans, if a European firm puts forward a satisfactory project, but for a new industry, or one in the experimental stage, Indian capital can only be obtained by—

- (a) the promoter employing his own capital,
- (b) the promoter inducing capitalists to invest as a personal favour, or as a patriotic desirability, or by holding out the prospect of large profits,
- (c) a European firm forming a joint stock company under their management

There is plenty of Indian capital available for enterprises but the capitalists have not themselves any commercial knowledge or experience, and they distrust industrial proposals, knowing that even if honest the promoters may lack the necessary knowledge and ability to achieve success. But if a project came before them with the approval and financial support of the Industries Department of Government the capitalists would know that the project had been examined by capable independent persons and that there was every reason to believe it would be conducted with ability and honesty, and that it had so far commended itself to the Government officers who examined it that the Government were able to afford financial support. With this lead by the Government, Indian capitalists would, I believe, have confidence in industrial ventures and invest freely in industrial concerns.

Industrial undertakings are now assisted by European banks chiefly in the purchase of raw materials and in the marketing of the products. The European banks do not exist for the purpose of providing funds for expenditure on capital account. Their business is to finance trade, not the construction of factories, and it would not be proper for such banks to lock up any large part of their funds in such capital expenditure. Securities upon which they advance money must be of a kind that can be readily realised. Deposits may be withdrawn, and the manner of their employment must therefore be such that the money will be available whenever required. This is the theory upon which British banks have always based their operations, and the exchange banks keep more or less closely to this practice.

The joint stock banks domiciled in India do not in all cases employ their whole funds for financing trade, and they are able to use a part of their funds for loans which represent capital expenditure. But very much more is desirable in this direction, and the establishment of banks whose financial arrangements would permit the employment of considerable funds in the shape of loans for capital expenditure is very greatly to be desired. It is often not easy to obtain all the capital required for a new venture, and if a financial institution could be found to furnish a definite portion of the capital (the proportion differing according to the security) it would be so much easier to obtain the remainder.

Even for financing trade movements banking institutions are not found in many places where they might be expected. For instance, within a radius of 12 miles from the centre the movement of money is upwards of a crore in the year, but there is not a bank in that area.

New factories should not be constructed with exclusively Government capital unless they are for a new industry or an industry in which it is desired to demonstrate a new process. This will not compete with progressive private enterprise, and Government aid to any industry should always be of the form that is calculated in that particular case to conduce to the greatest development of private enterprise.

There should be no limitation to Government aid to a new enterprise because it competes with an established external trade. It should be the deliberate aim of the Government to establish industries which will compete with external trades, with the exception that no assistance should be given to a new enterprise, beyond that needed to demonstrate its commercial practicability, if it competes with an existing external trade with some other part of the British Empire, unless it is an industry on which another desirable and practicable industry depends.

I know nothing of the rules by which the purchase of anything by the Government is supposed to be regulated, my experience is of only one article. I was interested in a project for a factory to manufacture in India a requirement of railways. Plans were prepared, and the capital was partly arranged. The President of the Railway Board was consulted and he advised us that, unless the Secretary of State so directed, the Government of India would not be able to purchase from us, and it was also pointed out that the railway companies, whose offices are in London, would be extremely unlikely to purchase from us in any circumstances, so that, although we were confident of being able to provide an article of equal quality at a less price, it was hopeless to expect that we should be able to sell our manufacture, in spite of the fact that the Government of India is the owner of the railways and provides, alike for the state-managed and the company-managed lines, the capital which would be expended in the purchase of our product.

The project was therefore abandoned.

There is no organisation in this province, nor in the province of Bihar and Orissa, for the development of industries. I proposed to the Government of Bihar and Orissa a couple of years ago that a Department of Industries should be formed in that province.

There should be a Board of Industries, composed of—

The Director of Agriculture,

The Registrar of Co-operative Societies,

The Conservator of Forests,
Six commercial men (if so many can be obtained).

The functions of the Board of Industries should be—

- (a) executive, the disposal of the funds available for aid to industries, except the limited sum which may be within the personal authority of the Director of Industries;
- (b) advisory, to advise the Director of Industries on all matters connected with the working of his department.

There should be a Director of Industries, the executive officer of the Board of Industries. He should be a business man, not an official, and not necessarily an expert. It is more important that he should have a general knowledge of industrial processes than that he should be an expert in any one industry.

The Director should convene and attend meetings of the Board of Industries at regular intervals, and the work of his department should be brought to the notice of the Board at its periodical meetings.

There would be many advantages in an Imperial Department of Industries with a branch in each province. No important work can be done by a Director of Industries involving the expenditure of a considerable sum of Government money without a grant from the Government of India, and it would be convenient in some respects to have the money spent directly by a department of the Government of India instead of being handed over to a provincial department to spend. It would also be easy to correlate the work in different provinces, as it would all be the work of one department, and there would be no chance of work of any kind being repeated in different provinces, to which there is an inevitable tendency with different provincial departments.

A branch of an Imperial department in any province would have the disadvantage, on the other hand, of being dissociated from the provincial Government, and it is undesirable for the local administration to be separated from all commercial interests. It would be of advantage to industries that they should have the sympathy and active help of the Provincial Government, that the provincial Government should be directly concerned in the industrial enterprise of its own province. There is, moreover, a great deal of provincial patriotism abroad, which finds expression in a craze for decentralisation, on account of which a proposal for provincial branches of an Imperial department will meet with considerable opposition apart from its merits.

If provincial branches of an Imperial department are not formed, there should be in each province a Department of Industries, of which the Director of Industries should be the head. He should report to, and take orders directly from, the head of the provincial Government, and not through the Secretary of another department, *e.g.*, Revenue or Finance.

The provincial departments should work in correspondence with and communicate direct with the Imperial department (not through another department, *e.g.*, Finance) and all important experimental and investigation work should be previously reported to the Imperial department so that duplication of effort in different provinces may as far as possible be prevented. Each province should then be advised by the Imperial department regarding the intended programme of experiment or investigation in every province.

The Imperial department may be obtained by dividing the present Department of Commerce and Industry into a Commerce Branch and an Industries Branch, each with quite separate organisations. The new Industries Branch, or Industries Department, would be similar in some respects to the Railway Department, and be similarly regarded as a technical department.

The head of the Imperial Department of Industries, like the provincial Directors, should be a business man. The functions of the Imperial department would be to control the scientific departments, and the technological research institutions, and to assist the provincial Industries Departments so as to secure co-ordination, and to allot grants for special purposes to the provincial Industries Departments.

Each provincial Department of Industries should obtain the most recent technical literature in connection with all the practicable industries of that province, except such as are already developed by financially strong corporations, *e.g.*, tea growing, jute weaving, or gold or coal mining. Catalogues of these provincial libraries should be in the Industries office of each province, so that any Director of Industries may know where to refer for information that happens not to be in his office.

The publications of every provincial Department of Industries should be listed for public information by the Department of Industries of each province.

All technical schools should be under the control of the local Department of Industries, and not under the literary Department of Education. The Education Department should not control engineering or other technical education any more than it controls medical education. The Department of Industries may be expected to know what technical education is required at each centre, and we may hope for the disappearance of the present conditions under which a technical teaching institution is formed and to justify its existence students who have no aptitude for the particular study are induced to join.

There should be scientific technical departments for—

Technical and scientific departments.

- (a) Geology,
- (b) Chemistry,
- (c) Botany,
- (d) Physics,
- (e) Zoology,

which should be Imperial, and under the control of the Imperial Department of Industries. It is important that the control of these scientific departments should be commercial, because a scientific department is always in danger of being purely scientific. The tendency of a scientific man is always to think of his science, and to disregard or disdain its sordid economic application, and control by a purely commercial department will act as a very desirable corrective to this tendency, a tendency which could easily be illustrated from the past history of a scientific department in this country.

There should also be technological research institutions, perhaps four. Their location could only be decided after careful inquiry and consideration of the conditions. An effort should be made to locate them in or near to the largest commercial centres. Each technological research institution should specialise in the subjects most important in the part of India in which it is located, and should be staffed with trained specialists, so that an enquiry on any subject would be sent, not to the nearest research institution, but to the one that specialises in that subject. It would be necessary to consider to which, and if to more than one institution, a chemical research laboratory should be attached, and each chemical laboratory, if more than one is established, would be required to specialise in certain products or compounds. The point I wish to emphasise is that investigators in a chemical research laboratory, for example, should be specialists, and not general practitioners. We do not want in this century the chemical maid of all work as an investigator. Valuable facts may be obtained by the employment of a chemist who is not a specialist, and who one day is working on metallic binary systems, on another is experimenting on wood distillates, and on yet another is required to investigate a methylene dye, but any success obtained by procedure of this kind would be an accident. For this reason a small chemical laboratory in every province would probably be a waste of money; investigations can be so much better carried on, and with much better chance of useful results, in a fully equipped laboratory with a full staff of specialists.

The technological research institutions should not be allowed to develop independently. This would involve waste of effort, the work not being done where it could be done most advantageously, and, more important still, it would not be possible for the different institutions to specialise to the same extent. The institutions should be under the control of the Imperial Department of Industries. There is no other way to obtain the necessary co-ordination of effort except by the control of a central office, and as the institutions are established for the purpose of economic investigation the appropriate controlling head is the Imperial Department of Industries.

The meeting of the Indian Science Congress should be made the occasion for the staffs of the technological research institutions to confer about their programmes of work. Valuable suggestions are likely to be made as to where certain work can best be done and how certain problems can best be attacked. I am not sure as to whether this should be allowed to develop naturally or whether it should be made the subject of definite proposals.

It may very probably be necessary from time to time to send Government technical experts to study conditions and methods in other countries. It would not be desirable, under any circumstances that I can foresee, for Government to send technical experts of private firms to study methods abroad.

Provision should be made for all research to be conducted in India, not in the United Kingdom, but it may at any time happen to be necessary, on account of inadequate provision in India, to have some researches made in the United Kingdom.

The loan of Government experts to private firms or companies should be for a definite purpose and for a limited specified time, and the firm or company should pay the amount of the remuneration of such expert for the time his services are lent. A Government expert should not be *entitled*, until the expiry of, say, 5 years, to publish the result of researches made while attached to a private business, if the private business pays for him as above.

When the services of an expert are lent by the Imperial department to a provincial department, the expert should be attached to the provincial Industries Department, and should work under the orders of the Director of Industries.

I do not think there is any need for a college of commerce in Bengal, and I believe that the establishment of such a college would not assist, but would retard, industrial development. It will be time enough to consider the establishment of such an institution ten or twenty years hence.

The importance of economical transportation cannot be overestimated. But it is not Transportation enough that it should be economical, it must also be reliable. Unless there is in the minds of the users of transportation a feeling of security that transport will be available when required there cannot be that confidence which is the first condition of unfettered commercial progress. If there be, as there now is, a feeling of doubt, consciously or unconsciously,

whether when goods are offered for transport by railway they will be conveyed or be kept waiting an indefinite time, there is wanting that confidence without which a commercial venture is removed from the ordinary transactions of trade and becomes a gamble.

A railway, like any other mechanical contrivance, works most economically when it is fully and continuously employed. It is therefore the aim of every railway administration to provide such facilities, such rolling stock, as shall always be fully loaded and never be idle or spare. But practically all Indian products are seasonal, with the exception of coal, the production of which does not vary so greatly month by month, and there is therefore not a uniform quantity of traffic available in each month. The attempt of the railway administration to keep their rolling stock fully occupied, so that their records of wagon duty shall not fall below a very high standard, results in the provision of rolling stock just a little more than is necessary to carry their average traffic, distinctly less than is necessary to carry the traffic offering in the maximum month. It is therefore the deliberate programme of Indian railways to provide for something less than the expected traffic, and if there happens to be a specially prosperous year the railways are hopelessly overburdened.

It would not be reasonable to expect a railway to provide transport capacity so much in excess of current requirements as to be able to cope with the traffic offering in a year of a great trade boom, but in the anxiety of railway officers to surpass their records of wagon duty and never have an idle wagon they restrict trade and force upon all traders a feeling of uncertainty and an absence of confidence that goes a long way to injure trade. It is probable that so far from this policy being the most profitable to the railway, the provision of more transport capacity would result in more total traffic and more profit. Instead of providing transport estimated to be sufficient for a good deal less than the expected maximum demand, it is probable that it would be more profitable to provide for nearly as much as the maximum demand (a rapidly increasing figure), although the wagon duty would not be so high, and would perhaps be the subject of adverse criticism by officials in London, who may still (as they used to) like to see records showing a high average of wagon employment, regardless of the circumstances of the case. Even if the actual net profit realised by the railway were not proportionately greater, the beneficial effect on trade of a transportation agency able to meet all demands would be very great.

Provision of rolling stock of course connotes provision of facilities for handling them, but these do not appear in "duty" statistics, and are not subject to the same objections on the part of railway men as the provision of a full complement of rolling stock. All expenditure on increased transport capacity is, however, subject to the established practice of only providing the very least with which the railway can deal with immediate needs. This used to be the admitted policy, it survives as a general practice.

For many years the Calcutta commercial organisations have urged the railway administrations to increase their capacity *relatively to the trade demand*, and have urged the Government to provide the necessary funds. Year by year we have endeavoured to persuade the Government to take a more reasonable view of the importance of ample transportation capacity and have punctuated our prayers with special illustrations from time to time, as in 1912 when we obtained the appointment of the Coal Traffic Conference to bring home to the Government the special shortcomings of the local railways in coal transport capacity. It is only by dint of ceaseless worrying, continual re-statement of demands, incessant reiteration of requirements, that we have been able to get the railways brought up to the capacity they have reached, but all this ought not to have been necessary, and would not have been necessary if the Government of India had any real appreciation of the part that is played by transportation agencies in the prosperity of the country.

We cannot expect railways to be liberally treated during the war, but the provision of three millions for the current financial year is so small that a feeling of deep disappointment cannot be avoided. Disappointment not only because the country will lose so heavily in consequence, but still more because it seems to betoken a continuance of a point of view that one might have been forgiven for hoping was a thing of the past. It is disheartening to find it even now not realised by the Government of India how deficient transport hampers and strangles trade out of all proportion to the deficiency.

I venture to commend to the notice of the Commission the address of Major Hepper, R. E., to the Railway Conference at Simla this year, and in particular the following expressions:—

"The industrial progress of a country is limited by its communications."

"The plain fact, as I see it, is that the possibility of any substantial increase in the volume of business must continue to depend on the ability of the railways to handle it, and that if more rapid progress in this respect is to be assured, it will be necessary, after the war, to adopt a bolder and broader policy of railway development."

All means of transportation, railways and rivers, ought to be considered together, and worked in unison for the efficient conveyance of everything needing transport. Hitherto the railways have been allowed and encouraged to develop separately and in competition with rivers. By railway officers the rivers are only regarded as obstacles to be bridged, or as carrying traffic which railway strategy may succeed in flopping, and large sums have been spent on railway lines whose only excuse for existence is that they can pay for their construction by short-circuiting traffic that could equally well be carried by river. The worst

example is, of course, the Assam Bengal Railway. It was designed to live upon the traffic which was carried on the two great rivers which flow through the two cultivable areas, and sanctioned on obviously inadequate estimates of cost, and after twenty years of working, in spite of efforts on the part of the Government and the working company to the contrary, the river traffic has gone on steadily increasing. Sixteen crores were spent on the construction of this line, which has failed altogether to do that for which it was intended, failed even to cover its interest charges, the loss on which to-day amounts to about seven crores.

This railway is only an example, the most conspicuous because the greatest failure, of the wasteful policy of constructing railway lines to compete with rivers instead of building them so as to make the greatest use of the rivers. This policy is as active as ever, and lines have recently been built, and others are being surveyed to-day, to carry traffic which is carried by water, and for no other reason. This involves at least the expenditure of capital which could much more usefully be employed in providing transport in places where there is not a railway and perhaps few roads.

The manner in which rivers have always been regarded by the Government is illustrated from time to time in various ways. About the same time as the Standing Committee for Waterways was formed to advise the Government of Bengal respecting waterways (if any matter was submitted to them for advice), the Government of Assam convened a conference on the improvement of communications. To this conference were summoned representatives of everybody in the province interested in transport or in goods with one single exception, no one connected with water transport was invited, although the trade of the province by water is in many respects more important than that by rail. Even in the formation of the Standing Committee for Waterways something of the same point of view is apparent; the Committee includes a "representative of the railway interest," it being apparently feared that a waterways committee might to some extent interfere with the ruthless disregard of the value of water transport that had hitherto characterised the attitude of railway administrations.

To counteract the adverse view of the railway interests, and to ensure that in future transportation questions shall be regarded as if railways and rivers were part of the same organisation, there seems to be no other way but the creation of a strong river organisation, either a Trust or a Waterways Department of Government. The financial difficulties surrounding a Trust are very great, perhaps insuperable, and there are difficulties about the control. The Calcutta Port Commissioners are practically a department of the Government of Bengal, but the great rivers running into the delta of the Ganges run through four provinces and which of these would control the Trust? The personnel of the Trust would also be a difficulty, the only members who would take a constant interest in its proceedings would be the representatives of the river steamer companies who would therefore virtually constitute the membership of the Trust. Provincial Waterways Departments would be useless because the four provinces could not agree upon united and uniform action without wasting time in protracted discussion of every point, and probably not even then. It appears, therefore, that the formation of an Imperial department of Government charged with the care of rivers is the only possible way in which the present apathy, or active hostility to waterways, can be counteracted. Such a department would not be allowed to fall entirely into the hands of river transportation organisations because rivers have other uses besides being carriers of merchandise. The part played by rivers in the physical, agricultural, and sanitary development of a country is gradually being understood, and a department of the Government of India whose duty it would be to care for all the interests of the rivers and all that pertains to them would have to regard the influence of the rivers in their effect upon the country, upon its physical features, upon its productive capacity, and upon its sanitary condition, as well as their use for purposes of economical transportation. No one function of the rivers would be permitted to override or obscure the importance of the rivers in their other functions, as would be the case if a controlling body were constituted to deal with rivers in one aspect only, *e.g.*, navigation.

The importance of such an Imperial department cannot easily be over-rated, the exceedingly insanitary condition of the Nuddea, Jessore, and Murshidabad districts, for example, has been ascribed to the neglect or unwise treatment of the rivers, and this ground alone would be a sufficient reason for the appointment of a competent controlling authority in charge of rivers, apart from the improvements that might be effected in other directions of river activity. The sanitary condition of an area reacts on the industrial condition of the area, and hence may come within the purview of the Industrial Commission to the extent of making it desirable to recommend that the authority to be constituted to have charge of rivers may be such as to efficiently control all the activities of the rivers, including those which influence the productivity of the soil and sanitation.

All industries, excepting only (to a great extent) agriculture, require power, cheap power, and without cheap power, no country can become a manufacturing country or a wealthy and strong country. Even if we establish manufactures now, these will have to be abandoned if cheap power is not continuously available, and India will revert to the position of an almost purely agricultural country, dependent to a large extent on the September rain for its annual prosperity.

Power is now obtainable from the combustion of fuel and from water falling under the action of gravitation. On the western coast of India, with considerable areas at an elevation of over 1000 feet, and with fairly steep slopes to the lower levels, there are great opportunities

Power.

for hydro-electric installations which may provide a large amount of power, whereas on the eastern coast with the country running down to the sea in a gentle slope, broken here and there by ranges of hills, there is not the same possibility of making use of water power, and the Himalaya with their high ridges and deep valleys do not lend themselves, speaking generally, to large water power schemes. Nothing has been done to make use of the available water power on this side of India, and very little is known of the possible sources of supply. Calcutta and district use more than 200,000 horse power, the increase having been over 10 per cent. in the last 10 years, and perhaps as much as the present requirement of Calcutta could be provided hydro-electrically. While our coal is comparatively cheap we are not compelled to look for suitable sites for hydro-electric installations, but it would be well to have the country within, say, 200 miles of Calcutta thoroughly examined so as to ascertain exactly what water power we have available to fall back upon, and so that hydro-electric schemes where practicable may be put in hand, and as much as possible of our cheap coal saved for the future and for the many uses where water power cannot be applied. Hydro-electric power, provided it is cheap, also makes several industries possible, e.g., the manufacture of aluminium which may well be undertaken in India, also other processes in electro-metallurgy.

The fuels in use are wood, petroleum, and coal. Of these, wood is too valuable for other purposes to make it desirable or even possible to use it to any great extent for power purposes. Petroleum is very convenient for small units, but the principal oil fields now being worked are showing signs of exhaustion, which, though not imminent, yet renders it unwise for us to regard petroleum as likely to afford a cheap fuel for an indefinitely extended future.

There remains only coal, and in coal of a good quality this country is extremely poor. Coal is of course mined in the manner that brings the largest profit to the miner, and the miner is naturally unable to consider the country's future, his duty is to extract the coal in such a way as to bring the greatest return on the capital employed, within the time available to him. Unfortunately this is hardly ever the method which makes the best use of the country's store of coal, because it is generally more profitable and always more easy to extract only part of a seam and leave a very considerable percentage of the coal underground, where it is permanently lost, than to take out all (or nearly all) the coal in a seam.

The need of the country for cheap power being vital beyond all other industrial needs, and it being impossible to replace coal for power production for many purposes, the poverty of the country in good coal makes it of extreme importance to protect the country's store of coal in every possible way, and to see that none is wasted by methods of mining which abandon and render useless and inaccessible a large percentage, and one of the most important duties of the State is to secure the future by close control of the coal in the country.

It is difficult now to interfere with the manner in which coal is mined in the coalfields already being worked, on account of the dislocation of acquired rights which interference would cause, and it is therefore too late perhaps for useful action as far as these coalfields are concerned, but there are coalfields yet untouched which constitute the country's reserve of coal and there is no reason why the State should not acquire control of these, a course which two years ago I urged upon the Government of Bihar and Orissa, in which province lies the coalfield containing probably the largest quantity of untouched good coal in India.

There are several ways in which the mining may be controlled--

- (a) Legislative enactment may prescribe the way in which the coal may be mined.
- (b) The mineral rights may be purchased by the State and resold at once, the State prescribing conditions under which mining will be permitted. This would not entail any outlay of State capital.
- (c) A third alternative is for the State to purchase the mineral rights and to lease out suitable areas to mining companies, prescribing the manner of working. This would require the outlay of a considerable sum for acquisition, but it would have several advantages. In the first place it would result in a very large profit to the State from royalties as soon as these reserved coalfields began to be worked. Secondly, it would prevent small areas of coal lands from falling into the hands of persons financially weak, and who consequently, even with the best will in the world, are unable to scientifically work their mine and do justice either to the property in their possession or to their own limited capital. Coal mining is an enterprise for persons or corporations with large capital, and it is not to the benefit of the State that others should be permitted to attempt it. Thirdly, as all the mining companies would hold leases from the Government there would be security of title, whereas hitherto, with the best legal advice, there has been the greatest uncertainty, and titles which when they were purchased were believed perfect have been successfully attacked in the law courts.

The conservation of the country's store of coal is not a pressing matter to-day, but a generation or so hence it will be an extremely pressing matter, and will be forced upon the attention of power users and the Government, but then the progress of the public demand for power will have used up the cheap good coal now in sight, and most of the coalfields now untouched will have been settled and work in them commenced, and it will then be too late to do what it is possible, indeed easy of accomplishment, to do now.

With reference to the last question in the list, the increased manufacture of castor oil would reduce the large quantity of lubricating oils now imported for, e.g., railway axle lubrication. The manufacture of castor oil would be increased if it could be cheapened. It could be very considerably cheapened if the bye-product, the oil-cake, could be made more valuable. If its medicinal qualities could be neutralised, the oil-cake would be an extremely valuable food, and the destruction of its medicinal properties would therefore form a suitable subject of investigation in a chemical research laboratory.

ORAL EVIDENCE, 10TH JANUARY 1917.

Mr. C. E. Low.—Q. With reference to the first heading, "The Financing of Industries," would you agree that money grants-in-aid by Government, or bonuses, or subsidies should preferably be given when the company has got the expert, and it is not possible for Government to get one. How does that point of view strike you?—A. Yes, I think that would be reasonable.

Q. Expert assistance should be given of course freely, but direct cash assistance should be given, with a view of getting something out of the concern in the public interests, *vis.*, the establishment of the possibility of a proposition by reason of the fact that the company has got the expert assistance available. It might not be convenient for Government to employ the expert; they might say to the company, "If you will engage the expert, we will give you a grant-in-aid"?—A. I think it would be quite easy to imagine circumstances under which any of these possible forms of aid might be desirable.

Q. But when it comes down to formulating a criterion, one would be very glad of any point like that which bears on it. With reference to your point 5, you are not in favour of supplying machinery on the hire purchase system. Would you extend that restriction even to small cottage industries?—A. Oh, no; certainly not.

Q. Or things like small power crushing factories for zamindars or a small association of ryots?—A. No, it must be quite a convenient way in such a case, because it would provide security for advances.

President.—Q. Another point is, supplying the small man with machinery on the hire purchase system would enable Government to give a certain amount of advice as to the kind of machine he should take?—A. Yes.

Mr. C. E. Low.—Q. In the case of small plants, Government would presumably have a Department to look after it and see that nothing happens to it, and the nearest Government mistry could be called in?—A. Quite so.

Q. You say, "But if a project came before them with the approval and financial support of the Industries Department of Government, the capitalists would know that the project had been examined by capable independent persons, and that there was every reason to believe it would be conducted with ability and honesty, and that it had so far commended itself to the Government officers who examined it that the Government were able to afford financial support." Is that not rather a difficult thing to secure?—A. Exceedingly difficult to secure, but what I meant was that at all events Government thought it would be so.

Q. Supposing Government were unfortunately mistaken; the investor would have some ground for complaint?—A. I don't think so. What was in my mind was that they would regard it as more reliable than projects put before them by any private persons.

President.—Q. Would it not make Government officials unduly cautious?—A. It might.

Q. That is a very serious matter; a great deal of delays are sometimes due to excessive caution?—A. Yes, it might have that effect.

Mr. C. E. Low.—Q. A Government official enquiring into the position of the would-be promoter might say, "He is not an expert, and we have heard some bad reports about him," and that might perhaps put them off?—A. That is possible. Some caution might be wise on the other hand.

Q. Government might very well say that these people have not sufficient capital, that the supply of raw material and the demand for manufacturing products are satisfactory, but it would not be wise for them to say that this business will always be carried on honestly?—A. That was not in my mind at all that any body would say so. All that I meant was that if a project had been well examined and approved by a Government department, that it would convey to the investor a sense of—I won't say security—but convey the idea that at all events the project had been approved by a responsible person, and that there would be more probability of its being carried on with ability and honesty than one put forward by interested persons.

Q. In the last paragraph under the heading "Assistance by banks" I don't think I quite follow your last sentence. You say, "For instance, within a radius of 12 miles from the centre, etc." Do you mean Calcutta?—A. Oh, no; I was thinking of a particular place. I had the Jharia coal field in my mind. I mean the payments in cash to the people living there, as far as I know, amount to about a crore in the year.

Q. You say, "The provincial departments should work in correspondence with and communicate direct with the Imperial department (not through another department, e.g. Finance) and all important experimental and investigation work should be previously reported

to the Imperial department, so that duplication of effort in different provinces may, as far as possible, be prevented." I suppose you are aware that all these proposals come up to the Administrative department in the first instance, and if expenditure is involved, then the Administrative department consults Finance. Do you wish to remove Finance out of it altogether?—A. Naturally any proposition which would involve the Local Government in any expenditure would have to go through the Local Government and its department. That I quite understand. What I was anxious to avoid was the necessity for all communications to go through some other department.

Q. You say, "The Education Department should not control engineering or other technical education any more than it controls medical education." Do you know whether the Education Department take any share in that portion of the Medical Department?—A. I don't know, but am under the impression that the Education Department have nothing to do with medical education.

Q. The point of my enquiry is this that in engineering and technical education, as at present carried on, there is a very large amount of what I might call general subjects, chemistry, physics, etc., much larger, I fancy, than the share which general subjects take in medical education; don't you think that is the case?—A. That may be.

Q. It has often been put to us this way, that the Education Department work might be limited to those general branches, but the general control and all the strictly technical part of education, i.e., the general control of education, with a view to the kind of product you are going to turn out, should lie in the Department of Industries. Do you agree with that position?—A. Yes, I have no objection to the assistance of the Education Department being obtained. Personally I don't think it is necessary.

Q. With reference to your remarks about railway congestion, without in any way suggesting that the state of affairs hitherto has been satisfactory, is it not the case that in all countries there are considerable complaints about railway congestion, more particularly in countries where the market is of a seasonal nature?—A. Quite true at times, but not every year.

Q. Is there not always a complaint in the Argentine?—A. I am not sure whether they have annual difficulties there.

Q. Don't you think that apart from any question of trying to make the supply of fund more elastic, it would also be a good thing to spread the traffic a little more?—A. It certainly would, and perhaps by season rates to some extent.

Q. Do you still adhere to this, "the provision of three millions for the current financial year is so small that a feeling of deep disappointment cannot be avoided," in view of the present state of affairs?—A. Conditions are different now from what they were when I wrote this. I don't suppose the Financial Department, when they granted the three millions, foresaw the present position.

Q. Would the railway have got the materials if they had been given more money?—A. That I am not prepared to say now. Six or eight months ago I would have said that they would have been able to spend most of it quite easily.

Q. Under the question of waterways, you speak of the Imperial department's care of rivers. A rather different point of view was put before us this morning, viz., the appointment of a Trust to deal with the big block of riverways, the canals, and lower courses of the Ganges and Brahmaputra rivers. Don't you think that a localised body would be preferable to the Imperial department?—A. No, I don't think so.

Q. You don't think that the special knowledge and interest which you would be able to bring to bear, in case of a localised department, will be preferable?—A. I take it the same special knowledge would be available; the same officials would take part.

President.—It would not be possible to represent in that Imperial department the Bengal Chamber of Commerce.

Mr. C. E. Low.—Q. Then again an Imperial department would encroach a good deal on the functions of Local Governments, which the Trust would not do, because the Trust would be consulted by Local Governments?—A. A Trust would be a purely Navigation Trust. Would it not?

President.—Q. Mr. Low's point is that where you have locally a big group of interests fairly well defined and big enough for one Trust, then it is better to decentralise to that extent and hand over power to this big local concern, treating the others as independent propositions, would that not appeal to you more than an Imperial department interfering with all?

Mr. C. E. Low.—Q. They would fall under some department of the Government of India, presumably the Public Works Department, or Commerce and Industry. You have a Port Trust under the local Government which concentrates on the solution of local problems and you find a sufficiently large body of men to do it?—A. If you could have a Trust which would cover other functions of rivers than carrying traffic, I should prefer the Trust.

Q. That could be secured by the appointment of officers or persons representing those interests on the River Navigation Trust?—A. Yes. Perhaps it could, but I am not sure that it could.

Hon'ble Pandit M. M. Malaviya.—Q. You want a body that would take care not only of the rivers in Bengal but in the United Provinces also. You do not want the Trust to be an entirely provincial matter; you want that it should be so that it might take care of the rivers of the two provinces. It may be by sub-committees of the two provinces?—A. Yes.

Mr. C. E. Low.—Q. You say "while our coal is comparatively cheap we are not compelled to look for suitable sites for hydro-electric installations, but it would be well to have the country within, say, 200 miles of Calcutta, thoroughly examined so as to ascertain exactly what water power we have available to fall back upon." You have not considered the possibility of the future provision of alcohol as fuel?—A. Manufactured from wood?

Q. Or produced from crops?—A. No, I had not thought of that, because I did not consider that the quantity possible to obtain would be worth consideration.

Q. You are aware that crops, such as potatoes, have been modified in such a way as to give the maximum alcohol results. Would you think that that is a desirable line of work to be taken up in India?—A. I am not prepared to say off-hand.

President.—Q. You would say that it would cut into such food-producing crops, and if so it might be added to your list of substances that ought to be used only sparingly for fuel; therefore your argument still holds that there is a good case for making out hydro-electric developments?—A. That is so.

Mr. C. E. Low.—Q. At the end of your note you speak about trying to make castor cake more suitable for food and the destruction of its medicinal properties would therefore form a suitable subject of investigation in a chemical research laboratory. Are you aware that it is a very valuable sugar cane manure as it stands at present?—A. I know that.

Q. Is not the market for castor cake as manure sufficient at present?—A. No, I understand it is not sufficient to induce a much larger manufacture of castor oil.

Q. Or the growth of the castor? You think more castor might be grown?—A. Yes. If the value of the castor cake were increased, more castor would no doubt be grown.

Q. In Bihar and the United Provinces, manuring with cake is almost nil, and might be done to great advantage considering that there is at least a million acres of cane waiting for somebody to manure them with cake. Don't you think that an equally promising line of action would be in getting these people to use castor cake?—A. Because of the price?

Q. Other cakes are used very often as manure for cane which have also a feeding value. You think that castor cake would be prejudiced. Don't you think that the demand has so enormously increased as to encourage the production simply as manure?—A. No, the point was that it was necessary to increase the price very considerably.

Q. If you increase the price you would lose your existing cane demand which is very considerable in the south and west of India?—A. Yes, you would lose the cane manure and acquire a food instead.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. You say that some of the banks have got capital which they invest in capital expenditure; can you give any instance of this?—A. Banks like the Allahabad Bank and the Alliance Bank lend money against capital expenditure.

Q. Don't you think that Government should directly or indirectly help in starting such a big bank to help industries?—A. What I would like to see is a combined industrial and co-operative societies bank in each province. The present co-operative scheme provides for the federation of groups of societies into central banks, and a further stage in co-operative development is the federation of the central banks into a provincial co-operative bank.

Q. What help should the Government give to such banks? Should they guarantee interest on debentures or something like that?—A. No, if the Government give loans to industries, perhaps a good method would be to deposit the money with the industrial banks. Let the bank give the loan to the industrial concern and charge a small commission for looking after it.

Q. Then about the industrial banks, should they be started without any Government help?—A. A combined industrial and co-operative bank would be started in the same way as they had been in other provinces. It does not require any special help from Government in the guaranteed dividends or funds.

Q. In Bombay we have a central co-operative bank and Government guarantees interest on the debentures?—A. I don't think that would be necessary in Bengal.

Q. Then about the functions of the Board; you say the Board ought to be executive and they must have certain funds at their disposal. Don't you think that Government will not have very much funds at their disposal always to allot to different centres for industries? If in a province the industry did not come up, that money would lie idle?—A. If you have an Imperial Department of Industries, that department would only allot funds to provinces that require them.

Q. Then about the commercial college. You are not in favour of a commercial college in Bengal at present?—A. I take it that a college of commerce is intended to prepare for a University degree. University degrees are so regarded in this country that we would have a considerable number of young men who would take the college course for the sake of the degree, and when they had obtained the degree they would consider themselves qualified to conduct any commercial undertaking. The possessors of degrees would be able to impose on

some of their countrymen, who would be misled into believing that the degree was equivalent to a certificate of competency, and would entrust graduates with the control of new enterprises, and when these failed industrialism would suffer.

Q. In the Bombay Presidency we have a college of commerce; do you know the curriculum?—A. I have seen something of it.

Q. Don't you think that when people in this part of the country would leave industrial colleges they would be efficient to carry on industrial businesses?—A. Bengal is not Bombay. I don't think we have reached in Bengal a stage of industrial development in which a college of commerce would be of any use. At present it would be a positive hindrance. The Government Commercial Institute is doing just about what a college of commerce would do in the way of useful teaching. It has a two-year course with a similar curriculum to that of the college of commerce in Bombay.

Q. But we have got a University degree?—A. That is a stage beyond.

WITNESS No. 179.

ai Bahadur
 J. C. Ghose.

RAI BAHADUR JOGENDRA CHUNDER GHOSE, M.A., B.L., *Secretary of the Association for the Advancement of Scientific and Industrial Education of Indians, Calcutta.*

WRITTEN EVIDENCE.

I shall confine myself to three matters: first, industrial education; secondly, development of industries; and thirdly, raising of capital.

As regards the first, the present industrial schools train up only surveyors and sub-overseers for the Public Works Department and as such are useful. The Sibpur Civil Engineering College trains up overseers and civil engineers for the Public Works Department and, after the Oldham Commission's report, a certain number of mining engineers.

In 1906 when I was a member of the Bengal Council I submitted a scheme for a technological institute and thereupon His Honour Sir Andrew Fraser was pleased to appoint a strong committee (generally known as the Oldham Committee), of official and non-official gentlemen to make a report about industrial education and development of industries. Copies of the correspondence and the Government letter are annexed herewith. The official members at the outset set their face against higher technical training on the ground that industries should precede industrial education as otherwise the young men, who are trained, would be unemployed. A large number of Indians and Europeans are still of that opinion and are opposed to the methods of the Scientific and Industrial Association.

The Committee went on with its labours and decided that the Sibpur Civil Engineering College should afford facilities for scientific and technical subjects on a par with European Universities in mechanical, electrical, and mining engineering and in industrial chemistry. It was also agreed that B.Sc. degrees should be granted in those subjects. The report was adopted by the Government of Bengal and approved by the Government of India and the Secretary of State for India. The Secretary of State however as a tentative measure sanctioned only the industrial chemistry classes which were opened. A mining class for overseers was also opened. The chemistry class has not succeeded because a high standard of initial education was of necessity required but young men could not get any degrees which are so dear to the heart of a Bengali. The experiment has not thus been given a proper trial. Again as there are few industries, industrial education must in the beginning be at a great disadvantage and the Government should not be discouraged by the disappointing results. The Scientific and Industrial Association repeatedly approached the Government on the subject and were assured that the three classes approved should be opened. In the matter of higher technical education nothing more than carrying out the recommendations of the Oldham Committee is necessary for the present.

The committee also fully dealt with the lower standard of technical education and the apprenticeship system. I must, however, here mention one very serious matter. The artisan class of Bengal is disappearing. The carpenters, blacksmiths and electrical mistries are mostly Chinese, Punjabese or up-countrymen. The offices and courts now absorb the young men of the castes from which those artisans were formerly recruited. Education has brought about this result. Hindus who have taken to education more than the Mahomedans are at a greater disadvantage. The masons, tinmen, the khalasis, the serangs and engineers of the inland steamers are all Mahomedans. The trade is also slowly passing away from the hands of Bengali Hindus, who are all aspiring after judgeships, seats in the Executive Council or large lucrative practices at the Bar or after the fame of newspaper writers or political agitators. The Bengali Hindus are thus about to barter a jewel for broken glasses, as the Sanskrit saying goes. It is necessary for the Government to remedy this state of things. Education cannot be stopped. The remedy is universal education which will remove the lower status of the uneducated artisans, and make him the equal of his brother who

attends offices. The other remedy is that the Government should open technical institutions for carpenters, blacksmiths and electrical mistries and fitters and employ the young men trained there instead of employing Chinese and up-countrymen.

As regards higher technical training, the complaint against the Scientific and Industrial Association is that more young men are trained by it in foreign countries and in more industries than is necessary at present. The figures in the report which have been published in the newspapers are a complete answer to the charges of unemployment and nonefficiency of the young men so trained.

Bengal's great industries are the manufacture of jute and the milling of rice. Matches, sugar, paper and leather, among other industries, can be profitably started. From the report * of the Association sent herewith it will be found that the students of the Association are employed in about 38 industries. It will also be found that they have been instrumental in starting more than ten new industries as Bengal capital is shy and capitalists further have not yet got sufficient confidence in Indian experts and prefer German and American experts to them. An Indian London D. Sc. will find it difficult to get Rs. 800 a month and will have to serve under an ordinary American B. Sc., who will not come to India for less than Rs. 800 a month. The industrial experts are looked down upon by barristers, doctors, civil engineers and building contractors as an inferior class. Purely Indian managed factories have little banking facilities. These are some of the difficulties in the way of industries being successfully started under purely Indian management and with Indian experts. The exploitation of the resources of the country by German and American capitalists and experts does it good but I would prefer pure Indian, also asserting their fitness in the field of industry and in developing the industries of their own country.

Appendices to written evidence.

(1)

GENERAL DEPARTMENT.

BENGAL SECRETARIAT.

D. O. No. 114.

CALCUTTA,

The 6th March 1906.

DEAR SIR,

I am desired to forward for your information the accompanying copy of His Honour's note, dated the 5th instant, on the proposed Technical College for Bengal and to invite your particular attention to paragraphs 4 and 5. The other gentlemen concerned have been informed.

Yours faithfully,

Babu Jogendra Chunder Ghose.

PROPOSED TECHNICAL COLLEGE FOR BENGAL.

Babu Jogendra Chunder Ghose, Secretary to the "Association for the advancement of scientific and industrial education for Indians," forwarded to the Private Secretary with his letter of the 2nd instant, a "scheme for a Technical College for Bengal." He intimated that a deputation from the Association would wait on me to-day to place that scheme before me. Accordingly Maharaja Manindra Chandra Nandi, Raja Peary Mohun Mukerjee, C.S.I., Mr. D. M. Hamilton, Babu Narendra Nath Sen and Babu Jogendra Chunder Ghose came to see me to-day on the subject.

2. The desirability of encouraging and developing technical education in Bengal was admitted on all sides and seemed to require no special discussion. As to the scheme, it was at once admitted that there is hardly room for two technical or technological colleges in Bengal at the present time. It was considered more expedient for the present, to aim at the extension and development of the scope of the present Technical College. This is called the Sibpur Engineering College, but its scope is already somewhat beyond engineering; and its name might be altered to indicate its wider aim. Mechanical engineering, physics, mining, and electrical engineering, which form part of the proposed scheme, are all already taken up at this college. What is desirable is, therefore, not to start a second college in opposition to this, but to endeavour to enlarge the existing college to include as far as possible all that is wanted. The demand for a second college will come later.

3. There are two points which were raised by the deputation. The one is, whether instruction in industries should await the complete establishment of these industries in the

country. It seems to me that one can hardly say that this is so. Instruction in industries has to proceed *pari passu* with the introduction of these industries. The instruction ought not to be postponed to the introduction of the industries, nor the introduction of the industries to the instruction. The second point is how far artisan instruction ought to be given in connection with the college. The training of artisans is, in all industries, of importance. Whether the artisan school ought to be a part of the technological college is a question requiring consideration. The technological college will require practical classes which are of the artisan school type. But how far artisan training should be part of the college is the question. There may be an artisan school either as part of the college or in its neighbourhood, like a practising school beside a training college.

4. These questions were briefly referred to by the deputation. It was ultimately decided that, in the opinion of all, it would be more expedient not to aim at starting a new technical college but to aim at developing the existing college so as to include as far as possible all that seems to be required. I then proposed that a conference should be held between the five gentlemen who have met with me today along with the Maharaja Bahadur of Darbhanga and the Nawab Bahadur of Dacca on the one part and the Principal and certain members of the staff of the Sibpur college on the other. Mr. Oldham, Director of Agriculture and Industries, might preside at that conference. I shall be very glad if you will arrange it, inviting Mr. Meaton and one or two of his staff to be present. The conference should report to me.

5. Let a copy of this note be sent at once to Mr. Oldham and to Babu J. C. Ghose and Mr. Meaton. Mr. Oldham will kindly arrange for the conference. It should take place, if possible, this week as Mr. Hamilton leaves for England within a fortnight.

A. H. L. F[ARBER],—5-3-06.

(2)

DIRECTOR OF PUBLIC INSTRUCTION, BENGAL.

D. O. No. D-164.

CALCUTTA,

The 6th April 1907.

MY DEAR SIR,

The other day you were saying to me that mechanical engineering had not been properly developed at the Sibpur Engineering College. On referring to the results of Mr. Oldham's conference of last year I find that it is definitely stated that the mining, mechanical, and electrical engineering training at the college is at present confined to lower classes but that under the new scheme now before the Senate graduate courses will be added and that the rules of the college will be framed so as to admit all students to the courses, irrespective of age, provided that they have had a sufficient general education to enable them to benefit by the instruction without proving a drag on the classes. It was further stated that these classes would, as far as the conditions of this country admit, be on a par with similar classes in Europe, I now write to inform you that steps are being taken to provide mining, mechanical, and electrical engineering training up to the standard required.

I am, Yours Sincerely,

E. A. EARLE.

The Hon'ble Jogendra Chunder Ghose.

ORAL EVIDENCE, 10TH JANUARY 1917.

President.—Q. You appear to misquote Sir Andrew Fraser in your written evidence. You state that "Sir Andrew Fraser decided that it is advisable that industrial education should precede industries"?—A. That is how I understood it.

Q. This is what he says, "Instruction in industries has to proceed *pari passu* with the introduction of these industries. The instruction ought not to be postponed to the introduction of the industries, nor the introduction of the industries to the instruction." There is no statement there that it should precede?—A. That it should not follow.

Q. It does not mean that it should precede. You have definitely stated there that he said that it should precede. What he really said was that it should not be postponed. That is an entirely different matter?—A. I understand it in that light because that was the issue.

Hon'ble Pandit M. M. Malaviya.—Q. What amount of money has your Association spent hitherto in sending out students for education abroad?—A. The amount of money that was received was four lakhs.

Q. From the time it was started in 1906?—A. Yes. The amount spent on the boys was about 15 lakhs.

Q. Four lakhs is the amount which you have collected from the public plus what you have received from the Government?—A. Mostly from the public.

Q. Do you receive also a grant from Government?—A. Yes, for the last six years. It was Rs. 5,000 before and since the war it has been Rs. 2,500.

Q. Is any condition attached to that grant or is it left entirely to your discretion to spend it as you think best?—A. It is left to the discretion of the committee to spend the amount as it thinks best, but we have to send in a list of our students for the approval of Government.

Q. Since the time when you began to receive Government grant?—A. Yes.

Q. You say that 15 lakhs has been spent altogether on the students. Was the balance derived from private sources?—A. Yes. All from private sources.

Q. How many students have you sent out up to this time?—A. More than 300.

Q. You say 140 students have returned. Is that figure brought up to date?—A. Yes.

Q. And you say that 130 of them are employed?—A. Yes.

Q. It is only ten who are not employed? Are these among the latest arrivals?—A. Some of them earlier ones too.

Q. You say in page 5 of your report that your students have started 20 new factories and are in charge of several factories employing a capital of over forty lakhs of rupees. Did these students who are in charge of these new factories receive education in foreign countries with the help of your Association's funds?—A. All.

Q. What positions are these students holding in these 20 factories?—A. They are either managers or principal experts.

Q. How do you select your students? I suppose you insist upon a certain standard of preliminary education here?—A. Our standard is this, that they must have either passed the Intermediate examination in Science or have undergone a three years' course in the Sibpur Apprentice Department, or two years in the Engineering Department, before they are eligible to any of these scholarships.

Q. Do you keep a watch over their progress there? Do you receive any reports?—A. We receive reports. The constituted guardian of our boys were the Y. M. C. A. in the countries to which they were sent.

Q. Even in Japan?—A. Yes, but as a matter of fact, very little control is exercised.

Q. You are not satisfied with the amount of supervision which is exercised over them?—A. No. It was not possible even in the case of my own sons who went up for the Bar.

Q. You have to leave the students very much to look after themselves?—A. Yes.

Q. You have got it as one of your objects, to make an advance or render other help, when necessary, to properly qualified Indian experts returning home from foreign countries to enable them to start industries or to impart instruction in them. Have you rendered any such help to any of your students? Has there been any occasion for it?—A. There has been occasion for it. From the funds of the Association we have not been able to render any help. We also have to raise capital for starting industries.

Q. As individual members of the Association?—A. Under the patronage of the Association. Furthermore, we have got promises in writing from the Maharajah of Darbhanga that he would invest ten lakhs of rupees for the starting of industries, and from the Hon'ble Kumar Arun Chunder Singh that he would pay Rs. 50,000 a year for ten years for starting industries in which our students would be employed.

Q. Has this been done?—A. Not yet. We have recently received a promise from the Maharajah of Kasimbazar that he would pay Rs. 50,000 a year for ten years provided we get another Rs. 50,000 a year.

Q. Will he pay it as a gift or as an investment?—A. As an investment on industries in which our students should be employed, and I hope that all these promises will be carried out in a short time.

Q. You say in clause (c) of the report it is one of your objects "To enable distinguished graduates of the Indian Universities to prosecute further studies in science in Europe, America, Japan or other foreign countries." How many of the 300 students whom you have sent out were graduates?—A. Most of these scholars were graduates. We have got three systems, those that get scholarship, those that get passage money and those that go under our guardianship.

Q. How many of these 300 were distinguished graduates of Indian Universities who went up to prosecute further studies abroad?—A. Not less than fifty.

Q. And these gentlemen have found employment in technical and scientific pursuits after returning from abroad?—A. Yes.

Q. Can you give me any idea of what their average income is?—A. The highest that they have got up to this time is Rs. 800 and the lowest is Rs. 100.

Q. You mention at page 4 of your report, three persons who have obtained the D. Sc. degree of the London University. Are these gentlemen employed now?—A. Dr. Biman Robert Dey has got an appointment in the Presidency College. Dr. Hemendra Nath Sen

is employed in Messrs. Tata and Company at Sakchi. Dr. Brojendra Nath Ghosh has not yet got employment. The other two are getting fairly good salaries.

Q. Have you any idea of the salaries?—A. I heard that it was above Rs. 500, but I am not sure about it.

Q. I have heard a complaint and I want to clear the matter. It is said that the selection of the students has not always been fortunate, that they were not selected with sufficient care to ensure their turning out successful students. Do you think there is any justification for this view?—A. No.

Q. You are satisfied that your system of selection is good?—A. It cannot be anything else than what it has been.

Q. You do not think you can improve it?—A. We cannot improve it. As regards the selection committee, it is always unanimous and we have got in the committee Mr. Gourlay, Mr. Hornell, Mr. Everett. We are always unanimous.

Q. Who are the members of the committee besides these three men?—A. Some of the best men of the country. We have got a regular committee to select students. We get a very large number of applications about 300. A dissent in the matter of selection has very seldom happened. The selection has always been unanimous.

Q. You have no system of keeping up correspondence regarding the students with the institutions where they are being instructed?—A. No.

Q. You mention in your note that the report of the Oldham Committee was adopted by the Government of Bengal and approved of by the Government of India and the Secretary of State. Has this been given effect to?—I have said about that in the note.

Q. You only say that the Secretary of State sanctioned the opening of industrial chemistry classes. Has anything been done beyond that?—A. I have repeatedly complained that it has not been given effect to.

Q. You say in your note, "The industrial experts are looked down upon by barristers, doctors, civil engineers and building contractors as an inferior class." Is that still the feeling, or is it changing?—A. It has not changed and it would not change for a long time.

Q. You say, "Purely Indian managed factories have little banking facilities." Have you any suggestion to make to us as to how these facilities should be increased?—A. I have been thinking over that matter for a long time. We have already been reading the evidence of several gentlemen before this Commission and they have made suggestions as to how Government could help.

Q. Have you any definite suggestion to make?—A. All those suggestions are before you. How far they are practicable is a matter for consideration by the Commission.

WITNESS No. 180.

Sir H. A.
Farrington.

SIR H. A. FARRINGTON, BART., *Officiating Conservator of Forests, Bengal.*

WRITTEN EVIDENCE.

Pioneer factories.

Q. 7.—I have no personal knowledge, but the Forest Department have turpentine factories in the United Provinces and Punjab which are, I believe, working at a good profit. I can make no suggestions as regards pioneer factories in Bengal to be started by Government.

There are large quantities of savannah grasses in the Duars Forests, supplies of which have been taken from time to time by the Calcutta firms for experiments in regard to paper manufacture but as the matter has always been dropped, as far as I am aware, these appear to be unsuitable for the purpose indicated.

As soon as the war is over, Calcutta firms, who have the first refusal of large concessions for bamboos and timbers, intend to start work on pulp for paper manufacture, a new industry in Bengal.

Financing agencies.

Q. 9.—A good proportion of the timber trade is in the hands of Indians, being carried on by small men working on borrowed capital, interest paid being about 24 per cent per annum as a minimum.

The only remedy appears to be a co-operative society and co-operative working and disposal, but I am advised that it is doubtful if such co-operation would be of long duration with the class of men concerned so that it is probable that, as heretofore, the "Mahajan" will continue to make most of the profit.

Research abroad.

Q. 22.—Provision for special chemical research work in England may be desirable; in that case it would not be necessary for the Indian Government to bring out to India experts of the highest reputation from whom the best results would be obtainable, after the preliminary work had been put through in India—in the case of the Forest Department, at the Forest Research Institute.

Industrial surveys.

Q. 25.—The Forest Research Institute is, I believe, doing all that can be done as regards the development of Forest resources.

Q. 30.—I have no personal experience but have heard that about 20 years ago an attempt was made to start a sale agency for Forest produce in Calcutta which failed. Sales agencies.

I may point out that one firm held the agency for the sale of Padouk timber from the Andamans for many years, I understand such agency or monopoly has not been considered altogether advantageous to Government and has been put a stop to recently.

The best method of disposal of any saleable product is to dispose of it to as many persons as possible and so widen the area of distribution, even at low rates of sale at first.

Q. 34.—In Bengal we have at present no timber which is exported to Europe in sufficient quantity to keep up a regular supply and there appears to be no scope for a trade representative. In a short time it is possible that provincial Governments will have their own Forest Economists when any possible developments in this direction will no doubt be investigated. Trade representatives.

Q. 40.—Raw materials should be supplied from the Forests on favourable terms, and as a matter of fact, are disposed of on such very low royalties that any industry should be able to afford them. The royalty is generally a small item on the total cost of any product, e.g., 1 anna per cubic foot for Simul timber for tea boxes is charged in Assam. Supply of Government owned raw materials.

Q. 74.—To avoid overlapping of research work is desirable and this can be effected by exchange of literature between the different research institutes, who would only send out to other institutes papers likely to be of practical help to them; this would avoid extra expenditure on printing and circulation of matter useless to others. Co-ordination of research.

Q. 87.—The leading Calcutta firms have, I believe, obtained much information from the Forest Economist's monographs to which they frequently refer. Special instances are wood for bobbins and for match boxes. Government publications.

Q. 101.—As regards the Bengal Forests, the question of freights is of little importance, simply because we have no timber at present in sufficient quantity to keep up a regular export business and little if any timber is so exported as far as is known. It is, however, believed that freights were prohibitive before the war—whereas tropical Africa and America compete against India as regards hardwoods and have no Suez Canal charges to pay and lower freights generally prevail. No remedy can be suggested. Shipping freights.

Q. 102.—It is believed that hydro-electric power has been fully investigated by the Calcutta Municipality and by a large Calcutta firm and may eventually lead to considerable development in the working of the Forests in the hills and the Terai or Doars below the hills. Hydro-electric power surveys.

Q. 105.—The following are among the few Forest industries possible in Bengal:— Forest department.

1. Match making.
2. Paper pulp from bamboos.
3. Wood for boxes, jute bobbins.
4. Destructive distillation of wood for charcoal and bye-products and cutch manufacture.

Nos. 1 and 3.—Sufficient trees of the right kind are seldom found in one locality and this means greatly increased expenditure in extraction. The Forests are far from Calcutta. It is not yet known if our timbers will make ply wood or bobbins. Experiments with bobbin wood are being made by a Calcutta firm.

No. 2.—A Calcutta firm have this project in hand and if any one can make it a success they will do so.

No. 4 has been taken in hand by the Forest Research Institute. The question of cutch manufacture in Bengal might well be investigated in the near future.

Q. 106.—There are various possibilities for reducing the cost of assembling raw forest products, such as wire ropeways, hauling engines, and tramway development, all of which will require investigation by an expert before it can be definitely said that they are practicable.

A central factory would be desirable, for example, for the tea box industry and this would be a great difficulty.

Qs. 107 & 108.—These two questions may be taken together, Simul in the plains and Cryptomeria in the hills suggest themselves as example of forest crops which might be concentrated in one locality. The raising of an exploitable crop would take perhaps from 30 to 40 years.

The application of the uniform method to sal in the Doars and Terai will ensue in the near future and this will facilitate both extraction to depot and transport to a railway. Hauling engines and tram lines could be employed to great advantage in these concentrated fellings.

NOTE.—Witness did not give oral evidence.

WITNESS No. 181.

PROF. C. J. HAMILTON, M.A., Minto Professor of Economics, Calcutta University.

(The written and oral evidence of this witness is confidential.)

Prof. C. J. Hamilton.

WITNESS No. 182.

HON'BLE MR. M. S. DAS, C.I.E., M.A., B.L., *Lawyer and Merchant, Cuttack.*

WRITTEN EVIDENCE.

- Q. 1.—2nd part. People don't believe in success.
- Q. 2.—Loan from money lenders and friends.
- Q. 3.—No.
- Q. 4.—None yet.
- Q. 5.—(4) Desirable on certain conditions.
(5) Desirable in the case covered by Q. 8.
(6) Desirable under certain conditions.
(7) Desirable.
- Q. 6.—In all cases where Government pays money (oral examination).
- Q. 8.—1st part. When an industry requires large capital and Government is consumer on a large scale.
2nd part. When the business is well established.
3rd part. This should never be done.
- Q. 12.—All branches of industry which now constitute India's handicraft.
- Q. 13.—(Oral evidence.)
- Q. 14.—(Oral evidence.)
- Q. 17.—Free or payment according to the financial position of the firm.
- Q. 18.—Don't understand experts making researches. (Government does not allow.)
- Q. 20.—Preparation of hides in Government estates.
- Q. 22.—Necessary in certain cases to be explained in oral evidence if branches are correlated.
- Q. 25.—Yes.
- Q. 26.—1st part. Local knowledge should be a factor.
2nd part. Utilize waste products.
- Q. 27.—(Oral examination.)
- Q. 28.—Not of much use.
- Q. 30.—1st part. Very necessary.
2nd part. Local influence and Government aid.
- Q. 32.—1st part. Yes, to encourage and reward.
2nd part. Raise the social status of the artizan.
- Q. 33.—2nd part. If they are popular the other result will follow.
- Q. 34.—1st part. Yes.
2nd part. Business men.
3rd part. (Oral evidence.)
- Q. 36.—1st part. Yes.
- Q. 37.—Do both.
- Q. 38.—1st part. Division of patronage.
- Q. 41.—1st part. Yes (oral evidence.)
- Q. 44.—Very little has been done by Government.
- Q. 45.—(a) Primary education to cultivate powers of observation and manual dexterity.
(b) To induce literate men to work as labourers and raise supervisors from labourers.
- Q. 46.—Have some experience.
- Q. 47.—Had no opportunity of knowing the advantages but great disappointment from men educated in Europe and America.
- Q. 48.—They should go together.
- Q. 49.—I have some experience of night schools for full-time employees on same lines as other schools are developed.
- Q. 50.—1st part. The latter.
2nd part. Unison should be avoided.
- Q. 51.—Supervisors should be men who commenced at the bottom of the ladder.
- Q. 52.—(Oral evidence.)

- Q. 57.—2nd part. Yes, if of the right type.
3rd part. (Oral evidence.)
4th part. Both.
- Q. 59.—Both official and unofficial men of experience and sympathy.
- Q. 60.—1st part. Yes.
2nd part. The first.
- Q. 61.—(Oral evidence.)
- Q. 86.—Illustrated leaflets in easy language to be compiled in consultation with workmen.
- Q. 98.—1st part. Yes.
2nd part. Railways through the Garjats.
- Q. 102.—1st part. Nothing.
2nd part. Yes.
- Q. 104.—(Oral examination.)
- Q. 105.—2nd part. More power to local authorities.
- Q. 106.—(Oral examination.)
- Q. 107.—This can be done.
- Q. 109.—Prisoners who are skilled in any industry should be allowed to be employed in neighbouring schools of industry on terms to be fixed by Government rules.
- Q. 111.—(Oral examination.)
- Q. 112.—(Oral examination.)

ORAL EVIDENCE, 16TH JANUARY 1917.

Mr. C. E. Low.—Q. Will you state what your tannery at Cuttack is turning out at present?—A. Just now it is turning out the things that are required in the bazars and I have got some orders from Government for hospital slippers which I am turning out.

Q. What method of tanning do you adopt?—A. Chrome tanning as well as bark tanning.

Q. Is it worked by machinery or by hand?—A. By power machinery.

Q. What is your turn-out in the year?—A. It is not equal to the capacity of the factory, the machinery and other equipments. It is my own property and I lost a good deal of money in the experimental stage. For want of funds I cannot use the factory to its full capacity.

Q. Where do you get your materials from?—A. For vegetable tanning I get the materials in Orissa locally and I am using one or two things which nobody else uses. I found by experiment that we could make use of them.

Q. Had you any difficulty as regards the supply of tanning materials? Are they easy to get?—A. No. You cannot easily get them because the people are not accustomed to the wants of the industry, there being no industry. When there is an industry people fall into the way of getting things and there is a market. I had great difficulty in getting the people to collect the bark and bring it to me, but that of course is natural in every industry which is new, and I am getting over the difficulties gradually.

Q. You mean to say that there is plenty of the articles in question but that the supply has not been organised and that a larger demand would help to make things better and would make for a more organised system of supply?—A. Yes.

Q. Do you use tanning extracts?—A. No.

Q. It has been put before us in the course of evidence that the most effective way of breaking the monopoly of the German export trade in hides would be to tan the hides locally. To what extent do you think this can be done?—A. If it were done here we could not utilise all the hides here unless there is some improvement made in the tanning. In Germany they use these hides for many purposes, whereas tanneries here have hitherto been confined to foot-wear and some to harness. There is not the same demand, the same variety of demand in India as yet as there is in Germany. In Germany there is the Army demand and so many other demands.

Q. There they use up every part of every kind of leather for some purpose or other?—A. Even the worst hides that would be thrown away here are used there to some purpose or other. The trade is in the hands of big German firms who buy all qualities of hides and they mix them all together and then they are sent. The result is that the purchaser buys them and he loses so much per cent. But it does not affect them. But if the hides from all parts of the country are to be used here there must be some arrangement for collecting them together and distributing them to different branches of leather industry, and that must be undertaken by some big firms so that the loss may not be perceptible.

Q. Which hides do you use—fresh hides or cured hides or arsenicated hides?—A. I use fresh hides. Arsenicated hides are not to be found in this part of the country.

Q. Have you tried salted hides?—A. We use them.

Q. Could you make good leather out of them?—A. Yes.

Q. Is it much more difficult to tan these cured hides than fresh hides? A. Fresh hides from the slaughter houses give better quality, better feel. As regards the sun dried hides one has to take great risk because as soon as you put them in lime sometimes three-fourths of the hides is lost.

Q. Do you suppose the same is the condition in Germany?—A. The same hides go to Germany and the same is the result.

Q. On what do you base that opinion?—A. I have seen tanning in Germany, in England and in France.

Q. Did you find any difficulty in getting access to the German tanneries?—A. I found difficulty but I went in company with a German Sanskrit scholar who took me to one tannery. That was of course long before the war, some time in 1908. As you have been questioning me about Germany I may tell you one thing. That is this. I got hold of some lizards, something like iguanas which are found in Orissa and had them skinned. I had in my service a German tanner and I had also one Austrian and they communicated with me for buying these things and from the correspondence I understood that they were corresponding with the German Government for buying these. They wanted to make gloves.

Q. Have you had any difficulty in financing your tannery. You want money to buy considerable quantities of hides? Have you applied to any of the ordinary banks for financial assistance?—A. I applied through a friend of mine to one of the Indian banks and the interest they charged came to something like 31 per cent.

Q. You have not applied to any of the Presidency Banks or the exchange banks?—A. No.

Q. Have you any local banks in Orissa?—A. No. But I have my account with a bank and they would not allow me to overdraw even by one pice.

Q. What bank is it?—A. The Delhi and London Bank.

Q. Where is their branch of which you speak?—A. In Calcutta.

Q. They would not advance anything on the security of the hides or the leather in your tannery?—A. They would not give anything even on the tannery itself.

Hon'ble Sir R. N. Mookerjee.—Q. Is it a bank that you mentioned as charging 31 per cent. or is it only a Marwari?—A. It is a bank. If you want to know the name I can give it confidentially. There is one point which I would like to mention to the Commission. One difficulty that I feel is this. Now the money lenders are mostly Hindus in a large part of the country. They would not advance anything to any one in the hide trade. Consequently the Marwari has to borrow it from the Hindu and then he lends it.

Q. Have you any suggestions for remedying this state of things?—A. My suggestion is this. If a factory has been successful and the articles turned out by it have a good demand, and if the things can be sold any day, and if it cannot work up to its full capacity because of the want of funds my suggestion is that Government ought to help it at a very low rate of interest on the security of the property.

Q. We naturally contemplate a considerable expansion of industrial enterprise and it is obvious that the Government cannot go on doing this beyond a certain point. They have neither the funds nor the machinery. Can you suggest any means that would be automatic and would go on expanding, advancing money on ordinary commercial terms?—A. Government might give the money to a bank and authorise the bank to issue the money at a low rate of interest.

Q. What do you think is standing in the way of these people advancing the money. They do not refuse to pay out of sheer iniquity?—A. No. I do not attribute any malice or anything of that kind. The thing is that of late there have so many failures in industrial enterprises and the banks does not naturally like to risk the money and go to litigation and all that sort of thing.

Q. Is there any way in which Government might help the bank to ascertain whether a business which it is going to finance is good business or do you think that Government help is not required?—A. I think Government ought to come in.

Q. You don't believe in spoon feeding. That cannot go beyond a certain stage?—A. My point is that if the Government helps for a short time then the industry ought to be able to stand on its own legs.

Q. One difficulty would be that the bank may take all the good business and leave the unsafe to Government?—A. I suggested that Government need not engage themselves in the thing directly but that they may authorise the bank to satisfy themselves and then consult the Government as to whether any particular proposition is satisfactory. The bank can easily ascertain what things are there to serve as security, what they will be worth and so on, and then advance the money.

Q. The difficulty seems to arise from the fact that in the first place the bank seems to be unwilling to take to any new line of business and secondly they have not got the mechanism for ascertaining the value of the stocks and whether the business is being conducted in a way which would make it likely that the money would be repaid?—A. There is an easy way of solving that difficulty. For instance small sums repayable in three or four months may be advanced which would be far below the value of the property and as soon as the business can repay the money from their sales they would repay the money. So there will always be a

current account. They will take the money and they will return the money and they will again take fresh money.

Q. In your answer to question 47 you say that you had great disappointment from men educated in Europe and America. It is an interesting point. We have seen one Indian who seems to have got satisfactory education in tanning in England and in Europe and he is now managing a tannery himself with some success. Presumably there are a certain number of failures but from what you say it appears that the men whom you have met have all been failures?—*A.* They were failures in the sense that they had enough scientific knowledge but that they could not apply it to the conditions on the spot. I fully endorse the opinion given by Dr. Proctor before the Morrison Committee. He says that they are very good in the laboratory and in the lecture room but that they are quite unsuited to commercial purposes. That is to say they can never adapt their experience to the altered circumstances here. For instance I shall tell the Commission what happened yesterday. I told my man to do a certain thing. He came back and said that he had told another man to do it and that this man said he could not do it. I told him that the man would naturally like to idle away his time and then I went and showed how to do the thing. The thing is they cannot do the things themselves.

Q. Is it not the case that most of these young fellows who go over to foreign countries do not get shop experience there?—*A.* Exactly so. Very often it is not their fault but with the system of education given. For example in a tannery one has to deal with hundreds of hides. It is not possible to ascertain by chemical test whether each one has attained a desired stage. A man's eyes and hand ought to be trained to do this.

Q. So you think that if they had shop experience that would improve these young men?—*A.* Certainly.

Q. Do you think that getting into shops could be made easier. There seems to be some difficulty at present?—*A.* I cannot say as to getting into the shops. I have no personal knowledge of the subject. I think that in all industries people must begin at the bottom and work their way up.

Q. Don't you think that the best way to get over that difficulty is to have shops in this country?—*A.* No doubt that will help.

Q. Do you think it would be a good thing if these young men who came from foreign countries were made to serve for some time after their return in some Indian factory?—*A.* I cannot agree with you there. My idea is this. My experience has led me to believe that the hand and the eye should be trained simultaneously with the acquisition of scientific knowledge. If you get the head only stuffed with scientific knowledge then the result is that the man would not work with his hands. They should begin as apprentices here. The brain must be assisted by the eye and the hand. If the brain is stocked with scientific knowledge the man becomes a mere ghost and a ghost is only mischievous. I fully endorse what Dr. Proctor said. He said 'Don't send a man to learn the leather industry unless he has the leather in him.' In one case a man was successful and that was because he was the son of a mochi.

Hon'ble Sir R. N. Mookerjee.—*Q.* Have you observed this only in the leather industry?—*A.* These observations refer to every kind of industry. If the training of the hand and the eye is so important in ordinary education it should be much more so in industrial education.

Q. In answer to question 52 you say that you would give your opinions orally?—*A.* When I took up this leather industry I made many mistakes and I lost a good deal of money. I asked Government to give me access to the Harness Factory at Cawnpore and they did not want to show to others the method of their work. I had then to approach the Bengal Government. Even Government factories are jealous of showing what they are doing.

President.—*Q.* Whom did you get that answer from?—*A.* That was long ago. It was some Major. I forget the name and then I spoke privately to Sir Andrew Fraser.

Q. He is the Superintendent of the factory. Is that what he actually wrote?—*A.* They do not allow. I have got the letter.

Mr. C. E. Low.—*Q.* With reference to your reply to question 57 what should be the functions of the Board of Industries?—*A.* They must be not only advisory but also executive. They could have power to come to a decision in the matter of seeing whether a particular industry should be developed and they can take such measures as Government can take in the matter of the development and the growth of an industry.

Q. Do you think there should be a Board as well as a Director of Industries?—*A.* I should not at this stage answer that question. Unless the Board actually works it will not be possible to say.

Q. Supposing there were a number of experts, such as the glass expert and so on, whom would they take their orders from? Don't you think that there will be difficulty in having a multitude of executive officers?—*A.* I do not want a multitude of executive officers. They are not a blessing. What I say is that the Board might come to a decision in certain things and then the executive might rest with the President or the Board or somebody else.

President.—*Q.* If you have a Board of Industries and a Director of Industries the Director of Industries will be responsible for the executive work only?—*A.* There must be one person to do that.

Q. The question now comes to this. Somebody must be responsible not only to give the order but also to see that the order is carried out. You cannot have an honorary man doing that?—A. No.

Q. Now what Mr. Low wants to know is whether this Board should have power to give executive orders to the Director or whether the Board should only give advice which the Director may or may not accept?—A. I cannot answer unless a thing like that actually works. It is very difficult to say how far their advice will be binding or not. If it is binding in every case then the Director simply becomes a person in a subordinate position. That of course he should not be. If every decision is binding then what is the good of having a Director. I think the Director might be a man with local experience.

Q. If the Director frequently went against the advice of the Board the Local Government would ask the Director his reasons for passing over the decisions of the Board?—A. That the Local Government ought to. I cannot say what the relation between the Director and the Local Government will be.

Q. The Director will be an official appointed by the Local Government and he therefore must be under their orders. We are not proposing to supersede the Local Government?—A. If the Director has been regularly discarding the opinion of the Board it ought to be open to the Local Government to ask the Director his reasons for his action.

Q. Do you think that the Board of Industries should have executive power?—A. You cannot trust the executive power to a number of people. It must rest with one of the members of the Board or somebody outside it.

Q. You would not object for instance to the proposal that there should be a Director of Industries with executive power and with him associated a Board which has advisory powers?—A. No. If the executive power was to rest with the Board it must rest with somebody in the Board. It must rest with one person and not with a number of persons. I think that can be done. There need not be any fear in such an arrangement.

Mr. C. E. Low.—Q. What have you to say in regard to question 106?—A. The difficulty is about communications among forest produce, I include also the hides. In the Garjats for instance, I am talking of Orissa only. There are Government estates where they sell not only the animals that die but also animals belonging to the ryots and Government gets as much as Rs 12,000 and Rs 15,000 for selling. They call it by a different name. Really Government takes the money and I have very strong feelings on the subject.

Q. Would the peasant take it away if he were allowed to?—A. He would not take it on religious grounds.

Q. In what way does the auctioning by Government result in any deterioration of the hide?—A. Because Government does not do anything to preserve the hide. The hide ought to be skinned and then it should be salted. If Government were to take up that work then other people will do it.

Q. Do you find that any difficulty which you experience in getting forest products arises from any deficiency in the Government system for collecting raw forest products?—A. There is difficulty. It would be more convenient to people if they were allowed plots of the forests for the taking of the bark. If they auction the whole forest nobody will buy.

Q. At present Government sells by the compartment system or the coupe system by which the auction purchaser removes things. Do you get the tanning materials from the auction purchaser?—A. I do not collect my materials from the Government estates. I find that they are quite unwieldy and difficult to work.

Hon'ble Pandit M. M. Malaviya.—Q. When did you start this tanning business?—A. This tannery I started about 12 years ago. There was a tannery previous to that.

Q. When did you start the first one?—A. It was an experimental one and I started it some 17 or 18 years ago.

Q. Is that the only industry in which you have been engaged?—A. I have dabbled in the gold and the silver industry also, and I have also done some work in connection with the utilisation of the waste products.

Q. Wasted in what industry?—A. Take for instance the horn industry. The horns were used for combs. The tops of the horns are too thin. I found that they were wasted. I got some men to take it up and turn it to account. When they learnt it and got a market for their goods I advanced some money and had it worked out.

Q. Who is the manager of your factory?—A. Myself.

Q. Is the tanning work done under your orders?—A. Everything is done under my distinct orders.

Q. Who supervises the thing?—A. I supervise.

Q. Have you given up practice?—A. No. In the beginning I had to attend to it too often but now my workmen are trained and they are able to understand my instructions. In the beginning I had a German manager and then an Austrian manager, and after that several Indian managers. Now my workmen are trained. I have still a manager—Mr. Dutt.

Q. Has he had any special technical education?—A. He was educated in America in the leather industry.

Q. How long has he been with you?—A. Two years.

Q. How long did he receive his education in America?—A. For three years.

Q. Before he went to America what sort of education did he have. Is he a graduate?—A. I do not know whether he has got a University degree or not. My manager works under my orders, and consequently I do not expect much responsibility from him.

Q. Has he studied the chemistry of leather?—A. He understands the chemistry of course. My previous manager was a B.Sc. of the Calcutta University. Then he went to the Sibpur Engineering College. He went to Glasgow and Leeds but I found that he could not do much.

Q. You said that you had an Austrian manager. How long was he with you?—A. Three years.

Q. And the German?—A. A year and a half.

Q. What sort of education did these men have?—A. They were workmen. They could not adapt their education to suit the altered circumstances of this country.

Q. Did you find that in their case lack of scientific education was the cause of their failure?—A. Because they received their training in a foreign country.

Q. Is not the leather trade the same everywhere?—A. No. It is very different. People imagine that the leather trade is just like carpentry or blacksmithy. In the case of these two latter, nature supplies the materials. In the case of the leather industry, it is essentially a chemical industry. It all depends upon the bark, the climatic conditions, the water and so forth.

Q. Does your present manager who has returned from America possess the scientific knowledge necessary for your industry?—A. Not for my industry but for the leather industry in America.

Q. He does not possess the knowledge necessary to carry on your industry?—A. Not for Indian industry because the hides are so different. You don't get the English or the American hides here.

President.—Q. You apparently are of opinion that a boy who is sent abroad should, after he returns, receive a certain amount of practical sympathetic training in this country?—A. Yes.

Q. The present system is being condemned by some and upheld by others without considering that there is an intermediate course, namely of combining the theoretical training abroad with practical training in this country, and the difficulty seems to be to get these young men the practical training that is necessary under sympathetic supervision?—A. That is a great difficulty and I have myself lost a good deal of money in this tanning industry. I heard from some people that even in England the professors are averse to teaching the secrets of the industry. They give all the scientific teaching and when any one wants to know how a particular leather is made the professors say that it is not their business to teach that unless you pay them so much money. They would not give out the secrets of the processes.

Hon'ble Pandit M. M. Malaviya.—Q. Suppose there is a young man who has been to Germany, England and America, and suppose he has received practical training in addition to his scientific training, would not that training enable him to take up business here?—A. It has not been successful in practice.

Q. You are aware that before the war a lot of hides used to go to Germany from India?—A. Yes.

Q. Suppose an Indian went and received training in one of the factories where these Indian hides were cured, would not that experience stand him in good stead?—A. No. Up to a certain stage he can get on well. But if you say that he can produce leather he will fail there, when the question of the climatic conditions and the water and so on come in. The first part of the thing he will be able to do all right.

Q. Suppose a boy returns after receiving education in a foreign country and is then put into some tanning trade in this country in order that he may acquire the necessary local knowledge and experience, do you think he will be immensely better qualified to be a successful tanner than a boy who has not had the advantage of such education?—A. Yes.

Q. Do you admit apprentices to your tannery?—A. Yes.

Q. Have you any at present?—A. Not at present.

Q. How many have you had during the last 12 years?—A. About two or three only. They would not stick to the trade.

Q. Would you modify what you said about men becoming ghosts and all that in view of what you have now said. You do not suppose that anybody would recommend that only scientific education should be given unaccompanied by practical training?—A. I have told you what I feel, whether anybody recommends it or not.

Q. How many of these Europe-returned men have you come across who have studied the art of tanning?—A. I have seen about five in all. All those five worked under me.

Q. In what capacity?—A. As managers.

Q. Then you have had eight managers in addition to yourself?—A. Yes and I have lost three lakhs.

Q. Do you know who is the manager of Dr. Nilratan Sircar's factory? He has been regarded as a very successful student?—A. That may be so. I am glad to hear it. I do not say that all are failures.

Q. Do you agree that if there was a big tannery started by Government here where both scientific and practical training could be given, that would be the best way of preparing our young men for work in this line?—A. You cannot possibly imagine anything better.

Q. You think there is need for such a school?—A. Yes.

Q. You mean in Bengal?—A. I thought you had asked me for all India.

Q. Do you want one in Orissa?—A. In Orissa there is room for one.

Q. Do you know that a very large quantity of hides is exported from Calcutta?—A. I know that about R70,000 worth of hides comes to Calcutta every day for export.

Q. In view of that fact do you think that Calcutta is a suitable centre for a good school of tanning to be established by Government?—A. Yes.

Sir F. H. Stewart.—Q. Should it be a school or a factory?—A. It should be a combined institute.

Hon'ble Pandit M. M. Malaviya.—Q. You would not prefer that practical instruction should be given in the tannery and scientific education in a school apart from the tannery?—A. They should be combined, there should not be any disintegration of education.

Q. You say that the Government should help this industry by advancing money. Do you think that Government should advance money on easy terms?—A. I was not speaking of this tanning industry alone but of all industries. If Government finds that there is a market for the article and that the industry is suffering for want of funds then they should help that industry. My opinion extends to all industries and not merely to the tanning industry and if such an impression has been created by the wording of the sentence I should like to alter that.

Q. Do you think that a direct loan from Government on easy terms would be suitable or would it be better that Government should help some bank which should finance industry?—A. I really cannot say. From the borrower's point of view it would be preferable to get money which carries the cheaper rate of interest.

Q. Don't you think that if the Government gave the money to some bank and that bank advanced money after examination of the possibilities of the industry, it would be better?—A. That would be the businesslike way of doing the thing.

Q. One difficulty that has been advanced in this connection is that the banks at present do not have the machinery necessary to ascertain whether a particular industry is worth encouraging and whether it is a sound undertaking. Do you think that there will be any great difficulty in getting the necessary experts?—A. I cannot see that there will be any difficulty on that account.

Q. With regard to the executive power to be given to the Director of Industries your objection was that a number of persons cannot act as an executive body?—A. They cannot be armed with executive powers.

Q. Suppose the Board is constituted of a number of persons, say half a dozen, and they come to a decision on certain important matters, then their decisions can be given effect to by the Director as the executive of the Board. Suppose the Board passed a resolution that some light railway should be helped, then the carrying out of that resolution in whatever form Government may prescribe can be left to the Director. Would you leave that power with an individual or with the Board?—A. In that case if it is left to the Board there is no necessity of a Director of Industries. He becomes actually subordinate to the Board.

Q. He becomes the mouthpiece of the Board?—A. I understood that he was a person in a superior position. I understand from the way in which you have put it that the Director of Industries would be something like a Secretary to the Board of Industries.

Q. By whatever name you call him, he will give effect to the decisions of the Board. Suppose the question was whether a jute enterprise should be helped. Don't you think that it would be an advantage to have on the Board men who have done business in jute. Do you think that the Director should or should not listen to their advice? Should he be bound to act according to their advice or left to decide the matter for himself?—A. If you leave the final decision with the Board where is the necessity of having a Director. The Board can certainly have in that case a Secretary to carry out their decision. The Director of Industries becomes simply a hand of the Board. And then my second difficulty comes in regard to the working out of the details. When you work out details, I think it would be very difficult to leave the working out of the details in the hands of a single person.

Q. The Director of Industries will not be like the manager of a business firm who has to decide promptly whether he should or should not buy, say, 100 thousand bales of cotton. He will carry out a certain policy which will probably be laid down by the Board. He will help enterprises in their initial stages and advise about the purchase of machinery, etc., and publish information about a particular business. He does not require the power to decide promptly and at once what ought to be done in a particular business. Do you contemplate that the Director of Industries should have power to decide whether he should go into a particular business or not, or whether he should advise anybody in the way of purchasing materials?—

A. Hitherto I have been under the impression that it is the Board which will be in contact with the people and it would have the people's representatives, there and consequently their decision would be the popular wish or whatever it is. I understood from your questions that the Director will have to decide upon questions which came to him through the Board.

Q. In that case you agree that it will be largely questions of policy or questions of helping particular enterprises in their initial stages that will come to the Director and not details of particular transactions? Will it not be an advantage that the Director should be guided by the collective wisdom of the Board?—*A.* Then we come back to the whole question whether this Board will deal only with principles or take into consideration particular cases.

Q. In the case of a light railway for instance to Garjats, would you leave the recommendation to be made by the Director or would you leave the recommendation to be made by the Board of which the Director will be a member?—*A.* I understood that all recommendations come from the Board and that the Director will be the executive officer to carry them out. Then the only question which arises is whether he is bound to carry out the Board's orders in every case or not. He might be a man who might upset every action of the Board and throw their recommendations into the waste paper basket. I understand that he will be responsible and answerable to Government who will ask him his reasons for acting in an arbitrary manner.

Q. Do you think that ordinarily he should carry out the orders of the Board and that where he differed he should report the matter to Government?—*A.* That would be a satisfactory arrangement.

President.—Q. Would you allow the Board also to report to Government?—*A.* It will all depend upon what sort of a Board it was. Much will depend upon that.

Sir F. H. Stewart.—Q. Can you say how the land policy of Government has affected industries? What remedies can you suggest?—*A.* I shall take the abolition of the salt industry for instance. It is intimately connected with land policy. Now salt tax itself is a most unique taxation having no precedent in the world. The same difficulty arises with regard to the salt-petre now. There was a time, about 1804 or 1805 when a regulation was in force which said that the salt duty should be annexed to the revenue. Now you take the revenue from the man and still you say that he cannot use the land for salt manufacture. Since the salt industry was abolished people have been subject to famine every fourth or fifth year because they have nothing to fall back upon.

Q. What is your suggested remedy. Would you allow them to make salt under Government supervision?—*A.* They should be allowed to make salt because that would develop another industry, the fish industry. The fish lives in the water and when it is there it consumes any amount of salt and when it comes out you do not allow it to be preserved with salt.

Q. Are the people in Orissa willing to work in factories, tanneries and so on?—*A.* It takes one a very long time to get the necessary training.

Q. Do you attribute that to backwardness in education?—*A.* I attribute this to this cause, that you do not give the artisan the position he deserves. The artisan is looked down upon because manual work is considered degrading. I think the social position of the artisan should be raised. I have had a good deal of correspondence with Government on this matter. Government for instance would not recognise the artisan. Public bodies welcome a Lieutenant-Governor and present him a casket containing an address but the artisan who made the casket is not allowed to enter the premises. I know an artisan in my workshop. His son passed the entrance and preferred to be clerk and declined to follow his father's calling. He thought he would become a municipal commissioner some day and then he can shake hands with the Lieutenant-Governor. At present the artisan has no position in society.

Q. Is there any change for the better?—*A.* No, I think it is getting worse.

Q. Would you explain a little more clearly what you say about the railway for the Garjats?—*A.* The Garjats are the tributary states. There is any amount of mineral there, such as manganese, coal, etc. At present they are inaccessible simply because there is no railway.

Q. Would it not be desirable to see more about the resources of the place before you decide on the alignment of the railway?—*A.* Quite so.

*President.—*We had this matter brought before us by the Political Officer and one difficulty was that the mapping is imperfect and that is why the Geological Survey has not yet extended its operations in that area.

Hon'ble Sir Fagalbhoj Currimbhoy.—Q. Suppose that the boys are educated in the first instance in the theory and then they gain experience in the factory, would that meet your point?—*A.* I should prefer that the two educations should go together.

Q. Which is the more essential?—*A.* I cannot say. I get a man who is good at the scientific part and he fails in the manual part. My experience shows that the mechanical part needs more attention than the scientific part.

Q. Have you trained any man in your factory who will be able to do the things for him self?—*A.* I cannot say that they get all round training. We are only making some things for which we can find a market.

Q. You are a practical man then?—*A.* Whether I am a practical man or not I am a man, and I can turn out things that can be sold. Before I go I should explain one thing to the Commission with regard to this leather business. Some time ago the Australian Government

Mr. K. Chowdhry. found that leather coming from India was poisoned. The trade in England went up to the Secretary of State also. These cases ought to be stopped. The Indian population in India is divided into two parts—the educated and the masses—and one turns its back to the other. The question is how the handicrafts should be encouraged. There is a market for the things. Artistic work can never be done in factories or machines and more men should be encouraged to take to it. With this view I have brought certain things made in Orissa to show what even backward Orissa can do in this matter and if the Commission wants to see them I can show them.

President.—Q. I am afraid we cannot alter our programme?—A. No. I have brought the things here and shall not take more than 10 minutes. (Witness showed the things.)

WITNESS No. 183.

MR. K. CHOWDHRY, *Chilka Lodge, Puri, Orissa.*

WRITTEN EVIDENCE.

Financial aid.

With the exception of long established industries, such as, jute, tea, cotton, light railways and a few others, which have paid steady dividends for years, capital is naturally difficult to attract to new enterprises of unproved possibilities. These difficulties will be less as soon as public opinion is educated in favour of sound finance and new industrial propositions are submitted to and approved by technical and financial experts before inviting public subscriptions. The recent failures of a number of joint stock concerns have hit the middle class investors very hard but the time is not far when the landed aristocracy, particularly of Bengal, will open their purse strings for capitalising industries specially approved of and patronised by Government. The Companies Act which has recently come into operation has already had its desired effect on unscrupulous company promoters and the statistics show considerable falling off of the mushroom limited liability companies which were multiplying before 1913. I would suggest further amendment of the new Act to bring it to absolute uniformity with the English Act with regard to sections dealing with minimum subscriptions on which companies should be allowed to commence business and elections of auditors and filing of balance sheets. The relation of managing agents to the shareholders requires to be clearly defined and their present powers should be further limited by amendments of certain sections.

Government assistance, such as bounties, loans, and other practicable aids to deserving industrial enterprise are essential for a start but the problem of selecting particular industries and the amount of assistance to such is a very intricate one, as Government officers, unless very carefully recruited, are bad business men and their judgments are likely to be hampered by unhealthy influence. I would suggest the creation of an industrial bureau in each province in charge of an experienced officer assisted by the executive committee of select business men who must be well paid for their labour.

Pioneer factories.

I have no personal experience of Government pioneer factories but I have some experience of Government pioneering industries, e.g., fisheries, and I say unhesitatingly that this particular method though expensive and somewhat onerous is about the best to remove certain obstacles that stand in the way of establishing new industries in a country as proved by undertakings of the Governments of South Africa and Australasia.

The Government, however, must take the public into confidence in this matter and employ only the very best men available and the most up-to-date tools and plants in all pioneering work so that the fiasco such as the "Golden Crown" Deep Sea Fishing Experiment is not repeated. I had the good fortune to work with the very crew who manned this trawler in Hull after they returned home and have heard scathing criticism regarding the purchase of this pioneer craft in Hull effected by an officer deputed from the India Office. I am, however, abso utely convinced that the Bengal Government, when they undertook this work, was prompted by a sincere desire to help us to start an industry whose possibilities are untold and well-nigh incalculable. I do not approve of converting any pioneering experiments into permanent Government enterprises.

There should be more co-operative societies specially formed with Government aid and organised to finance cottage and rural industries and market produce or manufacture on advantageous terms. Trade guilds are all ancient institutions and served their purposes very well, and they still thrive and afford collective facilities to members of same trade, such as the Cloth sellers or Leather sellers Guild in the city of London. Their transplantation in this country will be perpetuating the evils of the caste system which stand conspicuously in the way of our social and industrial progress.

As for limiting Government assistance to industries care must be taken that such industries should not as far as avoidable compete with cottage industries. No new enterprise, particularly manufacture, will survive unless it can compete with an established external trade and to refuse aid to such enterprise because of such competition would practically be bidding good-bye to the efforts of this great Industrial Commission. This involves intricate problems of tariff and I am in favour of an Imperial preference and protection against purely foreign countries.

My personal knowledge of Government technical aid was in connection with fisheries Technical aid. and the present Deputy Director, Mr. Southwell, has been frequently consulted by me. Only the other day I sent him a sample of jelly fish which he carefully analysed and he determined the ingredients. Technical or scientific aid of this kind should be more popular and more easily accessible to the public than it is now.

The loan of Government experts, e.g., Geologists, should frequently be made to private firms or companies on certain conditions, e.g., experts should be allowed to make records of their work with such firms and those records should be available to *bond fide* business men.

Surveys of the available resources of the country require to be materially supplemented by fresh investigations from a purely industrial or commercial standpoint. The reports of the Forest or Geological Departments or at least most of them, appear to be more scientific and therefore incomplete without such information which attract capital or entrepreneurs. Compare them with the reports of Washington or Chicago bureaus published periodically for information of the mercantile public.

Commercial museums are no doubt very useful institutions but I would prefer travelling Assistance in exhibitions to be held periodically under Government control at different centres and under a permanent Exhibition Committee. Its location in Calcutta does not seem to attract the same amount of attention of the purchasing public as it would if held in different districts or centres. Marketing products is as equally important as manufacture itself, and want of special and proper care in this respect has brought about more failure to makers of indigenous goods than want of perfection of the manufacture itself. Our trades and industries are not sufficiently developed yet to warrant the appointment of trade representatives outside India. It would however be useful if British Consulates in foreign countries can spare men to reply to Indian trade enquiries. As regards official patronage regarding purchase of stores there should be no secret publication of lists of manufacturers as is now done by the Director of Commercial Intelligence. Open and public enquiries should be made by competent men about the position and capacity of Indian manufacturers before their names are included in Government list.

Banking facilities in marketing indigenous products are absolutely essential. Many Banking facilities. important industries under Indian management have failed because the banks would not advance a pice against hypothecation of products or plants and properties. I would suggest the creation of a department in Presidency Banks to deal with this matter and to have proper powers to advance money against goods, bills of lading, and assets. This is a supreme problem and requires definite solution and no half-hearted measure would be of any avail. The huge mills on the bank of the Hoogly or the Titanic tea plantations in Assam and elsewhere are monuments of not mere joint stock ventures under expert management but depend, every one of them, on advances made by the city banks on moderate interests.

Indian entrepreneurs, most of whom are neither shareholders, nor directors of the exchange or joint stock banks, receive little or no facilities from these fountain sources of capital which feed finance and commerce in every progressive country of the world. The Government would do well to step in and see that the banks do co-operate with *bond fide* Indian manufacturers, exporters, importers and entrepreneurs.

The land policy of the Government requires considerable modification to cope with the Land policy. industrial progress of the country. In its present form it gives no encouragement to entrepreneurs, as for instance not long ago I had protracted negotiations with the late Sub-Divisional Officer of Khurda in the District of Puri for a small parcel of land to build a fish curing yard and a depot on the bank of Chilka and was, after four months of correspondence, referred to the Khasmahals Act which precludes grant of land excepting for purely agricultural purposes. Managers of Government estates and forests should, unless the law is amended, be specially instructed not only to grant lands on favourable terms for industrial purposes but give additional facilities which lie in their powers to further such purposes.

Lack of primary education does to a certain extent hinder industrial progress and its Training of labour acquisition materially helps artisans and workmen to learn efficiency and skill. In the and supervision. fisheries industry, in which I have been engaged, very little has been done to improve the fishermen's efficiency and skill. Proprietors and managers of big industrial concerns should provide facilities for theoretical training of employes by holding occasional classes and demonstrations. If necessary, they should be given Government aid to encourage and continue such theoretical training for employes. In my own industry, viz., fisheries, instructions may be given to fishermen to make and handle improved boats, nets, and gears, and, where there is dry or desicated fish industry, practical instructions in preserving and curing fish with or without salt should be very useful.

Apprenticeship is about the best system of training skilled hands for industries and my Apprenticeship own experience is considerable in this respect. I was a premium pupil in a well-known engineering firm in Manchester subsequent to my completing a three years' engineering course at the Owens College, and as Secretary of the Manchester Indian Association it was part of my duty to help young Indians to enter manufacturing firms as ordinary or premium pupils. For those who aspire to be supervisors and managers, I found the sandwich system, as prevalent in Scotland and in a limited scale in Lancashire, viz., schooling in winter and workshop training in summer brings about the best results. I am in favour of evening classes being started in some of our Government institutions in large industrial towns with

ordinary tools and equipment and fairly competent staff, instead of founding expensive technical schools as the City and Guilds of London, and the famous Manchester School of Technology which latter is run exactly on the lines of the world's best Technical Institution in Charlottenberg in Germany. Technical institutions, in my humble opinion, are not fore-runners of industry. They train pupils to run industries after they are well established and they help pupils to devise means to compete with foreign manufactures. Let us have small mechanics' institutes as they had in England and Scotland during early days of industrial activity, with evening classes for the benefit of industrial pupils.

State scholarships or stipends may be given to specially selected supervisors and managers to study conditions and methods of industries abroad and their conditions and terms should be different from what they are now.

Mechanical engi-
neers.

There should be a Board of Examiners in each province to grant certificates of competency to duly qualified candidates as mechanical engineers and qualifications of candidates should be the same as that required for the Board of Trade examinations in England. No racial bar should stand in the way of candidates for any professional examinations. It is a matter of regret that Indians are not allowed to qualify as Boiler Examiners.

Official organisation.

I do not know of any official Department in this province for development of industries except perhaps the Fisheries Department which is amalgamated with Bengal and worked and controlled from Calcutta under a single Deputy Director whose establishment is partly paid for by the Bihar and Orissa Government. I speak from my knowledge of Orissa, which has more valuable fisheries and where trade in fish is more extensive than that of Bihar that so far very little has been attempted by the Fisheries Department to improve the industry in this benighted province. There is a sea board of over 200 miles from the mouth of the river Subarnarekha to the Chilka border of Madras, almost as long as the East coast of England, with such important ports as Balasore, Chandbally, False Point, and even Puri, with the magnificent railway system of the Bengal Nagpur Railway running parallel to the coast. This offers splendid opportunity for the Fisheries Department to study first hand the conditions under which the seafishermen ply their trade and to instruct them to improve their lot, but little has been done during the five years' existence of this department. I have worked with some of them and lived among them and I say most unhesitatingly that there is no better set of fishermen than these fellows anywhere in India, noted for their seafaring qualities, adventurousness and heroism in rescuing lives and property. Not long ago the Nuliah fishermen of Puri saved the life of an Indian Civil Service officer who was caught by an under current while sea-bathing. I strongly advocate the establishment of a small navigation and training school for fishermen and mariners, somewhere near Chandbally, where boat building, sail making, navigation, preservation of fish, and other allied subjects essential for the seafishing industry should be taught with money that is now being spent on the upkeep of a Fisheries Department located hundreds of miles away in another province, far out of touch with the needs of an industry of first rate importance. It is a matter of common knowledge that the British mariners who are now watching the shores of England like bull dogs ready to hunt down German invaders are partly recruited from the fisher folks who toil unceasingly on the coasts of Great Britain and Ireland. After our experience of the ravages of the "Emden" we may yet need a small naval squadron for the defence of our East Coast and why should we not recruit our Indian blue jackets from our seafishermen if they are trained in the same way as his fellow workers are in Japan and elsewhere? I should see the Government to seriously consider the question of training Indians for a seafaring life. I happened to be, while I was in London, the Honorary Assistant Secretary of the British Indian Seamen's Institute in the Docks of London and I had considerable dealings with the Indian Lascars "whose labour," says Lord Ampthill, "contributes to the national wealth and prosperity upon which our security and very existence depend." We need more of these men and better trained than they are now for our Indian mercantile marine which is a necessary adjunct of all industries in India. The reading of books like "Robinson Crusoe" must have fired the imagination of many Indian youths and stirred their spirit of adventure, but unless there is an opening for them in the Indian marine or other equally adventurous vocation this spirit will remain bottled up and will burst, as it is now doing, in mischievous activities.

Touching on the question of training I am not in favour of any college of industry, neither any degree in commerce. The course for the Bachelorship of Commerce has proved a failure even in the University of Manchester backed as it is by the local leaders of industry and commerce. With the exception of simple subjects like book-keeping, stenography, etc., commerce cannot be learnt in academies. It is the probationers and apprentices in the big city house that we must look to for attaining fame as our future captains of industry and our merchant princes.

The Departments of Director of Statistics and Director of Commercial Intelligence are only infant institutions and, under able heads like the present Director of Statistics, are likely to play a great part in the future of our commerce and industry. The *Indian Trade Journal* is a useful magazine and should be more useful if printed in vernacular as well. Publications of the Geological Department, which have led to important discoveries and the subsequent foundation of great mining companies, are of very high order, but no one seems to attach much importance to Forest or even Agricultural reports for commercial and industrial guidance.

Railways and
seabways.

So far as the province of Orissa is concerned it is high time that the project of linking Bhadrak, a station on the Bengal Nagpur Railway, and Chandbally, a great port of Orissa,

by a light railway of 28 miles was carried out. This will, among others, help the fishing industry materially. Chandbally is adjacent to the important fisheries of Dhamra belonging to the Hon'ble Raja of Kanika and offers the finest refuge for sailing smacks or trawlers even in the worst monsoon. It is not far from the important banks discovered and charted during the "Golden Crown" experiment full of prime fish hauled by that vessel and with advent of capital is likely to be the Grimsby of the Bay of Bengal. The Orissa coast canal system is one of the best in India and I suggest that the branch or channel, a matter of about 20 miles, connecting Mahanady with Chilka Lake, which is only navigable during rains should be excavated to form a connecting link between the border of Madras (Ganjam) and Hoogly *via* the Chilka Lake. This will incidentally help cheap transport of dry, desiccated and salt fish and other merchandise from Puri and Ganjam to Bengal and even the Central Provinces.

I have already indicated the lines on which the Government should proceed to help the fishing industry in Orissa. The fishermen in this backward province are constantly in the grip of money-lenders and to free them from indebtedness the co-operative credit society should form local societies in Puri and Balasore. Such societies should help the fishermen to buy better nets and boats with advances on the security of their catches to be marketed collectively and more profitably for the benefit of the men. There are extensive private fisheries in Chilka in the district of Puri and also in Balasore which are leased direct to fishermen but neither the owners nor the lessees take protective measures for conservation of fish and it should be the business of the Fisheries Department to instruct them to avoid capture of immature fish and thus save the fisheries from rapid exhaustion now in progress. Attempts recently made by the Fisheries Department to control Government fisheries and impose restrictions on lessees as to close season, etc., are quite commendable but care should be taken to introduce these innovations gradually and with the approval of fishermen. Their living is as precarious as ever, depending on seasons the failure of which means sheer starvation as most of them on Orissa coast have no lands to fall upon and their security is too poor to get loans from village money-lenders. It is to be hoped that they will not be forgotten in any new organisation now being proposed to improve industries in Orissa.

Little has been done so far to encourage industries based upon the utilization and manufacture of marine produce and fish products, with the exception of shell-buttons and other minor industries. There was, according to Dr. McLelland, an extensive trade before 1867 between China and Bengal in Indian isinglass, *vis.*, dried air bladders or sounds of the fish known as *Polynemus indicus* or tassel fish commonly called *Sahal* in Midnapore. The trade is practically extinct now, although huge shoals of this species, which belongs to the same family and looks like our Bengal *Topsi* only very much larger and weighing between 10 to 30 lbs., visit the shores of Balasore and Midnapore regularly in October of every year. I had samples of this isinglass sent to a London house who expressed willingness to buy any quantity of it at very remunerative prices. I have also found that the fish itself, if properly smoked, will be welcome as a breakfast delicacy on European tables but the difficulty is to devise suitable boats, gears and nets to haul them, when they come in sufficient quantity, to feed a small factory. Probably a co-operative society in Contai Sub-division of Midnapore, noted for this fish, will find it profitable to revive the trade. The most valuable substance obtained from fish refuse is oil which is mostly used for medicinal purposes, (*e.g.*, cod liver oil) but which is also converted into "curriers' oil" while a certain amount is used in the manufacture of soaps. The livers of sharks and rays, which abound in the Bay of Bengal and adjacent estuaries, are the principal sources of fish oil. It is well worth the attention of the Government to start an experimental factory to extract oil and engage in other researches somewhere in the vicinity of Puri. We have heard a good deal of conch-shells being imported from Madras to Bengal in very large numbers. I firmly believe from samples brought to me occasionally by sea fishermen that there are important beds of these shells not far from Orissa Coast awaiting discovery and exploitation. Another important industry which employs thousands and has escaped the notice of the Fisheries Department is the produce made from boiled shrimps and prawns, which is exported in bags from Khulna and Chilka Lake to Burmah where it fetches almost fancy prices. I made some experiments myself and found that shrimps made into paste and sauce and large prawns properly canned, as they do in America, are very attractive commodities, and raw materials for such products are enormous in Chilka alone and well worth exploiting in a Government experimental concern. Sardines and small species of the sprat family swarm on the coasts of Puri and Ganjam and only a fraction of them is caught by foreshore fishermen with their old fashioned boats and nets. If one could only place a dozen sailing drifters with modern nets and gears, hauls will be enormous and more than repay capital outlay in two or three good seasons. The sardines and sprats could be profitably utilized for production of oil and the refuse converted into fertiliser known as fish guano which can be sold by thousands of tons to Calcutta merchants. In Egypt fish skin leather is made from Red Sea fishes and glue and gelatine is manufactured out of fish scales and there are many other aspects of fish economics which will offer field for researches by the Government fisheries expert instead of his working elaborate theories regarding the habits of hilsa or breeding of carps, which are best left in the hands of the zoologists. The fishing industry in Bengal and Orissa is now passing through a state of transition from primitive to modern stages and requires every support that the State can lend. My own experiments or adventures confirm that the boys of "bhadrolog" or middle class are gradually attracted to it on account of small capital investment and ordinary skill necessary to achieve fairly moderate success. I find that they are beginning to appreciate dignity of manual labour and are slowly and surely

forgetting to despise the so-called low class labourers round Chilka lake and elsewhere engaged in catching, transporting and desiccating fish and from which they are now learning to earn their daily bread instead of driving quills in the chambers of city houses.

ORAL EVIDENCE, 16TH JANUARY 1917.

Mr. C. E. Low.—Q. What is your profession?—A. I am now an organiser of fisheries.

Q. Is that an honorary post?—A. No. It is purely a commercial venture. I belong to a private company. It has been working for the last four years.

Q. Is it succeeding at present?—A. To a certain extent. Of course I have my difficulties just as others have in their ventures.

Q. We have been told that your proposal is a very difficult proposition, because the fish population of the Chilka lake varies in different parts of the year?—A. I am there practically all time and I know more about its conditions than a gentleman who comes there occasionally and I do not suppose that I can agree with him. Of course fishes do vary in different places of India. That condition is prevalent all over the world.

Q. Where does the capital of this fishery company come from?—A. It is subscribed by a few friends of mine, who are commercial men, pure and simple.

Q. Had you had any training in fishery work?—A. I had my training in Grimsby. I was there for 2½ years.

Q. In the first paragraph of your evidence you say "The time is not far when the landed aristocracy, particularly of Bengal, will open their purse strings for capitalising industries specially approved of by experts." What experts?—A. Government experts.

Q. What is your reason for thinking that they will do so?—A. Because the zamindars take a considerable interest in anything that is patronised or in any sense backed by Government, and as soon as they find out that so and so industries are under the supervision, or initiative, or the instruction of Government, they will naturally pour in capital. This does not apply to the middle classes because they follow practically their own way of thinking. I am thinking of Bengal zamindars.

Q. But you recognise that even with an industrial organisation of considerable efficiency it is likely that there will be a certain number of failures?—A. Yes.

Q. What about those failures? Would not you find people turning upon Government and saying, 'You advised us and we have lost our money'?—A. Government would not undertake any liability for the failure or success of a business. They will do conscientiously what they can to put the promoters in the right track and that is a sort of guarantee to the capitalists.

Q. Take a reputable firm, or a good agency house in Calcutta. They go through a proposition and they think that it is good enough and put it before the public. In some cases it succeeds but in a few cases it fails. The public dealing with private concerns recognise that there must be a certain percentage of failures and they have not very much to say about it, but if it were Government, don't you think that a good deal of excitement would be created?—A. When I particularised the zamindar class as distinguished from the middle class, I really wanted to impress that the zamindar class have plenty of money in their hands, and simply at the dictation of the Government they would be only too pleased to pour it into enterprises. I do not say that the zamindar can fall back upon the Government for refund of the money, but if the Government is convinced of the importance of an industry or the benefit that is likely to be derived from it the Government may reasonably be expected to advise the zamindar to put money into it and that advice would be not merely advice but a sort of dictation to the zamindar—I mean by dictation, not arbitrary dictation but in the sense that a Maharaja of so and so is asked to subscribe to a charitable purpose. I do not compare charity with industry.

Q. Lower down in the same page, you say, "There should be more co-operative societies specially formed with Government aid and organised to finance cottage and rural industries and market produce or manufacture on advantageous terms." Have you had experience of co-operative societies?—A. Not practical experience, but I have watched its growth.

Q. By Government aid you mean Government finance?—A. Under Government supervision—the same as the Registrar of Co-operative Credit Societies is doing.

Q. But does not the Registrar organise industrial societies at present?—A. He does, but he is too full up and he expects also the public to do things on their own initiative and then go to him for help. I mean there ought to be more education about the benefit of co-operative movement.

Q. Have you seen anything of the working of the Calcutta Commercial Museum?—A. I did pay a visit to it.

Q. Do you think its site is a suitable one for the purpose it is meant?—A. So far as the location in Calcutta is concerned it is quite all right, but if you take it for the whole of Bengal or for the whole of India, it offers difficulties to visitors, to the purchasing public, and so on as I have pointed out.

Q. As it is organized mainly to assist small industries to sell their products you think it is all right where it is?—A. Location in any place would not make any material difference.

Calcutta is not a huge city like London or New York. Bow Bazar, or China Bazar or Clive Street would not make any difference.

Q. Do you think that the commercial museum should undertake a sales agency business for cottage industries, or should any other organisation be formed as a sales agency for cottage industries?—A. I am not very keen on Government undertaking to sell any things. They are not very smart business men, I mean the agents appointed by the Government, unless they have had special training in the particular line.

Q. Referring to the land policy of the Government, you allude to the Khasmahals Act which precludes grant of land excepting for purely agricultural purposes. I do not know the Act, would you explain it a little more fully?—A. In fact, I did not go through the Act myself but I am talking from personal experience. I wrote to the Sub-Divisional Officer of Khurda, who is the manager of the Khasmahals State, for a grant of a piece of land and he referred the matter to the higher authorities and he eventually told me that there was a certain section in the Khasmahals Act which precluded the grant of land. The sub-deputy under him also told me that the land was reserved for agricultural purposes and nobody was allowed into it because it would trespass on the agricultural reserve of the locality. But I explained to them that one acre would make no material difference, but they said that I should go to higher authorities. I then saw the Collector of Puri over this matter and he asked me to write to the Commissioner and so on, but I did not as I had a plot of land let out to me by one who had it leased from the Government, and I thought it was not worth my while to go to the higher authorities on the matter. I have found that, in the case of my business as well as other small businesses started there, the Government puts all sorts of obstacles in the way of acquisition of land for non-agricultural purposes—I do not mean the Government in the particular district there.

Q. You suggest the establishment of a small navigation and training school for fishermen and mariners, somewhere near Chandbally where boat making, sail making, navigation and preservation of fish and other allied subjects should be taught. How could experts in boat making and sail making be obtained?—A. We do not want any special experts to be imported from abroad. In India there is a bit of sea fishing industry in Madras and west coast and Cochin. They are more advanced than the people of Orissa and a few can be brought over from there. They are expert sail makers, boat builders and sailors and there might be one trained fisherman from Japan to supervise them.

Q. Each particular coast has its own types of boats and sails which are suitable there and not elsewhere—I mean there is difference not only in local conditions, but also in the materials available?—A. To a certain extent it is so. As a rule they have got to use wood and plank, and whether it is sal plank or some other plank it does not so much matter.

Q. Do you think that a school is practicable?—A. That is very practicable. There is a school at Grimsby which is a very old one. I know that when they started the school the fishermen would not come to it because they thought it was waste of time. After the people began to see the advantage of having school-training in sail making and other crafts, students went to it in great numbers. In the beginning we have always the difficulty of getting people to come or getting the proper people to train, but once a beginning is made, I think we shall be able to get proper men to teach and suitable people to be taught.

Q. Whom do they get to teach them in Grimsby?—A. They have got an ex-trawler captain so far as the trawling portion is concerned. They have got boat builders, sail makers and navigators. In Madras we have the instance of a Fisheries Department started by Sir Frederick Nicholson and he, I believe, in a small way, has started a school somewhere, but I am not sure about it—somewhere near Cochin, but I have not tried to ascertain that particular point. I only want to say that what is done there may be repeated here.

Q. You suggest that something should be done to make available the deep sea fish which you say exists off the Orissa coast, and you suggest a co-operative society. Don't you think that it is rather too big a thing for a co-operative society?—A. I suggested a co-operative society in a particular sub-division to tackle the small industry of isinglass only.

Q. Would you mind looking at it from the question of deep sea fish which is practically untouched there. You have got to organise your means of collecting fish, you will have to get expensive boats, and you have got to devise means to preserve the fish either by cooling or by some other method, and you have got to get your means of transport and arrange the market, and that is a large undertaking? It is apparently being tackled in Madras?—A. Yes.

Q. Do you think that it is a kind of work that the Government ought to take up in the first instance if private enterprise is not forthcoming?—A. After our experience of the "Golden Crown" it is very difficult to say.

Q. We have been told that the "Golden Crown" was not intended to work up the trade, but only to find out whether there was fish there?—A. The people who are interested in fisheries know that. The class of people and the class of boat selected were not suitable for the business. For example, you appoint a statutory civilian to be the director of fisheries or that sort of thing. Fish used to be brought by the "Golden Crown" and allowed to rot. There was no arrangement to take the fish to the market. What I say is that the Government might repeat the experiment very conveniently on a smaller scale not with steam trawlers but sailing vessels.

Q. Do you think that one sailing vessel would be sufficiently regular to cover the trade?
—A. Not one, but a dozen sailing vessels.

Q. You have got to have either cooling arrangements or freezing arrangements or preserving arrangements?—A. The business in fish is not merely in fresh fish. For dry fish there is a ready market. You can do away with the idea of fresh fish business and start with dry fish business, and when this is successful you can go for a refrigerator or ice making plant or that sort of thing for fresh business. We have got plenty of coolies in Calcutta down the river Hooghly, and they will only be too glad to pay a decent price for mere dry fish which they cannot get now because it is too expensive for them and fresh fish is a luxury. You give them what they want and what they are accustomed to.

Q. Where from is dry fish brought to Calcutta?—A. In Calcutta at present there is no big market for dry fish. What little supply there is from Orissa and the Madras Presidency goes to Burma where there is a big demand. In Calcutta dry fish is sold in one or two markets, where they have Chinese customers and also in the Calcutta New Market.

Q. Does the mill coolie purchase dry fish when he gets a chance?—A. The up-country coolies do not care for fish. Amongst the coolies there is a class of people who are accustomed in their native homes to eat dry fish. The Uriyas will eat it very comfortably and they will want it more.

Q. Do that class of people get it in Calcutta?—A. No, because the price is very high. It is eight annas a seer in Toretta Bazar.

Q. At what price could it be landed at Balasore?—A. It is the price of labour. There is no fixed scale of wages. There is a sort of division of the produce. The owner of the boat gets a share and the crews get a share. From my own experience I find that you can land fresh fish of good quality at one anna and nine pies a seer in Balasore or Puri or Chandbally.

Q. Does not dry fish at present come from Orissa or Balasore to Calcutta?—A. They go to Burma. There is a great local consumption amongst the inhabitants of the feudatory principalities. They get it there for 4 to 5 annas per seer and the price is a little too much for them. If the price is reduced to three or two annas the consumption will be trebled or quadrupled.

Q. You say towards the end of the last paragraph, "The boys of bhadrals or middle class are gradually attracted to it." Have you any definite instances?—A. I can give you instances. A gentleman who passed his F. A. examination and was a clerk somewhere here, worked under me as my employé and he saved a few rupees and left me and started business on a small scale with a capital of Rs400 or Rs500 and he is making Rs50 or Rs60 a month.

Q. What does he do?—A. He simply works as a middle man. He helps the fishermen to get more fish than they would get when they were left to themselves.

Q. By giving them advances?—A. Yes and by telling them the advantages of having improved things and systems.

Q. Have you had any instances of bhadrals going out with a boat or owning a large boat?—A. I know of bhadrals owning boats but not actually fishing but following fishermen to see that the fish are not sold away to anybody else. At present they get fishermen for 2 or 3 annas a day. The bhadrals go daily with the boat.

Q. Are any considerable number of bhadrals doing that?—A. I know of about 20 or 25 cases, in Puri, Orissa, Eastern Bengal, Goalundo, Khulna, Monghyr. They go up there and buy fish and send it to Calcutta. They supervise the fisherman and make advances and so on. They have some representatives in Calcutta who receive it on their behalf.

Q. The fishermen at present cannot organise their market and they are in difficulties?—A. Yes.

Hon'ble Pandit M. M. Malaviya.—Q. You say at page 2, "Banking facilities in marketing indigenous products are absolutely essential," and you say that the banks would not advance a pice against a hypothecation of products or plants and properties and that many important industries under Indian management have failed on that account. Have you any instances in mind which you would mention to the Commission?—A. I do not like to be personal. I know of one Calcutta tannery. Their finances were rather in a low condition and they applied to banks. Of course, the very name of an Indian factory frightened the bankers and they deputed people to make enquiries and they found that it was not well organised and so on, but they did not go into the question of assets. Everything has got an asset, and even a little cottage is purchaseable and saleable. That particular factory was certainly worth Rs50,000. A capital of over a lakh was invested on it and it is under the proprietorship of a well-known gentleman in Calcutta. They wanted, to begin with, Rs10,000 or 12,000, as advance.

Q. They did not get the amount?—A. The bank made all sorts of enquiries and finally the matter was dropped. The general impression amongst the Indian capitalists and proprietors of factories here is that the doors of exchange banks are closed to them.

Q. What kind of bank was it?—A. It was an exchange bank.

Q. You suggest "the creation of a department in Presidency banks to deal with this matter and to have proper powers to advance money against goods, bills of lading, and assets." Suppose that the Presidency banks cannot start a department such as you suggest, would you be in favour of starting a separate bank?—A. The difficulties in the way of starting a separate

bank and that it would have in the initial stage to undergo difficulties, it would not pay, whereas in the Presidency banks there is a certain amount of Government deposit and the Government might induce them to make an experiment and place one of their representatives to look after that particular business of advancing money against commercial properties, against factories and so on. If you have got to start a new bank you will have to undergo all the paraphernalia. Which will be very slow work.

Q. The Presidency Banks would not like the Government to put one of their representatives on their Board?—A. I fancy the Presidency Banks owe their existence to Government support.

Q. But assume that they do not see their way to accept your suggestion, the only other course is to open a separate bank?—A. Yes. There is no other way of dealing with it.

Q. You think that unless more banking facilities are available the Indian industries cannot improve?—A. Yes. They cannot improve even a bit.

Q. Speaking of the training of labour and supervision you suggest that certain factories should be provided for theoretical training of employes by holding occasional classes and demonstrations. In how many centres would you have them?—A. In all industrial centres. If you take Bengal, Calcutta is the right place. If you take Orissa, Cuttack is the right place, for Bihar, Bankipur. I am thinking of economy. I want as a beginning that some of these workshops should be subsidised by Government for this particular purpose and I have seen things of that sort abroad.

Q. You speak of the apprenticeship system. Did you in your experience find workshops in England admitting Indian students as apprentices in large numbers?—A. There is no remarkable prejudice against Indians or anybody, but the thing is that the workshops are run on very much different lines from here. For example, the trade union people have got their own opinions and they do not like anybody coming in to learn work eventually with the idea of competing with them on cheaper wages. That is due to ignorance and once they are convinced that the Indian boys are going back to India to work in India they will not object. There is no marked prejudice excepting in certain special industries as manufacturing chemicals, where of course they do not want Indians to learn the secrets of certain processes. I know Messrs. Brunner Mond and Company at Northwich would not allow anybody to enter their firm to learn any special processes in manufacture of chemicals.

Q. You say you were the Secretary of the Manchester Indian Association and that it was part of your duty to help young Indians to enter manufacturing firms as ordinary or premium pupils. What is your experience? Did you find that in 50 cases out of 100 that you took up these pupils were admitted or not admitted?—A. The admission was not refused on the ground that they were Indians.

Q. I want to know as a fact whether you found that they could find admission or not?—A. When there was a vacancy we always found room for an Indian. They will be glad to take an Indian.

Q. In your experience were you able to find admission for 50 per cent. of those for whom you endeavoured to seek admission?—A. With the exception of one or two cases I succeeded everywhere.

President.—Q. To what firm were you apprenticed?—A. Hans Renold, Limited, Upper Brook Street, Manchester.

Q. Have you given up engineering?—A. Yes.

Q. Why?—A. Firstly because I found that the jobs offered to me were not attractive on account of the low remuneration attached to them. Secondly, I was keen on Government Service and I found that there were a lot of difficulties in getting Government service because they have got to give preference to men from the Sibpur and Roorkee Colleges and they cannot take all students trained in England. I gave up engineering because I found I cannot get jobs on the terms I should like to.

Q. You tried any firms?—A. I tried Messrs. Martin and Company, and Sir Rajendra offered me a job worth Rs100 and I told him that I had invested Rs12,000 on my education and if I had invested that money—

Q. Sir Rajendra started on less than Rs100—A. He did not spend so much money as I did on my education. I made a mistake there and I admit it. I had a sort of conceit or vanity.

Q. After that you took up fishery?—A. After spending some time here in commercial work, I took up fishery and went back to England to study fishery.

Q. And you are engaged in a fishery firm?—A. Yes. We formed a fishery company called Chikka Fisheries.

Q. Is that company organised by yourself?—A. Yes.

Q. You had left the original company before that?—A. Yes.

Q. You did not go to England originally as a Government scholar but as a private scholar?—A. Yes. When I went to England first I studied engineering in the Manchester University. Subsequently when I went back I did not join any school, because there was nothing to be done. I went to Ormsby and joined a trawling company.

Q. You went to Owens College and took up your degree in engineering?—A. I took the diploma course in engineering.

Q. You were there for three years?—A. Yes. For a year I was meteorologist in the University of Manchester under Professor Schuster. Professor Schuster during the absence of Mr. Bell asked me to do it.

Q. You are getting on all right with your Chilka Fisheries?—A. No. There are failures and disappointments.

Hon'ble Pandit M. M. Malaviya.—Q. Had you to work at any time with a bachelor of commerce?—A. I did not work with any bachelor of commerce. I know how he is looked upon by the commercial people and financiers.

Q. Have you had any practical experience of working side by side with a bachelor of commerce in Manchester?—A. No.

President.—Q. You were at home ten years ago in the Owens College?—A. Yes.

Q. Before the faculty of commerce was established?—A. It is a thing I experienced after I returned. When I went back I used to re-visit Manchester and used to meet commercial men.

Q. And there you get this impression that the Manchester graduates in commerce were worthless?—A. I tell you why I have got such an impression. There was a meeting of the University. Sir Forbes Adams who was a partner in Messrs. Graham and Company, said, if I remembered rightly, that these bachelors of commerce who had been produced lately by the Manchester University were not doing well. I have also heard from the students.

Q. What year was that?—A. 1910 or 1911. One or two Bombay students—I mean Parsi students—who went in for this bachelor of commerce degree told me that the only opening for them would be to act as professor of commerce when they went back unless some public gentlemen like the great Tatas took them up.

Q. You know Mr. Rowbotham?—A. I do not exactly remember.

WITNESS No. 184.

Mr. G. Findlay
Shirras.

MR. G. FINDLAY SHIRRAS, M.A., F.S.S., I.E.S., *Director of Statistics, Calcutta.*

WRITTEN EVIDENCE.

NOTE ON THE DEPARTMENT OF STATISTICS, INDIA.

Summary.

	PAGES.
1. Organisation of the Statistical Department	2
2. Office establishment	3
3. Statistics—

5. Promptness and accuracy of trade statistics	26
6. Statistics of Labour	27
7. Instructions to compilers	28
8. Distribution of Statistics	29-33

This Memorandum deals with (1) the collection and (2) the distribution of statistics by the Department of Statistics, India.

I.—THE COLLECTION OF STATISTICS.

2. It is, perhaps, unnecessary to refer to the history regarding the collection of Indian statistics. For over half a century the publication of statistics has been systematically undertaken by the India Office. In India a Director-General of Statistics was appointed in 1871. The first occupant of the post (Sir William W. Hunter) was connected chiefly with the organisation of a statistical survey of the Indian Empire which began in 1869. The different departments of the Government of India Secretariat compiled their own statistics. The Department of Revenue and Agriculture, e.g., had, as one of its functions, "the duty

complete and systematic ascertaining and rendering available of the statistics of vital, agricultural and economic facts for every part of India, in order that Government and its officers may always be in possession of an adequate knowledge of the natural condition of the country, its population, and its resources." By 1895 it was considered that the disconnected manner, in which Indian statistics were compiled and published, seriously detracted from their value, and that their intelligent examination, collation, and discussion were necessary in order to secure uniformity and to render these statistics as useful as they might and should be. The periodical returns of the Departments of Revenue and Agriculture and of Finance and Commerce, together with those of the Home Department, were placed under the charge of Mr. J. E. O'Connor, C.I.E., as Director-General of Statistics. In this capacity he was an independent officer who published his compilations and reviews in his own name and on his own responsibility, although he dealt with the statistics belonging to each department in communication with and under the general direction and control of that department. This arrangement continued until 1905, when the Department became a part of the new office of the Director-General of Commercial Intelligence. From the 1st April 1914, a Department of Statistics under a Director was formed, as the experience of the working of the Commercial Intelligence Department, as constituted in 1905, had shown that a Commercial Intelligence Department and a central Statistical Department could not, consistently with efficiency, be combined under the charge of one officer. The Secretary of State agreed with the Government of India that the compilation and publication of statistics required the undivided attention of one officer. He assumed that it was intended that the Director of Statistics should be responsible for the issue of the general crop forecasts and reports. The system, introduced in April 1914, obtains at the present time, and the department compiles and publishes statistical returns and reports on behalf of the various departments of the Government of India, such as the Commerce and Industry Department, Home Department, Finance Department, Department of Revenue and Agriculture, and Department of Education, as well as in regard to the inland and frontier trade of Bengal on behalf of the Government of Bengal.

3. The office establishment consists of 73 assistants (including two temporary clerks) and 2 Superintendents and is divided into two main divisions, each under a Superintendent. The first division comprises six sections and the second four. Section I, the Registry and Issue Section, deals with the receipt and issue of letters, as also with pay, pensions, distribution of publications, record, etc.; Section II deals with prices and freights; Section III with wages statistics; Section IV with judicial, administrative, educational and vital statistics; Section V with rail and river-borne trade statistics; Section VI with statistics relating to the rail and river-borne trade and frontier trade of Bengal; Section VII with sea-borne trade returns, including coasting trade, treasure, shipping, and customs duties returns; Section VIII with frontier trade; Section IX with agricultural returns and crop forecasts; and Section X with commercial and financial statistics.

The strength of each Section is as follows:—

Section	No. of Assistants.
1—General	7
2—Prices and Freights	5
3—Wages	2
4—Judicial and Administrative Statistics	4
5—Rail and River-borne Trade	6 Including one Statistical Auditor.
6—Bengal Statistics	10
7—Sea-borne Trade	21
8—Frontier Trade	6
9—Agricultural Statistics	6
10—Commercial and Financial Statistics	6
TOTAL	73

4. *Prices and Wages.*—Sections 2 and 3 deal with the statistics of Prices and Wages. The publications compiled in these sections are:—

- (1) Prices and Wages in India.
- (2) Variations in Indian Price Levels expressed in Index Numbers.
- (3) Fortnightly Return of Wholesale and Retail Prices.
- (4) Occasional publications, e.g., on war prices and freights, etc.

5. *Prices.*—The prices of food-grains, etc., in the principal marts in India are compiled from the fortnightly statements of wholesale prices received from the provincial Directors of Agriculture and other local statistical officers in the several provinces of British India and the Resident in Mysore. The prices of commodities imported into and exported from the chief Ports are generally taken from the Prices Current published by the different Chambers of Commerce. The prices paid by the Supply and Transport Corps are supplied by the Quartermaster General in India. The prices in the United Kingdom are compiled generally from the "Economist" and the "Corn Trade News." The retail prices of the principal food-grains and salt in British India and in certain Native States (Rajputana, Central India, Hyderabad, and Mysore) are compiled from the fortnightly statements of retail prices at the head-quarters of districts, received from the Directors of Agriculture and other local officers in the several provinces of British India and from the political officers in Native States.

6. *Prices*.—Variations in Indian Price Levels expressed in index numbers are compiled mainly from the figures published in the volume of Prices and Wages. This pamphlet, which is not an annual one, exhibits four series of Index Numbers of prices in India. The first is a special index number for imported articles (11 in number), the second is a special index number for exported articles (28 in number), the third is a general index number for the articles (39 in number) for the preceding two special index numbers, and the fourth is a special index number for the retail prices of 7 food-grains (cereals and pulses).

7. *Prices*.—The fortnightly return of wholesale prices deals with food-grains, oilseeds, sugar-raw, ghee, salt, tobacco leaf, turmeric, grass, straw, jawar stalks, bhusa (white), bran, sheep, plough bullocks, and kerosene oil, and that of retail prices deals with food-grains and salt. The figures are compiled from the statements furnished by the provincial Directors of Agriculture and other local statistical officers in the several British Provinces and political officers in the case of Native States. The local figures are scrutinised, consolidated, summarised, and then published with summary tables in the *Gazette of India*.^{*} This section is entrusted with the preparation of other statements regarding prices and freights, e.g., the fortnightly statement of wholesale and retail prices of wheat, the Calcutta index numbers of wholesale and retail index members. This Section also compiles quarterly rate lists of stores purchased in England for Government departments in India. The lists contain information as to Home prices as well as the cost of sea freight, insurance, freight brokerage, landing charges, import duty, and interest.[†]

* Appendix X.
(Not printed).

† Appendix XX.
(Rate Lists.)
(Not printed)

8. *Wages*.—The statistics of wages are those paid to certain classes of labourers and artisans in districts and in certain railways (East Indian Railway and North Western Railway) and Government establishments, as well as in certain private industrial establishments in various parts of India. The district wages are compiled from the returns of wages received from the different provincial authorities and from the Political Officers in Native States. The Provincial reports are half-yearly in the case of British Baluchistan and Native States (Rajputana, Central India, Hyderabad, and Mysore), yearly in the case of the Central Provinces, and quinquennial with regard to the other British Provinces. The wages regarding Government and railway establishments are furnished by the heads of the establishments concerned. Those regarding private industrial establishments are supplied by the managers of the concerns. The statistics of wages paid in industries are meagre and refer generally to a representative mill in the chief locality of the industry. Returns are not yet received of wages paid in the various mills of each industry.

Charts are ordinarily appended to the publications of these sections to illustrate graphically the variations in prices, etc.

9. *Public Health, Administrative, Judicial, Local Self-Government, and Educational Statistics*.—Section 4 deals with Judicial and Administrative Statistics. These statistics (with the exception of the sections relating to Area and population, Emigration, Passengers by Native Passenger Ships, Port Trusts, Port Blair, Pilgrims by Pilgrim Ships, and Medico-legal investigations) used to be compiled formerly in the Home Department, but the work connected with these statistics was transferred in 1896 to the then newly created Statistical Bureau under the Director-General of Statistics. The following are the publications of this Section:—

- (1) Public Health (Volume III of the Statistics of British India—Statistical Abstract).
- (2) Administrative, Judicial, and Local Self-Government (Volume IV of the Statistics of British India—Statistical Abstract).
- (3) Education (Volume V of the Statistics of British India—Statistical Abstract).
- (4) Special returns for the Home and the Education Departments (*vide* paragraph 12 below).

10. *Public Health*.—This volume contains five sections, namely, (1) Vital Statistics, (2) Hospitals, (3) Lunatic Asylums, (4) Vaccination, and (5) Wild Animals.

- (1) *Vital Statistics*.—This section deals with statistics relating to births and deaths, and is compiled from the Annual Sanitary Reports supplied by Local Governments and Administrations and the Sanitary Commissioner with the Government of India.
- (2) *Hospitals*.—This section deals with the statistics relating to the different classes of hospitals, the number of in-door and out-door patients treated in them, the diseases for which they were treated, together with the number of deaths among the in-door patients treated. Figures are compiled from annual reports on hospitals and dispensaries supplied by Local Governments and Administrations.
- (3) *Lunatic Asylums*.—This section deals with the statistics relating to lunatic asylums, the number of lunatics (male and female) admitted into them, the types of insanity among the lunatics, and their causes. They are compiled from annual reports on lunatic asylums supplied by Local Governments and Administrations.
- (4) *Vaccination*.—This section deals with the number of operations (primary and re-vaccination) performed by the agency of a special department established for the purpose, and to a small extent by the staff attached to the ordinary hospitals and dispensaries, as also by other agencies. Figures are compiled

from annual reports on vaccination furnished by Local Governments and Administrations and the Sanitary Commissioner with the Government of India.

- (5) *Wild Animals*.—This section deals with the statistics relating to measures adopted for the destruction of wild animals and snakes and the number of human beings killed by them. The statistics are compiled from the provincial reports on the destruction of wild animals and snakes furnished by Local Governments and Administrations.

11. *Administrative, Judicial, and Local Self-Government Statistics*.—There are seventeen sections in the volume of Administrative, Judicial, and Local Self-Government Statistics. The sections are stated below :—

- (1) *Area and population*.—This section, broadly speaking, presents data relating, firstly, to the population of India as recorded at the decennial census, and secondly, to area. The statistics relate generally to the last three decennial censuses. The section is compiled from the latest census tables and is revised every year by Local Governments and Administrations, which also supply the figures of land revenue and rates for the section.
- (2) *Administrative Divisions*.—The data presented are, firstly, the number of administrative divisions, districts, and sub-divisions in each province, and secondly, the total area, population, number of villages, and land revenue of each province. This section is compiled from table No. 3 of the section "Area and Population."
- (3) *Police*.—This section deals with cognisable and non-cognisable crime, the strength and cost of Civil and Military Police, and the general internal management of the force. It is compiled from the annual reports on the Administration of Police supplied by Local Governments and Administrations.
- (4) *Jails*.—This section gives information relating to convicts admitted into and living in the jails of the different provinces, together with particulars of the cost of guarding and maintaining prisoners, and of the earnings of the prisoners, and the net cost to Government. It is compiled from the annual report on the administration of jails supplied by Local Governments and Administrations.
- (5) *Port Blair*.—This section deals with the population (convict and free) of Port Blair and the receipts and expenditure of the Settlement. It is compiled from the statements appended to the annual report on the administration of the Andaman and Nicobar islands and the Penal Settlement of Port Blair.
- (6) *Registration* deals with the statistics relating to the operations under the Registration Act and is compiled from the annual reports of the Registration Department supplied by Local Governments and Administrations.
- (7) *Presses and Publications* show the number of printing presses at work, and the number of newspapers, periodicals, and books published in British India. The figures are supplied by Local Governments and Administrations.
- (8) *Emigration* deals with indentured emigration carried on under the Indian Emigration Act and rules framed thereunder relating to the emigration of natives of India. But certain persons who proceed to the Colonies or other foreign countries without coming under the operation of the Emigration Act, as for instance, in the capacity of shop assistants or personal domestic servants, are also taken into account in the statistics. The section is compiled from returns furnished by Local Governments and Administrations.
- (9) *Passengers by Native Passenger Ships*.—These statistics show the number of passengers carried in the native passenger ships on long and short voyages from Indian ports. This section is compiled from the provincial reports on the working of the Native Passenger Ships Act.
- (10) *Pilgrims by Pilgrim Ships*.—The data presented in this section are the number of pilgrims who sailed from, and returned to, British India to and from the Hedjaz under the provisions of the Pilgrim Ships Act and are compiled from returns furnished by the Collectors of Customs, Bombay and Chittagong, and the Port Officer, Karachi.
- (11) *Judicial Divisions*.—This section deals with the number of Judicial divisions, districts and sub-districts, and the number of the several cases of officers exercising Original or Appellate jurisdiction, in each province, as also the number of cases decided in, and the total receipts and charges of, the Civil and Criminal Courts in each province. The section is compiled mainly from data given in the annual reports on Civil and Criminal Justice supplied by Local Governments and Administrations.
- (12) *Civil Justice*.—This section shows the number, description, and general results of civil suits tried in the Courts of Original and Appellate jurisdiction of the different provinces, and is compiled from the annual reports on the Administration of Civil Justice supplied by Local Governments and Administrations and Provincial High Courts and Chief Courts.
- (13) *Criminal Justice* shows the number of offences reported, number of persons tried, general results of the trials, and the punishment awarded by the Criminal

Courts of the different provinces of British India. The section is compiled from annual reports on the Administration of Criminal Justice supplied by Local Governments and Administrations and the Provincial High Courts and Chief Courts.

- (14) *Medico-legal Investigations* show the number of cases of human and animal poisoning in which articles were chemically examined, distinguishing the poisons most commonly used in each province. The section is compiled from the annual reports of the Chemical Examiners supplied by Local Governments and Administrations.
- (15) *Municipalities*.—This section shows the population and constitution of municipalities in each province and their income and expenditure, and is compiled from the annual reports on the working of the municipalities supplied by Local Governments and Administrations.
- (16) *District and Local Boards*.—This section deals with the number and composition of the Boards and their income and expenditure. It is compiled from the annual reports on the working of the District and Local Boards supplied by Local Governments and Administrations.
- (17) *Port Trusts*.—This section deals with the constitution, income, expenditure, and debt of the Commissioners for the several ports, and is compiled from the annual administration reports of the Commissioners for the Ports of Calcutta, Bombay, Madras, Karachi, Rangoon, and Chittagong.

12. *Education*.—This volume deals with various educational statistics such as the number of public and private institutions and scholars (male and female) in each province, the number of university graduates and undergraduates in each province, the expenditure on education, etc. The figures are compiled from the annual reports on Public Instruction received from Local Governments and Administrations, and the Directors of Public Instruction.

Special annual compilations are made regarding wild animals and snakes, for the Home Department, and regarding education in all-India for the Education Department.

13. It should be noted that there is a considerable amount of labour involved in the compilation of the 'All-India' returns. Misclassification, incorrect returns, e.g., totals, etc., are not uncommon, and the work connected with these statistics sometimes involves considerable correspondence.

14. *Inland Trade*.—Section 5 deals with the statistics relating to inland trade (Rail and River-borne) of India. These statistics used to be compiled formerly in the Revenue and Agriculture Department, but the work connected with them was transferred in 1895 to the then newly created Statistical Bureau under the Director-General of Statistics. The publications compiled in this section are:—

- (1) The Annual Inland Trade Accounts,
- (2) The Quarterly Inland Trade Accounts, and
- (3) The Monthly Trade Fluctuations in the imports of certain staples into the Chief Ports.

(1) *The Annual Accounts* are compiled from the four quarterly abstracts. The quarterly returns are furnished by the provincial officers and certain railways in maunds and show the articles detailed in the list* enclosed. These returns are consolidated, progressive totals are made for four quarters, and figures are converted into hundredweights and posted in to the abstracts or working sheets from which the tables for the Annual Accounts are prepared. The supplementary tables relating to the trade of the Chief Port of Madras are compiled from the special annual statement supplied by the Board of Revenue, Madras.

(2) *The Quarterly Accounts* are compiled from the returns furnished every quarter by the provincial officers and certain railways. The returns are consolidated, and totals are made and converted into hundredweights before publication. In the accounts for the second, third, and fourth quarters progressive figures for six, nine, and twelve months respectively are also shown.

(3) *Monthly Trade Fluctuations*.—These relate to imports by rail and river and by sea into certain ports of the staples noted in the margin. They are compiled from the monthly figures furnished by the railway officials, Collectors of Customs, steamer companies, the Commissioners for the Port of Calcutta, etc., and contain monthly as well as progressive figures. They are published every month in the *Gazette of India*† with summary tables.

The improvement of the Inland Trade Statistics as also the discontinuance of the publication of the quarterly accounts of the trade ‡ are under consideration.

15. *The Inland and the Frontier Trade of Bengal*.—Section 6 deals with the statistics relating to the inland and the frontier trade of Bengal. These statistics were formerly compiled in the Statistical Department of the Government of Bengal, but the work connected with these

† Since this was written it has been decided to discontinue these quarterly returns.

oil.
tea and Tea.
Appendix XI.
(Not printed.)

was, at the request of the Local Government, transferred to the Statistical Department of the Government of India in 1901. The publications compiled in this section are—

- (1) The Annual Inland (Rail and River-borne) Trade Report of Bengal.
- (2) The Annual Frontier Trade Report of Bengal.
- (3) The Monthly Trade Fluctuations in the imports and exports of certain staples into and from Calcutta.

(1) *The Annual Inland Trade Report of Bengal* is compiled mainly from the quarterly returns received from the railway and steamer companies, canal authorities, and the Commissioners for the Port of Calcutta. The returns show only figures of quantity, and values are assigned to each article every quarter when the returns are made up. The average values are determined from the rates reported every quarter by the Collector of Customs, Calcutta, the Commissioner of Police, Calcutta, and certain selected district officers. Progressive totals are made of the four quarterly figures of quantity and value in the abstract, from which the tables of the Annual Report are compiled. The report contains two supplementary tables, showing the import and export trade of Calcutta by all routes, namely, by river, rail, road, and sea (coastwise and foreign).

(2) *The Frontier Trade Report* deals with the trade of Bengal with Nepal, Thibet, Sikkim and Bhutan. It is compiled from the monthly returns furnished by the Deputy Commissioners of Darjeeling and Jalpaiguri and the Political Officer, Sikkim. The returns show the articles mentioned in the list * attached. These monthly returns are consolidated and progressive totals for twelve months are made in the abstract, from which the tables for the Annual Report are prepared. *Appendix XI. (Not printed.)

(3) *The Monthly Calcutta Trade Fluctuations* are compiled from the returns supplied by the railway audit offices, steamer companies, canal authorities, the Commissioners for the Port of Calcutta, the Collector of Customs, Calcutta, and the District Officers, Howrah and 24 Parganas. They show the import and export trade of Calcutta by all routes in certain principal articles, and contain monthly as well as progressive figures. The statistics are published monthly in the "Calcutta Gazette."†

*Appendix XI.
(Not printed.)

†Appendix XIII.
(Not printed.)

16. *Foreign Seaborne Trade.*

Section 7 is sub-divided into 4 sub-sections, namely—

	No. of Assistants.
(1) Imports, Foreign Trade	8
(2) Exports „ „	7
(3) Duty, Treasure, and Shipping	2
(4) Coasting Trade	4

This section, the largest in the department, deals with the foreign seaborne and coasting trade and navigation of British India and also with the customs revenue. The publications compiled in this section are :—

- (1) The Monthly Customs Revenue Statement.
- (2) The Monthly Accounts of the Foreign Seaborne Trade and Navigation of British India.
- (3) The Monthly Review of the Seaborne Trade.
- (4) The Seaborne Trade and Navigation Accounts for the calendar year.
- (5) The Annual Review of the Trade of India.
- (6) The Annual Statement of the Foreign Seaborne Trade of British India—
Volume I.—Abstract and Detailed Tables of Imports, Exports, and Re-exports.
Volume II.—Abstract and Detailed Tables of Trade and Shipping with each
Country and at each Port and Returns of the Trade of Aden and of the French
and Portuguese Possessions in India.
- (7) The Annual Statement of the Coasting Trade and Navigation of British India.
- (8) The Weekly Note on the Imports and Exports of Wheat, Jute, and Cotton at the
Chief Ports.

Besides the above-mentioned regular publications, statistical tables showing the estimated value of the imports and exports of India at the prices prevailing in 1899-1900 to 1901-02 and in the year previous to the year of report, and periodical notes, *e.g.*, exports to certain neutral countries, imports of motor cars, total value of merchandise imported into and exported from British India, etc., are also compiled and issued from this section.

17. Foreign Seaborne Trade.

- (1) *The Monthly Customs Revenue Statement* shows the progressive figures of sea and land customs revenue, excluding salt revenue, collected on principal heads of articles for ten years. The figures are received by wire from the Collectors of Customs (except from the Collector of Customs, Calcutta, who sends his return in manuscript); and from local authorities as regards cotton excise duty.

They are consolidated in this department and issued generally on the 1st of the month following that to which the figures relate. Copies are furnished to Government, and the statement is published in the Supplement to the *Gazette of India*.

* Appendix XIV,
XV and XVI,
(Not printed).

Appendix XVII.
(Not printed.)

- (2) *The Monthly Accounts of the Foreign Seaborne Trade and Navigation of British India* are compiled from monthly returns furnished by the Collectors of Customs, and are generally issued by the end of the 3rd week of the month following that to which the figures relate. The returns show the articles as detailed in the statistical lists Nos. 1, 2, and 3*, with the details of countries from which they are imported and to which exported. For consolidation these returns are posted into monthly abstracts (about 4,500 pages) in which totals for all-India and progressive totals are made. The monthly accounts are compiled from these abstracts. In every quarter, ledgers (22 in number) are also prepared from these abstracts for compilation of the tables of imports and exports from and to each principal country published in these accounts. These accounts are revised month to month on receipt of errata statements.
 - (3) *The Monthly Review* is a supplement to the monthly accounts and is intended to give prominence to the special features of the month's exports and imports. This review is also published in the supplement to the *Gazette of India*†
 - (4) *The Calendar Year Accounts* are compiled just after the issue of the December accounts. They are exactly similar in form to the monthly accounts. Nine months' figures published in the December accounts are added to the figures for three months, January to March, of the previous official year, and the rupee figures are converted into sterling.
 - (5) *The Annual Review of the Trade* is taken up after the accounts for March are issued in April. The statistical data regarding the sea-borne trade are obtained from the March accounts and the twelve-monthly abstracts and ledgers. The data regarding prices, wages, freights, and inland and frontier trade are also compiled in the respective sections of this department.
 - (6) *The Annual Statement of the Foreign Seaborne Trade of British India*.—Volume I is compiled from the twelve-monthly abstracts and ledgers. The monthly returns are furnished by the Collectors of Customs in rupees and the rupee figures are posted into the abstracts for the monthly accounts. The progressive figures in the twelve-monthly (annual) abstracts are converted into sterling and the annual ledgers are compiled in sterling notation; from which abstracts and ledgers tables of the annual volume are compiled.
- As regards Volume II, the tables relating to the trade with principal countries are compiled from the annual ledgers. The shipping and duty tables are compiled from the abstracts of monthly returns. The trade at the chief ports is compiled from the advance proof of provincial annual statements, which are in rupee notation and are converted into sterling in this department. The printed tables of the trade of Aden are furnished by the Government of Bombay and are incorporated in this volume. The returns of the trade of the French and Portuguese Possessions in India are received from the respective Governments, and are compiled in this department for incorporation in this volume. The tables relating to the trade and shipping at each port are compiled from special annual returns furnished by the Collectors of Customs.
- (7) *The Annual Statement of the Coasting Trade and Navigation of British India* is compiled from the monthly returns which are posted into abstracts in which twelve months' figures are entered and totalled at the end of the year. The chief port tables are compiled, as for Volume II of the Foreign Seaborne Trade, from the advance proof of provincial annual statements furnished by the collectors of customs. The tables relating to the trade and shipping at each port are compiled from special annual returns.
 - (8) *The Weekly Note on the Imports and Exports of Wheat, Jute, and Cotton at the Chief Ports* deals with both the seaborne and the rail and river-borne traffic. As regards the former, figures are furnished by wire by the collectors of customs except the Collector of Calcutta from whom a return is received in manuscript. The rail and river-borne trade figures are obtained from the Magistrates, Howrah and 24 Parganas, the Port Commissioners, Canal Supervisor, and the General Traffic Managers, East Indian Railway, Bengal Nagpur Railway, and Eastern Bengal Railway, and steamer companies.

18. Foreign Seaborne Trade.

It may be noted that the seaborne trade returns (so far as the list of articles, and the specification of sub-heads are concerned) are revised annually in the light of applications received from traders, etc. The Director-General of Commercial Intelligence is constantly consulted, and chambers of commerce are also consulted, when necessary.

19. Frontier Trade.

Section 13 deals with the trade across the land frontiers of British India. The figures are furnished monthly by local authorities of Sind, the North-West Frontier Province,

the Punjab, the United Provinces, Bihar and Orissa, Bengal, Assam, and Burma. They are consolidated in this department. The quantity is stated in maunds which are converted into hundredweights before publications in the monthly accounts relating to the trade by land of British India with foreign countries. Formerly these accounts published progressive figures only, but since April, 1915, monthly figures, as well as progressive figures for months, have been published, as in the monthly seaborne trade accounts of British India.

20. *Agricultural Statistics, including those relating to Crop Forecasts, etc.*

• Section 9 deals with agricultural statistics, including those relating to crop forecasts and cotton press returns. (These statistics, except the last mentioned, were compiled in the Department of Revenue and Agriculture until 1895, when they were transferred to the then newly created Statistical Bureau under the Director General of Statistics.)

The following publications are compiled in this section :—

- (1) Forecasts of Crops (rice, wheat, cotton, linseed, rape and mustard, sesamum, groundnut, indigo, and sugarcane). Twenty-five separate forecasts are issued annually.
- (2) Area and Yield of Crops.
Preliminary statement of area and yield of principal crops.
- (3) Agricultural Statistics of India.
Volume I.—British India.
Volume II.—Native States.
Summary Tables.
- (4) Report on the Production of Tea.
- (5) Half-monthly Cotton Press Returns.

21. *Agricultural Statistics, including those relating to Crop Forecasts, etc.*

- (1) The Provincial Departments of Agriculture furnish periodically forecasts of crops * as shown in the list (Appendix III). They are scrutinised, tabulated, consolidated, and issued as General Memoranda on Crops, of which the number is 25 during the year. To settle discrepancies, correspondence is frequently carried on with local authorities. The forecasts are published in the Supplement to the *Gazette of India* † and in the *Indian Trade Journal* ‡. The chambers of commerce are furnished with them as soon as published, if they ask for the information by prepaid telegrams.

* No. of reports.	
Rice	35
Wheat	52
Cotton	60
Linseed,	
rape and	
mustard	26
Sesamum	27
Groundnut	9
Indigo	12
Sugarcane	27
† Appendices	
XI and XVIII.	
(Not printed.)	

The question of improvements of forecasts from time to time is also taken up and decided after consultation with local authorities and with the approval of the Government of India in the Department of Revenue and Agriculture.

- (2) For the compilation of Area and Yield of Crops figures are abstracted from the final General Memoranda on Crops. Introductory notes are annually revised by this department and explanatory foot-notes by provincial authorities. Certain tables, such as the yield per acre, rainfall, area and yield of minor crops, for which no forecast is prepared, are compiled in this department from different sources.

A preliminary statement of Area and Yield of principal crops is published in advance of the volume, as soon as final forecasts of all crops are issued.

- (3) The Returns of Agricultural Statistics relate to area, classification of area, area under crops, livestock, land revenue assessment, and transfers of land, and are furnished by the Provincial Agricultural Departments and Political Officers in Native States. The returns are scrutinised, consolidated, and published in the annual volumes. The appendices contain average yield per acre of crops, changes in district boundaries, a list of vernacular terms, and an alphabetical list of crops. The explanatory foot-notes are annually revised by provincial authorities and the introductory report is drawn up in this department.

A set of summary tables is compiled in advance of the annual volumes and is published separately, as is done by the Board of Agriculture for England and Wales.

- (4) The Report on the Production of Tea is compiled from returns furnished by provincial authorities. Figures regarding prices, wages, capital, and imports and exports both by land and by sea are compiled in the respective sections of this department.

- (5) Half-monthly Cotton Press Returns were introduced with effect from September 1914, but they were not published until September 1915. The object is to check the estimates of outturn as published in the cotton forecast, especially at the instance of the International Federation of Master Cotton Spinners' Association, Manchester. The returns are compiled from statements furnished by Provincial Directors of Agriculture in British Provinces and from original returns collected by the Bombay Chamber of Commerce from presses and mills in Native States. On receipt of local returns they are examined and consolidated into a half-monthly return for publication in the *Gazette of India* † and in the *Indian Trade Journal* ‡. (Not printed.)

22. *Agricultural Statistics including those relating to Crop Forecasts, &c.*

This section, in addition to unofficial references from the Revenue and Agriculture Department, is engaged from time to time on special enquiries, e.g., on that relating to the Census of Agricultural Production or the valuation of the gross agricultural produce in British India.

23. *Statistics relating to Commerce and Industry, and Finance (Statistics of British India, Volumes I and II, &c.).*—Section 10 deals with the undermentioned reports and abstracts:—

(1) Statistics of British India, Volume I—Commercial.

(2) " " " " Volume II—Financial.

Part I—Mint, Currency, Public Debt, &c.,

Part II—Principal Heads of Revenue.

(3) Monthly Statistics of Cotton Spinning and Weaving in Indian mills.

(4) Statistical Tables relating to Banks in India.

(5) Ditto

Joint Stock Companies in British India and Mysore.

(6) The Report on the Production and Consumption of Coal in India.

(7) A list of Factories and other Large Industries.

(Parts I to IV of
the 6th Issue.)

24. *Statistics relating to Commerce and Industry, and Finance (Statistics of British India, Volumes I and II, &c.).*

*Appendix VI.

† Post Office, Telegraphs, Industrial Census, Coal Mines, and Joint Stock Companies.

‡ Railways, Irrigation, and Mineral Production.

(1) *Statistics of British India.*—Volume I (Statistical Abstract) contains 18 sections as shown in the office calendar (page 44).^{*} Of these 18 sections, actual compilation of local returns is necessary for 10 sections (¹), 5 sections[†] are reproduced from departmental reports and other publications of this Department, and the other three[‡] are partly compiled in this department and partly reproduced from departmental reports. Seven sections relate to the calendar year and the remainder to the official year.

(2) Volume II of Statistics of British India (Statistical Abstract) contains two parts, namely, Part I which includes statistics relating to Revenue and Expenditure, Coinage and Currency, Registered Debt, Council Bills, Ways and Means, Prices of gold and silver and Exchange, Military Services, Banks, Co-operative Societies, and Life Assurance; and Part II including the principal heads of revenue such as Land Revenue, Forests, Opium, Salt, Stamps, Excise, Provincial Rates, Customs, Income Tax, Tributes from Native States, and Interest Receipts. The former contains 12 sections and the latter 11 sections. Of these 24 sections, 11 sections (²) are compiled from departmental reports such as Finance and Revenue Accounts of the Government of India and Home Accounts of the Government of India and other sources; actual compilation is made for 10 sections (³) from returns obtained from local authorities and other Departments such as the Controller of Currency, the Northern India Salt Revenue, the Mints, &c. Three sections[§] are partly compiled in this department and partly obtained from departmental reports. Only two sections relate to the calendar year, and the remaining sections generally to the official year.

(3) The Monthly Statistics of Cotton Spinning and Weaving in Indian Mills are compiled from returns furnished by local authorities. Besides the quantity of yarn spun and woven goods produced, the excise duty collected in each month is also published.⁴

(4) Statistical Tables relating to Banks in India are also published separately with details obtained from the presidency and joint stock banks in India and for the exchange banks from returns received through the India Office.

(5) Statistical Tables relating to Joint Stock Companies in British India and Mysore are compiled from returns and reports furnished by Provincial Registrars. The Companies are classified according to the nature of their business, and a detailed list of all the Companies (showing capital, date of registration, and objects of each) is also included with an index.

(6) The Report on the Production and Consumption of Coal in India is based on returns obtained from the Chief Inspector of Mines and the Director, Geological Survey of India, and also from non-official sources such as steamer companies, mills, iron and brass foundries, &c. Statistics of certain foreign countries are also obtained from Colombo, Singapore, and Yokohama. Figures of prices, freights, capital of coal companies, and imports and exports are compiled in the respective sections of this department.

(7) The Detailed List of Factories and other Large Industries is compiled from returns furnished by local authorities and those obtained through Provincial Inspectors

(¹) Factories and other large Industries, Breweries, Cotton mills, Jute mills, Paper mills, Woollen mills, Patents and Designs, Foreign Trade and Shipping, Wrecks, and Merchandise Marks.

(²) Revenue and Expenditure, Enforced securities, Military Services, Savings Banks, Banks, Life Assurance, Land Revenue, Provincial Rates, Customs Revenue, Tributes from Native States, and Interest receipts.

(³) Mint and Coinage, Paper Currency, Council Bills, Ways and Means, Prices, Opium, Salt, Stamps, Excise, and Income Tax.

(⁴) Another table showing the form value of Cotton Goods woven in the mills has been added with effect from April 1917.

§Registered Debt, Co-operative Societies and Forests.

of Factories. The list shows the name and locality of each industrial concern and the average daily number of persons employed, and is classified according to articles manufactured. Factories owned by Government and local bodies are kept separate from those owned and worked by Companies and individuals.

- (8) A note with statistical tables on the working of the Indian Factories Act in the various Provinces, etc. This is forwarded by the Government of India to the Secretary of State.

25. *The work of the Department as compared with similar work at the Board of Trade.*—It will be seen from paragraphs 2 to 24 that the work of the Department of Statistics differs in a large degree from similar work at the Board of Trade. In the United Kingdom there is no central Department of Statistics. The Board of Trade, however, is the office concerned with general statistical work probably more than any other. Several departments of Government prepare and publish statistical information dealing with matters falling within the scope of their respective functions, e.g., the Board of Customs and Excise publishes statistics of imports and exports (in consultation with the Board of Trade); the Board of Agriculture and Fisheries, the agricultural statistics of England and Wales, corn sales and prices; the Local Government Board, statistics relating to local Government, local taxation and expenditure, pauperism, etc.; the Home Office, statistics relating to mines and minerals, factory statistics, criminal and judicial statistics, etc.; the Board of Inland Revenue, statistics relating to general revenue matters, i.e., income tax, house duty, stamps, estate duty; the Lunacy Commissioners, statistics relating to lunatic asylums; the Board of Education, statistics relating to educational matters; the General Register Offices of England and Wales, Scotland, and Ireland, the periodical census, statistics of population, births, deaths, and marriages. The compilation of statistical abstracts at the Board of Trade is, therefore, a much easier task than that of the central Statistical Department in this country. The Department of Statistics has not only to compile the "all-India" figures from provincial or local figures but has to digest, summarise, re-arrange, and in many cases to convert statistical data. Following the principle of the Labour Statistics Department of the Board of Trade and Statistical Departments in other countries, the office has been, as already pointed out, divided into sections. Each section is familiar with the compilation and handling of the statistics relating to its section. This is of great advantage, provided that the sections are sufficiently strong, and that the heads of the sections are capable experts. The work of the department was established on a solid foundation by Mr. J. E. O'Connor from 1895 to 1902, and at the present time we are attempting to build a structure of growing usefulness to domestic and foreign commerce on this foundation. There is, however, an imperative need to strengthen the sections and especially the supervising staff if the statistics are to be published quicker and interpreted to a greater extent than is at present possible. From the 1st April to date (December 1916) no less than 200 publications, in addition to replies to queries, a selection of which is given in Appendix VII, have been issued from the department, and these have to be seen by the Director himself as there are no Assistant Directors or Gazetted Officers in the department. It is also necessary for the head of the office to visit (as at present), when occasion arises, the principal commercial cities. By this means he is able to discuss and settle, in personal communication with local Government officials (especially Directors of Agriculture, Land Records, and Industries and also Collectors of Customs) and non-official bodies and individuals, the diverse and sometimes complicated questions, that arise in connexion with statistical investigation, the treatment of Indian economic facts, and especially trade questions, e.g., in regard to cotton returns, wheat forecasts, etc. Corresponding with the expansion and growing complexity of commercial and industrial conditions, there is and must be the inevitable tendency to expansion in all the work of the department, and it is proposed to submit to Government, after the present financial stringency, a scheme for increasing the efficiency, as far as practicable, of the office.

26. *Speed and accuracy of trade statistics in general.*—Some of the publications of the department have to be brought out with the greatest possible rapidity. This applies especially to trade publications. Promptness is, without question, the first requirement in the case of the Monthly Customs Revenue Return, the Monthly Accounts of Exports and Imports, and Crop Forecasts. On the other hand, there are publications, such as Statistical Abstracts, which do not require to be so strictly up to date. The main object of Statistical Abstracts is that they should cover as wide a field as possible, and that the statistics should be comparable over fairly long periods of time. We may agree with Dr. Farr, in regard to these publications, who said in his "Vital Statistics"—1885—(when referring to his annual Statistical Volumes): "It is important that they (Statistical reports) should be *done well*.... It is desirable only in the next degree that they should be *done quickly*." Speed and accuracy of statistics in general are both desirable things; which is the more important depends on the purpose for which the particular statistical data are used. Appendix VI shows the dates on which the various returns are ordinarily published. It may also be possible to introduce gradually, in this department, mechanical methods of tabulation, which would increase the timeliness as well as the accuracy of the returns. The introduction of tabulating machines eliminates much clerical labour, which permits a more careful scrutiny of the returns and thus insures a higher degree of accuracy. The introduction of such machines has, it is believed, been successful in the case of the International Institute of Agriculture, Rome, and also the New York Custom House.

27. *Statistics of Labour.*—Statistics of wages paid in the important industries, etc., are, as already pointed out, very meagre. The question of collecting statistical information by simple forms is under the consideration of Government. Millowners, district officers, etc., will readily fill in forms, while they delay in answering circular letters requesting statistics when such letters are unaccompanied by forms.

28. *Instructions issued to compilers.*—Handbooks containing instructions on the collection of statistics relating to forecasts, sea-borne trade, domestic commerce or inland trade, are issued to local authorities. This has been found to be of considerable assistance to local authorities in the collection of the various returns.

II.—THE DISTRIBUTION OF THE STATISTICS.

*Appendix V.

29. *Distribution of Statistics.*—A statement* has been prepared to show the distribution of the publications of the department (1) in India and (2) abroad. It will be seen from the statement that the total number of copies distributed is 13,054, of which 9,711 copies, or 74 per cent. are distributed in India. The distribution noted in this statement against the quarterly, monthly, fortnightly, weekly, and periodical forecasts represents the number of copies distributed of one issue of each only. The statement also excludes the number of copies kept for sale by Superintendent, Government Printing. Government officers in India receive 5,807 or 44 per cent.; the commercial community, including chambers of commerce and firms, 1,131 or 9 per cent.; newspapers and public institutions 1,961 or 15 per cent.; and the balance 812 copies, or 6 per cent.; are distributed to Native States and Foreign Consuls in India.

† Appendices XI, XIII, and XVII (Not printed.)

30. A list of the publications of the department printed during each quarter is published in the "Gazette of India"† and Gazettes of Local Governments, and in the "Indian Trade Journal"†. Newspapers, especially commercial papers such as "Capital," "Commerce," etc., quote from the publications. The circulation is in reality greater than that shown in the statement of distribution, because much of the work done is largely obtained by traders and others through quotation. The distribution, therefore, is not altogether a good index of the demand for the information published by the department. The information, however, does not appear always to be known even to district officers as the correspondence (Appendix I) will show. We have sometimes been asked by firms and chambers to telegraph information such as that relating to the forecasts, but under the orders of Government we cannot telegraph at Government's expense to public bodies and associations or to private firms.

31. We do not at present have, as the Labour Statistics Department of the Board of Trade has, a gazette by which we could publish monthly the statistics which have been compiled. The gazette of the Labour Statistics Department of the Board brings out, on 15th of every month, statistics which have been compiled up to the 13th. The statistics are explained in very readable notes, and the information in the gazette is of a kind that ordinarily requires working up. The gazette is full, up to date, useful, interesting, and anything but a melancholy print. It is well printed and illustrated with charts or diagrams. It bears the impress of a sharp intelligence, and does not contain any obsolete extracts from random reports. At the present time, thanks to the courtesy of the Director-General of Commercial Intelligence, we use a comparatively large part of the "Journal" as a means of making known our most recent returns. The "Board of Trade Journal" also refers to the publications of this department from time to time in its list of Foreign and Colonial Publications, and in the body of the Journal itself and this is for the benefit of importers, manufacturers, etc., in the United Kingdom.

32. In connexion with the distribution of information, it may be noted that we send by post and telegraph information on forecasts, exports and imports, agricultural produce, etc., to the International Institute of Agriculture, Rome, which publishes the statistics in its monthly bulletin of Agricultural and Commercial Statistics. We also forward to the Revenue and Statistics Department at the India Office in addition to tables, etc., for the India Office abstract monthly reports on the prospects of certain staple commodities. This, however, is in all probability only a temporary measure during the continuance of the war.

‡ Appendix II.

33. The circulation of the department's publications‡ might be increased by a more extensive system of advertisement, e.g., in Government Gazettes, etc., where the publications published during the week might be given. The suggestion has already been made, in the Memorandum on Commercial Intelligence, of obtaining from chambers of commerce the names of firms with a view to sending gratis copies of certain publications for a short period, together with a circular letter that it is hoped that they may become subscribers. The circulation might also be increased (1) by placing the publications in the hands of booksellers and requesting them to advertise them in their regular advertisements of new books and (2) by a system of one annual subscription to firms which would cover all the purely trade publications, e.g., the monthly and annual trade Reviews, the weekly, monthly, and annual returns of exports and imports, crop forecasts, etc. The "Board of Trade Journal," it may be noted, notices weekly our publications in its list of 'publications received' and this results in enquiries from firms in the United Kingdom. Firms in the United Kingdom either direct or through their agents in India might also become subscribers on the basis of an inclusive annual subscription. By increasing the number of trade papers on our free mailing list greater notice might be taken of some of the returns at present published.

by the department. The methods of the United States of America and German Governments may be followed as far as practicable. It would, for example, be possible to issue postcards* to firms, of cotton press returns and of forecasts in which the firms are interested. We might be able, as a *quid pro quo*, to obtain statistics of wages and other industrial statistics. When the pressure of war work is over, the question of increased distribution will be considered. It will be seen from the statement of distribution of publications that the distribution, although capable of extension, is on the whole a wide and even generous distribution.

Appendix I.

Copy of a demi-official letter from a District Officer to the Director General of Commercial Intelligence.

Can you tell me whether any information is distributed to district officers regarding the average prices of principal commercial commodities such as hides, bones, etc., in the course of the year. I cannot find anything in my library except what relates to food grains and other food stuffs. I have just had an Income Tax Appeal in which such information would have been of great value, and I should imagine that other cases will probably arise. Perhaps you might consider whether anything can be done in this matter, though I may be mistaking your functions for the functions of the Director of Statistics.

Copy of a demi-official letter to the Director of Statistics.

Your demi-official No. 1255, dated the 8th May.

I must apologise for not having thanked you before for your letter and the mass of material sent with it. It was very kind of you to take all this trouble.

I have really delayed answering your letter till I had a little more experience of what District Offices really want. I am afraid my views are still somewhat nebulous. I think the first requisite is a very brief pamphlet showing what statistical information regarding trade matters is available and where. I do not know whether you have the leisure or inclination to prepare this but I am sure it might be made very valuable. If one knew where one could get information on a particular point it would be worth while to write for it, if it were not available in one's own office. At present the difficulty for officers in districts, somewhat out of the ordinary course of trade, is that when they are called on to furnish information or require it for their own purposes they do not know how to start about getting it. These are merely my impressions after less than three months of the district work and I would certainly recommend that you should verify them, when you get the opportunity, with the views of more experienced district officers.

Appendix II.

Publications of the Department of Statistics, India.

These publications are obtainable from the Superintendent, Government Printing, India, Calcutta. Remittances should be made by postal money order and should include forwarding charges, as indicated in brackets opposite each publication.

ANNUAL.

1. Review of the Trade of India. As. 12. (2a.)
2. Accounts relating to the Sea-borne Trade of British India for the Calendar year. As. 2. (2a.)
3. Annual Statement of the Foreign Sea-borne Trade and Navigation of British India—
Vol. I.—Abstract and detailed Tables of Imports and Exports. R4. (R1.)
Vol. II.—Abstract and detailed Tables of Trade and Shipping with each country and at each Port; and the Tables relating to the trade of Aden and of the French and Portuguese Possessions of India. R4-12. (12a.)
4. Annual Statement of the Coasting Trade and Navigation of British India. R3. (7a.)
5. Inland Trade (Rail and River-borne) of India. R1-12. (6a.)
6. Report on the Trade carried by Rail and River in Bengal. R3-3. (5a.)*
7. Report on the Trade of Bengal with Nepal, Tibet, Sikkim, and Bhutan. As. 13. (2a.)*
8. Prices and Wages in India. R2. (9a.)
9. Statistical Abstract for British India.—Vol. I.—Commercial Statistics. R1-8.
10. " " Vol. II.—Financial Statistics R1-8.
11. " " Vol. III.—Public Health. R1.
12. " " Vol. IV.—Administrative, Judicial, etc. R1-4.
13. " " Vol. V.—Education. R1-6.

(Note.—Those marked with an asterisk (*) to be obtained from the officer in charge, Bengal Secretariat Book Depot.)

14. Agricultural Statistics of India—
 Vol. I.—British India. Rs. 8. (12a.)
 Vol. II.—Native States. Rs. 1. (1a.)
15. Summary Tables of the Agricultural Statistics of British India. As. 4.
16. Estimates of Area and Yield of Principal Crops in India. As. 8. (2a.)
17. Preliminary Statement of Area and Yield of Principal Crops in India, one-half anna
 (½ anna).
18. Report on the production of Tea in India. As. 8. (2a.)
19. Report on the production and consumption of Coal in India. As. 8. (2a. 6p.)
20. Statistics relating to Joint Stock Companies in British India and Mysore. Rs. 3.
 (2a.)
21. Variations in Indian Price Levels from 1861 expressed in Index Numbers. As. 12
 (3a.)
22. Statistical Tables relating to Banks in India with an Introductory Memorandum.
 As. 4.

HALF-YEARLY.

23. Increase or decrease in the Capital of Companies incorporated in India and registered
 under the Indian Companies act. Half-anna.

QUARTERLY.

24. Inland Trade (Rail and River-borne) of India. As. 8. (2a.)
25. Rate List (of stores purchased in England for Government Departments in India.
 As. 8.

MONTHLY.

26. Accounts of the Foreign Sea-borne Trade and Navigation of British India. As. 8.
 (2a.)
27. Review of the Sea-borne Trade and Navigation of British India. As. 4.
28. Accounts relating to the Trade by land of British India with foreign countries.
 As. 8. (2a.)
29. Statistics of Cotton Spinning and Weaving in Indian Mills. As. 2. (1a.)
30. Trade Fluctuations in selected articles. Anna 1 and pies 6.
31. Calcutta Trade Fluctuations. As. 2.
32. Customs Revenue Statement. Half-anna.
33. Joint Stock Companies registered in British India and Mysore. Half-anna.

FORTNIGHTLY.

34. Wholesale and Retail Prices of cereals, pulses, oilseeds, sugar, salt, etc., in India.
 As. 6.
35. Wholesale and Retail Prices of wheat in India. Anna 1 and pies 6.
36. Cotton Press Returns. Half-anna.

WEEKLY.

37. Weekly Imports and Exports from Chief Ports of wheat, jute, and cotton. Half-
 anna.

MISCELLANEOUS.

38. Memorandum and Statistical Tables relating to the Trade of India with Germany
 and Austria-Hungary. As. 8. (2a.)
39. List of Factories and other Large Industries in India. Rs. 12.
40. Statistical Tables showing for each of the years 1901-02 to 1913-14 the estimated
 value of imports and exports at the prices prevailing in 1899-1900 to 1901-02. As. 8.
41. Memorandum and Statistical Tables relating to Prices and Freight in India since
 the outbreak of War. As. 4.
42. Crop Forecasts. Half-anna each.

- * 43. Return showing the Imports and Exports of merchandise by sea, from and to foreign countries. Pies 6.
44. Prices and Freights during the first year of War. As. 12.
45. Trade of Indian ports in the first year of War. As. 2.
46. Registration and publication of Statistics* relating to the Sea-borne Trade and Navigation of British India. Rs-2.
47. Return showing the Imports and Import duty collected during the first year of War. As. 12.
48. Statistical Tables relating to wheat. As. 13.
49. Imports into British India of motor cars, tyres, etc. Half-anna.
50. A manual on the preparation of crop forecasts in India. As. 8.
51. Export trade of British India with certain neutral countries. Half-anna.

	1913	72,352		1913	4
LOUISIANA	1916	29,780	<p>The statistics in this report include 26,085 round bales for 1916, 8,947 bales for 1915; 856 for 1914; and 7,810 for 1913. The number of sea-island bales included is 4,631 for 1916; 3,097 for 1915; 1,746 for 1914; and 486 for 1913. The distribution of the sea-island cotton for 1916, by states, is Florida, 760; Georgia, 3,871; and South Carolina, none.</p> <p>The statistics of this report for 1916 are subject to slight corrections when checked against the individual returns of the ginners being transmitted by mail.</p>		
	1915	5,858			
	1914	3,783			
	1913	7,449			
MISSISSIPPI	1916	10,081			
	1915	4,619			
	1914	2,689			
	1913	2,052			

CONSUMPTION, STOCKS, IMPORTS, AND EXPORTS—UNITED STATES.

Cotton consumed during the month of July, 1916, amounted to 489,933 bales. Cotton on hand in consuming establishments on July 31 was 1,632,456 bales, and in public storage and at compresses 1,090,914 bales. The number of active consuming cotton spindles for the month was 32,267,902. The quantity of cotton consumed for the twelve months ending July 31, was 6,395,373 bales; the total imports for the month of August, 1916, was 7,803 bales and the exports of domestic cotton, including linters, was 485,567 bales.

WORLD STATISTICS.

The world's production of commercial cotton, exclusive of linters, grown in 1916, as compiled from published reports, documents, and correspondence, was approximately 18,569,000 bales of 500 pounds net. The consumption of cotton (exclusive of linters in the United States) for the year ending July 31, 1916, was approximately 19,761,000 bales of 500 pounds net. Except for the United States, cotton included in this amount refers largely to that used in spinning. The total number of producing cotton spindles both active and idle is about 147,600,000.

American Consul-General, Calcutta.	Imports into and exports from India of gold and silver for the calendar year 1914.
Messrs. Rolls-Royce, Limited, Bombay	Imports into India during each month of 1914-15 of tyres for motor cars and tubes for motor tyres.
Superintendent, Industrial Education, Madras.	Shipment of Bauxite from India.
Consul-General for Netherlands, Calcutta.	Countries to which Djatti (teak) wood was exported.
Director, Geological Survey of India.	Imports of Pig Iron during 1909.
American Consul-General, Calcutta.	Imports into India of cotton linters, cotton batting, and cotton waste.
Economic Botanist to the Government of the United Provinces.	Monthly figures of the amount of barley shipped from the main ports and source of that barley.
The Gauri Gold and Silver Works Company, Surat.	Imports of gold thread, gilt silver wire and other tin-sels included in "Lametta".
Christie White & Co., Calcutta.	Imports of China Clay during 5 years.
P. N. Dutt, Esq., Calcutta.	Statistics of the different sizes of steel plates, sheets and hoops imported into Calcutta during ten years.
W. J. Burn & Co., Calcutta.	Detailed figures of cotton exports from Calcutta for the year August 1914 to July 1915.
Jal. F. Karain, Esq., Nagpur.	Full statistics of the imports of iron and steel.
Forest Economist, Dehra Dun.	Exports of teak wood and other timber during 1914-15.
Inspector-General of Forests.	Imports of wood and timber into British India during 1914-15.
District Officer, Meerut.	Exports of oilseeds from India.
Traffic Manager, Eastern Bengal State Railway.	Despatches of Rangoon rice and paddy.
The South British Insurance Company, Limited, Bombay.	Details of the imports and exports from and to Basra and the other Persian Gulf ports during the last few years.
Captain A. M. Cardew.	Total exports of Indian Merchandise and total imports of Foreign Merchandise from 1914-15—Japan, Germany, Austria-Hungary, France, etc.

SELECTED INQUIRIES RECEIVED IN THE DEPARTMENT OF STATISTICS—*contd.*

From whom received.	Subject.
---------------------	----------

*Commercial Statistics—contd.*1915—*concl'd.*

Captain A. M. Cardew . . .	Total imports and exports into and from British India by countries in the first six months of 1914-15.
Messrs. Tata Sons & Co., Bombay . .	Total imports into India and Calcutta of the different descriptions of cast iron pipes.
D. H. Wadia, Esq., Nagpur . . .	Suggestion regarding the inclusion of statements showing the monthly and running totals of the aggregate exports from and imports into British India to and from the various foreign countries.
Messrs. Gramophone Co., Limited, Calcutta.	Number of talking machines imported and number of records imported.
Messrs. Speyer & Co., Calcutta . .	Number and value of motor cars imported into Calcutta during 1913-14 and 1914-15.
French Motor Car Co., Calcutta . .	Whether cars of French make imported into India from Antwerp are shown as French cars or Belgian cars.
Messrs. Shaw, Wallace & Co., Calcutta	Imports of Sulphate of Ammonia into the various ports in India during 1914, also the countries whence imported.

1916.

H. B. Tilden, Esq., Calcutta . . .	Imports of Quinine and its alkaloids month by month from England, Holland, America, Java and other sources.
Messrs. Rolls-Royce, Ltd., Bombay . .	Imports of (1) motor cars and motor cycles showing number, value and country of origin, (2) tyres for motor cars and motor cycles showing prices of tyres, country of origin, and total value, also similar information in respect of rubber tubes for motor tyres.
B. Kirkpatrick, Esq., Calcutta . . .	Imports into Calcutta for past three years of tea chests or tea shooks—quantity and value, also country of origin.
N. N. Godbole, Esq., Lahore . . .	Exports of graphite from British India during 1913-14, 1914-15—quantity, prices, sources, etc.
P. Scofield Thomas, Esq., London . .	A return of the imports of tubes and fittings, wrought, month by month from each of the "other countries" shown on page 44 of the monthly Sea-borne trade Accounts.
F. W. Barlow, Esq., Calcutta . . .	Enquiry regarding figures of and suggestion regarding separate specification of bottled beer and stout and porter in the Sea-borne trade returns.
Bhavnagar Chemical Works, Kathiawar.	Quantity and value of commercial Nitric Acid, Sulphuric Acid, and Hydrochloric Acid imported during 1913, 1914, and 1915.
W. M. Burslam, Esq., Calcutta . . .	Quantity and designation of cotton piece-goods imported from Japan from September 1915 to February 1916.
American Consul-General, Calcutta . .	Imports into and exports from India of gold and silver during the calendar year 1915.
B. B. Ghosh, Esq., Konnagar . . .	Imports and exports of cement into the Presidency of Bengal. Annual consumption of coal in Assam and East Bengal.

Surendra Nath Dhar	Raw materials used in industries in Assam.
Director of Agriculture, Bengal	Number of operatives, looms, and spindles and capital employed in jute mills in Bengal.

NOTE ON THE COMMERCIAL INTELLIGENCE DEPARTMENT OF THE
BOARD OF TRADE.

GENERAL SUMMARY.

PARAS.

1. Origin and purpose	2 & 3
2. Nature of information collected	4 & 5
3. Sources of information	6
(a) His Majesty's Trade Commissioners and Imperial Trade Correspondents.	
(b) His Majesty's Embassies, Legations, Commercial Attachés, and Consuls.	
(c) Honorary Correspondents.	
(d) Official and Non-Official Publications.	
4. Distribution of information	
(a) By replies to enquiries.	
(b) By general publications.	
(c) To Chambers of Commerce and individual firms confidentially.	
(d) By exhibition of Samples.	
5. The Advisory Committee	
6. General points connected with the Department including the arrangement made before the outbreak of war between the Foreign Office and the Canadian Government as to the utilisation of the Consular Service	

This memorandum deals with the Commercial Intelligence Department of the Board of Trade to which I was for sometime attached when at the Board in 1918. It does not refer to the office of the Director General of Commercial Intelligence, India. It is perhaps of some interest and importance to analyse the methods of the Board of Trade in regard to Commercial Intelligence.

2. The Commercial Intelligence Department has recently been formed, with a view to improving the organization for assisting British trade by collecting and disseminating information, by the amalgamation of the Commercial Intelligence Branch and the Exhibitions Branch of the Board of Trade. It has been placed under a Comptroller-General (Sir William Clark, K.C.S.I., C.M.G.). The Commercial Intelligence Branch was established in 1899 as a result of the report of a Committee appointed by the Board of Trade in 1897 to enquire into and report upon "the dissemination of commercial information, and the collection and exhibition of patterns and samples." The total cost of Commercial Intelligence including salaries and allowances, but excluding rent and other expenses, is over £20,000 a year. This sum does not include the salaries of the Central Board of Trade staff or of the Commercial Department of the Foreign Office or of the Diplomatic and Consular service. It includes the salaries of His Majesty's Trade Commissioners who are paid from £600 to £900 a year. The Civil Estimates for the year ending 31st March, 1917, give the following details regarding Trade Commissioners and Trade Correspondents:—

	SALARY OF OFFICE.			1916-17.
	Minimum.	Annual Increment.	Maximum.	
8 Trade Commissioners	£ 700	£ 25	£ 900	£ 3,296*
1 ditto	600	25	800	810†
Remuneration and expenses of Commercial Correspondents in the Dominions and Self-governing Colonies, etc.	6,489
Remuneration of Local and Trade Correspondents	1,900
Total for Trade Commissioners and Correspondents	12,497

3. The Commercial Intelligence Branch is situated in the busiest part of the City, having been removed from Westminster in 1904. It is intended to be a centre at which information on all subjects of commercial interest can be obtained, and enquiries are replied to by the Branch with reference to openings for British trade abroad, general trade conditions in various countries, etc.

4. The scope of the information is wide, and the information deals with:—

- (1) Commercial Statistics.
- (2) Names of firms abroad engaged in particular lines of business.
- (These lists of buyers of British goods abroad are prepared as carefully as possible by Trade Commissioners and Consular officers who do not, of course, include knowingly doubtful firms. These lists do not compete with private directories. It should also be mentioned that the department formally disclaims any responsibility in regard to the credit of the buyers who are included in the lists. It may be noted that the lists of firms abroad, although printed, are not supplied to chambers of commerce, but are kept for departmental convenience only. The reason is that many of the chambers of commerce have not the means of discriminating between those members to whom the lists could be safely given and those from whom they should be withheld, e.g., firms which are agents for foreign manufacturers. If this information is supplied to chambers of commerce there would be other institutions, agencies, and bureaux, which would claim similar treatment.)
- (3) Contracts, both foreign and colonial, open to tender and similar openings for British trade.
- (4) Tariffs and Customs Regulations—foreign and colonial.
- (5) Regulations concerning commercial travellers and their samples.
- (6) Laws affecting patents, designs, and trade marks in countries abroad.
- (7) Certificates of Origin.
- (8) Trade conditions in foreign countries, e.g., means of recovery of debts, terms of payment, agencies, etc.

5. This information can be obtained at the offices of the branch, formerly known as "I. B.", without difficulty. The offices of the branch contain—

- (1) an enquiry room where enquiries can be made on various subjects dealt with by the Branch,
- (2) a sample room for the exhibition of specimens of manufactured goods, which compete with British products in British Colonies or foreign countries, and of new materials which may be of interest to British manufacturers.

* Includes non-pensionable Personal Allowance of £200 per annum.

† Includes non-pensionable Personal Allowance of £100 per annum.

- (3) a reading room where the latest official publications and the most recent commercial directories, year books, and a large number of trade journals may be consulted.

The strength of the Branch was, before the outbreak of war, as follows:—

Names section	9
Tariffs section	2
Enquiry room library, etc.	9
Journal and Commercial Statistical section	7
Special Register, Colonial and Consular Correspondence and correspondence with Trade Commissioners and Correspondents	9
Registry, etc., including typists	11
Director, one Chief Staff Officer, one Staff Officer	3
	50

On account of the special conditions created by the war the work of the Commercial Intelligence Branch has been recognised with the result that the staff of the Department of Commercial Intelligence has been increased to 160, part of which is on a temporary footing. Officers have been brought into the Department who are conversant with particular industries and with manufacturing processes employed in them and a special section of the office (the Home Section) has been created. The activities of the Foreign Samples Section and Foreign and Colonial Section have, in consistence with the present requirements of the commercial public, been extended.

6. The information collected by the Commercial Intelligence Department is obtained from a net work of sources.

- (I) His Majesty's Trade Commissioners and Imperial Trade Correspondents in Canada, Australia, New Zealand, and South Africa. There are 4 Trade Commissioners for the self-governing dominions and between 20 and 30 Imperial Trade Correspondents in addition to these Trade Commissioners. The Trade Commissioners give their whole time to the study of the trade conditions and requirements of their respective dominions. They watch foreign competition, and generally report fully to the Board of Trade on all matters affecting British trade in British dominions. The Trade Commissioners return generally every two years to the United Kingdom, when they visit the chief centres of trade for six months and interview British firms. The Commissioners are, therefore, kept acquainted with the needs of British firms and the development of British trade and industry. Individual firms in the United Kingdom can go to them direct in the same way as they would go to a Consul in a foreign country. These Trade Commissioners tour extensively throughout their respective dominions. They reply to all trade enquiries addressed to them by British firms, and they render assistance to the representatives of British firms in the dominion. These Trade Commissioners are, in fact, Government commercial travellers. I was told when in the "C. I. B." that Trade Commissioners had been instrumental in introducing Sheffield saws into Canada, English cocoa into South Africa, a certain line of cotton prints into South Africa, previously entirely held by Germans. They have also watched on behalf of the United Kingdom trade legislation in the dominions. The Imperial Trade correspondents are actively engaged in the trade of their own localities and are remunerated by annual fees from the Board of Trade. They answer enquiries from the "C. I. B." or from British firms direct and report on all matters likely to affect, if not already affecting, British trade. They send copies of all reports to the Trade Commissioners. These correspondents, in brief, work under the general supervision and guidance of the Trade Commissioners. Trade correspondents are appointed by the Board of Trade generally on the recommendation of the Trade Commissioner in each dominion.

- (II) His Majesty's Embassies, Legations, Commercial Attachés, and Consular Officers in foreign countries (directly or through the Foreign Office). Commercial information is furnished by this source usually in the following way. Replies to enquiries on ordinary commercial matters from firms in the United Kingdom would be forwarded through the Commercial Intelligence Branch of the Board of Trade, together with a duplicate copy for the use of the branch. Should the enquiry emanate from a firm in the dominions, a copy of the reply is sent to the dominion Government concerned as well as to the Commercial Intelligence Branch. If the enquiry is from a firm not in the United Kingdom and not in the dominions, a copy of the Consul's reply is sent to the Commercial Intelligence Branch, but in those cases Consuls are to use their discretion. It is well to bear in mind, however, in the case of enquiries originating from foreign countries, that foreigners frequently try to avail themselves of the machinery established for the benefit of the British traders, and that the interests of the British trade must alone be considered in replying to such of the enquiries of this kind as in the discretion of the Consular officer appear proper to be answered with a view to placing foreign customers in communication with the British firms. Specific requests from British traders which manifestly relate to the business of competing British firms would ordinarily be declined. The instructions already given as to communi-

cating to the Foreign Office any particulars which may be of interest to it, apply to the cases mentioned above. In reply to enquiries by British importers for the names and addresses of British manufacturers of foreign goods, the information desired may be furnished in cases in which it is not considered likely to prove injurious to British manufacturing interests. The question of supplying or withholding information of this nature is generally left to the discretion of the Consular officer concerned, but the information is not withheld when the enquiry relates to any food product, or to articles which may be subjected to further processes of manufacture, or which may be for use in factories in the United Kingdom. If in doubt, the Consular Officer should refer to the Commercial Intelligence Branch of the Board of Trade before furnishing the information desired. In cases of applications from British firms in foreign countries and foreign firms abroad for the names of traders or buyers in the United Kingdom, the Consular Officer would, at his discretion, transmit the application to the Board of Trade for insertion in the "Board of Trade Journal", subject to the approval of the editor, who does not undertake any responsibility whatever with regard to the standing of any of his correspondents. The Consul answers, as completely as possible, enquiries made with a view to promoting British trade and commercial interests generally. It is no part of his official duty to give opinions or to furnish confidential information as to the respectability, private character or solvency of individuals or firms. He may, however, at his discretion make one of the following statements in reply to enquiries from British traders :—

- (1) That the firm is held in high repute, or is generally considered one of high standing.
- (2) That according to the information which it has been possible to obtain, the firm is respectable, though not in a large way of business.
- (3) That he regrets to be unable to furnish information on the subject. Whenever the names of firms are given, it is necessary to state that no responsibility can be accepted in respect of their financial standing. In this connexion an extract from a memorandum prepared by the Board of Trade is appended (Appendix I).

It will be clear then that a Consul shall reply to enquiries made with a view to promoting British trade. Correspondence, as Sir H. Jewell Smith pointed out to the Dominions Royal Commission, is encouraged, subject to the condition that it is generally better for a firm to apply to the Commercial Intelligence Branch which may have the information at hand and, therefore, save time to the enquirer.

- (III) A third source from which the information is drawn is the honorary correspondents in the Crown Colonies and Protectorates. There are 39 of these. The Governors of the Colonies not possessing responsible Government, and Protectorates, have each nominated an officer to act as honorary correspondent of the Commercial Intelligence Branch, and to answer trade enquiries addressed to him by the department or by British traders. There is also an arrangement between the Commerce and Industry Department of the Government of India and the Board of Trade by which the Director General of Commercial Intelligence of India acts as a correspondent of the Commercial Intelligence Department of the Board of Trade. Such enquiries as cannot be immediately answered by the Commercial Intelligence Branch or by the India Office are referred to that officer. This officer also sends to the Board from time to time any requests that may be received from Indian traders for the names of manufacturers of British goods.
- (IV) The fourth source is the information obtained from official publications of British, Colonial, and Foreign Governments as well as from non-official trade publications, etc. Appendices II and III state the number of reports received from His Majesty's Trade Commissioners and the Trade Correspondents and His Majesty's Diplomatic and Consular officers and the manner in which they were utilised, together with the number of enquiries received at the Commercial Intelligence Branch of the Board in 1912.

Proposals for the development of Trade Representation abroad are now under consideration by H. M.'s Government.

7. Next with regard to the distribution of information. The information which is distributed, for example, on commercial statistics, on foreign and colonial tariffs and Customs Regulations, on foreign and colonial contracts open to tender and other openings for trade, on articles competing with the United Kingdom goods in overseas markets and on products likely to be of use to manufacturers, and regarding firms abroad engaged in particular lines of business, etc., is supplied in the following ways :—

- (a) By replies to enquiries ;
- (b) By general publications such as "the Board of Trade Journal" (which is issued weekly) and also by occasional publications, e.g.,—
- (c) a memorandum summarising the regulations in force in the British Dominions and foreign countries with regard to commercial travellers, the license

duties to be paid (where such taxes exist), and the special Customs arrangements made and facilities granted, if any, in respect of commercial traveller's samples; and

(ii) a memorandum regarding Certificates of Origin.

(c) Dissemination otherwise than by formal or general publication, *e.g.*, to Chambers of Commerce and to individual firms confidentially. The names of individual firms known to be desirous of receiving information as to particular branches of trade are inscribed on the "Special Register" on payment of an annual fee of one guinea which includes the annual subscription to "the Board of Trade Journal." The admission to the Register is at the discretion of the head of the department. During 1912, 1,098 separate circulars were issued (to the number of 146,578 copies) to firms on this Register; during 1915, 849 separate circulars were issued (to the number of 383,888 copies); during 1916, 550 separate circulars were issued (to the number of 142,612 copies). The decline in 1916 is due to number of prohibitions and other Government restrictions on export.

(d) Samples. The samples received at the Commercial Intelligence Department consist almost entirely of foreign manufactured goods which compete with the United Kingdom trade in the self-governing dominions or other British Possessions, and of foreign manufactured goods and natural products which are sent by Consuls. There is no duplication of work between the Commercial Intelligence Department and the Imperial Institute, and arrangements have been made for co-operation between the two offices in respect of enquiries that may be made from time to time. The work of the Imperial Institute is mainly directed to the question of the development of the resources of the Empire in matters of raw products and materials, while the Commercial Intelligence Department is mainly directed to the promotion of the export trade of the United Kingdom in manufactured goods. The exhibition of samples has been extraordinarily popular with the trading community, and these samples have been much used in the centres of the particular industries, to which the Commercial Intelligence Department sent the collections.*

* Cf. the U. I. system.

8. The Advisory Committee to the Board of Trade on Commercial Intelligence was first established in May 1900 to advise the Board on the work of the Commercial Intelligence Branch, and on such other matters as the Board might refer to it. The Committee determines its own meetings and meets regularly on specified dates. Special meetings which may be summoned at any time, should occasion arise, take place in addition to these ordinary meetings. The Committee is purely an Advisory body. It does not actively direct the work of Commercial Intelligence, but it is generally consulted on questions of policy arising in connection with the work of Commercial Intelligence, *e.g.*, special commercial missions have been despatched by the Board of Trade on the recommendation of their Advisory Committee to enquire into the conditions and prospects of British trade in China (1915-16) and Russia (1916), and a mission to Spain and Portugal is at present under arrangement. It may also make any recommendation which it thinks fit with regard to the collection and dissemination of Commercial Intelligence. The average attendance of meetings is 18. There are 19 commercial members and 11 official members, 30 in all. Sir H. Llewellyn Smith in his evidence before the Dominions Royal Commission summarises the work of the Committee as follows:—

Firstly.—The object is to advise on the work of Commercial Intelligence, commercial missions abroad, and other matters.

Secondly.—The Committee may advise on such matters relating to foreign tariffs and to other commercial questions not included in the first head, as the Board of Trade may refer to them from time to time.

Thirdly and lastly.—The Committee may advise on any commercial question which may be submitted by one of the commercial members of the Committee, subject to previous approval by the Board of Trade.

The Board retains absolute freedom with regard to the adoption of recommendations of this or any other of the Advisory Committees, of which there are a number. A number of members of the Committee are also members of the Council of the Association of Chambers of Commerce, and the Chairman of the Council of the Association of Chambers of Commerce is on the Committee as a matter of course. The Committee, therefore, is a link between the Board of Trade and the Chambers of Commerce. The Chambers can be addressed directly, and the Chambers in their turn can address the Board direct if they care to do so, without reference to this Advisory Committee. It will be seen, therefore, that the Committee deals with such questions as, for example, the best means of collecting information, and making the best use for trade purposes of information collected; the revision of foreign tariffs and their prospective effect on British goods; and also with miscellaneous questions which come up from time to time. The majority of the questions, however, refer to tariffs and commercial intelligence. The Advisory Committee may take evidence by calling witnesses but it usually circularises and gets information. It is an expert Committee which advises the Board from its own knowledge. The 19 commercial members are carefully selected and represent big branches of trade in which they are experts. They do not act as delegates, but are rather a

combination of a great amount of commercial knowledge. The dominions are represented on the Advisory Committee of Commercial Intelligence, although they do not pay anything towards the cost of or give assistance to the Commercial Intelligence Department.

9. Lastly, it may be necessary to emphasize one or two points connected with the Commercial Intelligence Department.

- (1) The duties of the branch are concerned primarily with external trade.*
- (2) The interest of the producer, other things being equal, is given preference to that of the merchant or carrier where these are in conflict.
- (3) It does not assist importers of foreign goods excepting so far as those goods and materials are for industry or for use in factory.
- (4) The primary duty of the department is to assist the United Kingdom trade. It assists the trade of the dominions, etc., but where a conflict of interests arises the United Kingdom's interest must prevail.
- (5) The bulk of the work of the department is on behalf of average traders who are aware of the advantage of obtaining information and who are not highly organised enough to have a commercial intelligence system of their own. Large firms are more in evidence on the "Special Register" than are small firms.
- (6) Continuous efforts are made to make the existence of the department known to traders. There is, however, the difficulty of insufficient publicity. The "Board of Trade Journal" is, as has already been noted, one of the principal sources of the dissemination of information. Daily bulletins, such as those published in the United States of America, are not considered necessary because the "Weekly Journal" is supplemented, where necessary, by a press announcement regarding any information which would lose its value by a few days' delay. Sir Hubert Llewellyn Smith, it may be noted, in his evidence already referred to, did not appear to be satisfied with the circulation and said that an increase in the circulation (the circulation being 5,000 copies) was desirable.† He pointed out, however, that while he should like to see a much bigger circulation, the value of the publication was really wider than that shown by its circulation because it is largely quoted by trade papers, and this is the chief way in which the journal permeates to the commercial community. It should be pointed out that the most valuable information which is given by the Commercial Intelligence Department to the trade is never published at all. It goes to those interested and is kept away from foreign competitors who are extremely eager to get such information. The Commission suggested that the circulation should be increased by obtaining from every Chamber of Commerce in the country a list of its members. The "Board of Trade Journal" would then be sent to every one of these with a circular letter saying that the information it contains has been gathered at a great cost and at great trouble, that it is considered valuable for the welfare of the whole country, that it is proposed to send free copies for four weeks to enable the prospective subscriber to see the nature of the information that is supplied, and that thereafter it is hoped to have him as a permanent subscriber at a guinea a year.
- (7) His Majesty's Trade Commissioners are wholetime officers, unlike the trade correspondents. They furnish people in the Dominions, desiring to export to the United Kingdom, with any information, subject to the exception that their primary duty must always be to the United Kingdom trade.‡ The trade correspondents are connected with active business and are paid from £50 to £240 a year. In addition to the fees mentioned they are authorised to claim a sum not exceeding £15 per annum for out-of-pocket expenses. The amount spent on Trade correspondents for Canada was before the war £850, Australia £410, New Zealand £210, and South Africa £550-15s.
- (8) It has been found impracticable and undesirable to attempt to make the work of commercial intelligence an Inter-Imperial Institution.
- (9) It is interesting to note the arrangement made before the outbreak of war between the Foreign Office and the Canadian Government as to the utilization of the Consular service for the assistance of Canadian trade. A copy of the Memorandum of the Foreign Office in regard to this will be found in Appendix IV. The Consular officers are authorised to give the same assistance to firms in the Dominions as to the United Kingdom firms except that the Consuls are primarily commissioned to serve the trade of the United Kingdom. They arrange, where practicable, accommodation for Dominion Trade Representatives in their Consulates and assist such representatives as far as possible. The Consuls are furnished with such dominion publications as the dominion Governments think will be of assistance in answering questions as to the resources of the dominions.

* *Vide* also Appendix V.

† The circulation of the Board of Trade Journal in January 1910 was about 5,000 copies; in January 1917 it was over 8,000 copies.

‡ For the importance of the export trade of the United Kingdom as compared with that of India, see Appendix V.

In the preparation of this Memorandum I have been assisted by the evidence of Sir H. Llewellyn Smith, K.C.B., Permanent Secretary to the Board of Trade, before the Dominions Royal Commission. It is perhaps, unnecessary to add that some of the details of the working of the department described above refer mainly to the working of the department at the outbreak of war.

Appendix I.

*Official Trade Representation of the United Kingdom in Foreign Countries.**

This consists of His Majesty's Commercial Attachés and His Majesty's Consular Officers (salaried and unsalaried). They are all appointed by, and under the direction of the Foreign Office, and they are authorised to communicate directly with the Commercial Intelligence Branch of the Board of Trade on all commercial matters.

His Majesty's Commercial Attachés, who are officers invested with a diplomatic character and whose functions consist exclusively in assisting British traders and furthering the interests of British Commerce, have been appointed for the following countries or groups of countries:—France, Belgium, and Switzerland; European and Asiatic Turkey and Bulgaria; China; Japan; Germany, Denmark, Holland, Norway and Sweden; Spain and Portugal; Austria-Hungary, Italy, and Greece; and Russia. In the four last-named cases, the Commercial Attachés have their headquarters in London, and divide their time between special investigations abroad and visits to trade centres in the United Kingdom with a view to placing their information at the disposal of British firms and receiving requests for further inquiries. The Commercial Attachés for Turkey and Bulgaria, China, and Japan also return periodically to the United Kingdom for the latter purpose.

The commercial duties of His Majesty's Consular Officers are summarised in the Consular Instructions as being:—“(1) to furnish immediate information with regard to all important changes in local conditions affecting trade or credit; (2) to deal promptly, to the best of their ability, with questions on commercial subjects addressed to them by the Commercial Intelligence Branch of the Board of Trade, or by individual British traders; (3) to prepare and keep up to date, for the use of the Board of Trade, lists of the principal dealers in various classes of goods; (4) to supply special reports from time to time on matters which appear to the Consular Officer to be of commercial interest, or which may be suggested to him by the Foreign Office; (5) to prepare an annual report on the trade of their district.” Amongst the matters as to which the Consular Officers are directed to furnish immediate information are contracts open to tender and changes in local duties and taxes likely to affect British trade, and in local dues and regulations affecting shipping.

* Excluding Reports for the year 1911, by His Majesty's Trade Commissioners for Australia, South Africa and New Zealand (published separately in 1912).

Appendix IV.

1. The Department of Trade and Commerce of Canada will be furnished with any reasonable number of copies of all trade reports from the Far East and from any other district which they may specify as soon as they are published.

2. Any Canadian firms will be at liberty to apply direct to any of His Majesty's Consuls for information as to possibilities of sale of Canadian products, the methods under which business is conducted, and the best means of getting into touch with markets. They will receive all possible assistance in this matter, subject to the condition laid down in the Report of the Canadian Minister of Trade and Commerce, that the Consuls are primarily commissioned to serve the trade of the United Kingdom. The Canadian Department of Trade and Commerce will be supplied from time to time with lists of His Majesty's Consular Representatives in the Far East and in other districts in which they are interested.

3. The Department of Trade and Commerce will prepare a statement of Canada's commercial and industrial resources and developments, giving a list of principal industries and sources of supply, and indicating the questions upon which Canadian merchants and manufacturers desire information. This document, which will be revised from time to time, will be communicated to His Majesty's Consuls from the Foreign Office with instructions to pay particular attention to the questions referred to. The Commercial Attachés will be instructed to report from time to time regarding them, and such reports will be forwarded from London to the Department of Trade and Commerce without delay.

4. Canadian Trade Commissioners will be at liberty to apply to His Majesty's Consuls for advice and assistance.

5. Before any decision is taken on the question of attaching commercial agents to His Majesty's Consulates in the Far East (China, Japan, and Eastern Siberia), the Canadian Department of Trade and Commerce will send out a special representative for the purpose of studying trade conditions on the spot and deciding on the best means of promoting Canadian trade there. His Majesty's Consuls will be instructed to give him every assistance, including the provision of interpreters and introductions to the principal officials and merchants, native and foreign. In particular he will be able to obtain in the offices of the Commercial Attachés in Yokohama and Peking a great deal of valuable information regarding all forms of commercial activity. His Majesty's Consuls and the Commercial Attachés will be empowered to discuss with him the practicability of attaching Canadian commercial agents to the Consulates, but it is recognised that periodical visits of the kind suggested may be found to meet the requirements of Canada more efficiently and at less cost than the permanent attachment to the Consulates of commercial agents.

6. Should the Canadian Government desire that office room should be afforded in British Consulates for Canadian commercial representatives no objection would be raised in principle.

7. Each case would be considered on its own merits and be a matter of arrangement between Canada and the British Government dependent on the needs and convenience of the Consular office. When such accommodation is granted it is understood that the Consular office assumes no responsibility for the direction or work of the Canadian representative.

8. The members of the Canadian commercial service will be eligible for selection and entrance to the British commercial service on such terms and conditions as are set for other entrants thereto, subject to the regulations of the British Government in the carrying out of its service.

FOREIGN OFFICE;

24th July 1912.

NOTE ON EXHIBITIONS.

SUMMARY.

	PARAS.
1. The Berlin Convention of 1912	1 and 2
2. " Universal " Exhibitions and " Special " Exhibitions	3
3. Official Exhibitions and Officially recognised Exhibitions	4
4. Provincial Exhibitions in India	5
5. Specialised or Special Exhibitions are of advantage not only to the consumer of goods, but to the manufacturer who requires educating equally with the consumer	6
6. Fairs on the Board of Trade Model	7
7. Specimen Catalogues as a means of familiarising manufacturers with enemy methods of advertising	8

In October 1912, an International Conference was held in Berlin on the invitation of the German Government for the purpose of limiting by international agreement the number of International Exhibitions and of establishing, as far as possible, a code of regulations with regard to the organisation and management of exhibitions. The Convention drawn up at this Conference was signed by the delegates of 16 countries. The Board of Trade in a memorandum summarised the causes which led to the summoning of the Conference: "International exhibitions had in the past constantly been held in places where the commercial results accruing from participation could not repay exhibitors for the expense of sending a creditable exhibit. The selection of the date and locality of such exhibitions had been influenced not so much by the suitability of the market or the occurrence of an opportunity of assisting the development of trade as by the prospect of attracting visitors, and achieving financial success for the promoters. The organisers of such exhibitions relied upon the rivalry existing between the manufacturers of the chief commercial nations to secure the participation of countries who would not take part if their commercial competitors were not represented. When deciding whether or not to participate in any great international exhibition, the Governments of the principal countries were in much the same position as individual exhibitors; their decision depended not so much upon the benefits which were likely to accrue from participation, as upon the loss which would in all probability be sustained by the trade of their country if they abstained from an exhibition in which its commercial rivals took part."

2. "The reasons for the reluctance on the part of manufacturers to take part in exhibitions were reviewed by a Committee which was appointed in 1906, under the chairmanship of Sir Alfred Bateman, to enquire into the nature and extent of the benefit accruing to this country (i. e., the United Kingdom) from participation in great international exhibitions. The evidence taken by this Committee showed that this reluctance to exhibit was attributable in a large degree to the following causes:—Exhibitions have been held too frequently. Their immense size has rendered it difficult for individual exhibits to attract the notice of prospective buyers, the attention of visitors being to a great extent diverted from the exhibits by the large number of sideshows and other items of entertainment. The large attendance of visitors

thus secured may benefit those industries classed under the heading of applied art which appeal to the general public, but this is by no means the case as regards the staple industries whose products are mainly of interest to commercial men. The cumbrous procedure and elaborate setting of great international exhibitions have, moreover, been found to entail unnecessary trouble and expense. The lengthy period of six months or more for which such exhibitions are kept open greatly increases the cost of maintenance and also involves the locking up for an unnecessarily long time of the capital sums expended in the manufacture of the exhibits. There has further been a general feeling that the value of awards gained at universal exhibitions has deteriorated owing to the frequency with which such exhibitions have been held, and the indiscriminate manner in which awards have been bestowed. Manufacturers of certain classes of goods have also referred to the danger of having their patterns and designs copied by foreign rivals. The Committee pointed out, however, in regard to this last objection that the opportunities for obtaining information as to new designs

* Board of Trade Memorandum, December 1913.

are continually increasing and are by no means confined to exhibitions."* These criticisms on exhibitions would apply generally to large exhibitions in this country.

3. The Convention differentiated between (1) Universal exhibitions, and (2) Special exhibitions, i.e., exhibitions the sole object of which is to assist in the development of one or more particular branches of a trade. This latter class of exhibitions is regarded as serving a useful purpose. Sir H. Llewellyn Smith pointed out to the Dominions Royal Commission that the Specialised Exhibition held at Leipzig was patronised keenly by British publishers, as Leipzig is the centre of the world's book trade. To a certain extent this class of exhibitions is free from the difficulties which have made the manufacturers reluctant to take part in universal exhibitions.

4. It may be noted that the experience gained by the Exhibitions Branch of the Board of Trade is that a large number of manufacturers will welcome the opportunity of taking part in officially recognised exhibitions, since this would offer a valuable opportunity of developing trade. An exhibition is 'official' when it is organised, directed, and managed by a Government or its delegates; it is 'officially recognised' when it is organised, directed, and managed by a body which has obtained, for that purpose, the recognition, patronage, or

† The Berlin Convention applies only to International Exhibitions, but the rules are very suitable for special exhibitions.

authorisation of the Government. The Convention † states that "the recognition, patronage, or authorisation of the Government shall not be accorded to an exhibition or to participation in an exhibition, unless it affords substantial guarantees

with regard to its administrative and financial organisation, and unless it assures to the Government and their delegates a power of general control over the administration and financial management." The direct responsibility is assumed by the inviting Government, and this is a principle which might be adopted for provincial exhibitions in this country held at a minimum interval of three years, a limit which is laid down for international exhibitions by the Berlin Convention. Such a provincial exhibition would, it is believed, be welcomed by manufacturers—large and small.

5. The exhibitors should be confined to British and Indian exhibitors but should exclude foreign non-British exhibitors. The exhibitions should be in principle unlimited in scope, but in practice should be specialised to suit the conditions of the province or of that part of India in which they are held. It is an undoubted fact that many manufacturers have been reluctant to exhibit, largely owing to the fact that such exhibitions have been promoted in places and at times where the expenses of sending exhibits would not cover the resulting business due to them. Exhibitions are useful as they stimulate the demand for products not hitherto known and they are of assistance in opening up local agencies as well as developing those already in existence. Provincial exhibitions should have as the basis Government responsibility and should generally follow the regulations which were made at the Berlin Convention in 1912.

6. Exhibitions, if properly controlled, are of advantage not only to the consumer of goods, but to the manufacturer who requires educating equally with the consumer.

7. Since the outbreak of war the Board of Trade has instituted fairs or exhibitions to promote special trade, which have been remarkably successful.† Such models might

‡ Appendix, pages 72-73.

possibly with advantage be adopted in this country. It is interesting to note that admission to the fair was by invitation of the Board of Trade, and the general principle was to restrict invitations to *bona fide* trade buyers. The object of the fairs was, in short, to give British firms an opportunity of exhibiting goods of their own manufacture and to bring them into touch with both home and overseas buyers. More than 30,000 persons visited the British Industries Fair during the days on which it was open, i.e., from the 10th to 21st May 1915. Over 300 foreign and colonial buyers were amongst the visitors. The business transacted exceeded all expectations. A similar Fair was held in 1916 and it is proposed to make these annual Fairs a permanent feature of the Department of Commercial Intelligence of the Board.

8. Another point connected with these exhibitions, which is worthy of imitation, is the success of the Board of Trade in familiarising manufacturers and exporters, etc., with

German and Austrian methods of advertising. The Board has recently made a collection of about 7,200 specimen catalogues of German and Austrian origin which are of special interest to the trade. "Catalogues, samples, and prices," as Mr. Hooker in his "Handicap of British Trade with special regard to East Africa" points out, "are the working tools of the exporter, and his stock in trade; the invoices are the final varnish or French polish." There are over 1,000 catalogues of machinery, in addition to over 2,000 catalogues of machine tools. There are about 300 toy catalogues, including the productions of the well known Nuremberg toy manufacturers. There are also about 200 catalogues of hardware, 200 catalogues of fancy goods, 520 of electrical goods, and 70 of glassware, in addition to a considerable number referring to tools, photographic apparatus, musical instruments, household utensils, furniture, stationery, etc. These German and Austrian catalogues are printed, it may be noted, in various languages to suit the importer. Some are printed even in three, four, and six different languages. Arrangements have been made by the Board of Trade whereby catalogues may be lent for a few days to United Kingdom firms. This scheme is well worth imitation in this country.

Appendix.

List of Exhibitions and Fairs since the outbreak of war (in the United Kingdom).

1914.

(1) Exhibition of German and Austrian samples at exchange meetings of manufacturers and buyers in London—September 24th to 25th; October 7th to 8th, 22nd to 23rd; November 5th to 6th, 19th to 20th, and December 3rd to 4th. (Board of Trade.)

1st Exchange meeting	.	.	.	Toy trade.
2nd "	"	"	.	Glass, earthenware, and china.
3rd "	"	"	.	Fancy goods.
4th "	"	"	.	Electroplate, cutlery, and clock.
5th "	"	"	.	Household utensils.
6th "	"	"	.	Jewellery and haberdashery.

1915.

(1) The first British Industries Fair held in London, 10th to 21st May, 1915. The object of the Fair was to give the British firms an opportunity of exhibiting goods of their own manufacture and to bring them into touch with both home and oversea buyers. (Board of Trade.)

(2) Exhibition of samples of German and Austrian goods held by the Board of Trade.

(3) Exchange meetings of manufacturers and buyers in London, January 7th to 8th, 28th to 29th; February 11th to 12th; March 3rd to 4th; April 15th to 16th. (Board of Trade.)

7th Exchange meeting (7th—8th January)—Electrical apparatus and appliances.

8th " " (28th—29th January)—Cotton piece-goods and other textiles.

9th " " (11th—12th February)—Paper and stationery.

10th " " (3rd—4th March)—Hardware.

11th " " (15th—16th April)—Hand and edge tools.

(4) Exhibition of German and Austrian Catalogues. (Board of Trade.)

(5) Exhibition of German and Austrian articles typifying successful design, 24th—26th March, London.

(6) War Exhibition in London by the London Chamber of Commerce, June to October.

(7) Exhibition by the Board of Trade of samples of German and Austrian goods from abroad at—

(i) Leicester—27th September—2nd October.

(ii) Nottingham—18th—23rd October.

(iii) Leeds—8th—13th November.

(iv) Glasgow—29th November—4th December.

(8) Toy Fair and Market in London.

1916.

(1) Second British Industries Fair in London held by the Board of Trade, 21st February to 3rd March.

(2) Exhibition of German catalogues in London by the Board of Trade.

(3) Exhibition of samples of German and Austrian goods from abroad by the Board of Trade at—

(a) Sheffield—7th to 13th April.

(b) Liverpool—22nd to 27th May.

(c) Birmingham—23rd to 29th June.

(d) Manchester—10th to 15th July.

(e) Bristol—1st to 5th August.

(f) Dublin—21st to 26th August.

- (4) London Fair and Market—14th to 24th March.
- (5) Clothing and Drapery Exhibition in London—May 1st to 12th.
- (6) Royal Agricultural Show in London—June 27th to July 1st.
- (7) Jewellers' and Silversmiths' Exhibition in London—July 5th to 13th.
- (8) Confectioners' and Bakers' Exhibition in London—September 2nd to 9th.
- (9) Grocers' Exhibition in London—September 18th to 22nd.
- (10) Shoe and Leather Fair in London—October 2nd to 7th.
- (11) Dairy Show in London—October 17th to 20th.
- (12) Brewers' Exhibition in London—October 28th to November 3rd.
- (13) Smithfield Club Cattle Show in London—December 4th to 8th.

NOTE ON CAPITAL INVESTMENTS IN INDIA.

Endeavours have been made from time to time to estimate the capital invested each year for trading, industrial, and other purposes, but it has not been possible to record the *total* public issues of fresh capital, Indian and foreign, within the country. The tracing of new investments is fraught with difficulties, and no regular statement of total capital invested has been prepared for publication. The main difficulties are :—

- (a) New issues may in part be made either for the redemption of debt or for the funding of loans already made,
- (b) Some companies conduct operations also in countries other than India, and capital raised for their general purposes cannot be correctly allocated between the countries in which it is actually used, and
- (c) Much private capital including that of unincorporated bankers, money-lenders, merchants, etc., is invested, of which no record is available.

2. This department has, however, published annually the capital of the banks and joint-stock companies whether incorporated in India or out of India but working in India, under the following classes :—

- (1) Presidency Banks.
- (2) Exchange Banks.
- (3) Indian Joint-Stock Banks and Loan Companies.
- (4) Insurance Companies.
- (5) Trading Companies—
 - (i) Navigation.
 - (ii) Railways and Tramways.
 - (iii) Co-operative Associations.
 - (iv) Shipping, landing, and warehousing.
 - (v) Printing, publishing, and stationery.
 - (vi) Others.
- (6) Mills and Presses—
 - (i) Cotton Mills.
 - (ii) Jute Mills.
 - (iii) Mills for wool, silk, hemp, etc.
 - (iv) Cotton and jute screws and presses.
 - (v) Paper Mills.
 - (vi) Rice Mills.
 - (vii) Flour Mills.
 - (viii) Saw and Timber Mills.
 - (ix) Others.
- (7) Tea and other Planting Companies—
 - (i) Tea.
 - (ii) Coffee and Cinchona.
 - (iii) Others.
- (8) Mining and Quarrying—
 - (i) Coal.
 - (ii) Gold.
 - (iii) Others.
- (9) Land and Building.
- (10) Breweries.
- (11) Ice Manufacture.
- (12) Sugar Manufacture.
- (13) Others.

3. The Blue Books styled "Statistical Tables relating to Banks in India" and "Statistics relating to Joint-Stock Companies in British India and Mysore" publish the detailed figures of the abovementioned Banks and joint-stock companies. They are also given in

Parts I to IV of
the 6th Issue.

abstract form in the Statistics of British India, Volume I—Commercial Statistics and Volume II—Financial Statistics.

A half-yearly statement of increase or decrease in the paid-up capital of companies incorporated in India is also published by this department, *vide* Appendix I.

A statement of joint-stock companies newly registered in India in each month is compiled in this Department and published.

It may also be mentioned here that the capital employed on the Indian railways, irrigation, and co-operative societies of India is also compiled and published in the Statistics of British India, Volumes I and II.

Appendix II.

4. A statement* has been prepared for the Commission to show the total capital, including debentures, invested in India during the years 1905-06 and 1910-11 to 1914-15, so far as ascertainable from available statistics. The statement is, it may be noted, defective and incomplete inasmuch as it excludes, for example, the capital of exchange banks (£22,815,000), because it has not been possible to state correctly how much of it is employed in Indian business, and also the capital of certain foreign companies which do only part of their business in India for which accurate information is not available. The statement is divided into two parts—Part I deals with the paid-up share capital, including debentures, of companies registered under the Indian Companies Act, and those with a sterling capital carrying on business more or less exclusively in India. The share capital of railways is excluded as the total capital outlay on railways is shown in Part II, which also includes the capital outlay on irrigation and telegraphs, the loans of port trusts and municipalities, and the paid-up capital of co-operative societies.

The total capital shown in Part I amounted to £94,260,000, which is distributed as follows:—

	Capital. £(1,000)	Debentures. £(1,000)
Presidency Banks	2,500	...
Indian Joint-Stock Companies	46,685	7,259
Foreign ditto	84,155	3,680
Total	83,320	10,939

Taking this total as 100, the shares in 1914-15 of the principal lines of business are as follows:—

	Per cent.
Tea planting	24.0
Cotton Mills	14.8
Jute Mills	11.1
Coal mining	5.2
Indian Joint Stock Banks	4.1
Gold mining	2.7
Presidency Banks	2.6
Tramways	2.5
Cotton and jute presses	2.1

The total amount of capital outlay, debts, loans, etc., shown in Part II was nearly £434,000,000, of which Railways represent £346 millions, irrigation £36½ millions, telegraphs £8½ millions, municipal loans £16½ millions, and port trust loans £20 millions. The total capital investments shown both in Parts I and II amounted to ₹792 crores (£528,000,000) in 1914-15 as against ₹523 crores (£349,000,000) in 1905-06, showing an increase of ₹269 crores (£179,000,000) or 51 per cent. The most noticeable increases in 1914-15 as compared with ten years ago (1905-06) are as follows:—

	ACTUAL INCREASE.		Per cent of total increase.
	£ millions.	per cent.	
Railways	107	45	59.8
Irrigation	11	43	6.1
Port Trusts	11.2	124	6.3
Cotton and jute mills and presses	8.1	44	4.5
Tea planting	6.9	44	3.8
Municipal loans	3.7	28	2.1
Coal mining	3.3	206	1.8

It is, perhaps, unnecessary to repeat the caveat in the first paragraph of this memorandum that the table in Appendix II is not complete. The total of £528 millions, it may be noted incidentally, is considerably lower than the gross *annual* value of the agricultural produce of British India.

5. An index to the capital investments referred to in the preceding paragraphs is given in Appendix III.

Appendix I.

Joint Stock Companies.

Statement showing increase or decrease in the Capital of Companies, incorporated in India and registered under the Indian Companies Act (VII of 1913), during the half-year ending the 31st December, 1915.

NOTE.—Columns 9 and 10 include the paid-up capital of new Companies registered during the half-year.
(a) Revised. (b) Registered under the Mysore Regulation, III of 1895.

This statement is compiled from returns furnished half-yearly by Registrars of Joint Stock Companies. In a comparison of columns 2 and 3 with columns 15 and 16, it will be seen that in British India there is a net increase of Rs. 74,92,000 in paid-up share capital and of Rs. 10,07,000 in debenture capital at the end of the half-year ending December 1915, as compared with the preceding half-year ending June 1915. This increase the United Provinces accounted for Rs. 72,71,000 and Bengal for Rs. 52,07,000 in paid-up capital, and Bombay accounted for Rs. 36,42,000 in debenture capital. In the Native State of Mysore the capital increased by Rs. 3,87,000.

Appendix II.

Statement showing capital invested in India, so far as ascertainable from available statistics.

=R(lakhs)	5,33,18	6,70,70	6,98,28	7,23,97	7,63,80	7,92,10

NOTE.—This statement is necessarily incomplete. It excludes, among other things, (1) the capital of exchange banks Companies (e.g., Insurance, Navigation, General Trading) registered elsewhere than in India. This is approximately £340,000,000 sterling; (2) the capital invested in numerous businesses which do not come within the provisions of the Indian Companies Act.

(a) Incorporated under the Presidency Banks Act, XI of 1876.

(b) The total capital outlay on Railways, Telegraphs, and Irrigation at the end of each year has been taken into account.

(c) The total capital debt of the Port Trusts at the end of each year has been included.

(d) The municipal loans represent the debentures issued by the Calcutta Municipal Corporation and the Municipal Corporation of the City of Calcutta together with the Municipal and Sanitary Authorities of the City of Calcutta.

ORAL EVIDENCE, 16TH JANUARY 1917.

Mr. A. Chatterton.—Q. I understand that most of the statistics that are compiled in your office are supplied to you mainly by the various Departments of Government and what I want to know is whether you have any organization at all in the way of checking the methods by which these statistics are prepared locally?—A. The methods by which the statistics are

prepared are checked from time to time. The check is often an indirect one. The returns when received in the sections (of which there are ten in the office) are scrutinised carefully and discrepancies pointed out to local authorities. This often results in a change of method. The check on the returns has been greatly increased since the department was recreated in 1914. For example, as regards prices, two days ago I got a return of wheat prices from the United Provinces and I was not quite satisfied with the wholesale price of wheat in Benares. I immediately telegraphed to the Director of Agriculture and he made enquiries and reported to me the correct figure. Similarly I had another case relating to wool. I was quite sure that the prices returned by the local agency were incorrect and I consulted Mr. McWatters, who is in charge of the wool scheme, and he said that the prices were not those which he was paying. I then reported the matter to the Local Government regarding the system of collection which was bad in that locality. Steps have now been taken to get the Sub-divisional Officer to check these figures. In August, 1915, while examining the method as to how the quarterly trade valuation returns for certain marts in Dacca had been prepared, I found that the return for a certain quarter was prepared weeks after the end of the quarter to which the prices related and was only a return for the day on which the prices were taken and not the average prices prevailing during the quarter. Also the prices were collected by a peon of the local Sub-Deputy Magistrate. For checking the method of preparation of rail-borne trade statistics we have a Statistical Auditor who goes round to the different railway audit offices, and in each office checks a complete set of weekly or fortnightly returns taken at random.

Q. Take cotton, for example. Do you check the estimated outturn of cotton against the subsequent movements of cotton in that area by the railway returns?—A. No. Attempts have been made from time to time in the Department of Statistics to check the estimates, province by province, by statistics of internal movements of cotton, but they have not been quite successful, owing mainly to the unregistered movements of cotton by road. Provincial authorities, who are acquainted with local conditions, are, however, to carry out such a check in accordance with orders of Government on the subject. This department makes a comparison of the total estimates for India with exports and consumption for India as a whole every year in the cotton forecasts and in the "Area and Yield of Principal Crops."

Q. With regard to statistics of prices, for instance, in the rail-borne traffic returns, I found in some cases that exports of silk from Mysore State, which is one of your sub-divisions, are valued at totally different rates when it is exported to Bombay as compared with the rates to Madras. Why is that?—A. The reason for this is that under existing orders the trade of a British Province with the Native States is valued according to the prices prevailing in that British Province. The whole question of improving the inland trade returns is now under the consideration of Government.

Q. Do you get your information from the Collectors of Bombay and Madras, or how is it obtained?—A. Which information?

Q. Take, for instance, the value of silk. Who would put down the valuation in the returns?—A. The provincial authorities.

Q. Have you any idea of how it is arrived at?—A. It is arrived at by multiplying the quantity by the value rate fixed by the provincial authorities. Each province prepares a list of value rates based on local prices, but I understand it is primarily the clerks who go out to the bazaar and get information. The maritime provinces, however, obtain their value rates for imported articles from the Custom Houses. The value rates for Bengal are compared, as far as practicable, with the prices quoted in the local Chamber's Price Currents. The inland trade returns of Bengal as also other Bengal statistical returns, it may be noted, are compiled in the Department of Statistics. The statistical work of the Bengal Government was transferred to the Department of Statistics during the administration of Sir John Woodburn in 1901.

Q. Have you any authority or any establishment by which you can deal with these figures when they have gone wrong?—A. Yes. These figures are compared with those of the previous quarter and any large variation in price is pointed out to the authorities concerned for verification. This has been very systematically done since April, 1914.

Q. But are these things properly investigated by the local authorities?—A. I think they do their best, and since we have given attention to this, local authorities are more vigilant now than they were. For example, Local Governments are now reporting and explaining variations of importance to us without our asking. This is eminently satisfactory.

Q. The sea-borne trade returns are very reliable and accurate, but the inland trade returns which are furnished by the railways are frequently inaccurate?—A. I agree with you that they are not altogether accurate. The quantities are taken from the invoices in the railway audit offices. You remember a case from Mysore recently. It was pointed out to us that our figures for quantities were incorrect. It was a case of coal. The Mysore authorities overlooked one vital point. They took as total imports of coal into Mysore only the imports from Bombay and Madras but left out of consideration coal which came from the Nizam's Territory, Bengal, and Bihar and Orissa straight through Madras to Mysore, and that made a great difference in the figures. Our figures, therefore, were correct. Quantities are taken from invoices and therefore are more accurate than the values assigned to the quantities. There is no checking of the quantity figures because it would require a much larger staff in all railway audit offices and errors occasionally find their way in these figures. For example (I quote a curious, but I am glad to say, very exceptional case), in the returns furnished by the Great Indian

Peninsula Railway it was shown that 7,115 maunds of raw Indian silk were imported into Bombay port from Calcutta. On enquiry it transpired that the figures related to Indian tea.

Q. As the figures are published it is not possible for any individual to discover how to get at the final returns. What I should like to know is, would it not be practicable to issue statistics of internal trade movements in a slightly simpler form so that people who have no technical knowledge of the methods of preparing these statistics can obtain accurately the information they want?—A. I do not think the returns are difficult to understand. The whole question, however, of simplifying the rail-borne trade statistics and of improving the "block system" is under the consideration of Government, and they have referred the matter to the Railway Board and that means reference to the Home Directors, and I cannot say how long it will be before a decision is come to.

Q. Have you ever issued hand books describing what statistics you issue?—A. To each publication a list is appended showing the various Blue Books, White Papers, etc., issued by the department, and this is also published in the Government Gazette and kept up to date. This serves as a guide. We are considering the publication of a hand book. We also have published special hand books as to the compilation of the forecasts, as to how to compile the inland trade returns, foreign sea-borne and land trade returns, etc., with the previous Government rulings on the subject.

Q. One difficulty that we have met with is that it is not easy to find out whether there is a change of method in recording these statistics. One example which occurs to me at the moment is one in which the Madras Government made a serious change by suddenly including all zamindari lands in their returns which were not previously included, and the consequence was that when we took up the statistics at an interval of five years we found an enormous increase, but not a real increase, which was due to the sudden change in the method of returning the statistics?—A. This is unavoidable when improvements are effected in statistical returns and incomplete returns are made complete, but whenever such important changes are made in the statistics the facts are clearly explained in the footnote to the tables in order to avoid any misapprehension on the part of the reader.

Q. Could you not issue a note as regards each statistical return stating during the last ten years or whatever interval is convenient for the purpose, what changes have been made either by the Department of Statistics or by the Local Governments who have furnished the statistics, so that we may not fall into gross errors on account of these changes having been made?—A. I will take a note of it. It will be rather a big piece of work as regards many of the returns. In the sea-borne trade returns, for example, every year in March we review all the requests we have had for additional information during the year and sub-divide our heads or specify new articles accordingly and every year we are making considerable changes there to meet the requirements of trade. For example, if a man comes and wants us to show talking machines and records, or stout and porter, or sulphate of ammonia, etc., separately, we look into the question and if he gives us good reasons I consult the Director General of Commercial Intelligence and the Collectors of Customs and then I write to the Collectors of Customs as to the classification to be adopted. It is, as I say, a big piece of work, but I do not see why we should not consider this.

Q. You think that a reduction can be made in the number of articles classified?—A. As regards the foreign sea-borne trade the articles are not too numerous. In fact we have to add to them as I have just mentioned. But with regard to the inland trade returns, when we met at the last Railway Conference, the general opinion was that it would be better to make a list of, say, about 20 articles which would cover 80 or 90 per cent of railway's trade, and the result of that would be that we would get out returns more quickly and they would be of considerable utility to the railways concerned. Until we hear from the Railways and the Railway Board, nothing can be done in the matter.

Q. For purposes of administration these statistics published in that form in comparatively general classifications are probably all that is wanted, but when we come to deal with the statistics for purposes of trade and for making enquiries with regard to a new industrial development, they are of too general a character to give the information which is usually required. In Mysore we have an enormously large classification in the railway statistics. Would it not be practicable to do something of that kind for the rest of India?—A. I do not think so. I do not think it would be wise. Would it not be better when you made a special industrial enquiry to get out special figures from the audit offices?

Q. Is it practicable for us to write to your office and ask for special information of this kind to be got out for making a specific enquiry?—A. Yes.

Q. Are you in a position to supply such information?—A. We are in a position to supply such information, i.e., information not given in the returns for the whole of India. What we would do is that we would write to the various audit offices or the Director of Agriculture, for example, of the Central Provinces, or local authorities, and see if we could get information for you from the invoices.

Q. But supposing I wanted to know the number of clocks imported into Bombay for the past five years, that is not returned separately in your classification?—A. In the sea-borne trade returns there is a head "Clocks and Timepieces" and figures for this head have been separately recorded since April, 1912. So I would be able to take the number of clocks and timepieces imported by sea into Bombay for the past four years. But if you wanted to know the inland distribution of those imports I should not ordinarily be able to take figures from the railway audit offices for more than a year or two years at most.

Q. The invoices in railway audit offices are destroyed?—A. They are destroyed generally after two years.

Q. Another difficulty that we experienced in dealing with these statistics is that a large proportion of the home trade is classified under 'Miscellaneous'?—A. At present that is the case. But I looked into this about a year ago, and found that the list of articles was an exceedingly large one (containing 123 articles) and that most of those articles in themselves were comparatively unimportant. They were not worth recording separately as they would unnecessarily increase the work in railway audit offices.

Q. They are comparatively unimportant from the statistical point of view, but when we are dealing with investigations many of them become of extreme importance?—A. We could in future write to the Director of Industries similar to what we do in the case of sea-borne trade returns to Collectors of Customs and chambers of commerce asking if there are any articles in inland trade which the Director would like to be separately shown, but then the difficulty would be that we should not always be able to get figures for such articles for all India.

Q. In regard to Inland Trade Returns you have a system of returning not the gross weights but gross weights minus certain deductions of an arbitrary character?—A. Prior to 1880-81 the weights shown in the returns were gross weights, but these were considered by Government as inaccurate and a table was drawn up after elaborate investigation, in which the proportion borne by weight of packing to total weight in the case of each commodity was shown in the form of a percentage. In 1883 Mr. (afterwards Sir) Bamfylde Fuller wrote a note on railway traffic registration under instructions from Mr. (afterwards Sir) Edward Buck, Secretary to the Government of India, Department of Revenue and Agriculture. In that note Sir Bamfylde Fuller said that inaccuracy resulting from the entry of gross instead of net weights was in great measure, if not wholly, obviated by the adoption of a system under which deductions were made in the audit office from the invoice weights in accordance with a table drawn up after careful investigation, in which the proportion ordinarily borne to gross weight by weight of packing was shown in the case of each article. The deduction rates are not arbitrary.

Q. Would it not be better to return gross weights on the railway invoices and allow those who have to deal with statistics afterwards to make their own deductions?—A. There seems to be no great objection, but the weights of packings in the case of a fairly large number of articles vary from 10 to 70 per cent of the total gross weights and those who use the returns will have no idea of the allowances to be made on account of packing; for example, gross weight of cotton piece-goods packed in boxes exported from Calcutta during 1915-16 amounted to 268,612 maunds, of which 48,350 maunds (or 18 per cent) represented the weight of packing and the net weight shown in the returns was 220,262 maunds. Similarly gross weight of imports of tea into Calcutta in that year was 3,095,336 maunds, while the net weight was 2,367,932 maunds, the difference 727,404 maunds (or 23·5 per cent) representing the weight of packing. It may be added that the net weight is always shown in the foreign sea-borne trade returns.

Q. As regards the values of railway traffic, would it be possible to get the values put on the invoices? Would it be possible for the railway companies to insist upon a declaration of value on the way bills?—A. I do not think so, and even if they did insist, this would not result in accurate returns. Nothing short of legal enactments will help us in the matter.

Q. Are there not returns of value on the way bills?—A. No. I should have thought that it would be an extremely difficult thing to insist that every person who sends a parcel or anything by railway should declare the correct value. How are you going to check these values? The question of having values declared by consigners of goods was considered by the Government of India in 1885 and 1898 and they decided that values based on declarations which there were no means of checking would be even more fallacious than those obtained under the present system. The question was also considered by the Statistical Committee in 1905 who were not in favour of the proposal. They said that, apart from the fact that Government appeared to have no legal power to require value declarations from consigners, they were more than doubtful whether the values so recorded, over which it would be impossible to exercise any appreciable check, would approximate more closely to the truth than the values obtained under the present system.

Q. Do these railway returns include parcel traffic or is it entirely omitted?—A. Parcel traffic is carried, of course, by passenger, and not by goods trains. The returns include parcel traffic of treasure only. We obtain for the Government of Bengal special returns of fish traffic which is compiled from parcel way bills.

Dr. E. Hopkinson.—Q. Are you in a position to judge whether the statistics which are prepared in your department are largely used by the commercial community?—A. The only way we can judge is by looking at the distribution lists and the number of enquiries we get from time to time from traders. Please see Appendices V and VII to my note on the collection and distribution of statistics. Experience has shown that the commercial public do not know all that is published, and I have been frequently advised by commercial men to ask Chambers of Commerce for lists of firms in special trades and to draw their attention to the particular trade statistics, returns, reports, etc., which are of use to them. In this connection please refer to my memoranda on statistics, paragraph 83, and on commercial intelligence, paragraphs 7 and 9. We would also be the better of a Publicity Section, and I mean to take this up

after the war, when other schemes connected with the usefulness of the department to traders will be discussed.

Q. You find that you do get a large number of supplementary enquiries?—A. Yes.

Q. Do you get much criticism of the form in which the statistics are presented?—A. We get such criticism sometimes from the commercial community and from trade papers or newspapers. For example, the *Economist* recently pointed out that the estimates of outturn published in our Cotton Forecasts were generally understated. Another critic recently pointed out that our trade values for Rangoon about steel pipes were in his opinion too high.

Q. Are you generally able to give the supplementary information which is asked?—A. Very often in the case of Sea-borne trade returns. It means sometimes going through the bills of entry and shipping bills in the Custom Houses and the Collectors of Customs are very helpful in the matter.

Q. How far has your Department been able to give such information without reference to higher authority?—A. Since I took over charge 3 years ago, the Hon'ble Member in charge, has given us a very free hand, and we have had every possible assistance. It is only in very special cases that extra staff would be involved and in such cases I refer to the Commerce and Industry Department by which we are officially controlled, and they usually sanction it if they think it necessary.

Q. And you have made it a point to study the needs of the commercial community and meet them as far as you are able?—A. Yes, and I am almost in constant touch, when I go on tour, with members of Chambers of Commerce, and in Calcutta I meet daily men who are well-posted in their particular lines of business. I have always got the greatest assistance from commercial men who have really been sometimes, as it were, a kind of advisory board. When too I was last at Karachi, they pointed out that the all-India cotton forecast was not quite accurate for that part of India, and then we sat down and looked into the matter and found that one firm exported a great deal of cotton, and as compared with the total production for a series of years it was probable we had underestimated the outturn in those cases. In this way and in similar other ways one gets into touch with the local authorities.

Q. It is part of your duty to collect statistics of joint stock companies?—A. Yes.

Q. Do you find any difficulty arising in the course of your investigation owing to the fact that there are not in India a body of Chartered Accountants just as we have got at home on whose information you can rely?—A. No difficulty has been experienced in the Department of Statistics. Under the new Companies Act, the Registrars of Joint Stock Companies collect information, and they see that the information conforms with the Act and they send us reports periodically. We refer to them regarding details, e.g., of misclassification, paid up capital, etc., when we have reason to doubt the accuracy of any return.

Q. You simply analyse the return?—A. We analyse, consolidate, and publish the returns. The Blue Book is published as "Statistics relating to Joint Stock Companies in British India and Mysore."

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. Do you get from the Bombay Chamber of Commerce correct returns about presses?—A. It is only as regards certain Native States, namely, Hyderabad, Mysore, Rajputana, and Central India, that the Bombay Chamber gives this information, and we have not, I regret to say, been successful. The information from British provinces (which include returns of Native States within their boundaries) is fairly satisfactory and will improve as time goes on. The Secretary of the Manchester Federation (Mr. Arno S. Pearce) wrote on 28th January 1916 as follows:—

The value of your compilation will be soon recognised and I trust that within a comparatively short time your Press Returns will be a reliable guide as to the size of the growing crop of cotton in India.

Q. As you know, in the Native States, there is a lot of cotton grown and we do not get statistics about it?—A. Exactly so. The difficulty is this. When we started this system of cotton press returns, the Bombay Chamber undertook to get statistics from certain Native States and we undertook to get them from the British provinces. But we are not getting complete statistics for the Native States. The Bombay Chamber of Commerce say that they have done their best and they cannot get any more. In order to improve matters greater co-operation is necessary, but Government consider it advisable to wait for the present and make the most of the figures supplied through the Bombay Chamber of Commerce. We get returns of area and outturn from Native States and we are attempting to get these more accurate. This involves patience as many States have not the requisite staff, and it is the policy of Government not to "importune the Durbars to perform a duty for the discharge of which they may be ill-equipped."

Q. So you seldom get very much information about cotton or anything produced or grown in the Native States except Mysore?—A. We get agricultural returns once a year from certain Native States and they are published in Volume II of Agricultural Statistics, and we also get periodically on prescribed dates returns from certain Native States for the following forecasts. (We publish 24 in all, Native States included):—

Due dates.

Area—	
1st	October 20th.
2nd	December 20th.
Final	February 20th.

										Due date.
Wheat—										
1st	January 31st.
2nd	March 15th.
3rd	May 30th.
Final	August 10th.
Cotton—										
1st	August 15th.
2nd	October 15th.
3rd	December 15th.
Final	February 15th.
Linseed, Rape and Mustard (Spring Oil seeds)—										
1st	January 1st.
2nd	March 15th.
Final	June 1st.
Sesamum (til or jinjilly)—										
1st	September 1st.
2nd	October 30th.
Final	January 15th.
Supplementary	April
Groundnut—										
1st	October 30th.
Final	February 15th.
Indigo—										
1st	October 15th.
Final	December 30th.
Sugarcane—										
1st	August 20th.
2nd	October 20th.
Final	February 15th.

Q. Do you consider that the values of crops returned as 12 annas or 16 annas and so on are correct?—A. No. We have taken that up and with the permission of Government I put in a circular No. 1083, dated the 5th December 1916, which was issued on our suggestion (*vide* Appendix A).

Q. Are you talking of the Native States only?—A. No. We have taken that question up as to the correctness of the yield of crops with local authorities. The question is now being carefully considered. There is a great tendency to underestimate, but it involves a good deal of change now in our present procedure. Any change that we make at the top filters down to the bottom and one must therefore walk warily.

Q. Will it take a year or two?—A. Yes. Perhaps even not so long before a beginning is made.

Q. About trade representation, do you get all the information through the British Attachés in the different Governments?—A. When necessary. For example, we get from Mr. Crowe in Japan returns of rice crop and things of that sort. Most usually we get them through the India Office. I have referred to this at some length in my memorandum on commercial intelligence.

Hon'ble Pandit M. M. Malaviya.—Q. In paragraph 8 of your Memorandum on Statistics, you say, "The statistics of wages are those paid to certain classes of labourers and artisans in districts and in certain railways (East Indian Railway and North Western Railway) and Government establishments as well as in certain private industrial establishments in various parts of India.....The statistics of wages paid in industries are meagre and refer generally to a representative mill in the chief locality of the industry." This information would be misleading then if it was taken as showing the average industrial wages in India?—A. That is so, but the question has been taken up with Government and after the war I hope to follow the practice similar to that followed by the Labour Statistics Department at the Board of Trade. We shall then get from industries, etc, correct figures. We will send out forms and get them back quickly and tabulate, examine, and publish them.

Q. You say in paragraph 29 of your Memorandum on Statistics about the distribution of statistics, "A statement has been prepared to show the distribution of the publications of the department (1) in India and (2) abroad." Is this distribution abroad made for payment or free?—A. It is made free. We generally get Blue Books free from State departments and from institutions abroad. These are of the greatest value to us, and we send them out in return.

Q. It is only to those that you receive information from, that you send your publications free?—A. Not always. If we get a request from any big institution abroad, we would, if it is a good case, put them on the free distribution list. The main point, however, is that we get from that country a *quid pro quo*.

Q. Do you supply these statistics free to the people in the United Kingdom or outside it also?—A. Both to the United Kingdom and also outside, to the Statistical Bureaux and various associations, libraries, newspapers, etc., all over the world.

Q. Don't you think that they should pay for them if they want them?—A. I do not think so, because they are not numerous and most of the countries follow the same procedure as we do.

Q. You say that Government officers receive 44 per cent of the publications. That, of course, must be free?—A. Yes.

Q. Do you think the distribution of your publications to so many officers all over the country is of any good? Would you not rather confine the distribution to men in trade who are likely to be able to utilise it?—A. Please refer to Appendix I of my memorandum on statistics. They find these statistics often very useful, especially, for example, to find out what the area of each crop in their districts is. They would like to have the Blue Book handy. This list is revised from time to time by each Local Government. Recently a revision has been effected with a view to economy.

Q. Do you send statistics regarding particular subjects which are likely to be of interest to an officer, or do you send them *en bloc*?—A. The Local Governments decide what publications would be of use to each class of officer and they send us a list and we issue accordingly.

Q. You say at the end of paragraph 30 of your Memorandum on Statistics, "We have sometimes been asked by firms and Chambers to telegraph information such as that relating to the forecasts, but under the orders of Government we cannot telegraph at Government's expense to public bodies and associations or to private firms".....?—A. The point is simply this, we think that our job is finished when we publish the information and let the Associated Press and other bodies publish it as they like.

Q. And it also ensures all the firms getting information about the same time?—A. Yes.

Q. Otherwise, if you supplied information to particular firms by telegraph the question might be raised of their gaining a particular advantage over others?—A. Yes. Sometimes, if the Chambers of Commerce would care to send a prepaid telegram and our forecasts had been published, we would send it to them at their expense.* In fact for the information which we send to the International Institute in Rome we make them pay for the cost of cables. They send us the cost from time to time but the Government of India are only one of the very few Governments which make the Institute pay, and there are 55 adhering Governments.

Q. With reference to what you have said in paragraph 31 of your Memorandum on Statistics, do you think that the publication in gazettes, which you speak of, would better help the distribution of this information?—A. It might in many ways. For example, to advertise our statistics it would be better. This is one of the post-war questions. I may say that the Labour Statistics Department at the Board publish their statistics in a Labour Gazette very promptly. They bring out on the 15th of every month statistics which have been compiled up to the 18th. The statistics are explained in very readable notes and the information in the gazette is of a kind that ordinarily requires working up. They get figures from all sorts of industries and work them out. It is a very excellent piece of work. In this connection please see paragraph 31 of my Memorandum on the Collection and Distribution of Statistics. At the present time the *Indian Trade Journal* publishes paragraphs and tables for us. We have recently introduced a system by which the Journal points out any of our publications of interest to trade.

Q. In paragraph 9 of your Memorandum on the Commercial Intelligence Department of the Board of Trade, you say, "lastly it may be necessary to emphasise one or two points connected with the Commercial Intelligence Department," and you say that the duties of the branch are concerned primarily with external trade and that the interest of the producer, other things being equal, is given preference over that of the merchant or carrier where these are in conflict. Have you got similar rules here?—A. Mr. Lindsay, who is in charge of Commercial Intelligence, would, I think, explain fully and better than I could the system that is followed.

Q. You then say in paragraph 9 (6) of the same Memorandum, "It should be pointed out that the most valuable information which is given by the Commercial Intelligence Department to the trade is never published at all. It goes to those interested and is kept away from foreign competitors who are extremely eager to get such information." So far as you are aware, does a similar rule obtain in our Commercial Intelligence Department?—A. Mr. Lindsay would also perhaps be in a better position than I am to answer that.

Q. Are the rules that you refer to in the same page definite rules laid down in writing or do they represent the practice of the department?—A. It is the practice of the department of the Board.

Q. In paragraph 7 of the same Memorandum you say, "His Majesty's Trade Commissioners are whole-time officers unlike the trade correspondents. They furnish people in the Dominions

* The Government of India have agreed to the proposal made in paragraph 33 of the Memorandum on Statistics and Chambers have been asked for lists of firms, etc.

desiring to export to the United Kingdom, with any information, subject to the exception that their primary duty must always be to the United Kingdom trade". That also is the practice?—A. Yes.

Q. Is there no definite rule on the subject?—A. It is understood. It is very well known.

Q. You also say in paragraph 9 of that Memorandum, "The Consular officers are authorised to give the same assistance to firms in the Dominions as to the United Kingdom firms except that the Consuls are principally commissioned to serve the trade of the United Kingdom"?—A. Yes. That is clearly understood. Please refer to paragraph 9 (9) of my note on Commercial Intelligence.

Q. In Appendix I of your note on Commercial Intelligence you say about the Commercial Attachés that their functions consist exclusively in assisting British traders and furthering the interests of British commerce?—A. It is capable of very wide interpretation. I have always found that any enquiry made to them have always been answered readily and completely so far as Indian trade is concerned. British interests, however, come first.

Q. Their instructions are summarised in the next paragraph of Appendix?—A. Yes.

Q. In Appendix IV of the same note you say that Consuls are permitted to give all possible assistance in the matter of trade to the Canadians?—A. This is a special arrangement made with the Canadian Government subject to the conditions laid down in the report. Please see paragraph 2 of Appendix IV to my Memorandum on the Commercial Intelligence Department of the Board of Trade.

Q. No such arrangement has been thought of yet with regard to India, so far as you are aware?—A. I am not aware of any such arrangement. When I was at the Board of Trade in 1913, I was told that the Board had been considering the advisability of having their own representatives in India. The matter, however, did not fructify.

Q. Are you aware of any such arrangement existing between the Board of Trade and any other Colony?—A. The arrangement with Canada was the only one up to the time of the war. Since Sir William Clark has taken charge, there might probably have been changes, but I am not aware of them.

Q. In view of the extensive import and export trade of India do you think that the time has come when Indian representatives of Indian trade should be appointed in other countries?—A. I think that a Trade Commissioner should be appointed for the United Kingdom.

Q. And outside and beyond it, in any other countries, for instance, in Canada, in Australia, in Japan?—A. I should like to see a beginning made in the United Kingdom and from the experience gained therefrom we could extend it later. Ultimately we might have a service of our own, I mean for India, but I should like to see a beginning made with the United Kingdom. That is my personal opinion.

Q. Mr. C. E. Low.—You are the compiling and not the collecting authority in the matter of most of the statistics?—A. Yes.

Q. Is it not the case that forecasts of some of the commercial crops are subject to very probably deserved criticism by the commercial public in certain cases, particularly of cotton and jute?—A. Yes, I quite agree. As regards cotton, wheat, oilseeds, rice, etc., we bring to the notice of provincial authorities any inaccuracy or inconsistency regarding the estimates which may be found on an examination of the returns or which may be pointed out by any interested party, e.g., we recently pointed out low estimates of cotton in Hyderabad and Sind to the local authorities, and in recent years we have found this to result in much better forecasting. There is a proposal to strengthen this section of the office and we shall then be able to exercise greater vigilance over local reporting agencies. As regards jute, this is left to the Director of Agriculture, Bengal, who publishes the consolidated forecast of Bengal, Bihar and Orissa, and Assam. The Director of Agriculture, Bihar and Orissa, and the Director of Land Records and Agriculture, Assam, furnish their returns to the Director of Agriculture, Bengal.

Q. In the case of cotton, are you aware of any country which has made any systematic attempts to estimate output by counting the bolls on the plant?—A. I am not aware. I have made a reference to the Departments of Agriculture in Washington and Cairo regarding the details followed as regards cotton forecasting.*

* Witness subsequently forwarded copies of correspondence on the subject, the relevant portions of which are the following:—

(1) Extract from letter No. ⁹⁶₂₅₋₆₋₄, dated 7th April 1917, from the Consulting Agriculturist, Ministry of Agriculture, Egypt, to the Director of Statistics.

"An additional factor is taken into consideration for the establishment of these preliminary forecasts, namely, the result of the examination of bolls made shortly before and during the time of picking, from samples received from each cotton district, by the head officers of the Technical and Scientific Division of the Ministry, enabling the counting of bolls on the plant and a checked estimation of the damage caused to bolls by insect pests."

(2) Extract from letter, dated 13th April 1917, from the Chief of Bureau, United States Department of Agriculture, Bureau of Crops Estimates, Washington, D. C., to the Director of Statistics.

"The basis of our crop estimates is reports from a large number of voluntary crop reporters It has been mentioned by a few that the number of bolls on plants is counted, but I do not believe that many of our reporters pursue such systematic and specific method of arriving at an estimate."

Q. Do you know if any other countries have any definite system, experimental or otherwise, for forming a basis for forecasts?—A. In the United Kingdom they use the Excise officers who go about in their own areas and collect information, and then of course, they utilise to a greater extent, than we do out here, the experts. At the present time we do not use in the way that we should the professors of the Agricultural Colleges to get reports. I know of no reports from any agricultural expert about the condition of the crops round about his college or the area with which he is acquainted. Suggestions have, however, been made to Local Governments in connection with wheat forecasts for utilising the services of the experts of the provincial Agricultural Departments as far as practicable for supplying the necessary information to the Local Directors.*

Q. Generally, the Local Governments in compiling them make use of the knowledge of the Deputy Directors of Agriculture?—A. I do not think that is general.

Q. The forecasts depend simply on the opinions of local officers of varying degrees in the official hierarchy?—A. Yes. On the whole it is not badly done, but the estimates of outturn are underestimates owing partly to the fact that Indian cultivators and village officers are generally pessimistic in their crop estimates and have an ingrained tendency to depreciate the present estimate in comparison with the past, and partly to the fact that the subordinate agency finds it difficult to regard 100 per cent. or 16 annas as representing a normal crop. (Please see the Government of India circular No. 1083-252-1, dated the 5th December 1916, Appendix A.)

Q. A lot of officers are frightened by the figure of 100?—A. Most of the officers regard 100, which we have prescribed, not as a normal crop but something above a full average, and the result is that our estimates are often very much below.

Q. Turning to the question of wages returns, apart from the mill and factory labour, do you think that the returns of wages of agricultural and village labourers are in a satisfactory state at present?—A. I do not. I have looked into this carefully and the question is at present with Government. As you know, some of the provinces have quinquennial wages returns. We have gone into that and analysed those figures, and on the whole, I think the machine which only works once in five years creaks badly, and it has not been altogether the success that I anticipated when it was first introduced.

Q. The annual returns are not very satisfactory. Do you think that anything can be done to improve them?—A. By giving clearer definitions and carefully drawn up forms in the vernacular, if necessary with explanatory footnotes, etc.

Q. That could be done a good deal better by making them fill up returns in printed forms with explanations?—A. Yes.

Q. Do you think its importance justifies having a few special officers—I do not say of very high status—to compile or inspect the compilation of prices and wages returns?—A. Yes, and those officers would also be useful in the offices of the Director of Land Records and the Director of Agriculture.

Q. Do you know of any such men?—A. No. Mr. Keatinge (Director of Agriculture, Bombay) suggested to me that if he could have a statistical officer on Rs. 200 he would be of great assistance to him in his forecasts and other statistical work, which Mr. Keatinge has to do for us. His office prepares these forecasts and it is very difficult for him to go into them with the thoroughness which he sometimes would like to do. I think this would apply to some other Directors of Agriculture and Land Records.

Q. Would you have a man on Rs. 200 who would simply be taught to make enquiries intelligently and also taught to find out what the price was or the wage was, or would you have a better man than that, with a more general economic knowledge, to go round and inspect the work generally and make any general enquiries of an economic nature relating to prices and wages?—A. It would be an advantage to have an officer of higher qualifications and pay.

Q. As regards the receipts of jute into the Calcutta block, a very large number of mills were left out which made the information of little use for the purpose for which it was wanted?—A. Since May 1914, I have shown in a footnote the imports of jute into those mills and I have prepared a comparative statement of our figures and the Chamber's figures.

Q. Have you any knowledge as to the relative amount of use which the commercial public or the various classes of it make of your different returns on commercial and economic subjects?—A. No, but only through the distribution lists and enquiries and references to our return. I should say that the monthly accounts and the forecasts are of special use to trade.

Q. Have you ever discussed this with commercial bodies from time to time?—A. Yes. I have had suggestions once or twice of the jute business men and they have often said to me, "Why don't you publish statistics which are published by the Chamber of Commerce, and could you not do it better and quicker?" and we have been considering that question.

Sir F. H. Stewart.—Q. Could you do it better and quicker?—A. As regards jute imports into Calcutta we publish weekly figures. We could publish a monthly statement about one or one and a half weeks before the Chamber does it. As regards the accuracy of the Chamber's figures I think we would be more accurate. I have recently had occasion to go into the salt imports into Calcutta and found that the Chamber of Commerce had gone wrong in one case

* Orders of the Government of India were issued in regard to this in their circular No. 210-C, dated 7th February 1917.

by a hundred thousand maunds, and in another by over a million maunds. This is rather an important question from the administrative point of view. The discrepancy between our figures and the Chamber's figures was noticed, and on an examination of the Chamber's figures it was found that the mistake of one hundred thousand maunds was in their progressive figures, and that of over a million maunds was due to their publishing in one of the issues of their price currents figures of tons as maunds. I think we could easily publish a statement for the Chamber of the monthly jute imports.

Q. You could publish it more quickly also? But would those statistics command the same confidence as the Chamber of Commerce figures?—A. I think they would command the same confidence. Our figures would be more complete than the Chamber's. We include Kidderpore Docks and the Chamber does not do that. We include imports into the mills served by the East Bengal, East Indian, and Bengal Nagpur Railways. The Chamber includes import into the mills served only by the Eastern Bengal Railway and excludes those served by the East Indian and Bengal Nagpur Railways. Another point is that the mills might be willing to give us figures of jute bought over the jetty, whereas they would not give them to the Chamber.

Q. The point I am getting at really is that if you could do it more quickly and better than the Chamber, then the Chamber might discontinue some of these things?—A. Yes. It is only recently that we considered this point.

Q. But you have not taken it up with the Chamber of Commerce?—A. No.

President.—Q. Would it not be possible to publish a figure which is known not to be accurate but sufficiently precise for business men to frame their ideas? For instance, as regards the statistics of minerals, I could say in November what the probable production of the next year would be. That is done in the Colonies. You get provisional figures issued almost immediately the year is closed, but everybody knows that it is not the final figure?—A. It would be roughly correct. Of course, our monthly returns of trade fluctuations, i.e., of imports into the ports of Indian staples, go out seven weeks after the date to which they refer, but those are audited figures—and show the sources by provinces. Unaudited total figures similar to those published by the Chamber could be got out within five or six days after the period to which they refer. These, however, will represent trade for four weeks. I have made a comparison between the Chamber's monthly figures and our unaudited weekly total figures for four weeks and they are roughly correct, so that in place of the Chamber having one monthly statement, they would have weekly figures plus a monthly statement based on weekly figures.

Mr. C. E. Low.—Q. Can you tell me why a great deal of detail is given as to things turned out by cotton mills and absolutely no information about jute mills. Is there any essential difference between cotton and jute trade?—A. The detailed statistics of production in cotton mills are compiled from monthly returns which the cotton mills are bound to furnish under the terms of the Cotton Duties Act, but there is no law binding the jute mills to furnish similar returns. I should like to have returns. They would be of use. Some day when we have a Census of Production Act this will be possible.

Q. Do you know if the cotton trade finds that information useful?—A. I think they do.

Q. Is there any particular reason why the same thing is not done for jute?—A. Because we do not have an excise duty.

Q. Your agency is to some extent a compiling agency, and you have had to do a certain amount of interpretation of statistics. How do you take steps to get yourself in touch with them?—A. In various ways: (1) by keeping in close touch with experts, e.g., in each trade, (2) by touring and settling points with Local Governments and their officers, (3) by meeting Committees of Chambers of Commerce, etc. I have no Assistant Directors and this makes it impossible to keep in touch in the way I sometimes would like. In this connection, please see paragraph 25 of my Memorandum on Statistics.

Q. You speak of the Committee which advises the Board of Trade about the different kinds of statistics. Do you think that anything of that sort would be useful to your department?—A. Yes. I have business men as already stated whose advice I avail myself, when necessary. At present I have a list of men well known in their own line of business on whose judgment I place great reliance. I always get invaluable assistance from them with regard to the purely trade point of view.

Q. As you mention it in connection with the Commercial Intelligence Branch, would it be useful to the Commercial Intelligence Department?—A. Yes.

Q. Local Committees advising them?—A. Yes. At present we simply depend on various individuals, but if we had a strong body of men not appointed simply because they are members of an association or anything of that sort but because they are well known as experts it would be useful. The Advisory Committee of the Board of Trade is an expert Committee which advises the Board from its own knowledge. The 19 commercial members are carefully selected and represent important branches of trade in which they are experts. They do not act as delegates, but are rather a combination of a great amount of commercial knowledge. The details of the Advisory Committee will be found in paragraph 8 of my note on the Commercial Intelligence Department of the Board of Trade.

Q. The Board of Trade do not rely on organized associations in trades or industries?—A. No. The Board consults its own Advisory Committee. A number of members of the Com-

mittee, however, are also members of the Council of the Association of Chambers of Commerce, and the Chairman of the Council of the Association of Chambers of Commerce is on the Committee as a matter of course. The Committee, therefore, is a link between the Board of Trade and the Chambers of Commerce. Please refer to paragraph 8 of my note on the Commercial Intelligence Department of the Board of Trade.

Q. You think that the other system is more efficient?—A. Yes. It is very helpful.

Q. How do you think it would work here?—A. It might be useful to have a small workable Committee meeting once a month or so. Everything of importance, before it comes to the Committee, would be considered by Government. Please see paragraph 8 of my note on Commercial Intelligence. We have in India the Committees of the Chamber who have done excellent work in the past when consulted by Government. That point has to be remembered when one is thinking of the advisability of having Advisory Boards.

Q. In speaking of the Commercial Intelligence Department of the Board of Trade in paragraph 9 of your note, you say that the interest of the producer, other things being equal, is given preference to that of the merchant or carrier where these are in conflict. It was said for a long time the Commercial Intelligence Department refused information to the producer because it was thought to injure the middleman?—A. I think it may be taken on the whole that they look to the producer's interest first and foremost. This was brought out very clearly by the Permanent Secretary to the Board in his evidence before the Dominions Royal Commission.

Q. You think the practice corresponds to the theories enunciated by the Permanent Secretary?—A. Yes.

Q. You are speaking in the same note of exhibitions of samples and catalogues of enemy trade. Do you think that a similar thing may be useful in this country? Do you refer to enemy trade or external trade?—A. Enemy trade I had in view.

Q. Do you think that it will be useful after the war, or don't you think that it will be a cheap advertisement of the enemy trade?—A. It does cut both ways, but it is very interesting to see the way in which the Germans did business, the way in which their catalogues of various things gave details, their careful study of the market, their ability to give long credit, and the assistance given by their Grossbanken. The information might be given to firms in a way that it would not act as a cheap advertisement.

Q. The United Kingdom is a much more producing, and India a much more consuming country, unfortunately at present, and do you think that a great benefit would result, or injury?—A. The benefit would not be so great certainly as in the case of the United Kingdom. It is worth attempting.

Q. Do you know of any departments like the Department of Agriculture or the Geological Survey who watch the statistics for this reason, that there might be a mineral which is being produced, or there might be a special crop being introduced to the public by the Agricultural Department. Do the departments watch that?—A. No. Not as a rule. There are, however, exceptional cases. Whether this is done or not depends as a rule on the Heads of the departments.

Mr. A. Chatterton.—Q. Have you got any technical assistance in classifying articles dealt with by importers or exporters? When the war broke out, the imports of potassium cyanide ceased and there were no returns of cyanide given but they were lumped together with sodium compounds?—A. Articles are shown in details in Bills of Entry and Shipping Bills which are dealt with in the Custom Houses. They have more or less expert officers (Appraisers) and the classification is made with their assistance. When, however, we have a moot point in classification in which any expert department is concerned, we always refer to that department, for example, the Director of Geological Survey would be consulted or the expert who dealt with that particular article.

Q. How are you going to deal with changes of this kind which not infrequently occur in the procedure? One sort is substituted for another and unless you have an expert to indicate what is the nature of the compound that has been employed :—your return, I think, shows no cyanide is imported into India at all now, whereas it really comes under sodium compounds?—A. Such changes are, as stated already, dealt with in the Custom Houses. Our returns of imports show cyanide of potassium separately under chemicals.

Q. Why I raise this point is that some arrangement should be made so that these returns for every half-year or every year may be revised to see that they are giving exactly the information that they are intended to convey in technical matters of this kind?—A. In practice this would be difficult. I should require a number of experts, and even then errors of detail such as you have mentioned would be possible.

Sir D. J. Tata.—Q. Is any commercial intelligence ever published in the vernaculars?—A. No, but this is subject to correction by Mr. Lindsay. We have had requests from time to time to publish in the vernaculars, but that is chiefly regarding a manual for crop forecasts and things of that sort. Sometimes the Native States write to us, "Will you send fifty copies of a Hindi translation of such and such a return?" and so on. We have recently printed Hindi forms of returns of live stock for use in Native States. Our aim is to assist Native States as far as practicable by translating forms or manuals containing rules for the compilation of statistics. The more we can assist Native States in regard to the collection of statistics and the more we co-operate with them, the better will be the returns, and at the same time the States will be more willing to furnish returns.

Q. There is no demand for any such information?—A. So far as I am aware there is no demand.

Hon'ble Pandit M. M. Malaviya.—Q. Do you say that there is no demand yet, or the matter has not been looked into?—A. We have got no request.

Q. That is probably because they do not know that they would be supplied in the vernaculars. There is a large amount of export and import trade by people who do not know English, and in their case information supplied in the vernaculars would be helpful. If they knew that they would get them, I think they would subscribe for them.—A. I shall note this.

Appendix A.

Copy of Circular No. 1983-252-1, from the Government of India, Department of Revenue and Agriculture, dated 5th December 1916, to all Local Governments and Administrations.

I am directed to address you regarding the method of framing estimates of outturn for the purposes of the forecasts of crops, a subject which, with the development of Indian agriculture, is assuming steadily greater importance.

2. In 1884 when instructions for the preparation of wheat forecasts were first issued by the Government of India, it was prescribed in paragraph 14 of this Department Circular No. 39 A., dated the 25th July 1884, that the estimate should be made on either the American or the Indian system with reference to an average crop, and that if the latter were employed 12 annas should be taken as an average, and 16 annas as a bumper crop. Subsequently in 1885 it was found that the order was not applicable to all the provinces, and in the same year it was laid down in this Department Resolution No. ^{129-A.}₇₋₁₈₈₇, dated the 6th November 1885, that an average crop should be denoted by 16 annas. Local Governments were again asked in 1892 to adhere to the above system in paragraph 5 of the memorandum of suggestions appended to this department circular No. 48, dated the 21st December 1892, and were also requested to state, when using the anna fraction in published reports for expressing the probable yield, the outturn represented by that fraction. In 1897 a question arose as to whether the anna notation or the American notation should be used in making crop estimates, and it was strongly urged upon the Government of India that, as the cultivators and village officers entrusted with the duty of collecting the data for crop reports, were chiefly accustomed to the anna notation, the adoption of any other system tended to confuse the estimate, with the result that in some provinces the estimates were never pitched so high as 16 annas or an average crop. The Government of India, therefore, decided (*vide* paragraph 4 of their circular No. 9-27-4, dated the 23rd October 1897) to leave it to Local Governments and Administrations to fix the scale of notation for themselves in accordance with local conditions, the object being to secure that the returns should be in terms of a normal crop. In order to secure conformity with the local usage it was thought that it might even be necessary to use different scales in different parts of the same province. But since the anna standard thus adopted would no longer possess any fixed or uniform value and would, therefore, be unsuitable for use in any published forecasts, it was ordered that in the forecasts submitted to the Government of India or the Director of Statistics the use of anna notation should be entirely discontinued, and the American notation used in its stead, 100 being taken to represent a normal crop and the estimated outturn being stated as a percentage of that crop. Under this system the local reporting agency in each province makes an estimate of the relations borne by the season's outturn to the normal crop either in annas or percentages; the provincial Director on receiving these estimates converts the annas (where the estimate is given in this form) into percentages and calculates therefrom the quantitative outturn of the season with the help of a register of standard normal outturns per acre which is maintained by him.

3. Experience has shown that the yields of crops thus estimated are generally understated, and it appears to the Government of India that the source of error in the estimates of yield lies mainly in the inaccuracy of the estimates framed by the local reporting agency. This may be due partly to the fact that the Indian cultivators and village officers are generally pessimistic in their crop estimates, and have an ingrained tendency to depreciate the present estimate in comparison with the past, and partly to the fact that the subordinate agency finds it difficult to regard 100 per cent or 16 annas as representing a normal crop. It appears to the Government of India that the idea of the reporting agency as regards a normal (100 per cent) crop is very vague. In the circular of 23rd October 1897 referred to in paragraph 2 above a normal crop was defined as "that crop which past experience has shown to be the most generally recurring crop in a series of years; the typical crop of the local area; the crop which the cultivator has a right (as it were) to expect and with which he is (or should be) content, while if he gets more he has reason to rejoice, and if less he has reason to complain." Later in paragraph 4 of Sir James (then Mr.) Wilson's circular letter No. 13-324-1, dated the 16th October 1905, regarding the preparation of the season and crop reports, the term "normal" was defined as the "figure which in existing circumstances might be expected to be attained in the year if the rainfall and seasons were of a character ordinary for the tract under consideration, that is, neither very favourable nor the reverse." This definition was adhered to in paragraph 3 of the Hon'ble Sir (then Mr.) E. D. MacLagan's circular No. 7-78-1, dated the 13th March 1907, regarding the improvement of the wheat forecasts. The

Government of India understand that in the United States of America a 100 per cent crop represents a condition of perfect healthfulness, unimpaired by drought, hail or other injurious agency and with such growth and development as may reasonably be looked for under these favourable conditions. This is described as a "full normal condition," but is obviously a condition above the average. The Government of India have reason to believe that a similar standard is followed by many reporting agencies in India, and that district officers often report 80 or 90 per cent when the crop reported on is really perhaps a normal (100 per cent) crop according to the official definition.

4. The Government of India think it desirable that the system should be placed on a sound basis and they will be glad to learn what is the experience of Local Governments and Administrations in the matter, and what measures are considered possible for the improvement of reporting either in annas or in American notation. They desire to know (a) at what stage the anna (if the estimate is returned in annas by the reporting agency) is converted into percentage, that is, by the primary reporting agency, by the district officer, or by the provincial Director; (b) what notation is preferred, the anna or the American, and, if the former, how many annas should be taken to represent the normal, or if the latter what should be taken as the normal; and (c) by what means the meaning of this normal may be impressed on the primary reporting agencies, e.g., by printing in bold type in the vernaculars, etc., on the forms the meaning of normal.

5. I am accordingly to request that you will be so good as to furnish the Government of India with the opinion of the

Governor in Council
Lieutenant-Governor in Council
Lieutenant-Governor
your opinion

 on the above points.

WITNESS No. 185.

Hon. Mr. W. A. Ironside.

HON'BLE MR. W. A. IRONSIDE, *Merchant, Partner in the firm of Bird & Co., Calcutta.*

* WRITTEN EVIDENCE.

From my personal experience the finance of industrial enterprise has presented little difficulty, provided the essential factor of careful development and commercial possibilities has been studied. Moreover promoters, to carry weight with the public, must possess some credit for commercial management. This takes time and costs much, and some people who fail to bear this fact in mind are apt to blame other causes and reasons for their disappointments.

Financial aid.

Subscriptions are naturally most readily obtained from European sources, though Indian subscribers are welcomed. Many people, however, seemingly prefer to wait until scrip is dealt in on the Stock Exchange, that is they join in after the scheme has been brought to fruition, or, oftener still, they prefer to accept wildly speculative rumours in the hope of getting rich quick. Such people bother little about the enterprise itself, and do not even care whether it is profitable or not and often do not even know where it is. The present unhealthy uncurbed spirit of speculation is, I hold, injurious to honest industry; so much speculation of this class proves disastrous and later the industry itself is blamed for results of which it is innocent.

I have had no experience of Government financial aid and I am opposed to the idea *per se*. If a scheme is really valuable it should be worthy of complete public support or none. It moreover restricts the education of the people by inducing enterprise to be spoon-fed and hot-house forced; we have enough lack of energy, grit, and pluck already without fostering it further. But I do consider all new industry (and in India all industry may practically be considered in its infancy) can be and should be assisted by Government in many more practical ways. I also do not believe that Government wish to interfere unduly, whereas were financial aid to be accorded dual control would be evolved and the result would certainly lead to chaos.

Industry, and in this I include agriculture as the greatest of all, requires assistance at some time or other, and no industry can be beneficial to the State or community unless it be successful and profitable, but in offering any suggestions to this end I wish it to be understood that in all things the happy mean is the goal I desire to aim at, an end which we are often apt to disregard. I hold that as we have arrogantly stood by theories and so-called moral sentiments which, run to death, have nearly led to our national ruin, we may, as a result of the present war, be led to exaggerated views in the opposite direction. Instead of serving to correct our difficulties this may only accentuate them and must be guarded against.

I consider, therefore, that the quasi-financial points raised in the forefront of the list of questions would, in dealing with this country's problems, have been better relegated to the last page; they could then, I think, have been more easily dealt with.

All industry is beneficial to the State and community but I desire to see 'industrial commerce' separately considered from 'mercantile commerce,' the two being antagonistic. The first only is the producer of benefit to the State, whereas the merchant's view must necessarily be confined to buying in the cheapest and selling in the dearest markets; the

* See also additional written evidence painted after oral evidence.

merchant or middleman fails to consider the internal producer. Obviously there must always be divergent interests. To my mind the multitude of merchants has, to a large degree, governed the country's policy towards industry.

Industry in this country is in its infancy and is not appreciated at its proper value. It cannot be managed by unpractical or scholastic methods. Financial aid in any form can only be a means to an end, and here I think Government put the cart before the horse by failing first to consider, to a full realization, the practical value of each separate industrial scheme to the State or community. This has been the weak point in my opinion of all present measures of industrial progress.

Money grants-in-aid, loans, supply of plant, are mere charities which end nowhere, and carry no incentive. Bounties and subsidies may in some instances be very necessary to assist nascent industries which, at starting, are crippled by one or more disabilities, and these are multifarious in this country though they are rarely found wholly in combination.

Free grants of land, reduced taxation, free and untrammelled cheap transport facilities, and guaranteed dividends are I think some of the more wholesome methods in the case of industries vital to the national safety, economic or military, and could safely be worked on much the same principle as now governs railway finance; but these should cease after a scheme had secured a solid foundation.

I do not generally favour Government participation in share capital but it might be found desirable in special instances; but Government capital should be paid back at the earliest possible date, proper regard being paid for the share of the goodwill which Government had created.

Government, during the period of investment and risk, naturally should be represented by one or more directors and auditors whose care should be that after completion proper provision should be made for depreciation and financial solidarity out of profits.

Pioneer factories should only be started if public interest cannot be obtained, the audited working results should be made public and the concern offered to the public for purchase as a going concern as soon as possible.

Demonstration factories can be of little real value either to Government or as a means of educating the public, they could only be on a model scale and I would personally distrust any financial results from model concerns. Raw material being available, the necessary technical guidance can be obtained by paying for it, and people who want pioneer factories are usually those too lazy and unprogressive to find this for themselves. Personally, I do not embark on any industry until I have first made all possible efforts to test its value, and I endeavour not to start until there is a sufficiency of capital to bring it to fruition. I agree, however, that we all make the fatal mistake of cutting our working capital too fine. This is sometimes done in order to interest investors who naturally desire to see a prompt and large return on their investments. In short we try to promise too much. One of the most serious instances of this error of a shortage of original block cash expenditure and working capital is the coal industry.

I have an idea there is danger at the moment that we are trying to force the pace, and all this talk of pioneer and demonstration factories betokens an unhealthy anxiety to run before people have learned to walk.

I have always found existing financial organizations adequate for my purpose, provided ordinary guarantees and security can be offered. An extension of the Charter of the Presidency Banks might allow them to take a somewhat greater share in the coming industrial expansion of the country. I consider the average bank manager in this country in advance of the British banker in providing financial assistance. The managing agency system has been, and is, to my mind, a considerable factor in many successful ventures, in this part of India at any rate. Powerful firms, by reason of their large stake in enterprises, often protect a languishing or difficult scheme from premature liquidation by providing that second string of security which a Board of Directors alone could not provide and enabling the scheme to weather the storm. Prior to my arrival in India I held a different view, but experience, sometimes bitter, has led me to view this method of business management differently, at least as to its value in industrial development.

I have little knowledge of village or home industries and I see little value in promoting home industries which must compete on unequal terms with the large factory. It has often appeared to me that the Indian handicraftsman has lost much of his old skill, particularly in artistic work, much of which is now being sloppy and ill-finished. Co-operative associations assisted by Government might be the means of rectifying this in time, but it is hopeless to expect one man to look after everything, for small industries are diverse, and each one requires and should merit individual care and attention. The question naturally arises, where is the money to come from for all this sort of thing; Government cannot do everything. Co-operation both as to finance and education on soberly conducted lines would undoubtedly be productive of excellent results. Agriculture, in all its branches, would to my mind most readily respond to co-operation.

I am strongly opposed to Government competition with private enterprise in any form. It is distinctly unfair, and it is bound to have the effect of choking enterprise. Instances which have come before my notice have caused bitter resentment and we must have them altered.

My principal experience has been with minerals. Technical advice from properly constituted departments must obviously always be productive of progress. The Geological Survey of India has, in recent years, done great work in spreading a more comprehensive knowledge of the country's resources, but is hopelessly under-manned. At the same time we cannot expect an encyclopaedic record of everything that exist in such a vast country. We are apt to suggest that Government should force the pace whereas the country is not educated yet to take full advantage of a multitude of information. Furthermore, before development can take place, we must first be certain that a sufficient market exists, not to mention transport facilities.

I have found some old geological records to be so inaccurate as to be worthless, leading to expenditure which is unfair to the prospector, and I would go as far as to say that practically all geological records more than twenty years old should be re-examined and verified.

Government technical and scientific experts should only in exceptional cases be lent to private firms or companies, for such aid, after the purely initial stages, is rightly the duty of the industrialist. There are always people ready to accept aid, and many indeed would like to get all their work done for them and are equally ready to reap all consequent gain.

We scarcely need to talk of extensive research work in India yet, for Britain herself has scarcely more than commenced to give the matter attention. We are short of scientific men of experience, for their numbers have been so few. Most of our scientists come out young, with only a smattering of training, and are grafted and absorbed into a country where the demands on their time and work is so great as to prevent methodical enquiry into the multifarious subjects which they are asked to deal with. The experience gained in the last few years will probably be put to greater use later, but we must first place our preliminary investigations on a sound basis before it can ever be possible to proceed to research. Consequently, for the present, I am inclined to depend on the established laboratories in Europe for research.

The Geological Survey is doing all that one can expect of it but it requires strengthening; this must cost money and this is just where Government will have to be more courageous. One so often hears that this or that work cannot be undertaken because there is no money for the salary of a first class man; yet money is thrown about in many other directions far less beneficial to the country. I would like to see an organized effort made to examine closely all possible substitutes for jute and other indigenous products which we are apt to consider safe monopolies. No monopoly exists for long and I know and have seen a possible one for jute which may develop. We have had surely warning enough in the case of indigo and other natural dye products.

The Forest Department requires co-ordination and expansion, the present system of transfer and lack of regard for the "commercial brain" prevents the Forests being developed as they might often be to greater advantage. A closer co-operation between Forest officers and timber companies and more reasonable royalty terms would be conducive to expansion.

I wish to place it on record, however, that the Government technical and scientific advisers seldom fail to give all assistance in their power, but cast-iron antiquated rules stand in the way and are the cause of most of the trouble which is experienced. I trust that the Commission will secure the opinion of the leading practical men engaged in the timber industry, for it is capable of almost indefinite expansion.

Commercial museums can obviously be of considerable assistance to minor industries but few visitors to them are immediate buyers. A major industry could not afford to place any reliance on them for markets, and they probably are the main source for the creation of competition. In that respect, perhaps museums and industrial exhibitions may be said to serve the State. They undoubtedly serve to create and educate foreign competitors, a factor which the British Government have ever viewed with complacency, if not indeed with undisguised pleasure, disregarding the needs of indigenous industrialists. I have as often as not formed the opinion when dealing with Government that they like to see British industrialists struggling against unfair competition, in order to prove an absurd dictum that a new industry can with equal benefit to State and people take the place of a ruined one. Greater co-operation, and an intelligent interest and appreciation of the value of industrial commerce to the State and people and an absence of academical views are now necessary.

Trade representatives should be attached to all British Consulates, but these should be men with special training having a thorough grasp of the trade of the Empire, able to give intelligent advice to prospective buyers. But this should only be a part and perhaps the least important part of their duties. A vigilant watch should be kept for all forms of possible competition, speedily warning manufacturers against the risks of unfair commercial methods, alternative cheaper, inferior, or superior values, patterns, and designs, and generally competition from without. Government departments should, one and all, work in the closest co-operation with local manufacturers. Local purchases should be insisted upon in order to foster the employment of indigenous material and labour, even to the point of paying increased prices. There has been an almost entire absence of any such co-operation in the past, and this has, to my mind, militated severely against industrial enterprise. It is disheartening to be turned back time after time by the stereotyped reply, "We have to buy these stores through the Secretary of State," or, "As this contract exceeds 3 lakhs of rupees it must be sent to London."

Government departments often put contractors or engineers to needless and useless expenditure in the preparation of costly plans and specifications only to be told that money is not available or that the work will be done departmentally.

The present extraordinary method of budget finance, particularly in Railway and P. W. Departments, is one of the most wasteful methods of expenditure it is well-nigh possible to conceive. Expenditure passed at the commencement of the financial year is rushed during the last quarter in order that no credit balances may be left, for if left, they are cancelled on the 31st March and have to be rebudgeted for, and often are not afterwards available. It is a method of finance which strikes a business man as highly unsatisfactory.

The existing Railway Siding Agreement to which industrial concerns are obliged to acquiesce is inequitable and unjust. I am certain similar terms for the provision of transport facilities to people who are risking money in the development of the country would not be tolerated elsewhere. In dealing with railways the risk, worry and work are all on the shoulders of the industrialist and I am certain no blame attaches to the business man for lack of progress in India, indeed the wonder is that we have gone as far as we have.

I am adverse to public money being used by Government for the creation of a department, and in order to cheapen its cost and to force prices down allows it to control 50% of the output by undertaking private work. I refer to the Mining Engineer of the Railway Board. I was the first and keenest supporter of the original action of Government to buy its State Railway coal, the department has been most efficiently run; in fact I would call it the most business-like Government department, but the work is as easy as falling off a log, when the control of the purchase of 50% of the output gives the department undue strength. This position has gradually come about by adding to the State Railways' requirements practically all other Railways in India, Burma, and Ceylon, Royal Indian Marine, and several important private consumers.

It is a smart piece of business and as such as a tax-payer I have nothing to say, but when it is carried to present lengths, when Government have laid themselves out to smash the coal trade by tackling each individual producer in turn bringing down prices practically to cost price, the result has been the restriction of development, and when larger quantities were suddenly needed in a national emergency, the country has found itself in a mess, a case of the bitter bit, and the tax payers, of which the colliery proprietors are a large section, help to pay for the bite.

Land policy.

The existing law relating to land is hopelessly out of date. Mining leases, except when obtained from Government, are at the mercy of many vested interests, and a lessee of a mineral property never knows from day to day when his title will be attacked and he will be called upon to expend large sums in litigation. Some claims may only be described as black-mail, whilst many seem to be brought on the sporting chance of hit or miss. But at any rate the unsatisfactory state of things does no one but lawyers any good and it is a great hindrance to proper development.

I hold the view that the minerals rightly belong to Government and should never have been relinquished. However, as no attempt has ever been made by Government to put this question in order, I hold that the subject must now be considered in the light of the necessity of the State and community. Mineral royalty proprietors take not the slightest trouble to develop their own concerns, and royalty is merely an easy method of drawing revenue without doing any work, whilst the title may be assailed at any time and the industrialist, having most to lose, pays the piper. As a consequence the lessee takes the line of least resistance and often develops on cheap and nasty lines. Sinfully wasteful methods are employed, as often as not a danger to himself and his neighbours. To such an extent is this the case that in the interests of the country I cannot too strongly urge the formation of a Department of Mines, as a portion of the Commerce and Industry Ministry, under a fully qualified and widely experienced Commissioner, a man capable of demanding a large salary. He should be assisted by an able legal and technical staff, capable, amongst other things, of examining and reporting on titles and giving a definite Government guarantee on the same, so that, once a colliery or mine owner has obtained a lease covered by a Government certificate he should be freed from all further hindrance and useless expenditure, and wasteful litigation stopped.

This proposed Department of Mines should be able to supply an equally urgent need by being empowered, in return for legalized titles, to insist on mineral properties being worked in the interests of the State on efficient and modern lines, that present wasteful methods should cease, and that proprietors who failed to carry out its instructions could be dealt with. This Department would undoubtedly cost money but coal, for instance, is valuable beyond price; it is the life blood of everything else and should be conserved; and as one interested in colliery matters myself I would willingly pay a considerable sum annually for the sake of obtaining the benefits possible from such a department. It would redound to the advantage of the individual as well as the State and community and this cannot be said of everything in this country. I could amplify this suggestion, with time and closer examination, by suggesting co-operative ropeways or tramways for the provision of stowing material, delivery of coal to railways, etc. At present the only mineral control is centred in the Inspector of Mines another hopelessly over-worked body. Indeed present methods are ridiculous and I don't know where we shall end if they are not speedily altered.

From the point of view of the mining industry the existing law is to my view defective in the following amongst probably many other respects.

It is confusing and uncertain with regard to the ownership of mineral rights. This uncertainty has been a fruitful source of litigation between zemindars and tenure-holders during

the last 50 years and although several suits have been fought up to the Privy Council the law has not been settled.

Several zemindaries and tenures in the mining districts constitute what are known as "impartible estates"; and the authorities are hopelessly conflicting with regard to the right and power of the holder of an impartible estate to grant mining leases beyond his own life time.

A considerable number of mineral properties is held by Hindu widows and shebaites of debutter estates who under the existing law have no power to grant leases for periods enduring beyond their own life time, except under special circumstances the existence of which it is impossible for an intending lessee to ascertain.

The law relating to Hindu joint families lends itself to fraud and does not afford adequate protection to persons dealing in good faith with the ostensible owners of joint family properties.

The existing law does not afford proper facilities for the acquisition of surface lands by owners and lessees of mineral rights. Special legislation is necessary to remedy these defects and anomalies; and such legislation should proceed on the following lines:—

- (a) A Department of Mines being a portion or section of the Ministry of Commerce and Industry should be created for each province under a Commissioner with power to decide claims to the ownership of minerals and mineral rights.
- (b) Every person having or claiming title to minerals and mineral rights should be required to file a statement of his claim before such Commissioner within a prescribed time.
- (c) All claims not filed within the prescribed time should be declared barred and extinguished for ever.
- (d) Minerals and mineral rights in respect of which no claims shall be filed within the prescribed time must be declared to belong to Government.
- (e) All claims filed within the prescribed time should be adjudicated by such Commissioner whose decision must be final.
- (f) *(Deleted by witness subsequently.)*
- (g) A mouzawar register should be kept in each district in which the names of the persons adjudged to be entitled to mineral rights should be entered by the Commissioner and such entry should be conclusive evidence of title.
- (h) The register should be kept up regularly and every person succeeding by inheritance to, or acquiring any mineral rights must be required to have his name registered within a specified time from the date of such succession or acquisition.
- (i) The register should be open to public inspection on payment of such fee as might be prescribed by the local Government.
- (j) Holders of impartible estates, shebaites, Hindu widows, trustees, and other limited owners, should be empowered to alienate and grant perpetual and other leases of mineral properties with the sanction of the Commissioner.
- (k) Provision should be made for the compulsory acquisition of surface lands required for mining purposes and full power should be conferred on the Mining Commissioner to carry out such acquisition.
- (l) The Commissioner should also be authorised to decide boundary disputes affecting mines and minerals.

Railways could be fed by cheap systems of tramway and aerial ropeway transport doing away with expensive sidings with the consequent costly loss of valuable surface land and locking up of minerals.

An Aerial Ropeway Bill which would have met the requirements fairly well was formulated 4 or 5 years ago by the Government of Bengal but has been lying untouched at Delhi ever since. We appear to go about everything in the most expensive fashion and cheaper methods of dealing with bulk material in quantities such as ore, coal, stone, etc., should be evolved.

Co-operative systems are possible for assisting neighbouring collieries to handle their output and for the supply of stowing material in order to enable the extraction of all coal and the prevention of surface destruction. This is an urgent matter and I have hammered at it for years. It is all going to cost money, but unless we improve our methods, and people who refuse to do so should be made, we shall find the final results more costly than anything we are able to estimate to-day.

We business people have not paid sufficient attention to the education and training of our employees, particularly as there is much local material at hand, and whilst I do not pretend that every locally educated youth is a genius still more might have been attempted in the past. We have worked along the line of least resistance, our industries have been simple, our methods generally crude, and we have been content to import trained men. The war will force us to alter these views. If industrial progress of real worth is to be obtained we must look about for scientific advisers and train our workpeople, from top to bottom, according as their duties require.

Attempts have been made, I know, by many people, but many existing industries have required little scientific advice or knowledge to produce more or less satisfactory results. The principle, "What was good enough must be so still" has governed nearly all of us. Expansion is now taking place, however, and some recently started schemes will need different methods and knowledge to be brought to bear. Moreover the supply of imported employees will in future be curtailed, and we shall be forced to use our wits to evolve a supply of men to fill many gaps. Engineering in all branches, mining and chemistry will be necessary in practically every form of manufacture or production; consequently the call will be for mostly from these branches of technology.

And as we have to deal with human material which has not environment or traditions to lead them mechanically, as it were, "to follow in father's footsteps," the expenditure of a lot of patience will be needed before we can expect to make much of the average individual; so do not let us try to evolve managers, superintendents, or budding industrialists and financial magnates.

The Railways, Port Trusts, etc., with their large staffs and the families of their employees to draw from, and an abundance of other peoples, money to play with, have had both material and means, and there are probably few other organizations which have any actual experience and results. Many others have tried in a perfunctory way but any such attempts were foredoomed to failure.

The present system of elementary school education is very unsatisfactory, and in this I speak equally of both Anglo-Indians and Indians. The former lack grit and initiative, but I believe, if properly tackled and taken young, are capable of a lot more than they are at present given credit for. The Indians dream of the University and there in most cases the dream ends in bitter disappointment. The younger generation of clerks in our office is far below its predecessors in ability, loyalty, or discipline. It is difficult to get even legible hand-writing, but rather than use their hands in trade they will eke out an inefficient, feckless existence in offices on small and indeed insufficient pay but that generally more than they are worth.

My firm has started a system of apprenticeship which is, I think, an experiment for this country; it concerns only engineering and mining at present, but, if successful, will be expanded.

Four apprentices' homes are built or in course, each to contain 8 to 12 boys from 16½ to 18 years of age. Lads of this age are not as developed as most boys of 14 in Europe; their education is generally on a lower scale.

The houses for mining are in separate districts giving an equal number of distinctive features of training. Transfers at stated periods will be made. The training of the lads will be under a technical instructor whose duty will be to give technical instruction for at least the first two hours of the day on two days of the week, whilst on three days the boys will work themselves on preparation work. I favour morning instead of evening instruction in this climate, the remainder of each day will be spent in the mines or works. The boys are housed and boarded and given small pocket money. Rules for discipline and conduct are provided. The lads are apprenticed. Fixed deductions from pocket money are made and placed in a deposit fund, and at the end of the period of agreement this will, it is hoped, be used by the boys to gain a chance of further education and experience at Sibpur, or Europe as may be deemed desirable in each case.

We have started with Anglo-Indian lads because they are more easily housed and more readily respond to discipline but principally because we want to give lads of this birth a chance. I hope some of our Indian neighbours may follow and improve on this idea with Indian boys.

I recognize the still greater desirability of evolving improved workmen and foremen in the engineering shops, and sirdars and overmen in the mines and we hope when the first scheme is set going to find a means of tackling the latter and apparently more difficult problem. Still I am sure it can be solved if we stick to it. An improved form of vernacular instruction would go a long distance towards helping this latter idea, for as soon as the Indian boys learn English their parents want them to be clerks and enter Government Service, or the University, when for all practical purposes, they are wasted and lost.

Official
 tion. organiza-

The Commerce and Industry Department has existed for some time but I cannot say that until recently we have had many causes or reasons to be aware of its existence. Personally speaking the whole future of the country appears to depend on a greater appreciation of the material needs of the country and the people. If this Department, in some form or other, controlled practically 75 per cent. of the activities of Government it would be none too large starting with education and so on, through railways and transport, and embracing everything concerning the material requirements of the country. I suppose it is, or has been hitherto, the least important of all Government Departments, and even now it consists of a relatively minute section located 1,000 miles from all the main centres of activity. It strikes me as strange that the appointment of a Director of Industries should be questioned; it is a relatively paltry affair at present but should be and could be made one of the most important posts in each province. A Ministry of Commerce for each province with a far-reaching organisation is I consider vital, the Imperial Government, Commerce and Industry Department, being posted regularly with the results, co-ordinating and supporting the requirements and wishes of industry. Railway facilities and working should be under its control. Government might then be in a position to appreciate what is likely to happen ahead and make necessary preparations to meet trouble. Instead of this, at present, continual crises

occur, when the Member for Commerce and Industry, or the President of the Railway Board are dragged down here at short notice to face problems which have grown simply because it is nobody's business to keep the country clear of them.

The Commerce and Industry Department should be a section of Government apart and distinct, possessing all the opportunities for advancement in order to create incentive, instead of as now being used as a post to be pitched into, or a jumping off place for something higher. The material progress and advancement of the country, to my mind, promises to be so vast that this question is one of extreme urgency, and methodical development on no niggardly scale must be ready to co-ordinate the great interests which otherwise will assuredly overlap and choke each other.

I do not think I have found any benefit from the Indian Trade Journal, the most of it being nearly "scissors and paste," whilst by a regular review of trade journals and technical publications relating to any particular industry, interested people can, if they wish, keep abreast of the times. There has been little original material in the Indian Trade Journal and that, often from obviously unpractical sources. I cannot suggest alterations. Industrial or trade journals by Government could only follow similar lines. But surely we have to create industry and trade before there can be any demand for literature, and the existing British journals cover almost all that can be required. Something more might be achieved if the present Trade Journal gave careful extracts from British Consular reports from abroad wherein possible competition and other matters of vital importance to producers and merchants are given attention, but as British Consular reports seldom bother to refer to useful items, my suggestion is probably a "wish as father to the thought." Perhaps translations from foreign reports from both British and foreign markets might be more useful.

The Forest and Geological Department records are the only publication that I know much about which are of real value, but both Departments are expected to do too much; men and money are needed in both cases.

The attention of the public consumer could well be drawn to the more economical use of fuel, pointing out that although we have an abundance of cheap fuel to-day, present methods if not quickly altered will cause our successors to curse us for our improvidence. There are probably many other similar problems which would lead to increased efficiency and improvement and a reduction of waste.

I believe that the lack of sufficient and efficient transport facilities, particularly in the matter of railways, has done more in the past to cripple the development of the country than anything I can think of. Railway..

I would emphasize the necessity for the public being taken more systematically into the councils of Government with regard to the general policy of railway communication. In ordinary circumstances such a suggestion might be deemed to be a mere impertinence, but the peculiar conditions under which the country is governed make it, I submit, legitimate for the public claim to be admitted to the confidence of Government in this great question. For Government as the great railway owners, the greatest landholders, and the principal agriculturalists and industrialists, are the predominant partners with the public in the joint enterprise of furthering the material prosperity in this Empire. Unless, therefore, Government affords its confidence to those who are working with it to this end, the rate of progress cannot be either steady or harmonious, and I maintain it is not only useless, but mischievous, to permit the public to continue to invest money with the result that the latter are fruitlessly endeavouring to develop the country and to distribute its products in the markets of the world, at a more rapid rate of progress than Government can proceed with its share of the work. If financial and other considerations prohibit an advance, it would surely be better that both Government and the commercial community should mutually agree to mark time rather than to attempt one to outstrip the other. I respectfully suggest that a Committee, which might be permanent, be appointed to enquire into the whole question with its varying aspects, and meet regularly at central points to deal with the multifarious questions which are constantly cropping up, which dovetail and intermingle, and affect each other, but which are now considered in detail and separately without a complete knowledge of the whole of the considerations involved.

Many years ago, in the report of the Mackay Commission, a report which was certainly framed in Whitehall, but wherein a fair and impartial attempt was made to define and decide the necessities of railway development in India, it was recommended as urgently and imperatively necessary that a regular yearly expenditure of about 12 million pounds sterling should be made on railway construction and development, and when one realizes that ever since that report was published no attempt has ever been made to realize that figure, the lack of development we are often accused of can be understood. In fact the Finance Department of Government has wilfully refused to consider or act upon that report. The late Finance Minister, indeed, went so far as to say that he was by no means convinced that there was much room for expansion of the railways of India. One has but to look back on the recent expansion which has taken place in spite of disabilities but which Government refused time after time to acknowledge as within the bounds of possibility only a few years previously. We have "slithered" along always behind instead of ahead of requirements. Railways or lack of them have in the memory of all existing commercial men been a stumbling block to improvement, efficiency, and method. One crisis and public clamour have been succeeded by some slight improvements but never have the complete needs of industry been met, and I hold

that until this fact is appreciated thoroughly it is useless to have Commissions of this sort or to formulate expensive ideas for education or anything else.

Railways policy has for years past been entirely under the control of the Finance Member and railway revenue has been the milch cow for every scheme of sentimental reform whilst the material needs of the masses of people have been left to take care of themselves. The excuse has been that Government are unable to obtain the money for railway purposes. My answer to that is that Government owns a monopoly in the railways and they are run as such, that practically any rate of freight can be charged and consequently we can afford to pay the market price for money, the revenue being adjusted to meet any interest and sinking fund charges. This however has never been the policy and until it is altered I fear any results from this Commission are bound to be rendered nugatory. During a busy grain season every wayside station is blocked with grain waiting for wagons, lying piled on the roads outside only to get damaged by the weather. What can be the only result from such a state of affairs? The local merchant, unable to despatch, is unable to purchase and the cultivator held up with large stocks is obliged to accept lower rates or he may see his stock destroyed as it often has been. Would it be possible to estimate the crores of rupees which have been lost in this way year after year? All this is done whilst, on the strength of a good budget, the salt tax is reduced by 8 annas a maund, a boom which goes straight into the middleman's pocket. Has it ever occurred to Government to ask the millions of peasants whether they would prefer to have the salt tax reduced or that their grain should be promptly removed and cash paid for it? The ryot's answer at any rate would be "let me have my money for my grain for I have never heard of the salt tax." It is sometimes remarked that every railway in India could not be expected to maintain sufficient rolling stock to deal with any possible maximum of traffic and it is obvious there might be wastage at times in such a case, so I would suggest that a Central State Wagon Company or Department be formed (Government owned if necessary) which would hold a sufficient number of wagons available to turn the scale at any period or point of shortage, which could be sent in any specific direction; for it is seldom that the entire community is affected at one and the same time, but it generally is in one quarter or other. It is naturally useless to consider rolling stock only, increased track, siding, stabling, and repairing facilities must of necessity follow in regular order and stand on exactly the same plane. I have only referred to wagons for the sake of brevity. I would further suggest that for the purpose of providing funds, Railway Bonds might be issued carrying the Government's guarantee of interest at the market rate, or better still a generous share of the profits over and above that figure in the case of Premium Railway Bonds carrying a definite fixed rate of interest high enough to attract investors, or, to go further and try Premium Lottery Bonds, which only a thinskinnyed hypocrisy prevents us using everywhere. It would at least possess the benefit of controlled speculation in comparison with the present wild gamble which takes place in every bazar in India on the merest rumour.

As with railways, so in a lesser degree with waterways. Why waste good money on railways when water transport is at hand. Waterways in India can be developed to a wide extent, particularly in the regions of Eastern Bengal and Assam where the development of the country, as regards agricultural, mineral and forest produce, is at present seriously hindered.

ORAL EVIDENCE, 17TH JANUARY 1917.

NOTE.—I have not qualified the three or four paragraphs which are referred to in the oral evidence, as I think it will be clearer hereafter if my oral evidence draws attention to the original paragraphs in the written evidence in preference to corrected paragraphs which might otherwise bring about misunderstanding.

W. A. IRONSIDE.

President.—Q. In your written evidence under the heading 'Technical aid,' you say "Consequently, for the present, I am inclined to depend on the established laboratories in Europe for research." When you say "for the present," I should like to know what your views are with reference to the desirability of developing in this country, as soon as possible, the means for research on the raw materials, that is to say, whether you think that it is better that we should develop our means in this country, or whether we should continue to rely on the laboratories in Europe for research?—A. As regards raw material, I am in favour of the present means at our disposal being expanded to enable us to gain a better insight into the value of the raw materials. But I was thinking more of methods of manufacture after the raw material was handled.

Q. There is probably much room for difference of opinion in the matter of raw material, especially on the question of vegetable material. The plant varies in its quality and producing properties at different stages of its growth, and consequently, if you do not undertake research here, you will never be able to get your raw materials tested properly, because there are many conditions, such as soil and climate, to be taken into consideration?—A. I was not thinking of pure and simple analytical work. I was thinking of manufacturing on a large scale.

Q. Even on a manufacturing scale, do you think we shall gain much by having experimental tests made at home rather than in this country?—A. Not experimental tests.

Q. Then what you might call manufacturing tests?—A. What I feel is we have got such a small staff and such small opportunity for methodically and quietly testing. You cannot expect this country to run specialists in each separate department of industry.

Q. Can you give us an example of something which will enable us to understand what you have in mind?—A. For instance, coal distillation covers an enormously wide field, and that has to be specialised work. At the present time my own firm are starting a laboratory of their own in the office and it is naturally impossible to find a man who can give us really valuable opinion on everything. I am thinking of work like coal distillation. It is impossible to expect a man to know everything in science. We are apt to load men in India with too many things. We expect him to do everything.

Q. Is the outlook in that case sufficient to warrant Government having a staff and plant big enough to carry on experiments like testing with regard to the quality of coke, quantity of tar, the quantity of bye-products other than tar, and even following further and determining the qualities of the tar for the purpose of getting from it some of many derivatives that can be obtained. In the case of coal, keeping that in mind, do you think it would be worthwhile—do you think it would pay the Government and therefore the country—to establish an installation and a staff for the purpose?—A. I believe this is one of the most necessary opportunities, I might say, for real examination and assistance by Government. Low temperature coal distillation provides for India an industry, the development of which has possibilities of a far-reaching character and immense value to the country, and would, I believe, repay the closest and most methodical examination and assistance by Government. We have many seams of low grade coal practically all of them containing valuable volatile products and the process of low temperature distillation is being rapidly perfected. When I was at home last, I saw a distinct advance on anything I had seen two years ago, and the suggestion is now, I believe, far enough advanced for a deliberate effort being made to tackle the question here in India. The need of a cheap smokeless fuel to take the place of wood and dung fuel needs no recapitulation and the demand is enormous for that fuel. Its effects on agriculture might be marvellously valuable. Similarly for the bye-products. Although there might be some difficulty in using the surplus gas economically, we may yet see coal distillation plants in close proximity to large manufacturing centres which, instead of sending, as they do at present, 90 per cent of the value of fuel up the chimney, will first turn the coal into smokeless fuel and bye-products, using the gas only for driving their plant, either by means of gas engines or gas fired boilers. That holds to my mind a most valuable future for industry of all descriptions, and I think it would well repay Government to spend a lot of money on it. But it is no use asking a man to come out on Rs. 500 a month with a miserable little laboratory. The thing is worth millions and therefore we can afford to pay many thousands for it.

Q. The apparent direct advantage to Government from a work of that kind from a financial point of view is nil. The Government have no direct interest at present in the mineral rights of the areas occupied by most of our coal fields, but, putting aside the question of public duty, the matter of ways and means must be dealt with. Do you think that the coal owners—I do not mean the colliery owners but the owners of mineral rights—might fairly be asked, or if necessary, be forced to assist for the purpose of covering the expenses of this work?—A. I think so. I think also the agricultural possibilities to the country are enormous. We can save dung for manure. The whole thing requires a vast organisation; it is not only the mere matter of a chemical laboratory that has to be tackled.

Q. The problem is obviously beyond the capacity of any one company. It is not fair to expect any company to do that; they would not be able to have anything like a monopoly?—A. We must not have a monopoly. It is too valuable to the community to have any monopoly.

Q. Do you think that this matter has had a set back in England purely on account of this financial problem?—A. Very largely. I think they tried to promise too much and they had not spent enough time in research work; but the financial problem is undoubtedly one of the chief things and unless you can keep up the public interest and good-will you cannot carry it on.

Q. With reference to the formation of what you describe as the Mines Department, presumably, you would link together in that department the Geological Survey and the present Inspector of Mines; and, in addition to that, you would extend the personnel of the department by giving it further powers—definite executive and administrative powers—which would require also the assistance of advisers?—A. I think every Government official in this country is overworked. The Geological Survey wants about four times as many men as they have at present. The Inspector of Mines wants at least three times as many men to do the work efficiently as he has at present. The value to the country of coal—I am speaking of coal because I am mainly interested in that—is so great that the present methods which are slipshod must cease. There is no use of talking of expansion of iron and steel unless we can maintain that iron and steel with cheap coal. I have set out as carefully as I could—but I am subject to correction and alteration—the present trouble that we have with regard to coal titles, and a charge of four annas a ton would be cheap at the price. The same department should be able to force people to work collieries properly. At the present time, the mine owner or the company spends a lot of money on deep workings when he finds himself flooded out by some cheap and nasty method employed by a neighbour. We want to try and co-ordinate the whole system of mining, and I should like to see its real value to the country recognised in a different manner from what it is at present. It is left to take care of itself.

Q. Four annas a ton will amount to forty lakhs on sixteen millions of output?—A. Yes. It would be cheap to the coal industry at that price.

Q. From my imperfect knowledge of the country, to my mind it is difficult, almost impossible, for any Imperial department to be able to grant a mining lease in any part of the country with safety, because local rights, as you point out in your note, vary from place to place to such an extent, not only vary in character but also in the degree of doubt as to real ownership, that a mining lease under present conditions cannot be granted except by Local Governments after very elaborate local enquiry. That, I take it, is your view?—A. Yes.

Q. But you have made a proposal of a practical kind which I do not think I have seen before, that we should organise this Department of Mines with a Mines Commissioner. May I say Mineral Settlement Officer?—A. That is the sort of thing that we want.

Q. Local investigation as to mineral rights? I suppose you would start by issuing a notice to every claimant of mineral rights within his district, by publication in the gazette or otherwise, that the case will be heard from a certain day onwards and claims should be lodged. These claims should be settled district by district?—A. Yes.

Q. It becomes a sort of local mineral survey?—A. Yes.

Q. These mineral rights when once established in the Court of the Mineral Settlement Officer will be published and mapped, and from that time no disputes of the kind will be possible?—Quite so. It should be possible for a colliery proprietor, who is prepared to spend money on a property, to get titles settled once and for all. I have a case in point. We have spent about twenty lakhs on a colliery and had been in possession for eleven years and 364 days. We were sub-lessees but were served with a notice an hour before the expiry of the 365th day of the 12th year after the date of the original lease on the ground that the original lease had been obtained from the man whilst drunk, and consequently they sought to oust us from possession. To defend that action cost us something like four lakhs and we found that our own legal adviser was advancing money to the other side to carry on the litigation.

Q. The settlement system would require legislative sanction, and the legislation would take such a form that, for instance, if A and B had rights over certain land, both A and B would get due notice that the case was going to be heard by the Mineral Settlement Commissioner and that his decision would be final?—A. That is so. I do not want to do anybody out of their rights. But when you take a lease in good faith and spend money, when once the colliery is started and the work is done, whatever difference there may be in relation to original ownership, let them settle their differences without dragging in the colliery people, who have at present not only to develop the colliery but to defend their title and the lessor's title as well. Some collieries have spent more money on legal costs than they have on machinery.

Q. Hon'ble Sir R. N. Mookerjee.—Up to the High Court the decision was in favour of the collieries company, but the Privy Council said it was all wrong?—A. That had not anything to do with the Privy Council. It was a case of the man who had given the lease to a lessee and who after 11 years and 364 days put in a claim saying that the original lease had been obtained by fraud.

Q. Sir F. H. Stewart.—Is it the idea that there should be a local investigation and adjustment of claims and publication by the Local Government and then it should be handed over to the Imperial Government?—A. I have only put forward my suggestion in the abstract form. It is a matter for legislation and very careful examination. The exact methods to be employed are rather difficult because what may be necessary in one province may not be so in another or to the same extent. But I do think that, when the royalty owner and the lessee have come to terms and the ownership of the royalty has been proved and registered, after an interval of twelve months, which is given for anybody to appeal against that registration, it ought to hold good afterwards in case of any second claim cropping up.

Q. Mr. A. Chatterton.—Did these difficulties greatly interfere with prospecting?—A. Yes. It starts almost at once. We are very lucky if we get our prospecting done without some trouble.

Q. Mr. C. E. Low.—Do you know of cases where property has not been exploited on account of this difficulty?—A. I know many of them. I can look up the record and provide a dozen cases.

Q. And in spite of this, it has been exploited?—A. The properties I am thinking of were properties which we relinquished because of the trouble after we had spent money on them.

Q. The destruction of capital by reason of legal proceedings is almost as great as by the navy and army?—A. Yes. We keep the mc-fussil courts going on questions of title.

Q. Hon'ble Sir R. N. Mookerjee.—There are firms who, knowing the defect in title, take certain properties. Do you say that they should be absolved of all liabilities because they have taken them up? Some of these questions ought to be seriously discussed?—A. By getting a proper title we should be quite prepared to pay more.

Q. You say in section (f) "Provision should be made for the preservation and protection of the title of persons who have already sunk capital in developing any mines or minerals." Supposing you, in ignorance, sink capital in a certain thing which you should not have done, do you claim that provision should be made to safeguard your interest?—A. I do not wish to speak entirely from the colliery proprietor's point of view. I want to safeguard all interests. At the present time money is wasted on all sides. It does no good to anybody. By means

of this suggested Commissioner, the royalty owner would be just as able to safeguard his title as the colliery proprietor.

Q. This would take effect after the settlement has been made?—*A.* No.

Q. It does not protect the present owners?—*A.* What I feel about it is this. We want to settle the whole of the difficulties at the present time by suggestion (*f*), which is that before people have sunk capital in developing mines provision should be made for securing them a clear title.

Q. How?—*A.* Through this Commissioner enquiring into the different claimants' rights. Take the subject of one of our own collieries where we are still litigating on the subject of title after 15 years.

Q. You must not take a firm like Messrs. Bird and Company, but take those who knowingly sink capital, taking advantage of this section?—*A.* I think that can be settled by the Commissioner direct; and probably the colliery proprietor, who has acted as you suggest, may be made to pay the cost of getting a proper title. But I am thinking not only of titles but the question of working the collieries properly.

Q. President.—Would it spoil your scheme if section (*f*) were modified?—*A.* In some modified form, you would find section (*f*) would work very well.

Q. It looks like providing a sinking fund to cover speculation?—*A.* I have no intention to do that.

Q. You do not look upon section (*f*) as vital? If it were dropped out the whole scheme would still be worth considering?—*A.* Yes. My suggestion is not to assist anybody who takes a speculative risk. These are only abstract ideas, and when they come to be elaborated in the shape of legislation, all safeguards could be taken.

Q. I am only trying to find out which of these proposals, if dropped, would practically have no effect on the principle of your scheme?—*A.* I am quite prepared to eliminate section (*f*) altogether.

Hon'ble Sir R. N. Mookerjee.—*Q.* You say in section (*d*), "Minerals and mineral rights in respect of which no claims shall be filed within the prescribed time must be declared to belong to Government." There may be an old widow without any education who may be the owner of such rights, and suppose she does not register her rights within 12 months or 15 months—she may be living in a village and may not know the world outside—will your proposal work fairly and equitably in that case? Bring your mind into India and into the Indian conditions.—*A.* The Commissioner's duty is to find out the widow and examine the claim.

President.—*Q.* When rights change it will be the duty of Government to give due notice to every owner of rights to lodge a claim within a prescribed period?—*A.* Give 12 years if necessary. We get our results eventually at the present time through litigation and uselessly spending money. I want to try and get them without this waste of money.

Sir F. H. Stewart.—*Q.* You say in section (*k*), "Provision should be made for the compulsory acquisition of surface lands required for mining purposes and full power should be conferred on the Mining Commissioner to carry out such acquisition." Who is going to decide?—*A.* In Bihar and Orissa that is already provided for, but has never, I think, actually been put into use. It is provided for in the Chota Nagpur Tenancy Act.

Q. Only in respect of lands in which the Government possess mineral rights?—*A.* No. It is extended to all collieries and railways, but we have no assistance of that sort in Bengal and at the present time we have the greatest difficulty in working the minerals. The law gives us power to obtain minerals from the surface, yet we have not got any power to acquire land to carry this into effect.

Q. Do you refer to the Land Acquisition Act?—*A.* I am thinking of the Chota Nagpur Tenancy Act provisions which enable collieries to acquire land as for a public purpose on the same terms as railways. In Bengal there is nothing. At the present time we sometimes have to lay out our collieries in an expensive way simply because of some surface obstruction. We are quite prepared to pay the market price and wish to treat owners fairly. If the railway has to go across a certain land, that land is acquired and the Government fixes a price for it.

Q. Subject to appeal?—*A.* The price is eventually fixed. At the present time we are sometimes blamed for not laying out our collieries properly. Government and railway collieries may be laid out properly,—they suffer from no such disability,—but we cannot. We have to make the best of a bad job and provide the freight for the railways.

Hon'ble Sir R. N. Mookerjee.—*Q.* There must be an appeal from the Commissioner's decision, otherwise he will not be acceptable?—*A.* I do not want to take advantage of anybody by that suggestion. I think legislation could be brought about, making it perfectly equitable for everybody. At the present time we get through after harassing delay, and endless expenditure though we probably do get a settlement eventually, surely these decisions could be come to without wasting all the money and the interminable time that is at present taken up.

President.—*Q.* I understand that the foundation of your proposal is that the development of the mining industry is as important in the public interests as the development of railways, and power should be acquired, in some way or other, to secure these title rights and simplify

them. You have a fixed belief that what is done on behalf of railways you ought to be able to do on behalf of mines?—A. Yes.

Q. That is really the fundamental principle of your proposal?—A. Yes.

Mr. C. E. Low.—Q. Supposing these rights are of the same importance and there ought to be the same facilities for mineral rights, does it follow that these mineral rights ought to pass through the possession of Government, that is, should the Government acquire them as they do in the case of railways. The actual title does not vest in the railways; the title is still with the Government?—A. I should prefer that.

Q. Section (g).—The register would correspond to the record-of-rights framed by the Revenue Settlement Department?—A. Yes.

Q. Has any record-of-rights been framed in any of the coal districts by the settlement parties?—A. Not yet complete.

Q. You do not know whether the settlement record-of-rights contains any record as to mineral rights, or whether there is any power to make such a record?—A. No.

Q. The general law, so far as I recollect, is that if, a certain entry has been attested before an officer, then the burden of proof lies on the other side to show that it is wrong. In some provinces, not in Bengal I think, it becomes indefeasible after a certain lapse of time?—A. Yes.

Q. Supposing it is impossible for the Government to accept the whole scheme it would be some good if you could have something of the same kind as exists at present, in respect of the record-of-rights for minerals?—A. It will be of very great assistance.

Q. I am assuming that the record-of-rights does not record any mineral rights.—A. It does not record mineral rights. As regards section (j), if the Government took over the minerals and protected all these owners it would more or less meet all cases.

Q. What I say is this, that when land is acquired for a railway that land is not acquired by the railway, but by the Government, and it remains the property of the Government although the railway have every right to use the land. The railway is for public purposes, but this mining is for private interests. There is one important qualification that exists in the case of railways, and that is that Government can refuse to acquire at all for the railway.—A. (No answer).

President.—Q. I should like to know whether the analogy is perfect, because what you call in mineral development the prospecting of coal, the railways call the survey of the land. How far are you going to push this proposal to acquire rights—to the mining stage or the prospecting license stage?—A. I would leave the settlement of terms to the original owner and the colliery or mine workers' own private efforts. When a settlement is effected, they can go to Government and say, 'We have come to terms and we want our terms registered, and will you register it now?' The Government can then take up the case, charging the colliery proprietor for that work, the original owner being assured that his title will be respected. Then the Government could turn round on the colliery proprietor and say, 'We have assisted you to this extent; now we shall see that you work the coal properly.'

Q. Will that be done to the prospecting stage or the mining stage?—A. At the commencement, before anything is done.

Q. Anybody can make his own arrangements?—A. Yes, and then go to Government for confirmation. Part of my proposals already exist in some districts. Government approve and register a Ghatwal's title in the Sonthal Pergunnahs. Until we get registration we are not allowed to do anything. The terms of agreement are settled between the Ghatwal and the buyers when they go to Government for registration. If Government think that they are proper and reasonable terms and the man has been safeguarded, the lease is registered.

Q. Is that registration of any value?—A. Yes. It is of considerable local value for the Ghatwal is not allowed to grant a lease beyond the period of his life unless the Government confirm the lease.

Q. There are cases on record, in my own knowledge of Burma, of owners of oil rights agreeing with the lessee to register on terms many times more than the actual consideration for transfer?—A. Yes.

Q. How is that going to be dealt with?—A. How do you do it in Burma? It does not apparently matter much as long as the terms do not ruin the title.

Q. It will have to be preceded by a Government investigation of rights?—A. Yes.

Q. Otherwise simple registration would be useless?—A. Quite so.

Mr. C. E. Low.—Q. In land acquisition cases the Government pays money into the court?—A. Land acquisition for industrial purposes may be the same as for railways as long as the original owner and the buyer come to terms. They can go with their lease to Government for registration when Government may enquire into the value of the original owner's title. After that, with the Government seal on it, the lease is of considerably more value to the mine owner than any lease at the present time can possibly be.

Q. If there is a dispute the money is paid into court and the parties settle among themselves?—A. Yes.

Hon'ble Sir R. N. Mookerjee.—Q. It is not a case of land acquisition where Government pays the money into the bank. Here it will be a case of everlasting royalty, and the Government cannot know how much the royalty will come to in the end?—A. If there is once a settlement made of the original purchase price the same will hold good in the case of royalty.

President.—Q. No mineral property can be determined in value in the same way as the surface property. Its value for the future is so uncertain that no figure could be put down as a fair and equitable consideration for the transfer?—A. (No answer.)

Mr. C. E. Low.—Q. Accepting entirely what the President says, you cannot accept as your basis a sum which the apparent owner is willing to accept, because it cannot be at all a fair one and there might be collusion?—A. I do not see where the collusion can take place. If an owner of property thinks that there is mineral below the property and he were to put it up for public auction, I step forward and say, "I am prepared to prospect your property and pay a cash sum down for the right of prospecting, and provided I find coal I am prepared to pay so much more down as salami and so much for royalty, and if I do not find coal, or do not think that the coal is worth the price that you fix, I merely lose my prospecting salami and retire."

Q. There may be cases where the sum might be too small and it might lead to collusion on his part?—A. There again the Government might step in to see whether the terms were equitable.

Mr. A. Chatterton.—Q. Would it be possible to establish a court by which the claimant of mineral rights can establish his claim to these minerals without reference to their value?—A. I think that is quite possible as a starting point.

SUBSEQUENT NOTE BY WITNESS.

I enclose for the benefit of the Commission, in case they have not seen the papers before, Blue books issued by His Majesty's Colonial Office in regard to the grant of concessions and Report on legislation governing the alienation of native lands in the Gold Coast Colony and Ashanti. The Rules therein might, with certain modifications, be made applicable in India; it is at any rate the nearest approach I have yet found to my requirements. They have been sent to me through the courtesy of a previously unknown correspondent after he had read the report of my written evidence before the Commission in the newspapers.

President.—Q. We have had at different times put before us this statement, that companies owned or managed by English firms sometimes refuse to register the transfer of shares to Indians. They sometimes also refuse to give Indians an opportunity of taking shares. Can you tell me, first of all, whether in any of the companies that you have floated here or managed, there has ever been any objection to inviting Indian subscribers? I take it from the second paragraph of your note that it is not so at present?—A. There has never been any such case to my knowledge. I am quite sure it does not exist.

Q. Do you know of any case of managing agents or the Board of Directors refusing to transfer shares to Indian buyers?—A. No.

Q. It has never happened?—A. No.

Q. Do you think that this practice is in any way prevalent in India?—A. I have never heard of it in Calcutta. I do not know what they do elsewhere.

Q. In the case of private companies, of course, it might happen?—A. Yes. It might be desirable for them to keep their interests in certain channels, but public companies never follow that practice.

Q. I know of a certain private company objecting to a Scotch subscriber of shares. You do not know of any case to your knowledge in connection with the Calcutta firms?—A. No. I have got here a list of all the companies with the names of shareholders, so far as we can get them from the register of shareholders. In our coal companies there are 1,551 Europeans and 405 Indians and 59 Armenians. You can say 1,600 Europeans and 400 Indians registered in coal companies. I should think there must be a much larger number than that, because the Indian buyer likes to hold his share on blank transfer and we have hundreds and hundreds of applications for dividends at the end of each half-year by the holders of shares on blank transfer. In the jute companies there are 2,471 Europeans and 423 Indians.

Q. Are those numbers of shares held or of shareholders?—A. Shareholders. In the case of coal companies the Europeans hold 97 lakhs of rupees and the Indians hold eight lakhs. I might say here that the Europeans include Messrs. Bird and Company and as we hold a very large interest in our concerns it makes the average European holding comparatively high. The partners of the firm hold almost two-thirds of the capital in some cases. In the case of jute companies, 148 lakhs of rupees are held by Europeans and 25 lakhs by Indians.

Dr. E. Hopkinson.—Q. Would you say that these figures that you have given are fairly typical?—A. Yes.

President.—Q. So far as your firm goes, there has not been any restriction of any kind as to who should take a share and to whom shares are to be transferred?—A. No. I am floating a company next week and I should think that at least one-sixth of the applicants are Indians and I would welcome a greater number.

Q. And so far as your general knowledge goes, you think that is the prevalent practice in Calcutta?—A. Yes.

Q. To your knowledge there has been no exception?—A. No exception to my knowledge.

Q. When a company is being floated I suppose you sometimes give a tip to your friends to ask whether they would like to come in?—A. We have Indian friends and European friends.

Q. And you do the same thing to your Indian friends?—A. Yes. I have two or three dozen names in my pocket book that always get the same information as the Europeans do.

Q. Have you been the Director of any bank in Calcutta?—A. Recently of the Bank of Bengal.

Q. We have been told that there are difficulties in the case of Indian industrial enterprise in obtaining accommodation from banks—not only difficulty in obtaining accommodation on the security of plant and machinery—but in one case we have been told definitely that there had been difficulty in accommodation being obtained for Indians on the security of stock, presumably saleable stock. Do you know, in the first instance, assuming that to be the case, whether that ever happened because the applicant was an Indian?—A. I have been director of the Bank of Bengal for only about a year but I have never heard of any suggestion of the sort. Each case is considered absolutely on its merits. Enquiries are made and I have seen a number of Europeans refused and probably there have been some Indian applicants refused accommodation. But I have also seen them accepted. In each case there is no question of preferential treatment. I have seen Europeans turned down for just the same reason as Indian applicants.

Q. You think that a statement of that kind is a hasty one?—A. I think that is the case. I do not say that a bank manager does not commit mistakes.

Q. I suppose it is possible that in the case of Europeans applications largely come from firm of standing?—A. Yes.

Q. And thereby your enquiry will be simplified as to the merits of the case?—A. Speaking for ourselves and the Bank of Bengal, we have to put up a second name under the Bank's Charter and naturally if we go to the bank at all with a suggestion, we back it with our own name, but the bank does not accept everything that we put before them simply because our name is on the paper. We try only to go to the bank with proposals which we know that they will accept.

Q. And therefore the percentage of rejection will be very small?—A. Yes.

Dr. E. Hopkinson.—Q. Difficulties may arise in the case of transfers of shares. How do usually meet them?—A. In matters of transfer we have simply carefully to carry out the law. If it is a case of difficulty as it is sometimes in the case of an Indian transferee, we try to make things as easy as possible. We try to smooth over the difficulties.

Q. You transfer the settlement of the difficulty into the other hand?—A. Sometimes under the law we are forced to do so, but we do not try to do that. In anything that comes before us, as I have said, we try to smooth over the difficulties. Some of the things we are asked to do are obviously impossible, whereby we should make ourselves seriously responsible.

Q. You do not attempt to test the validity?—A. As long as proper proof is brought to us that is all we want. Sometimes we get two claims and then care has to be exercised or we might be accused of taking sides.

Mr. A. Chatterton.—Q. You oppose the idea of Government giving financial aid to industries. We have had before us the evidence of a great many witnesses that Indian capitalists are shy and it would give a great deal of encouragement to Indian investors if the Government subscribed a portion of the capital to show their confidence in the *bonâ fides* of the undertakings and in the prospects. Do you think that it would be an objectionable procedure to advocate?—A. I think we should look round and see what has already been done without Government aid. A number of people would rather rush at Government for assistance simply because they had failed themselves. The Government is expected to do everything sometimes and that cannot go on indefinitely. It might be necessary in the case of a brand new industry to get a certain amount of assistance, but personally I should think that, provided people are able to show definite results or estimated results, they can get their capital.

Q. This would not be the permanent policy of the Government so much, but only temporarily for a few years in order to lead the people of the country to invest their capital in industrial enterprises?—A. I have said, "Many people, however, seemingly prefer to wait until scrip is dealt in on the Stock Exchange, that is, they join in after the scheme has been brought to fruition, or oftener still, they prefer to accept widely speculative rumours in the hope of getting rich quick." Talking of the Indian subscriber, he is likely to wait and see what the scheme is actually capable of doing before taking any risks—but I do not think there would be an appreciable increase in Indian subscribers simply because the Government took an interest in it.

Q. In your written evidence you say, "Money grants-in-aid, loans, supply of plant, are mere charities which end nowhere, and carry no incentive." Would you apply that to the development of minor and cottage industries?—A. No. I think that is a question entirely where co-operation comes in. I am talking entirely of major industries.

Q. I assume your remarks throughout are only applicable to major industries?—A. I have very little experience of cottage industries.

President.—Q. You say, "I have little knowledge of village or home industries and I see little value in promoting home industries which must compete on unequal terms with the large factory." You recognise there is a group of industries between the cottage and home

industries and what you would call major industries—a large number of small factories of the kind probably which your firm would not bother about—and they are necessary to fill in the gaps in the economic fabric?—A. I quite agree. I viewed that from too materialistic a standpoint and only from one point of view. There are, as you say, what we might call intermediate industries which perhaps need some attention. But I am afraid these intermediate factories are always subject sometime or other to competition from the big factory. The village weaver or the village oil mill cannot turn out the same regular quality or in quantity to meet the public demand. He might meet the demand of his immediate neighbourhood but he cannot compete, no matter how cheaply he values his own labour.

Q. I suppose it is fair to assume that anything like an industrial policy should not only take an account of the profits of larger concerns and the profits of smaller concerns, but also take into account the fact that a large number of people earn their livelihood from home industries. For instance, in the case of cottage weaving, I suppose five to six millions will be engaged and another ten millions dependent on them?—A. I should like to see artistic work assisted in every possible way because the old art of India is languishing.

Q. May we take it that you would qualify your statement under “financial aid” to the extent that you will say that some of these intermediate industries may be on their merits worth considering on the score of Government help, and for major factories you would not like Government help in the way of loans. You do not mention concessions of land but improved railway facilities?—A. Yes.

Dr. E. Hopkinson.—Q. Do you suggest on economic grounds that it is desirable to encourage the gradual transfer of cotton industry from home to mills?—A. No.

Q. You do suggest that in that paragraph?—A. I am afraid it is the natural process of evolution though it may not be desirable. I am one who believes in the small industry if it can be kept going.

Q. You would like to make a modification with regard to the cotton industry? Your opinion there is rather a sweeping one—the paragraph beginning with “I have little knowledge of village or home industries”?—A. Yes.

Mr. A. Chatterton.—Q. You say that “pioneer factories should only be started if public interest cannot be obtained.” Public interest may be obtained in many cases, but they may require a distinct support from Government—so much Government intervention at the outset that makes it desirable that Government should take up the matter in the first instance and carry out the work. For instance, you would agree in connection with the Forest Department, that it would be desirable that Government should start the distillation of wood or in connection with alkali industry it would be greatly influenced by the policy of the Government. Government might take such industries at first and work them out. The prospects of success under Government management would be much greater, and if such industries are desirable from the national point of view it would be better that Government should take them up and develop them to a certain point rather than they should be left to the chances of private enterprise. The importance of the industry in the first instance is so great that every possible care should be taken to make the pioneer industry successful?—A. As far as that is concerned, I think the chances of private enterprise would be just as great as those of Government enterprise. What we want is progress all round, and if the people are taught that they can go to Government for this or that, they will do nothing of their own accord. There has been a great wave of progressive development and keener ideas permeate everybody, and I do not think the same conditions existed 10 or 20 years ago. I think the business people of India are capable of seeing what is a good thing, as fast as anybody else.

President.—Q. My own experience has been that any mineral proposition that we have come across in the Geological Survey, if it proved on superficial investigation to be promising, we have been able to put before the commercial community. Am I suggesting to you too much if I say that, supposing we did reform the Government demonstration machinery to such an extent that we had departments capable of dealing with the scientific and chemical aspects of the problem, these departments would be able to find in the commercial community people always ready to take up projects?—A. I think so.

Q. That is the point you want to impress on us, when you think that it could not be better done by Government enterprise?—A. I do not think it could be better done. Government would have unlimited funds, and they could go to any degree of capital expenditure that they might deem necessary. Whether they would make a commercial return on capital is quite a different matter; and I think a private promoter would be best able to judge of it from that point of view.

Q. There are exceptions to this, because in the beginning of your evidence you said that in the matter of coal distillation Government should take it up?—A. It referred to matters of economic and military value. The economic value of coal distillation to this country is so enormous. It is being recognised in England to-day, but in this country we have not got much coal and we must conserve it in every possible way. Some of it is good, but most of it is very indifferent and we must not go only for the best and leave the indifferent to our successors, say, a hundred years hence. I hold that we must now look at coal distillation as a national matter. It is not merely an industrial question, but a far greater thing, and there are one or two probably other similar instances where I should like to see Government combine with public enterprise.

Q. The Government at home are at present working under war conditions?—A. Yes, and I think they will continue.

Mr. A. Chatterton.—Q. It is not a fact that in the development of many of the new industries the original promoters or pioneers suffer heavily?—A. Yes.

Q. And that acts as a considerable deterrent to people coming forward to deal with new schemes?—A. I think the pioneer is rather apt to be careless. He has got all the ideas and all the imagination and his scheme is probably very sound, but he lacks something of the business brain when starting his work. I saw a big sugar industry started in this country. Three-fourths of a million sterling were spent in trying to bring it to fruition. Within seven days of arrival in this country I represented to directors in London before 150 thousand pounds had been spent that the whole thing was commercially impossible. Had they stopped then and carried out the suggestions that I made, 750,000 pounds would never have been wasted. This mistake has been avoided by successors and they are perfectly successful to-day. Initially they made commercial mistakes. There was nothing wrong with their machinery. I really think that if we are to wait on Government to do everything in the shape of pioneer work there are other things to be done and waiting to be done, and we must educate the people to be more courageous.

Q. Is it not suggested that you should wait for Government to take up a certain pioneer industry, but certain pioneer industries are necessary because commercial enterprise as it at present exists is too slow to take them up. There are certain industries, take, for instance, the alkali industry, which if established in this country might lead to other industries on a very extensive scale?—A. Of course, Government could start as you say the alkali industry, but if the alkali industry shows a fairly certain good return on capital, and demand exists for the products of manufacture, I cannot understand why there should be any difficulty in enlisting the public support that is necessary. Speaking for myself, in my own firm schemes are brought to us and many of them are thoroughly good, and I shall be only too pleased to push them on; but we have not got men at the present time; but later on we hope we shall be more happily situated and may be able to take up some of them. Within the last two weeks there have been two schemes placed before us which are sound commercial concerns, but they would take at least eighteen months to develop even if no war existed. But I am only speaking for myself. There are a lot of other firms besides my own that would be equally capable of tackling any commercial possibilities. On the other side of India we have got only to look at the Tatas.

Q. In your note you refer to the official organisation that is necessary to be created to carry on the industrial development of the country and to deal with industrial and commercial matters. In speaking of the Director of Industries you say "it is a relatively paltry affair at present, but could be and should be made one of the most important posts in each province." I should like to ask you whether you would favour the appointment of a Development Commissioner in each province, controlling not merely what has been brought before us as part of the functions of the Director of Industries, but also dealing with agriculture, trade, forests, fisheries and inspection of factories, and also acting as an adviser to Government in matters relating to railways, harbours and questions of transport generally. Would you like that an officer of this type should be created?—A. Yes; further on I speak of the possibility of a permanent committee on railways. There are so many interests involved in railways that I should like, in each province if necessary, a transport committee to discuss the necessities of the different trades and industries and the requirements of the public, because we do not seem to work on any definite forward policy but work more or less hand-to-mouth. I think a Ministry of Commerce for each province with a far-reaching organisation is vital, the Imperial Commerce and Industry Department being posted with all the results. I think your suggestion is more or less what I had in view.

Q. Do you think that the appointment of a Director of Industries, such as you find in the United Provinces, Madras and the Central Provinces, is not sufficient?—A. They do not go far enough. I think they are very important, but I think they can go very much further.

Q. The question has been raised whether industrial schools should be placed under these officers and also whether higher technical education should come under them. These are comparatively minor matters, in your view, in comparison with the larger functions which you would like them to deal with?—A. Yes. I have not sufficient experience of the working of the Government departments to try and make too strong a recommendation on the subject of education. Education up to a certain point naturally is a departmental concern. When it comes to technology you are approaching commerce and industry in different ways. To ask one department to deal with one system of education and a different department to deal with the finishing schemes as it were means, I am afraid, dual control and might lead to a state of chaos.

Q. There is another point that has been raised in this connection, and that is whether a Director of Industries should be assisted either by an Advisory Council or put under the control of a Board of Industries. I should like to know what your views are on the point?—A. The system of co-operation in the working of the department, in other words, —I presume you mean to bring outside opinion to bear?

Q. Do you think that an honorary Board of that kind would be of real assistance in pushing forward the development of industrial matters in the presidency?—A. I do not think so.

I think that the Government can always call for necessary advice from industrial people without making any permanent honorary Board.

Q. Do you think it would be any advantage if the Board was not honorary, but one like the Harbour Trust Board, etc.?—*A.* I do not see any benefit therefrom.

Q. You prefer to leave the Director of Industries unfettered?—*A.* Yes. I think the less brake power you put on a man of that description the better. Let him use his imagination and then of course you will have certain control by Government, and if Government want advice on certain proposals, it will always be got by merely asking for it.

Q. Do you think that if the Director of Industries is so appointed, he would be sufficiently in touch with the requirements of the commercial and industrial world?—*A.* I think so. If the Ministry of Commerce and Industry is properly constituted, the whole working together might provide all that is necessary.

Q. You have not considered the question of the development of these minor industries, but you state that the Presidency Banks might take a greater share in the coming industrial expansion of the country, and you say that their Charters might be altered so as to allow them to undertake more business?—*A.* Yes. At the present time they are forced under the Charter to take certain forms of security, and also, a second security or name. At times that might be unnecessary. A separate department of the bank might be formed to deal with industrial matters and to keep the bank informed of the value of progress in industrial affairs. The bank is at present limited entirely to the promoter who states his case but the bank has little or no means of verifying it beyond the credit of the man that brings the proposal.

Q. Would you advocate the extension of their powers of doing business?—*A.* With due safeguards.

Q. What sort of safeguards would you consider necessary? A competent board of industrially and technically qualified men to advise on some of these points?—*A.* The banks always labour under a disadvantage in that they have not got their own technical experience and knowledge to advise on the technical value and possibilities. For instance, we might lend money against a mill which may be constructed wrongly, or it may have machinery which is entirely unsuited to the trade. They have to ask for a second security in every case now. I fancy this could be done without if the bank knew what the original security was really worth.

Q. Would you allow the Presidency Banks to have access to the London money market?—I think they could get in this country all the money they want. I do not think that you need go to London for capital.

Q. You state lower down that instances have come to your notice of Government competition with private enterprise which have caused bitter resentment. Can you give us confidentially or otherwise any examples of this? I presume you are not speaking of jail competition?—*A.* No. We have started building and have spent about a quarter of a million sterling on a coke oven and bye-product plant in connection with our collieries, using the waste gases for generating electric power. We are going to sell our coke in the open market and it is a distinct risk that we are taking. We have no railway facilities that can be depended upon, but in order to be progressive and to make the most of our material we have taken this step. We had not been started more than a month when we found the East Indian Railway selling their coke in the open market at considerably below current prices. The East Indian Railway have a large output of dust coal from their collieries and it was up to them when they started these collieries to provide ways and means of disposing of their dust coal within their own boundary and not come into the open market and sell coke in competition with people who provide their own funds to construct their plant. That is one of the most serious points. I discussed the matter at the India Office when I was there last year and they were forced to admit that I had a case. We are putting up an expensive plant and in order to show a return on the capital we have got to get a certain price for our coke. I do not know what the East Indian Railway are doing to-day, but they were recently selling coke at a price which was below ours.

Q. You do not want any competition?—*A.* Not from Government concerns, especially from the railways who get all their money from the public who are providing them with the traffic.

Q. Do you know the quantity of coke they were offering?—*A.* I think they were offering 2,000 or 3,000 tons a month on the market. I am speaking of coke. Naturally when they ask us to proceed with the progressive development of our collieries, which has been thrown in our face for a good many years, this sort of thing is a serious disability and it would break the hearts of most people. In the same way our collieries were blamed because we did not put up screening plant and modern methods of loading. My firm has spent something like Rs. 1,00,000 on that form of plant and we might as well have thrown the money into the sea. We have to wait for waggons. The railway and Government collieries do not wait for waggons.

Q. They have preference?—*A.* They have their own railway.

President.—*Q.* They do not sell their coal?—*A.* They are selling dust coal.

Q. They do not sell their coal in the big market?—*A.* No.

Q. They produce automatically a small amount of small coal. How would you make them dispose of it?—*A.* When they went in for collieries, their collieries were there for the purpose

of supplying the railways. When we start a coke oven plant we have got to find markets for everything, not only for coke, but bye-products and everything else. When the railways started it was on the definite assurance that it was for railway purposes; they ought to have provided for the whole output.

Q. They are pioneers in the matter of bye-products?—A. Had the colliery proprietor not been fighting over the waggon question for the last twenty years the question of progressive development would have been easy.

Q. As regards the question of small coal, could they dispose of their thirty thousand or forty thousand tons of small coal within the railway administration?—A. They have got the railway workshops.

Q. You think they are actually cutting the prices in the open market?—A. Yes.

Q. You do not object if they do not cut the price?—A. If they come to the open market and reduce the demand they are bound to cut the price.

Q. They must dispose of their coal economically in some way. How can they dispose of that coal without being unfair to the rest of you?—A. They could have experimented with soft coke which, I think, could be utilised to a far greater extent, in short utilized these organizations to carry out experiments. They have gone in for the bye-product coke oven, but I think they might have gone a bit further. They are working with the public money when they start all these collieries.

Q. I should like to know how they can go on to the market without cutting the price against you? The stuff must be disposed of?—A. I think they could have made a much greater use of the stuff in their own concerns. I think they ought to make coke for their own requirements, but I understand that it is not being used by their workshops.

Q. If it is not used but if they want coke, they should buy coke from outside?—A. To come into the open market is a totally unfair form of competition. We have to get rid of our dust as best we can,—it would cost them a little more to briquette it. They have got bye-products ovens erected with public money to keep them going. The point is this. We are blamed for not being progressive, and what chance is there of our being progressive? It is a serious matter to firms like ourselves, for we are interested in the railway question too to a degree which does not strike some people. We give the railways over two million tons of freight each year.

Q. How many ton miles?—A. I do not know. It cannot be less than a 150-mile lead. The tonnage handled is largely jute, coal and stone.

Q. You know their bye-product system has enabled them to reduce the cost of their coal from Rs. 1-15-0 to Rs. 1-11-0 a ton, and that four annas has gone into the railway revenue and if the railway is administered properly it will reflect afterwards to the benefit of the people in reduced rates?—A. We have had railway rates increased just recently.

The Commission adjourned at this point and resumed after an interval.

President.—Q. About this question of purchase of coal on behalf of railway companies you don't state clearly what the figure of 60 per cent. represents?—A. It should be fifty per cent. and not sixty per cent. That alteration has to be made.

Q. Fifty per cent. of what?—A. Of the total output.

Q. It cannot be fifty per cent. because the railways in India do not consume more than 30 per cent. of the total output of India?—A. But you must also add the Ceylon and Royal Indian Marine, the firm of Mackinnon Mackenzie, the British India Steam Navigation Company and two or three private consumers in Colombo.

Q. Is that only under war conditions?—A. No. I do not think so.

Q. In pre-war times the Mining Engineer of the Railway Board did not buy for Mackinnon Mackenzie?—A. Yes, he has done so, and gets something per ton. I do not know what it amounts to. It gives him a tremendous control. He knows what the consumption is. It gives him a tremendous handle.

Q. In pre-war times it was purchased on behalf of what?—A. The British India Steam Navigation Company. There are several private consumers besides. I think the fault does not lie so much with the system. The original system, I think, was sound. I was one of the first to whom the suggestion was made. I fell in with it when it started. I think the system was businesslike but the fault is that it was overdone. It went too far.

Q. You think there should have been some check?—A. The idea was sound. But Government, in trying to buy their coal cheaply for the railways, have carried the thing too far and consequently I am sure that it has restricted development work, particularly in the small collieries the proprietors of which see Government buying a restricted quantity of coal, for after the railway requirements are satisfied he has to depend on the public consumer. Being a small man he has not the power to organise, to go round and sell his coal and find markets for it. He therefore shuts down. That was a great mistake in my opinion and will affect the output. I think the present position is largely due to the fact that the Government tries to cut their coal purchase too fine in quantity and price.

Q. What proposal would you make to meet that difficulty?—*A.* I would leave it entirely to the State railway requirements and leave the other railways to purchase their requirements separately, and let private consumers who want to make use of assistance of that sort pay for it outside. I dare say there are people in Calcutta who are quite prepared to carry out the duties and I do not think that public money should be used for the purpose.

Q. You would limit them to the three State railways?—*A.* Yes.

Q. In regard to the other railways you say that they should have their own buyer?—*A.* Let them combine too if they like, or have their own buyers. That would certainly be an advantage. I think there should be competition in the selling of coal. In fairness to the purchaser there ought to be competition. Otherwise consumers would have to combine. I speak as a consumer using 200,000 tons yearly.

Q. Does the Mining Engineer buy for the Oudh and Rohilkhand Railway?—*A.* He buys for all railways. And the East Indian Railway are also working in combination. I do not know what exactly their arrangements are. Sometimes he is buying and sometimes not buying.

Q. Are you sure about the 50 per cent.?—*A.* That is what it works out to.

Q. My information is that 30 per cent. of the output goes to all the railways altogether?—*A.* Yes.

Q. And among the railways you say that the East Indian and the Bengal Nagpur Railways are not included?—*A.* The East Indian Railway raises a good deal of their own consumption. When you consider the present war requirements it is very great and has brought about a new position. I think it would naturally be restricted after the war. I think that the idea by itself is perfectly sound, but the policy has been overdone.

Q. It has developed into a monopoly?—*A.* A firm control especially when you consider the proportion of the total output of what is first class coal. Out of the fifteen million tons raised there is but a small proportion that can be considered first class coal and as the railways practically limit themselves to that quality it means that there is a considerable leverage in favour of Government.

Q. You mean by the 50 per cent. under war conditions?—*A.* Naturally.

Q. Even in peace times, that is in pre-war times, the control has not been so great as to be a danger to the public?—*A.* Yes. It is a danger to the public also in a way because free and unrestricted trade is better than anything of this sort.

Q. Would you think it suitable if the Government had a department or an individual with suitable assistance to control the quality of coal and not to make a commercial bargain?—*A.* I would not object to that. I think Government are at liberty to purchase their coal as well as they can. But I do not think they should make use of the department to assist the railways all round and large private consumers as well.

Q. Then you would be prepared to consider the two propositions, namely,—(1) that you limit the activity of the Mining Engineer of the Railway Board to purchasing of coal on behalf of State railways and (2) that you allow the Mining Engineer to check the quality of coal supply to all or any railways and to have nothing whatever to do with the making of contracts?—*A.* Yes. I am quite prepared to accept that.

Q. Which of the two propositions do you prefer. Those are the two propositions which naturally arise?—*A.* I would limit him to the purchase of coal for State railways and would allow him to inspect the coal for the other railways. I would cut out the private consumer entirely.

Q. I may then take it from you that instead of the present system you are in favour of making the Mining Engineer of the Railway Board responsible for the purchase of coal for the three State railways and that he would also be a court of reference in the matter of quality for any railway or any Government department and also to any private purchaser who may wish a certificate of quality?—*A.* I think the private consumer may well look after himself.

Mr. A. Chatterton.—*Q.* In your written evidence you say that "a vigilant watch should be kept for all forms of possible competition by the trade representatives to be attached to British Consulates and that they should speedily warn manufacturers against the risks of unfair commercial methods, alternative cheaper, inferior or superior values, patterns and designs and generally competition from without." In what way would you deal with reports received from these officers. Would it be desirable to institute some system of confidential reports which will not be issued to the public but only to firms and people who are interested in the matter?—*A.* It will be better if an arrangement of the sort can be made. I think that the information should first be made available to the British commercial firms at any rate.

Q. You would not advocate the publication of a trade journal and inviting all people to read it?—*A.* Of course it is not every piece of information obtainable in consular reports that is really of much value, but information which would be valuable in connection with any specific trade might be circulated to members of that trade both in Britain and India and also in any other of the dominions first, and steps ought to be taken to help to combat the trouble if any trouble is reported.

Q. How would you propose to work this?—*A.* Would you make individual firms who wish to get confidential information of this kind pay something like an annual subscription

on the understanding that they do not communicate this information to the public?—*A.* Yes. I think so, and these firms should be British firms entirely.

Dr. E. Hopkinson.—*Q.* Do you agree to this proposition that the exchange banks in particular, and to some extent the Presidency Banks, now provide all the financial assistance necessary both for the export and the import trade of India?—*A.* Yes. They do except in a few instances of little importance, and these are probably due to circumstances beyond their control. So far I think the banks have met all our requirements.

Q. You think they act even more liberally than the British banks?—*A.* I had no experience with the British banks for many years and I have not seen much of the British banks, but only speak from hearsay.

Q. You, as an export and import merchant, have nothing whatever to suggest in regard to the financing of export and import trade?—*A.* The present facilities seem to meet our views except perhaps, just at the present moment due to the war. But that is outside our discussion at present.

Q. We shall now come to the internal industrial trades of India. I think your view is that they are not at present provided for as regards finance?—*A.* It is not so much a matter of capital, but when we want a little extra money for expansion and in that respect the Presidency Banks are perhaps at a disadvantage though probably I have less bother on that score than some of the smaller firms or companies which have no managing agents. We put our assets into the scale when money is wanted.

Q. But the Presidency Banks will not lend money on the security of the plant or building?—*A.* They do, but they require a second signature at all times.

Q. And the exchange banks will not do so?—*A.* Yes, at times.

Q. How far is that ground covered by the Indian banks?—*A.* The Indian banks cover it fairly well, banks like the Allahabad and the Alliance. I have not had a great deal of experience of that sort of assistance. I cannot say I could give really valuable suggestions on the subject.

Q. Have any instances come before you although not personally?—*A.* I cannot think of any at the moment, not where there has been a disability at any rate.

Q. I was told that one bank provided for all the requirements of the tea planters on the security of the crop. Is that confined entirely to the tea crop?—*A.* No. We get advances on the sugar crop also.

President.—*Q.* On your firm's responsibility?—*A.* On the crop and the output.

Q. Is there any collateral security?—*A.* We are sometimes asked to provide our name also.

Dr. E. Hopkinson.—*Q.* It is a very different proposition then?—*A.* Somebody has generally got to give a second name.

Q. I was told it was not the case?—*A.* It probably depends largely on the original security.

Q. The security was only the crop?—*A.* So far as we are concerned we are prepared to give a second security. I have not come across the case that you refer to. We are not interested in tea of course. Take for instance the question of the jute crop when we buy our supplies of jute. I suppose our demands on that crop alone must be at least five or six millions sterling a year. Our name is generally at the back of the whole thing always in the case of the Presidency Banks; as security there is the crop and subject to the debentures the mill.

Sir F. H. Stewart.—*Q.* There are three securities, the mill, the company and yourself?—*A.* The mill subject to debentures.

Q. And then there is the crop?—*A.* In the case of the debentures it happens very often that you cannot give any security beyond the debenture. The bank at least would not take it.

Dr. E. Hopkinson.—*Q.* Any bank will advance on your name and the crop?—*A.* But some banks will advance money on collieries for instance where there is no stock.

Q. And where there is no name?—*A.* Sometimes. I do not say that they have done it always without the name. There is little trouble in getting any necessary advance in reason.

Q. What class of bank will it be?—*A.* The local banks, the country banks chiefly.

Q. Do you mind telling us whether your firm and the companies for which you act as managing agents deal for the most part with one bank?—*A.* We deal with several banks. Our main private account is kept with one bank but several banks keep the separate companies' moneys.

Q. So that the question of loans arises between you and a number of banks?—*A.* Yes.

Q. You seem to have a decided horror of Government advancing money to industries. But do you not think that is an extreme view to take? Do you not think that where an industry is sound and development has been retarded simply for lack of capital then Government might step in and help?—*A.* Well. If there are the disabilities in this country that you speak of Government might step in. But in the case of any ordinary industry I do not see why Government should advance money when private enterprise is sufficiently enterprising to go on with it. If you get Government to help one concern it means that everybody else would want the same thing. It will only end in a series of endless and harassing questions. Suppose a man has a jute proposition. He will expect the same assistance as a man who has already had assistance in coal.

Q. I have in mind two particular instances in which Government has provided the capital required. The first was for the construction of the "Mauritania" and "Lusitania." In this case the vessels would not have been constructed unless the company had had Government assistance?—**A.** That was a question which was of more or less national importance. The British Government of that day wanted the supremacy of the Atlantic to be maintained and they wanted two fast vessels constructed that could hold their own with any foreign vessel. That is scarcely applicable to industries.

Q. Take again the case of the British Dyes, Limited. What have you to say to the assistance given in this case?—**A.** That was a situation engendered by reason of what I consider to be the mistaken policy of the past. In this case the action was vital in the interests of the nation. If the British Government had issued a statement that they were going to protect the British dyer or the British manufacturer from the German dye concerns they would have got the whole of the money without any Government participation at all.

Q. Exactly so. That is the very point which I am trying to get out from you. For reasons either good or bad the Government were not prepared to give any assurance, and so they had to take to the other alternative of providing the capital?—**A.** That is a very expensive way of going about it and not I think the most efficient or cheapest way.

Q. I shall now put to you what is a purely Indian proposition. Assume that sulphate of ammonia is required for Indian agriculture. Might not Government properly provide capital for making this available?—**A.** I have suggested something that would apply to this case this morning in the matter of low temperature distillation.

Q. You agree that Government might properly provide capital.—**A.** Quite so. If public money is not available.

President.—Q. In this connection am I correct in recollecting what I think has been my experience in India. As you said to-day Government departments and the technical departments are not sufficient to meet the many problems that have arisen in the country. Successful business people engaged in one particular line cannot be expected to take up the many little things that ought to be developed; they are too small for them to bother about, because you are making profits on a large scale in big things. What can be done to develop these little things? There are some links among them. You cannot say that they are of national importance. For instance take the question of fertilisers. There are so many little things like that which can be fitted into a big machine and we could not get any firm to take it up, because it is too small. In a case of that kind would Government be justified in stepping in and fostering the industry?—**A.** That may be said of a few years ago. Now we have grown in years and in wisdom. I do not think any firm will now turn down a proposition of this sort quickly.

Q. In cases where the prize is big you will be prepared to accept a certain number of uncertainties but where obviously the prize is small you would not be so willing?—**A.** I think we also are considerably undermanned. What I have said about the Government departments is more or less applicable to firms. We have often not had the staff to deal with it. Personally I find the same thing in the case of my own firm. We have always tried to go along the line of least resistance and tackle the simple trades which did not want any scientific assistance. I think that some of us have now begun to see the force of this and wakened to the situation. My firm are now trying to equip themselves with five or six geologists and a chemical laboratory, and we shall take the scientific man as well as the commercial man in the office. If we are to go into subjects in which chemical knowledge is required we must provide the staff for the purpose. There are a number of firms in Calcutta now who have seen where possibilities lie and I think there is not now the same difficulty in getting people to take up things as was formerly the case. We are all waking up and people are trying to handle industries which ten years ago none of us would have even dreamt of.

Q. So far I admit your point but I am not convinced at present that things are so rosy as you suggest. I also wish it were possible for some of the firms to go in for scientific and technical assistance in order to cover these small grounds. For instance bye-product recovery is one. I tried to persuade the Calcutta firms to take it up. They all met me with the answer that the capital outlay is fairly big and that the returns are obviously small and that there are uncertainties of which they cannot judge because of the want of technical assistance?—**A.** We are gaining strength and gaining confidence which a few years ago we did not have. People now talk glibly of suggestions. When I first came to Calcutta and when first I saw the Bengal coal-field the suggestion that at once came to my mind was bye-product recovery. We were then short of capital and the public confidence that was necessary. We are only just getting to it now and I think the time is coming all round. We cannot run before we have learnt to walk. By rushing in a lot of Government aided industries it might bring about industrial speculation where every man would imagine himself an industrialist and there would be more harm than good done.

Dr. E. Hopkinson.—Q. You object to Government assistance because of the dual control which it would involve and you later recommend that where Government assistance is given Government should be represented by one or more directors. Do you contemplate dual control?—**A.** In cases where the matter proves to be one of national interest and where Government should rightly take a hand, I simply made the suggestion that there should be some means whereby Government may be represented in the Board.

Q. Supposing Government assistance went much further than you contemplate and that it was given to many nascent industries, I take it that you would consider it necessary that the interests of Government should be adequately protected?—A. Yes.

Q. It is not merely sufficient to have a Government auditor?—A. No.

Q. In the second paragraph you make some allusion to the stock exchange. Do you consider that Indian commercial undertakings suffer a disadvantage from the fact that the so-called stock exchanges in Calcutta and Bombay have not the recognised position and authority which the stock exchanges in the United Kingdom have?—A. I think so. I think they suffer a distinct disability.

Q. Would the business in Calcutta and in Bombay be sufficient to warrant the institution of a stock exchange such as that in London?—A. I think there must be a beginning and certainly I think a strong stock exchange would prevent these extraordinary periods of violent fluctuation and speculation. It is totally wrong to find a jute mill share rising as it has recently risen from 290 to 780 in about ten weeks, the intrinsic position of the industry not having changed an iota in the period.

Q. How is the list of quotations which is published in the daily papers prepared. Where do they come from?—A. I do not know exactly how it is prepared. I am not a member and I have not been in the stock exchange. I have never asked how it is prepared. I understand dealings are registered or reported.

Q. But the stock exchange is merely a voluntary association and nothing more?—A. Yes.

President.—Q. Paper reports vary considerably from day to day?—A. Paper reports are provided by separate brokers and separate brokers have their own lists. Sometimes they may be sent to the papers at 2 o'clock, others at 6, and considerable variations can take place in that time.

Q. Not merely that. At one time you see a long list and at another only a short one. I suppose it is due to variations in the methods of the journalist?—A. I understand the papers get it all from the brokers. There is no official list.

Q. The newspapers obtained their quotations from private firms?—A. Yes. The list usually has their name at the bottom. They generally refuse to give the list to any papers that do not give their names. Good firms, I think, insist on their names being published.

Dr. E. Hopkinson.—Q. Does the broker pay for the list or the newspaper?—A. I am not able to say what the arrangement is between broker and newspaper.

Q. We know that at home a quotation granted to a particular company, although it is no absolute guarantee of financial soundness, is still a guarantee to some extent?—Does anything of that kind obtain in India?—A. No.

Q. Can you suggest any methods by which stock exchanges might be established in this country on the lines of those in England?—A. I think that much could be done, but it is difficult to make useful suggestions towards any improvement; to put the stock exchange on anything like European lines would involve heavy subscriptions which the majority of the brokers who frequent the market here cannot afford to pay. At present transactions which have to be recognised take place regularly outside stock exchange limits. There is no stock exchange stamp or seal.

Q. The smaller people depend on the outside broker?—A. Exactly though there is some limit to trafficking in shares, and I believe the outside broker is not recognised when it comes to a question of dispute between outside or inside. It would be better if there were fewer brokers and one of the great disabilities here is that the broker often trades and speculates on his own account. There is little or no check on him.

President.—Q. Have you got anything to tell us what we can do to remedy this state of things?—A. I think a recommendation from this Commission might be useful. That would draw public attention to the fact.

Dr. E. Hopkinson.—Q. In your note under 'Technical aid' you say, "We scarcely need to talk of extensive research work in India yet, for Britain herself has scarcely more than commenced to give the matter attention. Most of our scientists come out young with only a smattering of training and are grafted and absorbed into a country where the demands on their time and work is so great as to prevent methodical enquiry into the multifarious subjects which they are asked to deal with." I agree that they come out young but that is not a disadvantage. But I cannot agree that they have only a smattering of training. During the last three months I have met many scientific men of the highest possible attainments?—A. I am speaking of the training of a man who comes out at the age of 23 or 24 to take up the post of an engineer. What breadth of training or experience could he possibly have; yet he is at once expected to carry on important work on which the Government have probably to base the whole of their policy of expenditure. That is where danger comes in. The same man after ten years in the country may alter his views entirely. I do not say that we have not got good men, but they are often overloaded with work.

Q. Is not then the whole point of your note that the amount of research work to be done is so great that the men are so few and that they are overloaded with other work?—A. Yes. I think that when a man comes out here it is impossible to have anything more than a very inadequate training and the experience that the man gets afterwards is all the result of the experience that he gets in the country.

Q. The way you put it here is not quite the same thing. Would you like to alter that?
—A. I can alter that.

Q. Do you not think then that the amount of work to be done in India and the fact that the scientific men are overloaded with work makes the strengthening of the scientific departments of Government, one of the most important matters that the Industrial Commission have to deal with?—A. I quite agree. I think that the scientific departments of Government want strengthening badly.

President.—Q. Would you not like to modify the way in which you have put the first sentence of that paragraph. Instead of saying that "we need scarcely talk of extensive research work in India" would you not rather say that we "ought to begin at once extensive research work in India"?—A. Well. I think the way in which Dr. Hopkinson has put it certainly forces me to modify my views as I have expressed them. But I may say that I was thinking more or less of higher research and not ordinary laboratory work.

Q. I know of several cases in which the laboratory has gone as far as it ought to go and the subject has dropped because there has been no translation of the result on an industrial scale and there are any number of problems to be solved. We have seen it in the Geological, Agricultural and Forest Departments. We have got laboratory results waiting to be translated into research work on an industrial and commercial scale. It is simply crying out for the next stage?—A. That is the practical side of it. I quite agree with you there. I may tell you as regards my own firm that we have so many schemes that if we had only the staff we could float a company every week.

Dr. E. Hopkinson.—Q. You mean that given adequate results and means you would be able to float a company once a week?—A. I refer to some of the schemes that are brought to us. I could name half a dozen straight away. They are perfectly sound. But we have not got the men at the present time.

Witness here gave confidential evidence.

Q. In what exactly have the Forest Department given you assistance?—A. By pointing out the timbers that they considered most suitable and by supporting our proposals for obtaining the timber on more equitable royalty terms. Previously the royalty rates were so high that it only paid us to take the timber nearest to the lines of communication. By reason of the reduction we hope to go much further afield, we have also a lease for a longest period so we know where we are. Previously leases were short and the royalties were high.

President.—Q. May we take that as an illustration of what the Forest Department can and ought generally to do in a case of this kind and not as a complaint?—A. It is not a complaint. Dr. Hopkinson asked me to give particulars of the work that we have started.

Q. This is a good illustration?—A. This is a good illustration of the point where the scientific department of Government have brought it to a point where the industrial people are able to pick up the thing and carry on.

Dr. E. Hopkinson.—Q. So you have got from the Forest Department all that you can expect reasonably and the advice has been competent?—A. The advice has been competent. I have made certain notes on the subject.

President.—Q. We should like to see them confidentially. We have heard several complaints against the Forest Department and this is a case in which it has been turned to account?—A. So far as we are concerned we have, I think, got the assistance that it lies in the power of the department to give.

Dr. E. Hopkinson.—Q. Another point raised in your note is the one relating to the fire-clay works. It is a highly scientific industry and I want to know how you got your scientific advice in the matter?—A. The man whom we have employed as manager is a man with a practical knowledge of clay work of all descriptions. He has not got the scientific knowledge and that is what we lack at present, but the scientific man whom we have engaged will start, I hope, at the beginning of next month. We have found our weakness when dealing with the scientific side. So far as purely scientific work is concerned we have to depend on the Alipore Government Research Department or some of the private analytical chemists locally, but they can only give us purely analytical results which is not sufficient. We wish to carry the subject further with our own laboratory.

Q. You say that Government departments often put contractors to unnecessary expenditure in the preparation of costly plans? Have you any cases in mind?—A. We had a case last year on the Bombay side. We were approached by the Government to quote for a large ropeway 19 miles long. After considerable trouble we put up a scheme. We then prepared elaborate alternative designs and estimates including cost of working. It took something like three months. And included details of the excavation, repairs, and renewals, running cost, supervision, etc. This started in March 1914. Our man went over to Bombay and stayed three months surveying the line and drawing up the specification. It was duly completed approved, but in the meantime the war had broken out and there was delay in getting it approved. It had to go to one superior officer after another and on to the Finance Department of the Government of Bombay. It came back with a request for cheaper designs, again estimates and specifications were prepared and the business went to and fro until January 1915. After being sanctioned by Bombay it was found that the cost had to be agreed to by the Government of India.

who approved but they in turn referred it to the Chief Engineer of the Government of India. Meanwhile the price of material rose and the estimate increased until finally the Government of India in the Finance Department considered that the matter had to go to the Secretary of State. It costs us something like 800 pounds and we have heard nothing more about it from that day to this.

Q. Have you any suggestions to remedy that defect?—A. I think that as the whole of that information will be wanted some day or other, after putting the firm to a fair amount of trouble the Government might at least have paid the out-of-pocket expenses.

President.—Q. Is it your opinion that cases of this kind should be chargeable to public funds?—A. I think the out-of-pocket cost at any rate might have been paid.

Dr. E. Hopkinson.—Q. Apart from that particular aspect of the question I want to ask you whether in your opinion it would be better for Government purchases of plant which must be made in England to be negotiated through the agent or the representative of the British firm here or should they pass from the Government of India through the India Office and either the Stores Department or the Consulting Engineer?—A. That is a very broad question. There are as many cases where the reply would be in the affirmative as the reverse. When at home recently I had an opportunity of visiting the India Office Stores Department and discussed many questions with them. I think that Government might go a long way towards assisting firms in this country to carry stocks of material on behalf of the firms at home. This, I think, would be better than the long tiresome process of purchasing every petty item through the India Office. Local competition would be a check on prices. I think it would pay Government to induce the local firms to carry stocks.

Q. On the assurance that Government would give their orders?—A. Quite so.

Q. Are not agents here much more likely to know the actual requirements of any particular case than can be conveyed to the manufacturer through the Stores Department and the Consulting Engineer?—A. Personally that is my view. That is what naturally strikes me. If the firms had a competent agent here it might be conducive of considerable benefit both to manufacturers and to Government departments.

Q. In the case of your enterprises would you prefer to consult the agent here or would you prefer to correspond direct with the matter?—A. We purchase our electrical machinery from the local representatives of the firms. Had we consulted an engineer in England we would not, I think, have been able to do it so well.

President.—Q. At present the Indian Government is maintaining in England a big staff for the purpose of purchases. It is efficient but it is also expensive. Am I correct in assuming that in your opinion the present order should be reversed, that a Government Stores Department in this country should supersede the Stores Department of the India Office, that India is now in a position with its industrial development and commercial representatives here to be ready to undertake home rule in the matter of purchasing stores?—A. I think the answer is in the affirmative to a large degree. The Stores Department in England should be superseded to the extent that if it is not possible to get the stuff here then they may go home.

Q. It would be a subsidiary agent?—A. Yes.

Q. You speak about your system of apprentices here. I believe that the scheme has just been put in operation and that therefore you cannot speak from experience?—A. I should not like to express an opinion until the next two years.

Q. Do you pay your apprentices any wages?—Rs. 30 a month in the first year.

Q. Have you got the exact terms. We should like to have fuller information on the point?—A. I can send you our rules * for the training of apprentices and the agreement * we give them. We want to evolve a type of man badly required from local supplies.

Q. You then make some remarks about the education that is necessary for any one who is to make his living in industrial undertakings. Your object is to stem the interminable stream of Bengalis in particular who go through the Calcutta University?—A. We have got quite a number of lads in our service. Some of them have been through the University and a lot of them are quite good material but they seem to be more or less thrown away. They have absurd ideas of their own importance and they are quite content with a purely scholastic education without any desire to go further. They take no practical interest in their work. They can scarcely write a legible hand and although we allow no man to leave us except to better his prospects we try to keep them and some have been with us for 30 and 40 years. Yet the present type of man is different from his predecessor.

Q. You mean to say it is difficult to get a good clerk?—A. The workmen are better. The education given seems to be utterly wrong for evolving a man with a capacity for earning his living.

Q. It comes to this that you, as engaged in many different industries and in commercial affairs in Bengal, have no use for the products of the Calcutta University?—A. I think they are absolutely no use.

Q. I hope you will be asked to give evidence before the new Commission. I have only one other question and that is about the system that you mention of enabling the employees to deposit with the company some portion of their wages?—A. We have a provident fund

by which each employé deposits with us 5 per cent. of his salary. The firm then adds an equal amount and adds to that interest at 5 per cent.

Q. On the total amount?—*A.* Yes. They have also the power to deposit money with the firm, depositing their savings at 6 per cent. interest and they can draw the money at any time.

Q. You are speaking only now of the workmen?—*A.* That statement refers to the office as well.

Q. It means a big thing financially?—*A.* I do not know what it amounts to.

Q. Can the full amount be withdrawn?—*A.* Not from the Provident Fund. Until they have worked seven years when they can take their own deposits without interest. From seven to fourteen years they can take their own deposits with interest. Beyond 14 years they get their own deposits and the interest and also the firm's deposits and interest in full. If they leave on account of sickness they get the whole of their deposits and the firm's deposits. I have got the rules* and I shall submit them to the Commission. We hope to start co-operative banks within the next few months in connection with our outside concerns, collieries and works—it already exists in the office.

Hon'ble Sir R. N. Mookerjee.—*Q.* About banking facilities there is a universal impression that Indian traders and the Indian commercial community do not get the same facilities in the banks as the Europeans do. Don't you think that is true. There can be no smoke without fire?—*A.* I do not think it makes much difference. There are a large number of Europeans who by reason of their lack of status have been unable to influence the banks. I do not think that merely because a man meets the bank official in some club or social function he will be able to influence him to give him the necessary advance. I think they examine every proposal absolutely on its merits. Of course there are also certain Indian officers in the banks and they are also called in to pass their opinion on proposals.

Q. I gather from your answers that you stand security and that goes a long way?—*A.* I think it is the case that the bank will not advance money to any person beyond what he is worth. They are always on the look-out and whenever there is anything wrong they step in.

Q. Don't you think that it is due to there being no Indian directors in the banks of Calcutta like Bombay where there are Indian directors on the Bank of Bombay?—*A.* We have got only one bank with directors at all.

Q. Don't you think that there are Indians in Calcutta, who can usefully be directors on the Bank of Bengal?—*A.* Except in one or two cases I do not think there are a great number of Indians in Calcutta that are of the same level as the Indian directors of the Bank of Bombay. Beyond you and a few more I do not think there are any who can be considered on the same level as the Indian directors of the Bank of Bombay.

President.—*Q.* Are there not Indian shareholders in the Bank of Bengal?—*A.* Yes.

Q. Have the Indian shareholders any opportunity of nominating their representative on the Board?—*A.* The directors make their nomination. I wish the Indian shareholders took a little more interest in their holding. During the last two meetings of the Bank of Bengal I do not think a single Indian shareholder has turned up.

Hon'ble Sir R. N. Mookerjee.—*Q.* With reference to financial help you have used very strong language and you are not in favour of any Government assistance. You must remember that this Commission is for the encouragement and development of industries by Indians and not for firms like Messrs. Bird & Co. and Gillanders Arbuthnot & Co. Don't you think that Government help is needed in the early stages for the development of industries by Indians?—*A.* I only put that in because I thought that the financial aspect of the industrial problem was not so important as some of the others. I should have to qualify that remark.

Q. You have personal experience of railways where besides their own directors there is a Government director, and there has been no friction. Are there any dangers to be apprehended from the dual control that you refer to?—*A.* In connection with railways there are such fixed methods of working that it is much more easily kept within rules and regulations. When it comes to the question of industrial working, I think there are so many subjects and there is likely to be a lot of divergent opinions. In the railway working I think it is quite easy. There are set rules and regulations and it is more or less easy to look after it but I cannot say the same thing in the case of industrial working.

Q. Then you refer to the free grants of land. What do you mean by that?—*A.* I think that is necessary in certain industries which are of great benefit to the country.

Q. In countries like Japan and Germany they have had help given to industries from the beginning, and that accounts for their position in the industrial world?—*A.* I have not had any direct experience of it. In Germany I think they assist in the commercial operations right from the beginning to the end.

Q. Why don't you recommend the same thing here?—*A.* The English people have always been against that sort of thing. It seems unfair so far as the rest of the community is concerned.

Sir D. J. Tata.—*Q.* As regards speculation in connection with the promotion of companies, don't you think that all the money you get is due to the people speculating on the

good name of the promoters?—A. That is quite true. I was only speaking of uncarbed speculation in industries.

Q. Speaking about the official organisation you say that railway matters should be under a Ministry of Commerce. Do you mean that the Railway Board should be abolished?—A. I should like to see the Railway Board abolished because as it is at present constituted it is of no use to anybody.

President.—Q. In the case of railways traversing several provinces how are you going to have railway administration in each province?—A. What I mean is that the Ministry of Commerce and Industry would correlate and co-ordinate the requirements of industry, bring them forward and deliver that in a finished stage at Delhi or Simla. That is what is required in Bengal and Bihar.

Q. Have you any criticisms to offer about railway rates? Do you think any modification is needed?—A. It is a very big problem. I think considerable modification is needed. Take for instance the Kumardhubi Works. We import a lot of material, send it to Kumardhubi and work it up and pass it on to Cawnpore and it is dearer to take the things from Kumardhubi to Cawnpore than from Calcutta to Cawnpore. There are many cases of that sort.

President.—Q. Of course a good deal will depend on the volume of trade. Later on you speak about the Mackay Commission. Do you know how much money has been spent on railways?—A. I cannot tell you off-hand.

Q. I have got some figures. 400 crores have been spent on railways since the beginning, and you will see that in 1912-13 they spent nearly 10 millions sterling. In 1913-14 they spent about 12 millions which is about the figure that you say the Mackay Commission recommended. In 1914-15 they spent 11½ millions and in 1915-16 after the war it was about 5 millions and the budget for 1916-17 is three millions?—A. I am speaking of development work and extension work alone and not repairs and renewals.

Q. We have never reached the extent of 12 million pounds on railway construction and development. What you say is that they have not spent in one year 12 million pounds on railway outlay. That goes under the heading of capital?—A. I know it does. But railway finance is a matter which has upset all calculations. So far as new work is concerned I am convinced that they have not spent 12 millions on the annual capital outlay. Owing to the way in which railway finance is conducted they can show any figures they like. I am speaking on the question of expansion.

Q. Do you mean to say that they should be spent on new lines?—A. There is no use in new lines without having stock to run on them. In one year 1913-14 very serious complaints were made here, and as the result of a meeting in Calcutta we got ten thousand wagons added to the railways of India. If we had not those ten thousand wagons we should have been shut up to-day.

Q. I am not quite clear as to what the 12 millions was intended to be spent on. Does it include new rolling stock and renewals?—A. They were intended for new lines and additions to stock.

Q. You say that these 12 millions, which we did once reach, included renewals?—A. At that time we were absolutely up against the most serious trouble. I think that at the time I was on the Coal Traffic Conference when we had millions of tons of coal lying on the collieries, and as the result of our protest here Government agreed to supply us with 20,000 wagons spread over five years. In three years we got 10 or 11 thousand provided. But for our protests we could not have got anything.

Hon'ble Pandit M. M. Malaviya.—Q. You are aware that the working expenses are not put under the head of 'capital' expenditure and whatever is shown as rolling stock is under the heading of 'development'?—A. 'Rolling stock'—that has been written off?

President.—Q. You say that the Finance Department of Government has wilfully refused to consider and act upon the report of the Mackay Commission. Most certainly that remark is not justified by the facts. If you read the financial statements you will find that every time that report is referred to an endeavour has been made to act up to it?—A. I do not consider that they have studied the requirements of the country sufficiently. I am quite prepared to correct the statement if necessary, but I know the financial statements have been one after the other a considerable disappointment down here.

Sir D. J. Tata.—Q. You said somewhere that Government should take up the construction of wagons?—A. I meant the supply of wagons.

Q. Don't you think that it might be left to private companies?—A. We are always short of wagons somewhere. To-day it may be between Karachi and Lahore. At the present time they are robbing Peter to pay Paul. One day we find North Western wagons are running coal between the collieries and the docks. I was therefore wondering whether a central supply or pooling of wagons could not be arranged.

President.—Q. You mean a reservoir of wagons?—A. Yes. A central office from which wagons can be drawn when needed.

Sir D. J. Tata.—Q. With reference to what you say about the salt tax are you aware that with the lowering of the duty consumption went up by sixty per cent?—A. That is quite true but the reduction is so small that the profit cannot be subdivided to an extent as to give the masses the benefit.

Q. It is not such an unimportant thing as you seem to suggest?—*A.* I would far rather see that the ryot is able to dispose of his grain which is lying now at every station in such large quantities.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. You have said that the Presidency Bank Act should be amended because they now require a collateral security although the first security is quite good?—*A.* I think that the Presidency Bank Act was formulated at a time when that might have been necessary as a safeguard.

Sir F. H. Stewart.—Q. Would you be willing to see an extension of the Bank of Bengal? That does not represent the views of the Board?—*A.* I am speaking more as a business man than as a banker.

Hon'ble Sir Fazulbhoy Currimbhoy.—Q. With reference to what you say about grants-in-aid don't you think that private capital will not come in unless Government gives some guarantee?—*A.* What I am afraid of is that that sort of thing will go on indefinitely. I think if one concern is helped it will lead to heartburning.

Q. If no such impetus is given the Bengalis will not come in?—*A.* They have got any amount of example before them and why do not they come in?

Q. Don't you think that in the case of the big industries it would be a good thing if Government gave some guarantee? Don't you think that would be much better?—*A.* I think Government guarantee is preferable to Government supplying the capital.

Sir F. H. Stewart.—Q. You said that Government would be interfering if it competed with private enterprise. Can you give us any particulars confidentially?—*A.* I have not got very many particulars myself. I cannot think of any at the moment.

Q. With reference to the timber industry and its expansion you gave an example of what might be done. Could you formulate your opinions and give us a note.* We have not so far had any evidence on the timber industry?—*A.* There is one of our men working in the Surma Valley. He knows a good deal about the industry.

President.—Q. Would you mind giving us his full name and address?—*A.* He is Mr. James Blair, Surma Valley Saw Mills, Limited, Bhangabazar, Assam.

Sir F. H. Stewart.—Q. You say that an Aerial Ropeway Bill was sent to the Government of India and that no action has been taken on the matter. Do you know what the present position is?—*A.* There was a Bill introduced by the Bengal Government and they formed a special committee to consider it and it was completed, and the matter was put up to the Bengal Legislative Council. When the Government of India heard the idea Mr. Clarke who was then the Member for the Commerce and Industry thought that it was very desirable that the Bill should be made an Imperial one seeing that ropeways might cross provincial boundaries. So it was sent up to Delhi and we have heard nothing more about it. When it went up to Delhi it came back to the Chamber for opinions and it went round and the views were all sent back, but I do not know what was done with them.

Sir F. H. Stewart.—Q. You are spending a good deal on the supply of labour. One of the witnesses before us the other day said that it was a great drawback that expert advice is not taken as to the form of the housing lines and the provision of adequate sanitary arrangements. Would you consider fair criticism?—*A.* To a certain extent. We have spent more than most people. It seems very difficult to provide just what they all want. They seem to prefer their mud walls and their thatched roof because they are warmer and drier. When you bring thatched roofs into big communities there is the danger of fire and moreover they are comparatively costly. The roofs are constantly blown down. The Bihar and Orissa Government have given their attention to the matter and there is a committee sitting at Dhanbaid before which we are giving evidence. I agree that it is very difficult to meet the views of everybody.

President.—Q. Do you think that we should recommend to Government the appointment of some architect or some consulting engineer to look into questions of this sort?—*A.* It is so difficult to meet the views of everybody and it will be very difficult to frame hard-and-fast rules. As a matter of fact we have just engaged a young Bengali engineer. The young man has done a certain amount of work at home and we are trying to find out if we can evolve some kind of safe and reliable building for the mills and the collieries.

Sir F. H. Stewart.—Q. With reference to the supply of labour, do you think there is any chance of getting the labour direct instead of through the contractors?—*A.* Personally I prefer that they come direct but I know that it is almost impossible. Especially in the collieries I prefer to try and get the manager to run his own labour. Complaints are made, and time after time we have had to fall back on the contractors. Our neighbours are all working on the contract system and we are more or less forced to do the same. Personally, I am in favour of some system of sirkari work. We do it largely in the docks and in our labour department.

Q. Do you think there is any means of breaking down the present system?—*A.* It is so difficult to break down or to interfere with the present system. We have now two or three men studying the system closely and are trying to evolve some means of doing it.

Q. You are also doing a great deal in the way of improving the conditions of living of the workmen?—*A.* Yes, and at the collieries we have started the system of 'bonuses.' Not

only the managers and the superintendents but the headmen, the sirdars and all the leading men get a bonus at the end of the half-year. I find that it has brought about a better feeling between the manager and the people.

Q. Is it a bonus on the quantity of work?—A. It is an extra cash payment. We provide the whole of the money and it is divided up amongst the staff, including the babus in the office and the sirdars and the mistresses on the recommendation of the manager.

Q. In your note you say that the supply of imported employees will in future be curtailed. Do you mean imported from Europe?—A. Yes.

Q. There is also another aspect and that is, it will be difficult to obtain imported labour from the different provinces of India?—A. I think it will and we are hoping that more and more of the local people will take to industrial work.

Q. What are the prospects of getting industrial labour in Bengal?—A. There are very few of the local men that are keen on their work. The bulk of the labour is imported. The whole of our dock labour comes from such distant places as Bilaspur (in the Central Provinces), the United Provinces, Delhi and the Province of Bihar and Orissa. Purely Bengali labour is very difficult to get.

Q. Is that not necessary in view of the industrial progress in future that we should get men locally?—A. I think that it is one of the needs. If we are going to import the whole of our labour from outside it is going to be a very serious problem.

Q. With reference to what you say about the official organisation, would you develop your ideas a little more fully and let us have a further note?—A. I think we want to know what will suit our requirements.

Q. Would it be desirable to separate the Commerce and Industry Department, if you had your provincial ministries?—A. I think Delhi cannot look after all these things from such a distance.

Q. You want a full staffed department and not merely a Member of Council?—A. Yes. It is too big a work and every year the work is growing more important.

Q. Could you let us have a further note?—A. I have got a note on that already. I think it is rather difficult to expect the present Member of Commerce and Industry to come down here and tackle the mass of questions that arise in Calcutta, in Madras and in Bombay as well. That is more than what one man can possibly do, and we in this province are growing at such a pace industrially and commercially and there are so many vital problems awaiting solution. I think they should be thrashed out first by the provincial minister.

President.—Q. Your proposal would be justified in the case of Madras, Calcutta and Bombay but would you be able to justify it in the case of the other provinces as well?—A. I think the United Provinces might have one. Some of the smaller provinces might have one minister in common.

Hon'ble Pandit M. M. Malaviya.—Q. You have been told that the object of this Commission is to draw out Indian capital and to suggest means as to how that might be done by Government, either by encouraging industries or giving their moral support in favour of industrial development?—A. I should like to be perfectly certain that Indian capital at least on this side wants to be really interested in industries. I do not think that all Indian capital wants to have anything to do with industries at the present time.

Q. Assuming that Indian capital can be induced to come in what measures would you suggest for encouraging industrial enterprises?—A. I cannot think of anything more than example in trying to bring about successful industrial development. Any one who wished to put in his money in industrial enterprises is welcome to-day, and I think that every year we shall find that more and more people will be coming forward. I should like to try the experiment of the combination of both Indian and European capital. Sir Rajendranath Mookerjee is a case in point. There is one Indian gentleman in Calcutta who brought me a scheme which he wants us to take up. We discussed it and eventually have taken it up and are going on the principle of half-and-half. We understand each other perfectly well and we are going, I hope, to bring about a combination. If both Indians and Europeans would throw in their interest together, I think each could be of very great help to the other, and I think we shall gradually find that that will come. That will be one of the most desirable forms of co-operation.

Q. Do you think that in that case Indians should always be allowed to take half of the shares in any concern?—A. I do not think it is possible to make any hard-and-fast rule. The thing must come gradually. When one joins others will easily follow his example and they in turn will recommend the thing to others and it will gradually extend. We might not be able to get 50 per cent. of the shares taken up by the Indians.

Q. In the companies that you have been connected with are there many Indians as managers and directors?—A. There are not a great number of Indians.

Q. Are there many Indians among your supervising staff?—A. At the present time in the collieries and the mill agencies and places of that sort we have got about 25 Indians.

Q. What is the minimum salary?—A. Rs. 150.

Q. And the maximum?—A. It runs up to 350.

Q. How many Europeans on the supervising staff?—A. Including our head office we have got about 260.

Q. Are there any men of the domiciled community?—A. Out of 260 there are about 48 to 50 of the domiciled community.

Q. With regard to the directorship of Presidency Banks and other banks, so far as you are aware, has any effort been made by Government recommending that men should be taken as apprentices?—A. I have been a director of the Bank of Bengal for a year. I would not like to answer that question. I have not studied it.

Q. You have drawn a distinction between "mercantile commerce" and "industrial commerce." Mercantile commerce receives at present the full measure of support from the Presidency and the Exchange Banks in Calcutta. Do these companies extend any help to industrial companies?—A. They do. My business is practically all industrial commerce. We have to depend much on the local banks for assistance.

Q. Do the local banks make any advances on the security of building, stock and plant?—A. The local banks do so with our own name behind it.

Q. How does it fare with those who have not a name?—A. They are generally asked to find a name. Each man gets accommodation according to his business and we must all cut our coat according to our cloth.

Q. Suppose that the Presidency Banks deal only with liquid assets, would you then be in favour of an industrial bank which should advance money on industries on the security of building and plant for long terms?—A. Ordinary banking practice is distinctly averse from long term advances and consequently when you come to a purely banking organisation which is dependent on the repayment of money it might find itself in a position of considerable difficulty at times of stress especially like the present. It is scarcely a bank when it comes to do that kind of business. Where are you going to get your funds from? Unless it is very carefully watched every body will go to it as a sort of milch cow and one of the industrial troubles is that mistakes are often made. It would mean that a great number of people will deliberately start industries with a minimum of capital in the hope that they could go to the industrial bank with some unsafe proposition and try to get the money.

Q. Have you given any attention to the system of industrial banks in Japan?—A. No.

Q. In England there is no such system of industrial banks?—A. No.

Q. Suppose there is a bank which by its constitution would not receive deposits for short periods and which would not have to meet calls at short notice?—A. The Presidency Bank already does that function. I am only asking for its extension?

Q. In what direction?—A. By enabling them to advance money on securities which at present they are not allowed by their Charter to undertake.

Q. Then you are in favour of the Presidency Banks doing the kind of business that the industrial bank would be doing?—A. Yes, with all due and proper safeguards.

Q. You are not then in favour of a separate industrial bank, but you would have an extension of the Presidency Bank in which case there should be a modification of the present charter of the Presidency Banks?—A. Yes.

Q. In practice it would be quite a different kind of thing from what the Presidency Bank is at present?—A. Yes.

Q. When you say that the Indian joint stock banks should be able to afford some help to Indian industries, are you aware that the capital of the Indian joint stock banks is only 12 per cent. of the total capital, whereas the capital of the Presidency Banks is 48 per cent. I do not think they are likely to be able to render very great assistance to industrial concerns?—A. As far as I have seen I think the present banking organisations of the country are able to meet all the requirements. I only say that as far as I can judge though there may be other requirements of which I am not cognisant. But personally I am not in favour of tampering with the present organisation of the country unless some urgent need for it has manifested itself. At present I do not see any urgent need for it. If there is an industrial bank I should make it part of the Presidency Bank.

Q. Assuming that there are some legal difficulties in the way of doing it, would you be in favour of Government putting in a good sum into the industrial bank in order to lend its support in the first few years of its existence?—A. That is a very big problem. That is grant-in-aid in another form.

Q. Don't you think that it would be a better way of helping industries than advancing the money directly in the shape of loans?—A. It would be preferable.

Q. The Government has been helping the Presidency Banks with the use of its money to a very large extent and the Presidency Banks have thereby been able to render help to the export and the import trade. If the Government put a fair amount of money into the industrial bank then the industrial bank would be in the field of promoting industries, what the Presidency Banks have been in the field of mercantile commerce?—A. Provided the industrial bank can also draw money from the public in the shape of deposits. They cannot depend entirely on Government. If you can provide from the public as well a large amount of deposit money in the manner you suggest then there is no reason why the corporation should not take place.

Q. In the case of the Japanese Industrial Bank the Government put in one million yen for five years and allowed interest on that sum to go towards paying a dividend of five per

cent which they guaranteed. Do you think that if the Government did a similar thing here, then the public will also subscribe?—A. That is rather a difficult problem. I should doubt whether it would be of much benefit in the shape of drawing out public money. As I have already said, speaking for myself as a business man, I should want to know whether the business existed, and whether there is a real demand for an industrial bank so far as the provision of funds is concerned.

Q. You say that unless the demand for financial help has grown considerably you doubt the utility of an industrial bank?—A. I doubt the utility of the industrial bank as a separate organisation. I doubt whether it could be made large enough to justify its existence.

Q. Large in what way?—A. In finding sufficient business.

Q. Don't you think that the progress which the industries have been making in the past ten years justifies the view that such a bank will find enough business?—A. I think we are apt to run before we have learnt to walk in this matter. If it is proved that the present organizations in the country have not met the demands and the requirements of industry, then I think it is time enough to talk about an industrial bank.

Q. There has been much evidence before the Commission given by Indian gentlemen, including men like the Maharaja of Cossimbazar, that Indian industrialists find it difficult to get accommodation from the Bank of Bengal and the exchange banks. Assuming that there is some foundation for it, will it not be desirable to have an institution which will help these industries?—A. I think the Maharaja of Cossimbazaar got it.

Q. Because he is a Maharaja. He got it after he had a solicitor to back him up and he had to sign a pronote with him. The Presidency Bank would not advance money on the security of his pottery works alone?—A. I think he has got some collieries and they were put up as second security and his agents also gave their names. But we are all in the same boat so far as that is concerned.

Q. You now find that there are many industries going on in Calcutta. There are many new works. There are pottery works, cotton and jute mills, and galvanising factories. Factories have been growing. Don't you think that in order to cope with the demands that are bound to come from all these industries a bank is needed?—A. If, as you say, it is proved that the question of accommodation has presented difficulties, then I for one would not stand in the way of one being started. Personally speaking from my own experience, I do not think that there is sufficient demand to justify a big organisation of the kind that you mention. We ought to try and find some means of assistance in some other way than starting an organisation such as an industrial bank.

Q. *President.*—If an industrial bank of the kind were started it would presumably take over some of the work that you have indicated, that is to say, advancing money to industrial enterprises backed by respectable firms. In that case it would compete with existing banks?—A. Every interest when it sees a prospect of competition endeavours to protect itself. I scarcely see that an industrial bank is necessary. If the Hon'ble Pandit can show me that it is necessary I for one would not stand in the way of such an organisation being created.

Hon'ble Pandit M. M. Malaviya.—Q. You are a gentleman with very wide experience, and you can help the Commission by speaking on matters like this with some authority. That is my only excuse for continuing the subject. I just want to point out to you that the industrial banks in Japan are permitted to do a lot of other business besides lending on securities. For instance, some of its principal duties are to make loans on the security of national loan bonds, prefectural and municipal loan bonds, or debentures and shares of companies; to subscribe for or take over by transfer national loan bonds, prefectural and municipal loan bonds, or debentures of companies; to receive deposits of money and undertake the custody of goods entrusted to it for safe keeping, to undertake trust business; to discount bills and to buy and sell bills of exchange and documentary bills of exchange; to make loans on the security of estates created by virtue of special laws; and so on. So that there is no apprehension that if the capital is a large one that it will not find employment?—A. It is not the question of capital. It is the question of inducing the depositors. It is not the question of capital. That is a very small item. You have got to induce your depositors to provide the additional funds which could be used profitably in industrial operations. Depositors would not loan funds at probably more than six months' or 12 months' call. I think the probability is that the bank would be left with a lot of unsaleable assets. They would have a large amount of money locked up in industrial enterprises and that is where the big banks are now able to spread their risks over a considerable area, and when the call comes in they are able to weather the storm. I think that any purely industrial bank would have to be handled with extraordinary care, and I do not think there are many of us who would care to face the experience yet. In Japan they have ways and means of doing things which we have not yet attempted.

Q. If it is shown that there is need for a bank of this kind then you are in favour of it?—A. I would not stand in the way if the need for one is shown to exist.

Q. In your note you speak of the appointment of a committee and about the difficulty of railway rates. Do you think that this difficulty arises out of the fact that different companies manage the different railways? Don't you think that if the State managed the railways, they would be interested in laying down a uniform policy all round?—A. Personally speaking, I am one of those who are in favour of State management of railways. There are a great

number of reasons which have been advanced on both sides. The question of State management involves a complete reorganization, the sweeping away of the Railway Board and a revolution in the methods of railway working in India. I think the change would be rather great to undertake at the present time. It may be worked up to in time, but at present my idea is that the Railway Board is crippled. Either it has not got sufficient power, or it has too much power. I have got a case in point to-day. I do not know why they really exist at present.

Q. If the Board is to continue you are certainly in favour of a more representative element being introduced into it?—A. My suggestion so far as the working of railways is concerned is that nobody who does not understand railways ought to attempt to work them. I should like each province to have a representative committee sitting to consider traffic problems consisting of railway members and commercial members. A policy might be laid down for a period of, say, ten years. This provincial committee will be more or less a voluntary organisation, a sort of advisory committee. They would examine any proposals and bring them forward and would have their representatives who will be the representatives when Government are considering their railway policy for the province. I think it will be a pernicious idea to have people dealing with railway problems who do not understand railways. They would do more harm than good.

Q. You know that the present Board was constituted, because there was a feeling that there should be somebody to represent the Government and look after the interests of those who use the railways. Don't you think that the presence of commercial men would make for the better presentation of the views of the commercial community to the Government as well as the general public?—A. I think it all depends on the men.

Q. I quite agree that much depends on the personality of the members. Assuming that the Railway Board does continue to exist in its present form, don't you think that the presence of such a man will count?—A. I think the advisory committees which I have suggested will carry very much the same weight. You should not have inexpert interference when it is not needed. I know that is the case in our own business. It is much better to have men who have actual experience of the subject than to have men who have not.

Q. Then how would you insure the interests of the general public and the travelling public?—A. I have had a good deal to do with railways for some time. I have been trying to place my views before them, and they do not always listen to me. I am still in hopes that they will do so. At the same time there is this point that too much cannot be expected all at once. If we place our views and case before the railways in a well reasoned spirit and a straightforward manner, we can only hope that they will give the matter their attention and eventually agree with us.

Q. The experiences of certain witnesses before the Commission show that the Railway Board has not been able to redress their grievances in the matter of rates and freights?—A. I suppose there is no one who has been harder on the railways than I have been during the past. The present Railway Board is not powerful enough for the duties they try to assume.

Q. If the State managed all the railways they would naturally consider the interests of the public and the trading community?—A. That is a point that I have my own doubts about. The railways are run for a profit and provide revenue to Government and it does not come back to the railway again. If it were handed over to Government my fear is—and that is my only fear—that that will increase and not diminish.

Q. Is that fear based upon any examination of the working of the State railways?—A. I have spent some of my time in Germany and although there are many points in favour of State working as accepted in Germany, I do not think that Germany is absolutely perfect. I should like to see whether we cannot bring about, through the Commerce and Industry Department, some system by which the views of the traders might be made paramount rather than the views of the railways. Everything depends on the prosperity of the people, and traffic facilities are one of the readiest means of ensuring it. My point is that at present the railway revenue is one of the largest sources of income to the Government, but Government devote it to all sorts of other expenditure. I should like to see railway revenue and expenditure kept apart.

Q. From 1854 to 1900 the railways in India worked at a loss, and it is only since 1900 that they have begun to yield some profit?—A. As regards railway finance I should like to have very much clearer evidence than I have myself been able to obtain on the subject of the amount of money that has been put aside for sinking funds and repayment of capital out of revenue.

Q. With reference to the salt tax, you say "Has it ever occurred to Government to ask the millions of peasants whether they would prefer to have the salt tax reduced or that their grain should be promptly removed and cash paid for it." Have you given sufficient time to the salt question as affecting the health of the people?—A. In the absence of any better evidence to the contrary we may take it as a conclusive proof that the salt tax was to their benefit, in view of the great increase in the consumption of salt? I was looking at the matter more from the point of view of the enormous amount of grain that has year after year lain at mofussil stations waiting to be taken to distant places. Recently whilst travelling from Bombay I am quite certain that 50 per cent. of the stations were absolutely blocked with enormous quantities of corn waiting to be transported. It was rotting in the stations, and had started growing in the bags. What I want to know is whether these people would not much prefer to have their bags despatched rather than get a small reduction in the salt tax.

Q. Do not for a moment imagine that I am against a greater expansion in the way of providing the wagons necessary for transport, and I hope that that expansion is coming. But do not advocate it at the expense of the salt of the poor people?—A. You and I are both at one on that point that the ryot should be benefited in the best possible way.

ADDITIONAL WRITTEN EVIDENCE.

(Submitted after oral examination.)

X.—General.

Coal distillation.

Low temperature coal distillation provides for India, I believe, an industry the development of which has possibilities of a far-reaching character and immense value to the country, and would re-pay the closest and most methodical examination and assistance by Government.

We have many seams of low-grade coal practically all of them containing valuable volatile products and, as the process of low temperature distillation is being rapidly perfected, the suggestion is now advanced far enough for a deliberate effort being made to tackle the question here in India. A cheap smokeless fuel to take the place of wood and dung fuel needs no recapitulation, the demand is enormous for the fuel, similarly for the bye-products. Although there might be some difficulty in using the surplus gas economically, we may yet see coal distillation plants in close proximity to large manufacturing centres which, instead of sending 80 per cent. of the value of the fuel up their chimneys, will first turn the coal into smokeless fuel and bye-products using the gas for driving their plant either by means of gas-engines or gas-fired boilers. I know I shall be accused by some people of presenting fantastic suggestions, but as the Commission have asked for suggestions I am confident in my own mind that this one is well worthy of instant examination by Government and the expenditure of money in proving it.

Waste of coal.

Urgent measures are required for dealing with the terrible waste of fuel which takes place on the Indian coalfields. India will ere long be proved lacking abundant fuel, at any rate, the main supplies are bound to be of an inferior quality, and yet it is astonishing how little regard Government and the Mines Department seem to have for this subject. The position can be most easily gauged by a visit to the Jherria coalfields where seams of coal from 10 to 30 ft. in thickness overlies each other with but short gaps of intervening strata. Large areas of these seams are standing on pillars more or less adequate, and as we are rapidly approaching the exhaustion of the coal-bearing area the value to the country of the pillar coal in the existing mines is inestimable. At present attempts are made to obtain this coal by extraction in the ordinary way and to a certain extent we are assisted by the magnificent sandstone roofs which overlie a large number of the seams, but in spite of all this probably an average of 40 per cent. of the pillar coal is lost whenever the present method of working is followed. The provision of hydraulic stowage is an item of immediate and vital importance and Government should, I consider, be pressed to listen to the views of the practical men on the subject. There are many other systems and causes of waste at present practised due to antiquated methods, for instance 10 to 12 per cent. of the total coal raised has to be expended on pumping and on raising the output to the surface. By means of the electric scheme which we are at present engaged upon, wherein the waste gases from 40 bye-product coke ovens will generate steam in tubular boilers actuating turbines of 2000 K. W., we hope to put at least 250 boilers out of action with a resultant saving of at least quarter of a million tons of fuel per year. At present much waste is prevalent on collieries due to the miners being allowed to carry away for their consumption relatively large quantities of coal for the purpose of cooking their frugal meals. The whole question of waste must be dealt with without delay for, I believe, it will be proved that the best coal in India has already been found in the Jherria and Raniganj coalfields. It would also be proved, I think, that the bulk of this good coal has already been extracted, and probably as much again has been wasted. Finally I shall not be surprised if it is hereafter proved that the only genuine coking coal in India exists in the Jherria field and that the termination of the life of this area is already within sight. Consequently the future of the steel industry, if it is to be dependent on coke for smelting purposes, does not require further dilation by me.

Restricted coal workings under railways and railway land.

This is a subject which requires the immediate attention of Government. The existing situation is very unsatisfactory no matter from what standpoint it happens to be viewed, unsatisfactory alike to railways, collieries, Government and to the community as a whole. The procedure adopted at present, when it is proposed to construct a railway, is that Government acquires the land to all intents and purposes compulsorily and passes it on to the railway company which constructs the line. When the land is acquired by Government under the Land Acquisition Act the minerals are expressly excluded, but the railways in their agreements relating to the construction of sidings and connecting railways to collieries and industrial concerns insist that the public company or private owner shall withhold all claims to any minerals known or unknown under any railway or siding, either on his own or other owner's land, or under any railway connected therewith. The Commission may express surprise that collieries and industrial concerns should ever have accepted such a one-sided arrangement, but this can be readily explained by reason of the fact that in the early days the question was never viewed in a sufficiently serious light, and furthermore as these were the only terms upon which the railways would construct a siding the terms had perforce to be accepted as no railway connection would be possible.

The matter has now come to be viewed in a serious light, for colliery workings are restricted in every direction by railway encroachments. As a result of the census taken by the Indian Mining Association it was ascertained that nearly 200 million tons of coal is locked up under railway sidings and railway branch and main lines, and all this coal will gradually be required ere long in order to maintain the output from Indian coalfields.

Government under the Land Acquisition Act expressly exclude the minerals when acquiring land and promise to pay compensation when the minerals are required. Obviously the present situation is one of uncertainty; it is not the wish of the coal trade to ask for compensation until all and every endeavour has been made to deal with the situation differently. Government recently endeavoured to contract out of their present obligation for providing compensation by an amendment to the existing Land Acquisition Act in which it was proposed to hand over Government's interest in railway land to the railway authorities and company. This effort was checkmated and the question has lain fallow for some time. It is one of the most pressing urgency and a determined effort should be quickly made to deal with it. The output from some collieries is already seriously restricted and this trouble is increasing daily.

I append as a note for the information of the Commission a draft proposal I submitted to Government relating to the appointment of a tribunal which should be able to deal with the subject. This question is one of several others which is of vital interest to the coal trade, and I trust the Commission before it closes its labours will be able to pay another visit to the coal-fields and hear the views of practical men on this and many other subjects of vital interest to the country.

Note on a proposed Railway Land Acquisition (Mines) Act Tribunal.

The Tribunal might with advantage be limited to one permanent Member or President, *i.e.*—

- (1) A Judge of High Court.
- (2) A Barrister, preferably European, of any of the Indian High Courts nominated by the Chief Justice of Bengal.
- (3) An English Barrister, having particular experience of the subject, to be brought out from home and guaranteed a retainer or minimum salary, to be provided from the fund, for a period of 3 or 5 years, say £2,000 per annum, with liberty to engage in other practice, and a special fee for each case, and with a Registrar or Secretary and office accommodation.

The Tribunal to consist of the President and two temporary assessors, one to be appointed by Government on behalf of the railway interests, the second also by Government on behalf of the commercial community. The assessors would receive fees during the case and during examination of documentary evidence. Upon receipt of a case for examination submitted by both parties for examination and decision the Tribunal would be constituted.

The Railway and Mining Companies concerned would submit evidence, legal or technical, or both, in support of their respective claims, and both sides would bear their own costs of such application and evidence (which would effectually prevent fictitious and frivolous claims for compensation), for I hold that with Government, the railways, the mining community, and the public at large being equally interested in the subject, it is necessary that extravagant claims are combated and prevented.

It is probable that both parties will, prior to submission of their respective claims to the Tribunal, have examined the subject mutually and have definite proposals prepared for submission. The methods of working to be adopted and the duties of the Tribunal will, I anticipate, mainly consist in the adjudication on the fairness of the respective claims and examining the accuracy of the extra expenditure which will have to be met by the parties to win the coal under the railway line concerned, for it must be borne in mind that the collieries will make a profit on the coal won, whilst the railways will secure the freight. The extra expenditure involved must only become chargeable against the fund, and the expenditure will also be spread over the period, short or long, during which the work involved has to be carried out; the Tribunal to have power to call in accountancy or auditorial evidence on the respective claims.

Government should also closely examine suggestions in advance, and, irrespective of the Tribunal, limit this expenditure. As hydraulic stowage will, in my opinion, afford one of the readiest and cheapest methods for preventing undue surface damage, the provision of valueless surface material, or river sand, should be made as cheap as possible. There are, for instance, millions of tons of sand in the beds of rivers within a few miles across country of nearly every colliery, and this sand should be acquired by Government as for a public purpose, and placed at the disposal of the railways and mining concerns at a minimum cost. Such material would be costly if transported by the railways. It would increase short distance traffic and use up wagons required for other general public purposes, but a co-operative system of aerial ropeways could be provided, at any rate in Jerriah field, where the difficulties and expenditure will be greatest. The ropeways should have power to acquire land for the purpose on the same terms as electric line wires and standards, and by working from the river bed to central points served by subsidiary lines, groups of collieries could be provided with material. The question of surface damage now affects colliery interests besides railway maintenance, and this method of working (*i.e.*, stowage) must speedily become general if half of the exist-

ing coal in Jerriah is to be won. Hydraulic stowage might therefore be a means to an end, providing for the railways at the same time as the collieries' general requirements, and the cost of maintaining the railways would by this means be reduced to a minimum.

The amount of money required will, in my opinion, if the public interests are carefully safeguarded, be found to be surprisingly small, and a cess of one or two annas per ton on the present output, at the outside, fixed for a period of 3 or 5 years, would provide a fund which could be drawn upon gradually and which could be reduced or increased as the demands upon it became known at the end of each period.

The fund should be handled conservatively and placed on deposit with the Bank of Bengal, as the interest thereon would soon probably pay the President's retaining fee and that of the Registrar or Secretary.

The fund's accounts should be under the supervision of the Accountant General's Department for audit purposes, or of a firm of Chartered Accountants, the latter probably would cost less and meet all requirements.

The railways should, to my mind, collect the cess by additions to their freight bills, and if they can prove the cost to them of so doing, they should be reimbursed out of the fund by means of an annual sum to be agreed upon after examination. These suggestions have been put forward hastily and no doubt are easily capable of being supplemented and improved upon; they are personal and I do not promise that they would meet the views either of the railways or of all my fellow members of the mining community.

Note on technical aid to the timber industry.

"The existing knowledge of the available forest resources of the country can be supplemented" by the practical co-operation of business men.

The manager of a timber business, for example, would probably have local knowledge, and acquire information from sources not available to Government Forest officers. The latter only serve in a district for a term and are apt to look at things from an official aspect with *forest conservation* as the principal object in view. The business man, timber company or sleeper merchant, permanently located in the district would always be on the alert in regard to the commercial possibilities of the forest in his area. Where a forest officer is unable to inspect or determine the value of the production from some particular unexploited area in his division, substantial inducements should be given to business men to investigate such propositions. In some particular forest areas there may be over a hundred different varieties of timber and the royalties charged by Government vary from, say, 1 to 4 annas a cubic foot, though it is well known for wholesale purposes the timber merchant has to classify them under one head as "mixed hard woods" or "mixed soft woods"—or "jungli woods" regardless of the forest classification and valuation. In the present state of forest exploitation an all-round flat rate should be charged instead of different rates for different timbers. It is the extra price recoverable on the better (and always rarer) quality timber which helps to cover expenses of extracting the cheaper (and commoner) qualities. The present system of auctioning standing trees does not tend to encourage private survey or exploitation. It may be suitable in certain districts—but its application all over India without regard to special conditions is a mistake. The man whose bid is accepted one year may be beaten by a few rupees the following year. This does not encourage him to sink money in transport and other organisation for working a forest as he would do, if he was certain of continuity of his tenure. Government forests in places which are "out of the way" and yet within reasonable reach of railways or navigable streams (*i.e.* navigable for lumber) might be found worth the attention of capitalists if an invitation was issued to prospect and investigate their commercial possibilities. *Prospecting licenses could be issued on terms similar to licenses issued to prospectors for minerals—convertible into long leases.*

It is suggested that commercial surveys by commercial prospectors would be more useful both as a means of supplying revenue to Government and ensuring proper exploitation. In the case of minerals, Government leaves the investigation and exploitation of the economic and commercial side to the private prospector. Why should not the same principle be applied to the exploitation of forests. A commercial survey by some expert official, such as the Forest Economist, should be made of all forests in India, and a uniform royalty fixed by him in each province or district.

Commercial prospectors would then know how they stood. At present a 4-anna royalty on a timber like 'toon' might work out at a far lower cost to the buyer than a 1-anna royalty on a timber like 'simal' (Bombax-tree cotton). A toon tree might be felled absolutely on the banks of a river while a simal tree might be standing 3 miles away necessitating tedious manual or elephant dragging—at a cost which would actually make the toon cheaper "to extract." A commercial survey with due consideration for local conditions, such as extraction, distance from markets, should be able to fix an equitable all-round rate and prospectors could then determine for themselves whether or not a working lease was worth taking up. Even if a flat rate for all India was fixed, prices would very soon adjust themselves. It should be borne in mind that the timbers in less demand might have been sold at a minimum profit or in some cases even at a loss—the profits on the better class woods being relied upon to make the whole a workable commercial proposition.

Trade names applied to timbers are often misnomers. In the case of *imported timber* some system might be introduced whereby importers should be made to give an official certificate before admission into the country, stating what the trade name is in country of origin and what is its botanic name and classification. It is quite possible timbers indigenous to India are also being imported to Indian markets under a fancy trade name. A Government expert should be deputed to investigate and classify all the various timbers imported into India. For example, there might be no need for a railway to import a timber known to them by one name, if the same timber, unknown to them, is obtainable in India.

See my remarks about the co-ordination of Forest Department in my written evidence, *reply to II/25*. The Forest Department should send consignments of timber for sale through timber merchants in the bigger Indian markets. Indian business houses might also undertake the sale of consignments on Government account in foreign markets, London and America.

Indenture of apprenticeship for lads employed in Bird and Company's collieries and other works.

This Indenture made this
Between

date of

191

of
(hereinafter called the "Guardian") of the first part

son of
(hereinafter called "the Apprentice")
of the second part and Messrs. Bird and Company of Chartered Bank Buildings, Calcutta, Merchants and Agents (hereinafter called "the Firm") of the third part. Whereas the Firm are the Managing Agents of the Companies set out in the Schedule hereto and the Apprentice has applied to the Firm to be admitted as an Apprentice and to serve the Firm at such of the Collieries, Engineering Works, Works Factories, etc., of the Companies set out in the said Schedule hereto or any other Companies of which the firm are Managing Agents as the Firm may think proper and whereas the Firm has agreed to take the Apprentice into articles of apprenticeship for a period of 4 years subject to his producing evidence of the necessary qualification hereinafter mentioned that is to say:—

That the Apprentice is a European or Anglo-Indian.

That the Apprentice has passed a School examination equivalent to the VI Standard and produces a Certificate of good character from the School at which he has been educated.

That the Apprentice is not under 17 years nor more than 19 years of age.

That the Apprentice shall submit his Baptismal or Birth Registration Certificate.

That the Apprentice shall submit a Certificate of general respectability and good character from the clergyman of the Parish in which the said Apprentice resides or a Certificate from some other respectable person not being a relative of the Apprentice.

That the Apprentice shall produce a Medical Certificate as to his general health.

I. Now this Indenture witnesseth that in consideration of the service of the Apprentice to be done or performed to or for the Firm and of the covenants and agreements hereinafter to be entered into by the Guardian and the Apprentice, they the Firm at the request of the Guardian and with the consent of the Apprentice testified by his executing these presents do hereby covenant and agree with the Guardian and also with the Apprentice in the manner following that is to say:—

1. That they the Firm will take and receive the said
as an Apprentice from the date of these presents for a term of 4 years and also will during the said term to the best of their power knowledge and ability instruct the Apprentice in the trade or business of
at
any of the Collieries, Engineering Works, Works Factories, etc., of the Companies set out in the said Schedule hereto or any other Companies of which the Firm are Managing Agents and in all things incident or relating thereto in such manner as they the Firm or any of the said Companies do now or shall hereafter during the said term use or practise the same subject nevertheless to the fact that the first six months of the said term of four years shall be considered as a probationary period during which either the Firm or the Apprentice may at their or his option cancel this agreement during such period of six months by giving to the other of them one week's notice in writing and that the Apprentice shall tender such notice of resignation through the medium of the Guardian.

2. That the Firm will during the said term find and provide the Apprentice with good and sufficient board and lodging in one or other of the Firm's boarding houses set apart for that purpose or in such other place as the Firm may think proper.

3. That in the event of the Apprentice being successful in passing the Government Hindustani examinations the Firm will pay him an honorarium of Rs. 100 upon his securing a Certificate of his having passed in the lower standard and Rs. 200 upon his securing a Certificate of his having passed in the higher standard such sums to be placed to the credit of the apprentice in the saving deposit account to be opened by the Firm.

4. That during the period of his apprenticeship the Firm will pay to the Apprentice subject to the conditions hereinafter mentioned the following rates of wages :—

During the first year Rs. 30 per mensem.
 During the second year Rs. 40 per mensem.
 During the third year Rs. 50 per mensem.
 During the fourth year Rs. 70 per mensem.

And also will provide medical attendance and will also pay the necessary fees in connection with the Government Technical Classes hereinafter mentioned provided always that the payment of wages hereinbefore referred to will be subject to the Apprentice's success or failure in passing such examinations as are referred to in Clauses (c) and (e) hereinafter mentioned and also subject to a satisfactory recommendation from the Manager under whom he has served. Continued failure to pass the said examination after three successive attempts will be considered by the Firm as sufficient grounds for cancelling this agreement should the Firm consider that the Apprentice shows no prospect of fulfilling the requirements of the Firm.

II. And this Indenture further witnesseth that in consideration of the covenants and agreements hereinbefore contained on the part of the Firm the Guardian doth hereby place and bind the Apprentice and the Apprentice with the consent of the Guardian doth hereby place and bind himself with the Firm during the term aforesaid ; during which time the Apprentice shall faithfully, honestly and diligently serve the Firm and obey and perform all their lawful and reasonable commands and requirements and shall not do any damage or injury to the Firm or knowingly suffer the same to be done without acquainting them therewith and he shall in all things conduct and acquaint himself as an honest and faithful Apprentice ought to do and for the consideration aforesaid the Guardian and the Apprentice do hereby further covenant and agree with the Firm in manner following that is to say :—

- (a) That the Apprentice shall faithfully, honestly and diligently serve the Firm as their Apprentice during the term aforesaid and also that the Guardian, his executors or administrators will at his or their own expense find and provide the said Apprentice with good and sufficient clothing and all other necessities during the said term.
- (b) That if and when the Apprentice shall reside in one of the Boarding Houses hereinbefore referred to he shall conform to the rules and regulations framed by the Firm for the conduct of the said house and keep such prescribed hours as may be determined necessary from time to time and obey the instructions and orders of the matron or superintendent in charge, the Firm being at liberty to alter such rules and regulations from time to time as they may think fit and proper.
- (c) That the Apprentice shall attend the Government Technical Classes provided in the District in which he may reside the Firm allowing the Apprentice such time as may be necessary for the purpose of attending such technical classes and the Apprentice will be bound to take instruction in such subject or subjects as may be decided by the Firm in conjunction with the advice of the Government Technical Instructors as are considered desirable and necessary for the attainment of his education and he will be bound to sit for such examinations as may be held by the Instructors from time to time.
- (d) That the Apprentice will be bound to attend regular religious worship as may be provided for by the local religious bodies of which he is a member at the place and time as directed by the Firm.
- (e) That the Apprentice will be required to pass the Government examinations at least in lower (colloquial) Hindustani or Bengalee before the expiry of the third year of apprenticeship.
- (f) That the Apprentice will not divulge to any person whomsoever and will use his best endeavours to prevent the publication or disclosure of any trade secret or manufacturing process or any information concerning the business or finances of the Firm or any of the Companies set out in the said Schedule hereto or any of their dealings, transactions or affairs which may come to his knowledge during or in the course of his apprenticeship or employment and will not during such apprenticeship or employment be concerned or interested directly or indirectly nor be personally employed or engaged in any capacity whatever in or in connection with any business whatever other than the business of the Firm or the Companies set out in the said Schedule hereto.
- (g) That the Guardian and the Apprentice shall both be answerable and shall make good all loss and damage which the Firm or any of the Companies set out in the said Schedule hereto may suffer owing to the wilful neglect or default of the Apprentice.

III. And in consideration of the premises it is further hereby agreed by and between the parties hereto as follows :—

- (1) That during the said term of apprenticeship the Firm will deduct from the wages of the Apprentice hereinbefore referred to a sum of Rs. 5 per mensem and such

- sum will be credited in the Apprentice's name in a Security Deposit Fund to be opened in the books of the Firm at their Calcutta Office. The said sum of Rs. 5 per mensem and all honorariums and other sums which stand to the credit of the Apprentice in the Security Deposit Fund will bear interest at the rate of 5 per cent. per annum and will be made over to the Apprentice on his completing the full term of his apprenticeship and it is expected that the Apprentice will utilise this money for the purpose of obtaining English training or in the alternative Sibpur Engineering College training.
- (2) That should the Apprentice die during the term of his apprenticeship the amount of the security deposit standing to his credit at the date of his death together with accrued interest thereon shall be paid to his executors or administrators.
 - (3) That in the event of the Apprentice resigning his appointment before the termination of the said 4 years' apprenticeship or leaving his work without permission or in the event of his being dismissed for misconduct, irregular attendance or absenting himself without leave or Medical Certificate or becoming unsuitable for the work the whole of the security so deposited as aforesaid shall be liable to be forfeited at the discretion of the Firm.
 - (4) That the Firm shall not require the Apprentice to attend to the business or affairs of the Firm for a longer period than nine hours in each day provided always that in the event of pressure of work or unforeseen circumstances the Firm shall be entitled to call upon the Apprentice to work for greater number of hours than above referred to and also to call upon him to work on Sundays or other Holidays without any extra remuneration.
 - (5) The Apprentice shall be entitled to privilege leave to the extent of 15 days in the year on full pay and he shall also be entitled to 15 days' leave on half pay in case of sickness or production of the Company's medical officer's certificate and in reckoning the period at which the increments fall due the Firm will take into consideration any time lost by the Apprentice on account of sickness and he will be bound to make up such time before any increments will be granted to him and at the end of this agreement will make good such lost time as hereinafter provided in Clause (7).
 - (6) That in the event of the Apprentice completing to the satisfaction of the Firm the full period of 4 years' apprenticeship he shall if required by the Firm to do so work for the Firm in any capacity as instructed by the Firm on such remuneration as the Firm shall think fit subject to a minimum of Rs. 120 and maximum of Rs. 175 per month according to his qualifications and in the event of the Apprentice after the said 4 years' apprenticeship refusing to carry out the aforesaid instructions of the Firm when requested to do so the security deposit hereinbefore referred to only shall be repaid to the Apprentice exclusive of any interest that may have accrued thereon and the Apprentice shall not be entitled to a Certificate from the Firm.
 - (7) That in the event of the Apprentice neglecting or refusing to obey the orders of his superior officers or of the Firm or being guilty of any misconduct or insobriety and be convicted of any offence or committing a breach of any of the agreements herein contained or on his marrying during the continuance of the apprenticeship the Firm shall be at liberty to cancel this agreement without notice in which case all security deposit together with interest will be forfeited to the Firm. And in case the Apprentice shall through his own act or negligence contract any disease or illness which will render him medically unfit in the opinion of the Firm to perform his duties the Firm shall be at liberty to send him back to reside with his parents or with the Guardian or with such other person or persons or institutions as may be willing to receive him until such time as in the opinion of the Firm he shall be fit to return to his duties and his absence during this period shall not be reckoned as any part of the term under the apprenticeship herein and the Apprentice shall be bound to make good such lost time by continuing to serve the Firm for a further period equivalent to the said absence under the aforesaid circumstances.

BIRD AND CO.'S COLLIERIES AND WORKSHOPS.

APPRENTICES' HOME.

Rules.

1. Apprentices whose parents or other relatives do not reside in the neighbourhood of their work must reside in the "Apprentices' Home", provided there are vacancies.
2. No apprentice will be allowed to leave the house and live elsewhere, without the permission of the firm.
3. Any apprentice who misbehaves himself or makes himself a nuisance to others, on being reported, will be liable to be dismissed.
4. The Home is fully provided with furniture, crockery, linen, etc., and is under the charge of a Matron, directed by the Manager in charge.
5. The senior apprentice will be appointed as monitor, and he will see that apprentices behave themselves when in the Home and that all lights are put out at 21-30 hours.
6. A book will be kept for the purpose and the roll will be called daily at 21 hours by the Matron and no apprentice must be absent without the written authority of the Manager.
7. Apprentices residing in the Home must attend some place of worship, unless they are unable to do so by reasons of illness or other unavoidable cause as directed by the Manager, and the Matron will record such attendance in the daily register.
8. No dogs are allowed in the Home, nor are apprentices allowed to keep pets or animals of any sort without the permission of the Matron.
9. No apprentice will be allowed to be absent for the night without obtaining previous permission from the Manager.
10. Servants attached to the Home must not be sent out on private errands without the permission of the Matron, nor must they be abused or ill-treated. A breach of this rule will be recorded against the culprit, and, if repeated, will be met by severe punishment. If an apprentice has cause to complain of any of the servants, he must report the matter to the Matron of the Home at the time, but on no account is he to take the law into his own hands.
11. No spirituous liquor will be allowed to be brought into the Home by any one.
12. In the event of any damage done to crockery, furniture, etc., belonging to the "Apprentices' Home" through carelessness on the part of any apprentice, the cost thereof will be paid immediately by the apprentice, and in default, the same will be recovered from any sum due to the apprentice in his Deposit Account.
13. Meals will be served as follows :—
 - Chota Haari.*—Bread, butter and tea at 6-15.
 - Breakfast.*—Meat, curry and rice and bread at 12 noon.
 - Dinner.*—Meat, vegetables, bread and pudding at 17-40.
14. Any apprentice absent at these hours for meals will have to go without, unless he is unavoidably absent, in which case he will advise the Matron.
15. On Dhubie-day the monitor must assist the Matron in checking the clothes going to and coming from the wash.

When clothing is lent to another apprentice and is dirty, it should be put into the bag of the apprentice who owns the article of clothing.

Apprentices are not allowed to give or receive any articles direct from the Dhoobie. This must be done through the Matron.

(1) HON'BLE MR. J. DONALD, I.C.S., Secretary to the Government of Bengal, Financial and Accounts Department. (1) Hon. Mr. J. Donald.

(2) MR. J. A. L. SWAN, I.C.S., Secretary, Board of Revenue, Bengal.

(2) Mr. J. A. L. Swan.

(3) MR. A. R. MURRAY, Member, Provincial Industries Committee, Bengal.

(3) A. R. Murray.

(4) MR. G. H. W. DAVIES, I.C.S., officer on special duty, Industries, Bengal.

(4) Mr. G. H. W. Davies.

They were examined orally in a conference the proceedings of which are confidential.

WITNESS No. 188.

MAJOR A. T. GAGE, I.M.S., Director, Botanical Survey of India.

Major A. T. Gage.

WRITTEN EVIDENCE.

The scientific staff of the Botanical Survey of India consists of a Director, an Economic Botanical Survey Botanist and two Indian assistants. The same officer who, under the Government of India, is Director of the Botanical Survey and is in administrative charge of the Industrial Section of the Indian Museum is, under the Government of Bengal, also Superintendent of the Royal Botanic Garden, Calcutta, of the other Gardens in Calcutta, of the Lloyd Botanic Garden, Darjeeling and of Cinchona Cultivation and Quinine Manufacture in Bengal. His multifarious administrative duties in connection with those posts afford him few or no opportunities for research work either apart from or in common with the Economic Botanists of other departments.

The two Indian assistants are fully occupied in classifying and identifying the vast collections of herbarium specimens that have accumulated during the last thirty years and that are constantly being added to. Although incidentally those systematic assistants may be able, within limits, to aid in the elucidation of the systematic side of any economic enquiry, it is essential for the primary purpose of the Botanical Survey that their work should be determined by purely systematic and not economic considerations.

The Economic Botanist is in executive charge of the Industrial Section of the Indian museum. His main work at present is and, for some time to come, must be concerned with the improvement of the public gallery of that section, although, for the time being at least, subsidiary to this work, economic investigations take up part of the Economic Botanist's time. As experimental cultivation on a practicable scale is not possible those investigations are limited to the systematic or literary aspects of an enquiry. They are none-the-less valuable on this account and often are of direct commercial importance, as, for instance, in the identification of spurious seeds wholly or partially substituted for genuine ones, or in the identification of the source of a dye, or a gum, or a tanning agent, or such like.

The question as to what can be done to correlate the activities of the Botanical Survey Department with those of the various Economic Botanists in the Forest and Agricultural

Departments therefore reduces itself to an examination of the relation of part of the work of the Botanical Survey Economic Botanist to that of the botanists of other departments. Stating generally, there always has been correlation—mostly unofficial but none the worse of that—between the botanists of the Forest and Agricultural Departments and the Botanical Survey. The Forest Botanist has made considerable contributions to the collections of the Botanical Survey. The contributions from the Economic Botanists of the various agricultural departments have naturally been rather less as their opportunities for collecting have been fewer. On the other hand the staff and the collections of specimens, books and drawings of the Botanical Survey have always been free for consultation by the Forest and Agricultural Botanists and have frequently been consulted by them.

When a Forest or Economic Botanist undertakes an investigation it is usually with a direct practical aim in view, such as the discovery of the cause or causes and prevention of the deterioration of a forest crop, such as *sal*, or the improvement in the yield of some agricultural crop such as wheat, cotton, sugar, indigo, etc. The enquiry is usually one mainly of scientific experiment involving cultivation and field as well as laboratory observations. On that side of an enquiry the Economic Botanist of the Botanical Survey could give little or no aid nor is his aid required. In the course of such investigations, however, questions of species distinctions, nomenclature, and such like may arise. The investigator may be quite competent to deal with such questions but may not be able to afford the time to study them, or may lack the specimens and literature necessary to thresh them out, or the investigator may distrust his competence to deal with that side of his enquiry. In either contingency the Economic Botanist of the Botanical Survey could render aid as he would be likely to have all or most of the specimens and literature required at hand. As an instance of what is meant I may state that when Mr. Maxwell Lefroy came out to India recently in connection with sericultural work he appealed to me for aid in identifying the various species of plants used as food by the silk worms. I instructed the Economic Botanist of the Botanical Survey to discuss at the meeting of the Board of Agriculture—then about due—with Mr. Lefroy direct the difficulties of the latter and to endeavour to clear them.

I presume it is not expected, and I would not consider it advisable from either the scientific or the official standpoint, that the botanists of other Departments should necessarily share every investigation with the Economic Botanist of the Botanical Survey. It should suffice for them to know—as most if not all of them already do know—that any aid that the Botanical Survey Department may be able to afford them is at their disposal at any time.

If more official semblance in co-operation is considered necessary it should not be difficult to evoke it. The Economic Botanist to the Botanical Survey is a member of the Board of Agriculture, of which the various other Economic Botanists are also members or at least could attend the meetings thereof. During the period that the Board of Agriculture holds its meetings it should be feasible for the various Economic Botanists to discuss their various programmes and problems and to arrange for the best disposition of the research work in connexion therewith. The Forest Botanist is, I believe, not a member of the Board of Agriculture but that should not preclude him from discussing with the Economic Botanists problems that may affect both his and their work in common.

As regards the question as to whether further work like that done in the Cinchona Plantations can be organised for other drug yielding plants I am of opinion that it could. A certain amount of such work is already in progress. Emetine, one of the alkaloids contained in *Psychotria Ipecacuanha*, a small plant belonging to the same family of plants that yields quinine, is practically a specific for amœbic dysentery. As this disease is common in the tropics and sub-tropics the desirability of ensuring a supply of the curative drug requires no advocating. The plant was introduced into India some forty years ago and has been in existence on the Government Cinchona Plantation, Mungpoo, in the Darjeeling District, ever since. It is only, however, within recent years that sustained efforts have been made to cultivate the plant with a view to the ultimate extraction of the alkaloid on a commercial scale. Thanks to the unremitting care taken by Mr. P. T. Russell, the Manager of Mungpoo Plantation, there are now about 100,000 plants in existence on that plantation and large annual additions to the stock are assured so that in a few years time it should be possible to manufacture emetine in the quinine factory on a commercial scale. Other drug yielding plants that have recently been experimentally and successfully cultivated either on the Cinchona Plantation or in the Royal Botanic Garden, Calcutta, are *Hyoscyamus niger* and *Digitalis*. Merely from the cultivation point of view a considerable number of drug yielding plants could be grown in some or other of the various regions of India, such as *Chenopodium anthelminticum* (oil used in Hookworm disease), *Taraktogenos Kurris* (oil used in treatment of Leprosy), *Strychnos Nux-vomica* (yields Strychnine), *Carum copticum* (yields Thymol), *Cassia acutifolia* or *C. angustifolia* (yields Senna), etc. Given the necessary staff and equipment it should be quite feasible to undertake the systematic cultivation of any or all of these species and the improvement, where desirable, of the quantity or quality of the yield.

ORAL EVIDENCE, 18TH JANUARY 1917.

Mr. C. E. Low.—Q. How is the programme of the Economic Botanist laid out in your department?—A. Well, it is practically made out by him and myself in consultation together. Of course the programme is usually made up so as to avoid conflicting with the programmes of the various Economic Botanists. Their work we know more or less; we know what they are going to take up.

Q. What principles are followed in laying it out; what subjects do you ask him to take up?—*A.* The subjects practically speaking are those which are not taken up by any of the other departments. That reduces it to a rather small number of subjects. There are very few which they do not take up, but the chief will be medicinal plants. These so far have not been taken up to any great extent by any other department although I noticed in the last programme of the Forest Department that the chemist was investigating such things as Strychnine and Brucine, etc..

Q. Does the Economic Botanist take up this question of gathering plants from the chemical point of view, or from the point of view of improving the yield?—*A.* Neither of these in fact; he scarcely has the time or the equipment to deal with yields of drugs. In order to do that it means that you must have a considerable amount of land at your disposal for experimental cultivation. He has none of those opportunities. His work is mainly—as indicated in my note—on the systematic and literary side.

President.—*Q.* No experimental work at all?—*A.* Practically no experimental work. There is no land available.

Mr. C. E. Low.—*Q.* He sees to plants that are likely to grow?—*A.* Yes, to a very limited extent. We could set aside small plots of land down at the Botanical Gardens at Sibpur, quite enough to judge whether they could be grown with fair ease in the climate of Bengal.

President.—*Q.* I suppose he is a sort of Economic Intelligence Officer?—*A.* Yes. He is that primarily.

Q. Then if you attend to any one of your six big duties have you any time left for research work?—*A.* I have practically no time at all.

Q. And whatever activities you can spare must be concentrated on this part of India?—*A.* Yes.

Q. So that, from the point of view of your department, you cannot do much more than take an intelligent interest in other parts of India?—*A.* That is about the limitation.

Q. And from the point of view of pure botany, would there not be enough work of a valuable kind for a staff very much larger than you have got?—*A.* There would.

Q. You have got a small number of botanists including yourself scattered about in other departments in India?—*A.* Yes, taking all the other departments in India, we certainly have. Within the Botanical Survey we have only two other men exclusive of myself. We have practically no time for active research work.

Q. Does it not strike you as undesirable that they should be scattered about?—*A.* It would certainly tend to greater economy of effort if there were some central co-ordinating organization.

Q. There are two ways of dealing with any scientific subject that you want to turn to economic account. One is classification from the point of view of the subject itself having sub-divisions devoted to their economic aspects; the other is forming a series of departments, to which the subject applies, and providing your establishment within that department; for instance, in the case of Forests they have their Forest Botanists of sorts, and it strikes one that the other classification is quite worth considering, namely, that you should have a big Botanical Survey containing all the reasonable varieties of botanists that you can afford and then spare your officer for the application of their products to agriculture and the forests?—*A.* What was practically that suggestion was submitted to Government a few years ago by the Board of Scientific Advice.

Q. What happened?—*A.* Government accorded the scheme its sympathy but it has remained at that.

Q. They did not send it to the Royal Society?—*A.* No, not to the best of my recollection.

Q. You are still of opinion that it would be better to organise the botanical services in India, on lines not exactly similar but nearly so to that adopted by the Geological Survey?—*A.* Practically so; that is the opinion that was given several years ago by a Subcommittee of which, if I recollect aright, you yourself were a member.

Q. We have met a case of this kind on our travels. We found at Pusa two Economic Botanists who were doing mainly pathological work, Dr. Butler and his assistant, and the assistant was devoting his energy to forest questions. That is a case in which no harm was being done, and it did not matter as he was doing good work, but it shows that even a botanist under the Agricultural Department can be used for botanical work under the Forest Department. There are therefore no reasons why a botanist of the Botanical Survey should not devote his energies to botanical research, to agriculture or anything else?—*A.* No reason whatever. He should not be averse to taking up any problem that turned up.

Q. In regard to publication it has been suggested to us that if the whole of the botanical output in India were issued under one department, not necessarily under one publication, you could issue the whole of the botanical output of India under one department, and then the papers that have direct application to agriculture could be reproduced in whatever agricultural journals they may be, and those on forests could be reproduced in the Forest Department publications. There would be no harm in duplicating a paper but there would be very great harm in not finding a paper when wanted. It has been suggested that it would

be an advantage if the whole of the botanical publications were gathered under one head. That would be the authority for the whole of India. Do you think there would be an advantage in that?—A. I decidedly do. I said something to that effect in the Indian Science Congress held last year.

Q. Your paper was published in the Asiatic Society's Journal?—A. Not in *extenso* but a short resumé.

Q. You have not referred to this question specifically in your note?—A. I endeavoured to confine myself to the matters put before me for opinion.

Q. We should be very glad if you could give us a note * on the subject for our own published record, i.e., the organization which you consider to be desirable, not only in nature but also in science, for the prosecution of botanical research in India, with reference to its application to economic botany. That would help us a great deal, because I have my own ideas on this subject?—A. Yes.

Q. If you had a botanical paper which bears on agriculture, it would be the duty of the Agricultural Department to republish that paper in its own publication?—A. There is one objection; if the Agricultural, or any other department, are going to reproduce it, it amounts to duplicating the whole thing. Why not have one distribution list to everyone?

Mr. C. E. Low.—Q. You meet a man like Mr. Leake, who has been doing some work on crossings of cotton. He does not publish it in the "Agricultural Journal in India," because the ordinary people who read that publication would not be interested in it, as it has no practical bearing on agriculture; don't you think that a good many men among the Economic Botanists in the Agricultural Department, who are doing work of that sort, which either does not see the light at all or only in papers outside India which would be collected and published and read in India; if you had some journal devoted to publications of this sort would that not be desirable?—A. I quite agree with you. There is always the conflict between a man's outlook and his own department. It may be better from his own point of view to publish in European journals than in an Indian one.

Q. If we can make an Indian journal so representative in character that it would pay a man to publish in it, because as far as technical publication is concerned, publishing in the Geological Survey paper is as good as publishing in any paper in the world, it gives the journal a purchasing value by exchange?—A. As regards such a publication as the "Journal of Indian Agriculture," that has a relatively more restricted circulation. There are the Memoirs of the various Agricultural Departments, which have a circulation to a very great extent duplicated by the publications of the Botanical Survey Department. If it is intended to publish and then reproduce, you have a double distribution.

President.—Q. If you made a discovery of botanical value and published it in one of the publications of the Agricultural Department and somebody else were later on to make the same discovery and publish it in a recognised journal, the other person would have a claim to its benefits; but if you had a publication which was recognised and you published that discovery there, it would obtain precedence at once. That, of course, from a scientific point of view, is as important as taking out a patent and advertising it?—A. (No answer).

Mr. C. E. Low.—Q. Do you think as a matter of fact that botanists outside India are interested in the Memoirs of the Agricultural Department?—A. I should not think so, except so far as the papers are of general botanical interest.

President.—Q. We also noticed this at Pusa, that Dr. Butler had published practically the whole of his work in the German tongue and that even his specimens were stored in Berlin. Do you consider that that was right?—A. It is rather difficult to see what he could do otherwise. The authorities on the subject were German botanists. There is no one within the British Empire who was quite capable of collaborating with him in the same way.

Q. That is a very special case and even if you had a botanical journal established in India you would think twice before you refused him permission to publish elsewhere?—A. That was practically the only way of getting his paper published at all, as he was collaborating with these botanists. The German publication is about the only publication of its kind.

Q. If this Botanical Survey was organized on the scale you consider necessary you would be keen in having together in the same department the economic as well as the scientific department?—A. I adhere most certainly to the view already expressed to Government by the Board of Scientific Advice. It should have a staff of at least eight officers; eight higher trained men and about as many assistants.

Hon'ble Pandit M. M. Malaviya.—Q. How long has this Survey been in existence—the Botanical Survey—when was it first organised?—A. As a nominal Botanical Survey, it was started in 1891 or thereabouts.

Q. When do you think it was really organised?—A. It never has been, properly speaking.

Q. Has the staff that you mention, the scientific staff, been the same staff from 1891?—A. The staff has practically remained the same. The real, actual, working staff, when it was first started, consisted of the Superintendent of the Royal Botanical Gardens who was given the designation of "Director of the Botanical Survey," so that he might be able to advise the Government of India direct upon botanical questions. It made not the slightest difference to his work or his staff, his appointment as Director being purely an honorary

* *Vide Additions*

ope. Under him as Superintendent was the Curator of the Herbarium. Both he and the Curator are officers, so far as their pay is concerned, of the Government of Bengal, and they were not allowed to travel outside of Bengal and Assam without special permission. To all intents and purposes the Botanical Survey was more or less a nominal thing. You will find in the official lists about that time such officers of the Botanical Survey as the Officer in charge of the Botanical Survey of Northern India, and the Government Botanist, Madras, and I fancy the official designation of the officer in Bombay was the same. They were all associated, and were called the Botanical Survey of India, but it existed only on paper.

President.—*Q.* You are practically the same as you were in the beginning of the last century?—*A.* In some respects it was even less at the end of the century than it was at the beginning. Somewhere about the fifties, there used to be an Assistant Curator of the Herbarium, as well as the Curator of the Herbarium. He was got rid of.

Hon'ble Pandit M. M. Malaviya.—*Q.* Fairly, this ought not to be called the Botanical Survey. It does not deserve that high designation?—*A.* I have no objection to its being called the Botanical Survey of India. The only fault is that it is understaffed.

Q. What is the duty of the two Indian assistants?—*A.* They are chiefly concerned with working up collections made in various parts of India, either by themselves or by officers of the Botanical Survey. What education have they received?—*A.* They are University-trained men.

Q. Have they received special training in botany?—*A.* They have all gone through a course of training in botany, either in Madras or Calcutta.

Q. Have you the training of Indian assistants to higher offices in future as one of your objects?—*A.* Yes, so far as the limited opportunities afford, but this is mainly for some time in the future, because the organisation of scientific teaching in India will require to be much more thoroughly developed than it is at present before Indian trained men are quite able to take the place of officers who have had a training in the schools of Europe.

Q. Do you think that in view of the future requirements of the country a certain number of such students should be sent abroad to complete their education?—*A.* I think instead of exporting students from India, in order to obtain education abroad, it is possible to get that education in India by improving the quality of the education in this country.

Q. How do you think that could be done?—*A.* I am afraid I cannot give a satisfactory answer to that question, on the spur of the moment. I have very little to do with educational matters.

Q. You will agree that provision should be made for the better teaching of botany in this country. Don't you?—*A.* Yes, it ought to be.

Q. About this manufacture of drugs, is there any systematic work being done, except what you have mentioned, in the way of planting cinchona and manufacturing quinine?—*A.* Not what I would call systematic. There have been certain sporadic attempts to grow medicinal plants but there has been no co-ordination in the work and no means of judging it on a scientific basis.

Q. Neither is there any machinery for providing the starting of manufacture on a large scale?—*A.* Not as far as I am aware.

Q. In view of the requirement of drugs in India, do you think there should be a fairly adequate establishment to judge what can be done, and see it done properly?—*A.* Before I could answer that question I should like to have some idea of what the demand for drugs in India is at present. I am in complete ignorance of that.

Q. Can you not form an idea of that demand from the reports you receive of the requirements of hospitals in the various parts of the country and the importation of drugs from foreign countries?—*A.* As a mere matter of cultivation, a good many of these plants could be cultivated in India. But whether they could be cultivated commercially, so as to compete with drugs at present imported from abroad, I do not know.

Dr. E. Hopkinson.—*Q.* Does not that come within the functions of the Economic Botanist?—*A.* Not the commercial side. He is not competent to deal with that point.

Q. Not even to ascertain what the demand would be?—*A.* That is no part of his functions; he could ascertain it but I do not consider it as part of his functions to go into the commercial aspects of the matter.

Q. Then it is no one's function at the present time?—*A.* At present there is no organisation in India which can bring together the various factors which have got to be considered in starting any industry based on plants or their products.

Hon'ble Pandit M. M. Malaviya.—*Q.* The Economic Botanist is concerned only with finding out what he can about certain things in his own way. There is no organised attempt to find out what drugs ought to be grown and what manufactures can be made out of those drugs?—*A.* None that I am aware of. There is a body, of which I am a member, called the Indigenous Drugs Committee, but it is a perfectly hopeless body. They find nothing or next to nothing of any real value.

Q. Does it ever meet?—*A.* I am a member of it. It is several years since they had a meeting that I know of.

Q. Is that constituted in Bengal?—A. It is under the Government of India.

Q. When was it constituted?—A. About a quarter of a century ago.

Q. How long have you been a member of that body?—A. Ever since I have been Director of the Botanical Survey about ten years.

Q. And you have never been called to attend a meeting of that Committee during the ten years?—A. I have attended several meetings.

Q. What is the nature of the work it takes up?—A. It takes up, say, one particular drug which is reputed to be a cure for some particular disease or diseases. It writes to the Medical Storekeeper, or some other officer from whom the drug can be obtained, to arrange to distribute it to various people who may or may not be competent to deal with it, and who for lack of laboratory appliances in most cases could not adequately find out the physiological reactions of the drug.

Q. There is no organisation at present to take up this important question?—A. I am not aware of any organisation that works in an efficient manner.

President.—Q. Would you put any of your proposals before the Indigenous Drugs Committee before you moved in the matter?—A. No. I would not dream of such a thing.

Q. You are aware that there are large quantities of drug-producing plants exported for the extraction of drugs at home and in Germany. These might be manufactured in this country. That would be beyond your immediate province?—A. It would. If one is going to investigate such questions he would want an enormous staff.

Q. Supposing that any one exported a drug-producing plant, your Botanical Survey, if fully equipped, would take notice of that fact, and the Indian Medical Stores Department would also be conscious of it. These two would get together with a view to investigating that drug in the country. The Botanical Survey would take up the question of improving that plant, or finding out more about its habits, etc., while the Stores Department would be responsible for the manufacturing work. You imagine that there would be a good deal of valuable work in that direction by co-option of the two departments, and that is now neglected simply because it is not your business to attend to it?—A. As a matter of fact it is no use my planting those drugs if no one cares a straw, and if there is no demand for them.

Mr. A. Chatterton.—Q. Do you get any enquiries from manufacturing chemists' firms such as Smith Stanistreet & Co., and D. Waldie & Co.?—A. We have had enquiries from Smith Stanistreet & Co. about such things as atropine.

Q. The difficulty experienced was to get any one who has sufficient botanical knowledge, and sufficient knowledge of cultivation of these plants, to undertake to look after the plantations in which to grow them. Is there any one in the Botanical Survey capable of doing that work?—A. Merely as regards the qualification of the officers it could be done, but as far as their actual time is concerned we could not possibly do it.

Hon'ble. Pandit M. M. Malaviya.—Q. As the President has reminded you, a lot of medicinal drugs are exported out of the country. Do you know that a lot of these used to go to Germany and is it a fact that Burroughs, Wellcome & Co. import a lot of drugs which had been manufactured in Germany to be used in England?—A. I do not know anything about the activities of Burroughs, Wellcome & Co.

Q. Do you know that since the war began there has been a shortage in the supply of medicines to India and the pinch has been felt in almost all the hospitals in the country?—A. I am aware generally speaking that there has been a shortage of drugs.

Q. Don't you think in view of the large plantations and of the large variety of medicinal drugs which can be grown in the country there ought to be a demand that some one should make it his business to see what medicinal drugs should be grown and what medicines can be manufactured in this country?—A. That certainly can be done and should be done. If we get the Botanical Survey sufficiently staffed, we could undertake the botanical side of it but in order to find out the best way of extracting the active principles from such plants we would require a pharmacist, or a chemist, or both.

Q. It may require co-operation between two or more departments or several departments as the problems are so interconnected, but you think that there should be provision made for the study of these drugs, and for their plantation, and for the manufacture of medicines from them?—A. I certainly think there ought to be some means of discovering how to make the best use of the medicinal plants we have or which could be cultivated in this country.

President.—Q. In your view it opens up a big field?—A. It opens up a considerable field.

Dr. E. Hopkinson.—Q. Was the Economic Botanist appointed with the specific purpose of becoming Curator?—A. Not nominally so; in order to explain that I would have to go back to the history of the case. The department in the Indian Museum, the Industrial Section, was under the Trustees, and the same officer who was Reporter on Economic Products was also in charge of the Industrial Section. As his work increased, it was found impossible for him to do it all. Consequently the necessity was discovered of having a Curator whose business it would be to look after the Industrial Section. The gentleman who was appointed as Curator was a Chemist and actually had nothing to do with the Industrial Section as far as the public collections were concerned. When Government decided to abolish the Department of Economic Products, and amalgamated it with the Botanical Survey of India, the question arose of giving a proper designation to the officiating Reporter on Economic Products. He could not be

called Curator of the Industrial Section chiefly because there already was a Curator of the Industrial Section, although the official Curator did not do curating but did chemical work; consequently, at the suggestion of the officiating Reporter on Economic Products, the designation given him was Economic Botanist to the Botanical Survey of India. The designation I would have suggested was Curator of the Museum which was a designation selected by the Board of Scientific Advice, but owing to the difficulty of there being a Curator who was still on the staff, we had to adopt this designation "Economic Botanist to the Botanical Survey," but I regard his Economic Botanical work as merely subsidiary to his work of improving the public collections and making them an educational museum. He can only have a small amount of his time devoted to economic research.

Q. How is it that the Economic Botanist, otherwise the Curator of the Industrial Section of the Museum is also the principal member of your staff?—*A.* He is, because he was transferred on the abolition of the Department of Economic Products, the only officer in the Botanical Survey before that time being the Director, except nominally those who are in various parts of India. In the official list you will see Mr. Leake put down as an officer of the Botanical Survey. He has nothing to do with it in any way.

Q. I suppose there is a Botanical Survey of India still going on?—*A.* So far as the limited staff will permit it.

Q. It consists in the receiving of specimens at the museum and putting them in the herbarium?—*A.* Yes, that is a considerable part of the activities of the department, and takes up a good part of the time.

Q. There is no field work going on?—*A.* Oh, yes.

Q. Whom do you send out; you have only the two Indian assistants to send out?—*A.* We have also the Economic Botanist who goes out.

Q. But he is tied hand and foot in the museum?—*A.* We release him for the time being and send him out.

Q. The museum cannot walk away?—*A.* No, but he can for the time being. We have practically the three men who are available, the Economic Botanist and the two assistants, but they can only go for a limited period.

Q. Is there any relation between the herbarium in the Indian Museum, and the herbarium at Pusa, or do the two things go on quite independently?—*A.* Quite. We have nothing to do with each other.

Q. Pusa knows nothing about you?—*A.* Oh, yes; because practically all the Economic Botanists in India have sooner or later to visit at the Botanical Gardens and consult the Herbarium.

Mr. C. E. Low.—*Q.* Do you know anything about the herbarium they are making up at Nagpur?—*A.* I have never seen it.

Q. Have any plants been sent to you for identification?—*A.* Oh, yes; from all the Economic Botanists all over India.

Dr. E. Hopkinson.—*Q.* What do you consider to be the principal function of the Botanical Gardens?—*A.* The principal function, of course, as far as actual use is made of it, is to provide a place for the people of Calcutta to have a pleasant picnic!

Q. But has it any other functions?—*A.* Oh, yes. It was started with a very definite purpose in view. It was started in order to try some plants which were at the time of its establishment of great importance, such as the variety of spices in the Eastern Island, and also for the experimental cultivation of timber trees, such as teak. In fact at the beginning of the last century a considerable area of the garden was teak plantation, but although at its start its main function was economic, it very gradually has come about that there is no longer any such necessity for spending most of its energies on the economic side of things, and it is now purely a scientific institution.

Q. Is any experimental cultivation going on now?—*A.* Practically none. There is no call for it. It would be merely wasting our energies to do with our depleted staff what the staff of the Agricultural Department can better do, because they have more ground at their disposal.

Q. Is it intended to serve an educational purpose?—*A.* Yes.

Q. What means are taken to that end?—*A.* You mean in the way of providing guides.

Q. Yes, and having suitable catalogues?—*A.* We have, as far as possible, named the trees with their scientific names. I myself published several years ago the first part of a comprehensive catalogue. You can go round the garden and get the names of any plant in the garden simply by looking at the number on the tree, and looking at the book.

Q. Is that catalogue out of print?—*A.* I am not aware of it. The guide book is out of print.

Q. I personally made several efforts to obtain something in the nature of a guide book but could not obtain one. The only thing I could get was a map showing the means of exit?—*A.* Undoubtedly that side of it could also be greatly improved but that is a very slow process.

President.—*Q.* What is the area of the garden?—*A.* About 270 acres.

Dr. E. Hopkinson.—*Q.* You think that the garden notwithstanding that it is so remote from Calcutta might serve a really useful educational purpose?—*A.* Undoubtedly.

Q. And it is only a question of staff?—A. And funds.

Q. Are there funds obtainable for such a purpose?—A. I am afraid not. We have just enough to scrape along.

President.—Q. Are the expenses met by the Bengal Government?—A. Yes.

Q. Do you still publish reports of the Botanical Survey?—A. Yes.

Q. Are they issued regularly?—A. No, just as we find material.

Q. And the Memoirs?—A. No, the Annals. That is a Garden publication. The report is a Botanical survey publication.

Q. Is there any special reason except past custom that you should stick to the word "Botanic" for the "Garden" and "Botanical" for the "Survey"?—A. It is simply history or tradition. It was originally called "Botanic."

Dr. E. Hopkinson.—Q. You have explained why the Economic Botanist of the Botanical Survey can be a member of the Agricultural Department, but why do you suggest that more co-operation is necessary?—A. I think the question was put to me as to how the activities of the Botanical Survey Department could be correlated with those of the botanists of the Forest and Agricultural Departments. If official reciprocity is required I said that, as a matter of fact, nothing more is required. We do co-operate, and I think I have cited instances of it.

Q. Do you mind taking the particular case of Emetine; who first discovered that Emetine was contained in the particular plant you mention?—A. I am afraid I cannot tell you that. It was a considerable number of years ago. I can quite easily find out.

Q. But having been discovered, who then proceeded to show that the plant could be grown in a particular district?—A. That was in Sir George King's time. In the early seventies Mr. Lister brought out from Edinburgh a collection of plants which I think had originally been got through Kew from South America to Calcutta. They were experimented with for several years in the Botanical Garden, where it was found that they were not doing very well, and were sent up to the cinchona plantation, and have been there ever since.

Q. With whom did it rest to push the cultivation to ensure sufficient production of the drug?—A. It rests in the long run for me to push, but it is no use for me to push it unless I get some assurance that it is going to be made use of.

Q. Whose business is it to inform you that it is required and is of therapeutic use?—A. I do not think there is any organization for me to be informed. It would probably depend upon the initiative of some officer like Sir Leonard Rogers, who would refer the matter to Government and Government would write to me.

Q. Where would you cultivate it?—A. On the cinchona plantation.

Q. Supposing the area available in the cinchona plantation was insufficient, is it the business of any department of Government to take it up further? Have you done all in your power to do?—A. It would have to be taken up in the same way as this extension of quinine. I could be put on special duty. If it were necessary to extend, some similar measures would have to be adopted.

Q. The quinine factory is under your control?—A. Yes.

Q. If you saw good reason to do so, you would follow a similar course in regard to ipecacuanha?—A. Yes.

President.—Q. There is another cinchona plantation in the Nilgris?—A. Yes.

Q. Is that under your charge?—A. No.

Q. You have no say as to whether that has been worked properly or otherwise?—A. Not officially.

Q. Have the Madras Government got a staff in charge of that cinchona plantation?—A. Yes, they have a staff.

Q. Do they manufacture cinchona there?—A. They manufacture quinine and other alkaloidal salts.

Q. Supposing you had perfected your plant here for the manufacture of quinine, or had found out the very best way of growing the cinchona for that purpose, your improvements here would not necessarily be applied at once in the Nilgris?—A. Not necessarily.

Q. And only by the merest friendly co-operation or fluke it would be; there is no official translation?—A. No.

Mr. A. Chatterton.—Q. Might I ask you if you were consulted about the appointment of Mr. Wilson?—A. I was unofficially consulted.

Q. Have they appointed a botanist?—A. Yes.

Q. Is that a larger plantation than the Bengal one?—A. No. It is much less. There are two plantations in Bengal 40 miles apart. One covers 15 square miles and the other 11 or 12. We have actually under cinchona about 8,000 acres.

Q. Have you got a factory for extracting the alkaloid?—A. Yes. We have a factory that can turn out about 50,000 lbs. of quinine per annum.

President.—Q. There might be cases of plants being grown in the Nilgris, more efficiently than in the Darjeeling area; therefore if the two plantations were directly under the Botanical Survey, work of that kind could be better done?—A. I think.

Q. This present divided system you think has no advantage at all?—A. The two departments are apt to take provincial views. After all the production of quinine is an imperial question.

Mr. A. Chatterton.—Q. Do you advocate the establishment of similar Government plantations for producing drugs of medicinal or economic value?—A. I am inclined to leave that an open question. I have not sufficient data to form an opinion on that point.

Q. There is a considerable amount of secrecy exercised by people who are growing drugs?—A. If it were possible, it would be better if the cultivation of most of these drugs could be taken away from private enterprise.

Q. The difficulty, I understand, in private enterprise is that it is a very risky thing to start the cultivation of drugs, you do not know whether you are going to get a market for it. I know of one or two instances in which drugs are being cultivated with extreme secrecy. The only idea is that they may be able to command a market to make money out of it?—A. The question would require to be considered far more than I have been able to do as to whether any particular drug should be taken up by Government.

ADDITIONAL WRITTEN EVIDENCE.

NOTE ON THE ORGANISATION OF ECONOMIC BOTANICAL RESEARCH IN THE INDIAN EMPIRE BY MAJOR A. T. GAGE.

(Submitted after oral examination.)

The problem of determining the most suitable organisation for the prosecution of economic botanical research in the Indian Empire is by no means easy to solve.

Organisation of
economic botanical
research.

Were the question concerned only with the purely scientific sides of botany, as morphology, classification histology, physiology, chemistry of plants and plant products and such like, the best solution would be to form a central organisation for the Indian Empire. Of course even in purely scientific investigation centralisation is limited by practical considerations, mainly political and geographical. An official Botanical Survey—even if confined to purely scientific investigations—for the British Empire would be an impracticable proposition. Within the Indian Empire there are no obvious political hindrances to a central organisation for purely scientific research while the very different physical—in a wide sense—conditions in the various parts of India and Burma would be merely incidental factors adding interest to the investigations themselves but not materially affecting the organisation for carrying them on. A properly staffed and equipped Botanical Survey could investigate along any or all of the lines mentioned above equally well the vegetation of the Rajputana deserts or of the mountains of southern Burma.

When the economic aspects of botanical research in their relation to agriculture, forestry, horticulture and such like enter into the problem, the practical limitations that affect the scope of centralisation of pure scientific research not only become more restrictive but are reinforced by others.

Were the area concerned of small or only moderate extent, did it form a single political entity, were its physical conditions more or less uniform and its population more or less homogeneous, undoubtedly a central organisation could conduct effectively both purely scientific and economic botanical investigations. The Indian Empire presents very different conditions. It is of immense extent with enormous variations in physical conditions; it is divided into more than twenty politically separate provinces and States, and it contains a great variety of races with different languages, habits and ideas.

Now while in purely scientific investigations these factors are mostly merely incidental, in economic questions affecting agriculture and forestry they may be and often are of great practical importance. These political economic and social conditions are so numerous, varied and complex that I doubt very much whether a single central self-contained organisation could gain and retain such an intimate knowledge of them as to enable it to direct with efficiency throughout the Indian Empire researches for which such knowledge is indispensable.

It is true that a central organisation deals or attempts to deal with all branches of geological research throughout India and Burma and the confines thereof. It does not however necessarily follow that what may be the best possible means for conducting all lines of research in one science is also the best for another. A comparison of botany with geology, as far as the economic aspect of research is concerned, holds good only to a limited extent, for the element of time and physical, climatic, political and human factors enter more largely into questions of the former than into questions of the latter.

Let us suppose a central organisation with a large staff including a band of "economic" botanists theoretically ready to undertake any research in any part of India or Burma. A demand comes from a particular province for the improvement of an agricultural crop, and an economic botanist is deputed to that province for the work. The botanist—whether he be an "expert" in the particular crop or not—is at least well grounded in the principles of plant improvement, which are of general application. He finds, however, that he has to supplement his scientific knowledge by acquiring a knowledge of all the local conditions, physical, climatic,

agricultural, etc., some or all of which may vary considerably within the province. He has to undertake experimental cultivation, possibly in more than part of the province, and has to keep a close and continuous watch on both field and laboratory work. If the problem is complicated as is not unlikely by chemical considerations, he has to arrange for co-ordination with a chemist. Now neither the improvement of a crop or the introduction of a new one, whether it be a field or forest crop, can be accomplished quickly. It is a work not of months but of years. Until the botanist had finished his work, it might be and probably would be difficult, if not impossible, for the central organisation to call him off to another province—even for work of the same kind—without detriment to his work in the first province. Such a contingency as more provinces calling within the same period for the same sort of work to be done than there were botanists qualified to undertake it available, would not be unlikely to occur.

Other and similar difficulties that I need not enlarge upon would quite likely arise.

An Economic Botanist of an Imperial Department would no doubt gain a very comprehensive knowledge of some crops or forest formations, but it would be offset by his ignorance of others. It would be impossible for each and all of the Economic Botanists of a centralised department to gain a comprehensive knowledge of all the agricultural and forest crops of all parts of the Indian Empire, and they would tend to become a body of specialists. Specialism in itself is not necessarily an evil. According to circumstances its advantages may overbalance its disadvantages or *vice versa*. I am inclined to think that in the present case such specialism as would almost be inevitable in a huge central organisation would have more disadvantages than advantages. It would be impossible for the Economic Botanists to perform their work properly by visits from headquarters. They would have to spend their service moving from province to province, a few years in each, having to learn a fresh set of local conditions with each province. It would be difficult, if not impossible, for them to set up permanent homes, and though this might not affect the popularity of the service while its officers were young, it would not tend to contentment later on. While nominally officers of an all-embracing Imperial department, they would in practice be under the orders of the Government of whatever province they might happen to be working in, for no central organisation could afford to ignore the wishes of provincial Governments in regard to the Economic Botanists' work.

Provincial research establishments.

The alternative scheme is for each political division to have its own staff of economic botanists. The advantages would be that the botanists in any particular province would after once gaining be in a position to retain a thorough knowledge of all local conditions; the principles of plant improvement or of plant introduction being of general application the botanists could undertake in succession or simultaneously the study of different crops—agricultural or forest—while keeping a watch if necessary on their previous work, without having to learn a new set of local conditions; they would readily co-ordinate their work when necessary with that of the provincial chemists, assuming of course that chemical research had not been subjected to centralisation; they would enjoy a practically permanent home, a personal factor by no means negligible.

Of course a system of rigid provincial organisation is not free from disadvantages. Provincial economic botanists although having an intensive knowledge of the crops and conditions of their own province might have their usefulness impaired by lack of knowledge of crops, methods and conditions in provinces other than their own. This disadvantage could be overcome by permitting or better compelling the provincial economic botanists to visit other provinces at intervals.

If the choice lay between the alternatives of a single central organisation to deal with all economic botanical research of whatever kind throughout India and Burma or separate provincial organisations, I am of opinion that the latter would be the more practical method.

Combined Imperial and provincial research.

There is however no necessity to be confined to a choice of alternatives. It is well to recognise that both systems have their advantages and disadvantages. Both may be made to appear in theory mutually exclusive, but in fact they are not necessarily so, and it is possible to utilise both, and I think to better purpose than either alone. It has been found impracticable either for the Government of India to rule in detail the whole Indian Empire or for the provinces and States thereof to be entirely independent. The provinces are allowed to manage their own domestic affairs as far as is thought possible free from interference by the Government of India, but questions that affect the inter-relationships of provinces or the Indian Empire as a whole have to be dealt with by the Government of India. The same conditions or some of them at least that affect the political organisation affect also the organisation of scientific research, which after all is or should be part of the functions of Government. Purely scientific investigations which form the basis for all economic research would best be carried out by an Imperial department, but the great bulk of economic botanical researches in so far as they would be of local importance would most effectively be carried out by provincial organisations.

Provincial Governments and provincial officers are apt to be astoundingly ignorant of other provincial Governments and other provincial conditions and could not deal effectively with questions affecting the Indian Empire as a whole or that demand special knowledge for their solution or with researches that call for special qualifications. As instances may be mentioned the general question of the destruction of forests by shifting cultivation; afforestation problem; the cultivation of cinchona and other medicinal plants. No research in the

chemistry of plant products, such as oils, resins, oleo-resins, gums, dyes, tans, medicinal alkaloids and glucosides is of quite a special character, is independent of local conditions and could be conducted better by specialists attached to an Imperial department than by provincial chemists who would ordinarily be occupied with quite other work.

I am of opinion, therefore, that the best organisation would be—what to a certain extent already exists—provincial departments to deal with purely provincial questions and a central Imperial scientific department or several such departments to deal with general questions and special problems and to act in an advisory capacity to the Imperial Government and, if need be, to the provincial Governments as well.

The Imperial departments nominally at present in existence that deal or should deal with economic botanical questions are—(1) the Botanical Survey of India, a negligible quantity; (2) the Imperial Forest Institute, a rather less negligible quantity; (3) the Imperial Agricultural Research Institute. Centralisation being as it were the theme, I may as well endeavour to finish it by discussing the feasibility or otherwise of amalgamating those departments into one to deal with all such questions of pure and applied botanical research that could not be undertaken by provincial departments. The idea of amalgamation may be a pretty one, but I am not enamoured of it. Headquarters could not be amalgamated for the natural conditions suitable for a central Agricultural Research Institute would not serve for an Imperial Forest Institute. The task of directing research in all lines of pure botanical research and along the multitudinous branches of agriculture, forestry and horticulture would be far beyond any one man however heroic his physical and intellectual powers might be. The theoretical advantage of amalgamation would be co-ordination of work. At present this is rather limited, but the reason is not any unwillingness of the various departments, but that their staffs—especially those of the Botanical and Forestry departments—are too hopelessly small and overburdened with routine work to allow of co-ordination on any effective scale.

The Botanical Survey of India—the high sounding designation of which implies that it takes the Indian Empire for its field—has a paid staff of one European—who is also in charge of a Museum that is intended to illustrate the vegetable products of the Indian Empire, a work that would fully occupy several officers if done properly—and two Indian officers. The superior scientific staff of the Imperial Forest Institute consists of five men. There is also one Forest Research officer for the whole of Burma. All have routine work to do in addition to research. Now, considering the vast area of the Indian Empire and the exiguity of staff just mentioned to talk of lack of co-ordination as if it were the only serious defect of the present organisation would be merely to indulge in academic twaddle.

As already stated centralisation of research, like centralisation of everything else, has practical limitations, and I am of opinion that these limitations have already been reached. What is wanted is clear recognition of the facts that the Indian Empire is an immense and complicated area, that the economic potentialities of its vegetation are almost boundless, that these potentialities have little more than begun to be scientifically exploited and that there must be a liberal expenditure of capital to enable research to be undertaken on a scale commensurate with the field. There need be no fear of the capital expended not yielding a satisfactory return. The Agricultural and Forest Institutes and the Botanical Survey despite their small staffs have already proved that very effectively in connection with such subjects as wheat, cotton, *sal* and cinchona.

Once the staffs of the various departments concerned with pure and applied botanical research are sufficiently strengthened to cope with the immense field of work that still lies untouched, there will be no difficulties in effecting co-ordination. Agriculture, Botanical Survey and Forestry are all under the same department of the Imperial Government, and it should be easy to arrange for conference, free discussion and mutual help.

In regard to publication of the results of research I am of opinion that complete centralisation of publications is as impracticable and undesirable as complete centralisation of research. From the distribution standpoint some individuals or institutes would require only agricultural papers, some only purely botanical papers, some only forestry papers and some all kinds of papers, but even the last class of readers would not want the papers mixed up indiscriminately in a single publication. So, even if publication were centralised for the whole of India and Burma, there would still need to be separate sections for purely botanical papers, for agricultural papers and for forestry papers. Separate editors or editorial committees would also be necessary as no one man would ordinarily possess the qualifications to edit all kinds of papers. In short, if complete centralisation were attempted, the result would practically be the arrangement at present in existence, whereby the forestry papers are all in one set of publications, the agricultural in another and the purely botanical in a third, and whereby an individual, university or society, can obtain whatever papers may be required.

What is to be deprecated is the existence of unnecessary provincial journals. The central and provincial departments would require to possess copies of each other's publications, and it would be a gain in economy all round if there were for the Indian Empire only one set of publications for each branch of pure or applied botanical research. One difficulty is that private workers in, say, pure botany would not necessarily contribute to a central official publication for purely botanical papers, so long as mixed societies such as the Asiatic Society of Bengal publish purely botanical papers mixed up with all sorts of other papers in their journals. Another difficulty is exemplified by the publication of purely botanical

papers in a journal like "The Indian Forester," which is mainly concerned with technical forest papers. Yet there is a good defence for this procedure, for it is only by publication in such a journal that the majority of Forest officers—who are unlikely to subscribe to purely botanical journals—can readily obtain botanical information of practical use to them. On the other hand, botanists may easily overlook the existence of such papers in what is to all intents a technical journal. The remedy here would be to publish such papers in both botanical and forestry journals, which would not be difficult to arrange for.

WITNESS No. 189.

Mr. H. A. F.
Lindsay.

MR. H. A. F. LINDSAY, I.C.S., *Director-General of Commercial Intelligence.*

WRITTEN EVIDENCE.

I will try to be brief in handling a very complicated question. I am afraid the Commission cannot count on me for any expert knowledge of technical processes, and my only justification in venturing to give evidence at all is a keen interest in the broad aspects of the problem, backed up by visits to a few leading industrial concerns in the course of tours. There are some broad principles which force themselves on one's attention at the outset and I propose to record these principles as they have struck me personally. In the course of touring my principal object in visiting factories and industrial concerns generally has been, firstly, to obtain from the organisers as much information as I could get as to the difficulties with which they had to contend; and, secondly, to encourage them to state in their own words the solutions which seemed to them most feasible. For many industries in this country success and even existence mean a prolonged and up-hill fight. If anything is to be done to aid the men in the fighting line the simplest plan seems to be to find out from them the handicaps under which they are fighting and to consider not only how the actual handicaps can be removed but also—the constructive aspect of the question—what assistance is necessary to ensure progress. I wish to point out at the start, therefore, that any recommendations I have to make are based largely on suggestions personally received from business men. Finally I am afraid that, owing to limitations of technical knowledge, I am not able to answer many of the questions. I will, however, answer a few which appear especially relevant to the line taken up.

2. To state the general position first as I understand it. There is of course the broad fact that a very large proportion indeed of India's wealth is derived directly and immediately from the soil. Her exports of raw material are enormous. During the last pre-war year 1913-14, the exports classified under this head in the Trade Returns totalled over 80 million sterling; and exports under the head "Food, Drink and Tobacco," most of which are unmanufactured, were well over 40 million sterling. The class "articles wholly or mainly manufactured" amounted only to 36 millions, the total exports exceeding 160 millions for the year. It is a very real thing therefore to say that India is primarily an agricultural country; and the enormous mass of her exports of raw produce show how extremely successful she has been in this rôle. Her natural bent is agriculture. It is fostered by advantages of climate and soil; it is an occupation congenial to the vast mass of her labour forces; and it gives full scope for the employment of her indigenous capital. At first sight, therefore, one is tempted to conclude that if any special effort is to be made to assist Indian industry, it could most economically be applied to improvement along existing lines. To stimulate the development of Indian manufactures is indeed from some points of view distinctly dangerous. In the first place waste is involved, for it means a diversion of effort from congenial to less naturally congenial occupations. In the second place European examples have shown the danger of any measure tending to stimulate abnormally the exodus of labour from the country to the towns. At the same time there is undoubtedly a very general desire on the part of educated India that manufacturing enterprise should be encouraged; and the two great advantages anticipated—one, that national education cannot be complete without the technical knowledge fostered by manufacturing experience, and the second that for many manufactures, originally luxuries now necessities, India should be independent of foreign markets—seem to outweigh, and rightly, other considerations. A serious danger would arise if the establishment of Indian manufactures could only be effected by measures so artificial and expensive that the general cost of living in the country was forced unduly high and that, in consequence, the production of food grains and other raw products could no longer be effected as cheaply as they are at present. Stated in other words, if the development of Indian manufactures involved any contraction of the area under cultivation this would seem to prove that progress with manufactures had been too rapid. It is very doubtful, however, whether this danger is sufficiently close to merit being taken into account at present.

3. I now turn from the general aspects to examine in some detail the actual difficulties with which industrial concerns are at present faced in this country. Most of these difficulties are obvious, but I have ventured to try to record them all the same; for, as already stated, the first step towards effectively helping a man is to find out what his trouble is. The principal difficulties, I take it, are as follows:

- (1) Difficulties connected with the climate. The extremes of heat and cold, dryness and moisture are very great and the liability of goods to deterioration is in consequence serious.
- (2) Indian labour, although content with low wages, has yet to be educated. Although it has devised and still carries on the cultivation of crops by methods more economical, perhaps, than any yet in force elsewhere, it has not yet learnt to carry out technical processes on economical lines, i.e., without undue waste of tools and machinery, without considerable supervision and without undue deterioration of quality. A close example of this is the fact that, although Indian *gur* is an established industry and safe from any foreign competition, so far as *gur* itself is concerned, the production in India of sugar as known in the European markets is still very backward.
- (3) Indigenous capital is already actively employed in agriculture, the reason of course being that it can count on favourable conditions of climate and soil and on economical methods of management. Business organisation, however, which is essential for manufacture on a large scale, is at present lacking, with the result that capital does not come forward readily to support manufacturing enterprise. The result is that progress is extremely slow. Public capital will not come forward until it can rely on a plentiful supply of capable business managers, who are naturally themselves not forthcoming since capital is so unwilling to employ them. This is one of the most vicious of the circles which the Commission are asked to short-circuit.
- (4) Transport by land is costly. I believe I am correct in saying that railway freights are generally at low rates in India compared with the rates in other countries. But the distances are enormous. It is no consolation to a paper manufacturer who has to bring his raw materials to a convenient centre from areas up to 300 miles away, and scattered in a semi-circle 300 miles across, to know that the railway rates are even a half of those paid by the principal manufacturer of foreign pulp, with whom he is competing, if his rival has only 20 miles to go for his raw material. Indeed many Indian industries—I think the glass industry is a fair example—find it safer to entrench themselves in central Indian sites close to their raw material, where they are protected from foreign competition by the length of the railway “lead” from the nearest port. I think then that the complaint against the railways, when pressed to its logical conclusion, resolves itself into a complaint aimed not so much at the stiffness of Indian railway rates as at the length of the distances to be traversed, and the unduly high proportion borne by transport charges in the costs of manufacture and marketing. The records of this department are full of instances which will support this contention.
- (5) Another complaint which I have received is with regard to departmental rules governing concessions for the exploitation of State produce, principally mineral and forest concessions. Here there is of course a serious conflict of interests. The intending exploiter is naturally anxious to get rich quickly, while on the other hand the State must keep an eye on the future and husband its resources (especially in the case of forests). With regard to minerals, strict supervision is necessary to prevent unscientific extraction and equally to prevent concessionaires from retarding their operations in one locality in order to stifle competition and specialise on other concessions which pay them better. I have not gone into any of these points in detail as criticisms from unofficial witnesses commercially interested will doubtless be forthcoming and will be backed by better technical knowledge than I possess. Evidence will doubtless be given also on the question of excise restrictions and their effect on the manufacture of industrial alcohol. This was dealt with in the eighth resolution of the first Indian Commercial Congress held at Bombay on the 26th December 1915.
- (6) Complaints are often received against the operation of the Stores Rules. These rules, although encouraging local purchases by Government officers where quality and price are not unfavourable, fetter the discretion of purchasing officers and are for this reason criticised by manufacturers in this country.
- (7) Finally, and of course most important of all, the chief difficulty is that of competition from overseas manufacturers, producing goods on a large scale and therefore able to dump them cheaply in this country. Personally I have been very much impressed when on tour by the vitality and enterprise of many of the Indian industrial concerns I have visited. The war and high freights are of course in their favour and at present there is much prosperity. There is no doubt that industrial enterprise is spreading even in face of competition from the Japanese and others of the world's cheap manufacturers. But development, to be permanent, must be gradual, and there is one aspect of the present situation which contains to my mind elements of danger. High prices abroad and high freights have encouraged the local manufacture of many articles which have been developed extensively since the war began. In Europe many of these

industries would depend for their very existence both on the cheap supply of raw materials or partially manufactured articles and on a ready market for bye-products. Both conditions are essential to a great many industries and where this is the case one has grave doubts whether such industries can survive with a return to normal trade conditions. As a country in which manufactured and partially manufactured articles are generally dumped pretty freely India already has one advantage, that of being able to obtain cheaply many of the semi-manufactures necessary to a complete process. It is the market for bye-products which is to my mind the serious difficulty in India and one too easily overlooked.

4. I now turn to consider the suggested remedies. There will, I fear, be some inconsistency with the previous paragraph, as the difficulties experienced have not necessarily each a separate remedy. In stating the recommendations I have received, therefore, I do not propose to set off each against any one of the individual difficulties already mentioned; but will classify them for convenience on a separate line, namely, according as they involve more or less direct Government interference with Indian industrial enterprise, taking first the proposals which seem to involve the greatest interference. At this point I wish to draw attention to what appears to me the radical principle underlying the whole problem. What Government are after, I take it, is not merely to create a number of industries and then to arrange the conditions in such a way as to ensure their continuance. Such a course is undoubtedly possible, if only sufficient revenue is forthcoming. To my mind, however, a solution on these lines would be disastrous. The cry for assistance to Indian industries arises surely from a very real and intelligible craving for business training, business experience and the business instinct which both will produce. To imagine that India merely wishes to be able to point to a number of subsidised factories and to base upon them a claim to a place among important manufacturing countries of the world is to underrate the whole movement. It is only from business training and experience that any real progress can be expected.

5. The following is a brief survey of the principal recommendations which may be advanced :—

- (a) One has heard much of the State subsidy. To my mind this proposal, namely, of direct grants by Government, stands condemned in the light of the principle suggested at the end of the preceding paragraph. What the State is required to do is surely not to find capital itself but to encourage the conditions in which capital is attracted to manufacturing enterprise. This tendency would be checked in two principal ways if Government itself should step into the arena. In the first place although private capital might and probably would be attracted to concerns subsidised by the State it would not unnaturally regard as unsound enterprises not hall-marked by Government assistance of this kind. Secondly, and by way of corollary, the State will itself be undertaking the function which the public must gradually acquire by experience, namely, that of distinguishing enterprises *a priori* sound from those which are less sound. An essential factor in the development of business instinct must surely be an attitude of healthy criticism which can fully appreciate the promising aspects of a scheme without being blind to its defects. Government cannot subsidise all industries and, in selecting some for financial assistance, it takes upon itself a responsibility of choice which must be borne by capital, if capital is to come forward on thoughtful and intelligent considerations.
- (b) There are much the same objections, though not perhaps to quite the same extent, to the proposal that Government should guarantee interest on capital forthcoming to assist promising nascent industries. For the Government guarantee may tend to a premature—and possibly often erroneous—discrimination between the sheep and the goats of industrial enterprise. Here, however, we are directly faced with the precedent of the dyes schemes of England and Japan. I am not sure that the application of these precedents to India is altogether sound. The conditions in England were peculiar when “British Dyes Limited” was floated. The raw materials for dyes lay ready to hand and the products were essential to many English manufactures; moreover an early start was necessary to ensure continued employment to textile labourers during the war. In India, however, it would be a long and expensive business to organise the manufacture of chemical dyes on a effective, i.e., extensive scale. Moreover the prospects of a ready sale of the by-products are not assured. The Japanese are already regretting the experiment; please see attached extract* from the “Japan Weekly Chronicle,” dated 24th August 1916.
- (c) We now come to less direct forms of Government assistance which, while not involving direct monetary subsidies, assist by reducing the costs of production. There is little doubt that much could be done to stimulate ready and cheap supplies of private capital if the co-operative movement were extended to manufacturing industries. Although I have no personal experience of the co-operative movement I understand that in some provinces a beginning has already

been made in this direction. Difficulties with regard to railway transport, mineral, forests and excise concessions have already been noted. There is no doubt that both Government and the railways have already done much to minimise the costs of production and transport. Much still remains to be done, however, under both heads. To the impartial observer the difficulty appears to be one principally of attitude. If the attitude of the officer granting the concession is, not so much what is the utmost return I can secure for Government, as, what is the maximum which the concessionaire can pay and yet make a profit on the business—then much help could be given which is at present not forthcoming.

- (d) I now turn to two further suggestions, very commonly put forward for Government assistance, which are directed to the cheapening of technical direction and management. There is little doubt that India badly needs a research institute run on up-to-date scientific lines and capable of giving practical advice at a reasonable cost to business managers. The institute would have to be a large one and capable of sending experts to advise on technical difficulties locally experienced. It seems essential that the experts should form a service organised on much the same lines as the Geological Survey; that is to say, an Imperial Service whose members are ready to assist in solving provincial problems under the control of their Director. With this recommendation I would couple another almost as important, namely, the careful reorganisation of the system of State technical scholarships. The training at present given by means of these scholarships could not probably be improved upon. I think, however, that greater care might be taken with regard both to the selection of the candidates and to their employment when the training is over. I am in favour of a system under which, after selection by Government of particular industries requiring assistance of this kind, actual business concerns engaged in such industries are invited to nominate candidates for the scholarships offered. There would also be a guarantee from the employer that he would give further employment to the scholar on his return. Indeed the closer the relations between the employer and the scholar the better, guaranteed full educational qualifications in the latter. A system such as this would go far to increase the number of scholars anxious for the training for its own sake and willing to turn it to account; and therefore also, in time, the number of business managers in this country having an up-to-date technical knowledge of the concerns under their control. In this connection I venture to draw attention also to the non-existence in India of any real system of apprenticeship. As the Commission are doubtless aware it is dangerous for any employer to take in an apprentice unless he receives a guarantee that the apprentice will not, on the expiry of his apprenticeship, join a rival concern and give away the trade secrets he has learnt. Indian Courts, however, have held that such guarantees operate in restraint of trade and are therefore unenforceable. I understand, however, that evidence on this point has already been given to the Commission and it has doubtless been backed by more detailed knowledge than I can personally furnish.
- (e) Finally with regard to Government contracts and with special reference to the Stores Rules, I am not sure that we are not somewhat hampered in the country by the precedent of British industry and its practical independence of Government purchases. In India, the position is different. Many concerns are, as it is, enabled to struggle successfully with foreign competitors in the Indian markets by their reliance on Government contracts involving settled business at fixed rates. I think that Messrs. Tata and Sons were glad of a Government guarantee to take a certain quantity of steel rails annually; and paper mills also rely to some extent on Government orders. Even though the rate of profit may be low it affords a basis on which extensions of business can satisfactorily be made. One would be glad therefore to see indenting officers encouraged to arrange contracts for terms of years with manufacturers in this country, subject to guarantees of quality. With regard to the Stores Rules, there are two directions in which I would be glad to see existing rules improved. In the first place I think it would be an excellent thing if branches of the best British firms were encouraged to settle in this country and stores usually indented from home were imported through them. The result would be to raise the standard of manufacture in this country, to extend our knowledge of up-to-date European methods, and ultimately it is hoped to encourage manufacture in this country by branches originally established merely to attract orders to home manufacturers. I believe I am correct in saying that this proposal is at present under the consideration of Government. In the second place, I would draw attention to an article which appeared in the "Pioneer" of the 8th September 1913, copy* of which is attached. There is much in this article with which I do not agree, but I would strongly support any proposal such as that made at the end of the article that the Stores Rules should be rules for guidance only; that

the Stores Department of the India Office should merely offer facilities for purchase; and that purchasing officers in this country should have full direction to purchase either through the Stores Department or else direct, in the most convenient as well as the best markets available. I understand that this is very much the system adopted by the Self-Governing Colonies.

6. On the assumption that the Commission will be able to accept some at least of the practical recommendations put forward for the encouragement of Indian industries, I now turn to administrative aspects of the proposals outlined above. I wish, however, first of all to draw attention to what appears to be a very serious initial difficulty. Government Departments are naturally prone to simplify the work of the executive officers by laying down rules which will cover the majority of cases likely to come up for disposal under those rules in the ordinary course of administration. To my mind, however, it will be difficult, if not impossible, to deal with Indian industries on similar lines. Not only each industry but each separate concern engaged in that industry will require treatment on separate lines. An industrial survey would doubtless be able to analyse the organisation of individual concerns and the treatment to be accorded to each; but the danger is that the record of such a survey very quickly falls out of date and the officers appointed to pass orders on its recommendations would very often find it necessary to revise its conclusions on new data subsequently coming to light. What appears to be necessary, therefore, is not so much an initial survey, to be completed by a certain date and then submitted for orders, as a continuous survey in which the officers deciding each case would be in close and constant touch with developments as they arise in each industry and each concern scrutinised.

7. It is evidently impossible, even if a Director of Industries existed in each province, that this officer should find the time, in addition to his ordinary duties, to analyse the possibilities of individual concerns within his jurisdiction. He would be able to give the best advice possible on recommendations put to him but he would presumably not be in a position to deal finally with each. I think, therefore, it would be necessary to organise special machinery for this purpose which would be in close and direct touch with local Governments on the one hand and with individual industries and concerns on the other; and the best solution would appear to be the appointment of a Board on which the Director of Industries and business men would find a place. The functions of the Board would be to examine the very different conditions in which different manufacturing concerns at present work and the assistance which is needed by, and should be given to, each. This Board would be presided over by an officer who would also supervise agriculture and co-operation in the province. He would in fact carry out the functions suggested for the Development Commissioner in paragraphs 199 and 200 of the Report of the Committee on Co-operation in India. It will doubtless be accepted as an axiom that the wider the discretion given to the Board the better will be the results of its work. In fact it would probably be found desirable to allot to it lump grants for the spending of which it would be responsible to the local Government. The detailed powers of the Board are however matters which it is useless to discuss at this stage. The chief point which I would venture to emphasise is that the various forms of assistance which can be given by Government to individual concerns—by scientific advice, by reduction of royalties, excise fees, railway freights, etc.—are very numerous. It is essential to ensure a very careful scrutiny before deciding what form of assistance a concern needs and must receive if it is to develop on healthy lines, and whether the grant of such assistance is practical in each case. The Board might be empowered to summon the help of officers of the research institute, when required, and with the concurrence of the director of the institute. The Board would not merely assist existing concerns, but would also be in close touch with local capitalists and would draw attention to industrial openings, hitherto unoccupied, on which the experts' reports were favourable. The Development Commissioner should control agricultural development and co-operation, as well as industries, in the province. This would ensure co-ordination of effort between all three, a point on which the Bengal District Administration Committee laid stress in paragraph 224 of their report.

Answers to Questions.

Financial aid.

I have no direct experience of pioneer factories or of industrial co-operative societies. With regard to questions 5 and 13, please see opinions expressed above regarding direct financial aid by Government. To my mind the system of direct finance is dangerous; firstly because to be effective it would have to be given to selected concerns which could only become popular at the expense of their rivals; secondly, and as a consequence, because capital would tend to follow the lead given by Government and would shun other ventures. For these reasons I am of opinion that any form of direct subsidy should be avoided and that the assistance given should be general *e.g.*, by technical advice, instruction, etc.—which would be made available to all industrial concerns able to prove that they will turn this assistance to effective account.

Commercial museums.

The commercial museum at Calcutta at first attracted a large number of visitors chiefly on account of its novelty; the visitors belonged to all classes. Subsequently however the numbers declined and the museum is now chiefly frequented by business men both European and Indian. To my mind the chief functions of the museum and all exhibitions generally is to bring buyers and sellers together. I don't entirely agree with the writer of "Commerce and Companies" in the "Pioneer" of the 13th instant that Government should organise selling

agents or agencies. In doing so to any great extent it would have to undertake responsibility either for quality or payment and this responsibility could not be assumed without financial risk. The method adopted at the museum is to encourage enquirers to place trial orders on order books provided in the museum. About 330 orders have been placed already, mostly for small amounts, but in some cases for considerable sums. Subsequent correspondence is direct. Efforts are also made to bring the exhibits to the notice of foreign importers.

Q. 87.—I am arranging for the exhibition of samples of articles required by the principal Government Departments, the manufacture of which might be undertaken or improved in this patronage country.

I concur in the recommendation of the Committee on Co-operation in India that Development Commissioners should be appointed; but I think each should be assisted by a Board on which the Director of Industries (preferably a business man) and other business men should sit. Please see above.

Q. 88.—The reorganisation of the Commercial Intelligence Department is under consideration, involving considerable additions to staff. I correspond at present chiefly with Directors of Industries, Collectors of Customs and Scientific Departments in India; and with the Board of Trade (Commercial Intelligence Branch) in the United Kingdom, Trade Commissioners in the Colonies and British Consuls or their Commercial Attachés abroad. I am also dependent very largely on advice and assistance ungrudgingly given by Chambers of Commerce and business men in India. I would like however to be able to supplement these sources of information by reports from paid correspondents in centres from which I have at present difficulty in obtaining information. I understand that the proposed reorganisation includes provision for correspondents of this kind.

Q. 84.—The chief advantages of the *Indian Trade Journal* are two-fold: firstly, in introducing buyers and sellers by means of trade enquiries and secondly as a convenient record of Government orders, statistics, etc., and used as such largely by Government officers but also to some extent by business men. In future I would like to see some interest imparted to the journal by publishing weekly letters of trade openings for Indian industries in Indian markets as received from the paid correspondents already mentioned; and later on, if Indian Trade Commissioners are appointed abroad, by letters on openings for Indian trade in foreign countries.

Q. 87.—I would like to see the journal supplemented by occasional monographs or Other Government bulletins bringing together in convenient form all information regarding any particular Indian industry or trade. Taking paper for example, a bulletin would summarise the results of scientific enquiries into suitable materials available in India and where they are to be found. Correspondents would work up trade conditions in the local markets, the prices at which competition is experienced from foreign paper and the particular grades in local demand.

ORAL EVIDENCE, 18TH JANUARY 1917.

President.—Q. There is a little confusion as to the relative functions of the Director-General of Commercial Intelligence and the Director of Statistics. People imagine that the man who makes up statistics ought also to draw lessons from the statistics. I suppose that the present practice is for him to be the compiler of statistics and the Director-General of Commercial Intelligence makes use of those statistics in addition to other information?—A. That is so.

Q. Is it your opinion that the two departments should be separate as they now are or should they be organized into one?—A. Going back over the history of the Department I think it was too much for one man to be able to prepare the statistics and also to make the deductions. That was certainly the experience of Mr. Noël Paton. He was absolutely unable to supervise the preparation of statistics and also to answer commercial enquiries satisfactorily.

Q. Would not the natural solution be for him to be provided with a statistical staff?—A. He had a statistical staff.

Q. He could have an officer like the Director of Statistics or a Superintendent and there would be no necessity to make any separate department?—A. He had an assistant Director.

Q. Would that not be sufficient instead of having two separate departments?—A. Of course they do to a certain extent overlap each other. I get enquiries for statistics and figures and so does the Director of Statistics.

Q. I myself cannot see how a man can compile statistics intelligently without learning some lessons from his work and if therefore the compiler of statistics were a member of the Commercial Intelligence Department those lessons would be properly used by the department. They could also be used by public firms and for reference purposes in answering questions. Surely there seems to be no special reason for splitting them into two separate departments?—A. At present the relations are more or less unofficial. They are very close.

Q. They might, but in personal matters they might become so close as to generate a certain amount of friction?—A. That is very largely a question of the personality of both officers.

Q. The present want of official connection does not encourage efficiency. I should have thought rather on the contrary that it suggests a possibility of friction. Is it your opinion that the two departments ought to be amalgamated?—A. I think there would have to be some re-organization. I don't think they could be amalgamated as they stand at present.

Q. That, of course, is only a matter of organization. One will have to be the head of the office?—A. There is a great difference between the two departments, in staff for instance. At present I have a staff of 14 clerks. My office work is very much the smallest part of the work of the department.

Q. In the statistical department is the office work practically the whole thing?—A. It has a very large staff indeed.

Q. You are not only Director-General of Commercial Intelligence but apparently a Director-General of Industrial Intelligence also. Are they to any extent different in character?—A. Yes, they are; except to this extent, that Indian markets are so widely distributed and often so remote from the Indian sources of supply that information regarding trade openings in such markets is practically commercial intelligence.

Q. The commercial side at present is so dominating that you do not notice the industrial side so much. Obviously the industrial problems most largely become technical and scientific?—A. I think that when we reach that stage in an enquiry, the enquiry should be handed over to a Director of Industries at once. Any purely industrial enquiry received by me is transferred to the particular Director of Industries concerned. Trade openings are, however, a different matter, and when I am asked by a manufacturer in Madras whether there are any openings for his wares in the Punjab I reply to him direct.

Q. There would in any case be a certain intelligent interest in mercantile and commercial methods in an industrial department. Of course one can understand that there is a good deal about each which is special. Would you like to amalgamate both?—A. As regards questions of market openings certainly, but not as regards industrial processes.

Q. At present the industrial side is either not cared for or only partly cared for. The fostering of a new industry in itself is nothing more than fostering its technical and scientific foundation?—A. That is the work of the Director of Industries.

Q. That really is not properly cared for?—A. That is quite true.

Q. About the commercial museum in Calcutta do you think it has done a great deal of good?—A. I think it has done good. It has done so specially in the placing of orders. Of course if did not start for that purpose. It started more or less as a sort of museum—a museum in which exhibits would be placed which would show the visitor what was being done in different parts of India in the matter of industries; the fundamental idea being that anyone who wished to invest capital would be able to see here what was being done in other parts of India and follow the lead.

Q. It has been suggested that the supply to the museum in a compact form of all the products of the various industries of India helps the foreign competitor as much as it does the swadeshi manufacturer?—A. Yes. We don't now show in the museum any foreign manufactured articles, only Indian goods.

Q. It has also been suggested that manufacturers do not get their information in that way and that a much more efficient way of helping the industries in India would be to form sales agencies. Are you in favour of sales agencies being organised by Government?—A. I think that it would be a sound thing if such agencies were provincial. It would be too big a thing to start a sales agency for the whole of India in one centre.

Q. Do you think the commercial museum would be more useful if it were situated, say, in the Harrison Road or somewhere where it is more likely to be better used by the Indian population?—A. Yes. I think it would. I think at present it is not very well situated.

Q. *Mr. A Chatterton.*—I want to ask you about the sales agency. You have a considerable number of examples of swadeshi manufacture in the museum and in certain parts of the country there are depôts in existence which are at the present time confined to the sale of local manufactures and it has occurred to me that it might be advisable to extend the sphere of these depôts. There are depôts at Cawnpore, Bangalore and a larger one in Bombay. Would it be possible for this central museum to act as a sort of go-between between the Indian manufacturers and these local sales depôts? Would it not be possible for your central agency to bring to the notice of the local depôts any class of goods that manufacturers in other parts of the country are making and promote a spirit of exchange between them?—A. Yes. I think that could be done within a limited extent. I should like to see it done in two ways. Firstly by the interchange of catalogues directly between the sales depôts and secondly by reference to the catalogue of the commercial museum.

Q. I understand from you that there is a fair amount of business already being done through the commercial museum by getting a number of orders placed with particular firms who have sent exhibits. Have you any arrangement for keeping track of these commercial openings? Do you correspond with the people who exhibit in your museum and do you ascertain from them what business they have done subsequently?—A. Most of it is unsolicited. We get a number of letters from the firms saying that orders have been placed with them from visitors to the commercial museum.

Q. Have you compiled any statistics from that as regards the volume of business that is going on in this way?—A. It is not very big. I have got a list showing the attendance at the museum for December and part of January and the number of orders placed during that time.

Q. Those are initial orders that are so placed?—*A.* They are the only orders placed through me. The average attendance during December was 47 a day and during January it was 69.

Q. President.—When I was at the museum there was no such list?—*A.* I started it sometime ago and I took it up again in December.

Q. What were the orders placed?—*A.* 31 orders were placed during December, and January is rather a special month. There was a special order on the 9th of January for Rs. 2,170. There were altogether 34 orders in January. The average value of the orders is between 10 and 60 rupees or about 30 or 40 rupees a day. The total value of the orders placed during December is only about Rs. 200. It is typical of the ordinary daily work at the museum but as I say I got a special order in January for Rs. 2,000 odd and I have since got a still larger order for Rs. 3,000. An order of this amount is exceptional.

Q. Mr. C. E. Low.—You do not know anything of the orders placed direct with the manufacturer?—*A.* No.

Q. Mr. Chatterton.—Have you any reason to believe that there are such orders?—*A.* Yes.

Q. Are you in touch with the exhibitors and can you get from them a statement of the business that ultimately results? *A* man for example exhibits some knives and an order is placed for Rs. 5. If the knives are found satisfactory a subsequent order is placed for Rs. 500 direct. Have you got any knowledge of such transactions?—*A.* I know that such transactions are going on but I have not got the details.

Q. Would it be practicable for you to ask those who exhibit the goods in the museum to send you monthly returns of the business that they are able to do as the result of the exhibition of their goods in the museum?—*A.* I have made a note of that and we shall work up to it as soon as staff permits. In our future enquiries we will add a foot-note saying that if further business arises as a result of this introduction we should be glad to know it.

Q. You state in your note that it is well-known for example, that the most favourable conditions in which to extract vegetable oil in this country are still to be ascertained and that at present European temperatures are more favourable to the successful carrying on of the industry?—*A.* I am afraid I am not a scientist myself but I was going if I remember right on a report from which it was shown that the best results were obtained in England.

Q. Are there any difficulties connected with climate?—*A.* In obtaining the necessary consistency vegetable oils should not be too solid or too liquid.

Q. You say in your note that high prices abroad and high freights have encouraged the local manufacture of many articles which have been developed extensively since the war began. Do you make that statement with reference to the fact that the development of many of these industries is not of a permanent character? Are they the so-called mushroom industries or war industries?—*A.* I was thinking of galvanized iron works as a matter of fact. I could not call it a mushroom industry. It has developed very much lately on account of orders which had hitherto gone to England, but I don't think that they are making use of their bye-products.

Q. What do you mean by bye-products?—*A.* The chemical refuse obtained after the galvanising process is finished.

Q. Is it not a fact that in some cases these people have been given the necessary stimulus to develop; that in the majority of cases they will be able to hold their own even if prices return to the normal conditions?—*A.* I should think they will in the majority of cases but it is very hard to say.

Q. Is it a case in which having once got hold of the market they will be able to retain the market?—*A.* It is very difficult to say whether they will be able to undersell foreign competitors after the war.

Q. President.—Are the costs now lower than the prices in pre-war times?—*A.* I cannot say off-hand. I should not think they are lower. I should think they are higher.

Q. Dr. E. Hopkinson.—If a manufacturer at home wants to know whether he can obtain any particular product in India, is it proper for him to apply to you direct for the information? *A.*—Yes.

Q. And you will be able to afford the necessary information?—*A.* Yes.

Q. If he were asking for example about a particular timber you will be able to give him the information?—*A.* Yes.

Q. Would your answer go to him direct or through the India Office?—*A.* It will go to him direct.

Q. If, on the other hand, a manufacturer in India wanted to ascertain whether there are any markets at home for his production or any purchasers in India, you may be able to answer from your own knowledge or take the necessary steps to ascertain and give the information?—*A.* If an Indian producer wanted to know whether he had any chance of getting markets for his goods in England, I would write straight to the Board of Trade. That is to say, if I do not happen to have the information myself, I pass on the enquiry to the Commercial Intelligence Branch of the Board of Trade.

Q. And they would ascertain so far as possible and let you know?—*A.* Yes. That would be the case. A great number of the enquiries are enquiries for dealers in the United Kingdom.

I tabulate the lists which I receive and bring them up-to-date so that they can be used as often as the enquiries come up.

Q. Mr. A. Chatterton.—When you send the enquiry to the Commercial Intelligence Department, do they pass it on to the Imperial Institute?—*A.* I don't think so. The Board of Trade seems to get into touch with the manufacturers direct.

Q. Dr. E. Hopkinson.—Take a question of this kind. Supposing some flax is grown or some flax fibre is grown and one wants to know how to get a proper value for it, would you take up an investigation of that sort?—*A.* Yes.

Q. And you will deal direct with the Commercial Intelligence Department?—*A.* Yes.

Honble Sir Fazulbhoy Currimbhoy.—*Q.* You want a Board of Industries. Is the Director of Industries to be a local officer or should he be Imperial?—*A.* He should be an officer of the Local Government

Q. You say 'that the detailed powers of the Board are however matters which it is useless to discuss at this stage. The chief point which I would venture to emphasize is that the various forms of assistance which can be given by Government to individual concerns by scientific advice, by reduction of royalties, excise fees, railway freights, etc., are very numerous.' These are Imperial matters. How can the Local Board deal with them?—*A.* Railway freights are not an Imperial matter.

Q. What about the excise?—*A.* Excise is also a provincial matter.

Q. There are many other concerns in which one will have to deal with the Imperial Government?—*A.* If it were a concession which only the Imperial Government could give, the course would be the same. The Board would go up to the Local Government with their recommendation but instead of issuing orders itself the Local Government would, if it approved the recommendation, pass it on to the Imperial Government.

Q. Will that not delay matters? Take for instance the question of expert assistance. The Local Governments cannot give experts for all industries?—*A.* That is why I am suggesting a research institute with a Director of the Institute.

Q. You say that the Development Commissioner should control the Agricultural Department, and Co-operation as well as Industries in the province. Don't you think that agriculture is too big a thing and that the Director of Co-operative Societies has himself a lot to do?—*A.* The Commissioner would deal with it only as Chairman of the Board.

Hon'ble Pandit M. M. Mulariya.—*Q.* When did you join the service?—*A.* In 1905.

Q. How long have you held this appointment?—*A.* For a year.

Q. Did you have any special training in respect of your present appointment before you were appointed? Did you have any special training in connection with commerce before you took up this post?—*A.* My father was for many years in the Bank of Bengal, and that meant a commercial training in my home life.

Q. Apart from that capacity which you have inherited have you had any other qualifications for this office?—*A.* I have been Under Secretary to the Government of India and also to the Bengal Government—on both occasions in commercial departments.

Q. You speak here of the work which you have been doing. You have in the course of your tours visited factories and industrial concerns and you have tried to obtain information as to the difficulties which the manufacturers are contending against. Is that a part of your duty as Director-General of Commercial Intelligence?—*A.* That is incidental to my tours. For instance I get enquiries from the Army Department of the Government of India. They ask me whether I know of any supplies of tinned fruit for the use of the troops in Mesopotamia and I am anxious to see that as much as possible is done to meet the demand.

Q. Is it part of your duty to go out and see what difficulties particular trades are contending against and to try to solve those difficulties?—*A.* I took that up specially for the purpose of this Commission. The chief part of my duty is to answer commercial enquiries.

Q. Enquiries as to what raw products or manufactured products are available, enquiries relating to rates, freights and markets?—*A.* Enquiries from shippers as to where they can obtain particular commodities which they require.

Q. Is it also part of your duty to find out what difficulties industries are contending against and to endeavour to suggest solutions?—*A.* I should not think so. That is more particularly the duty of the Director of Industries. If I receive such enquiries I refer them to the particular Director of Industries.

Q. Do you travel in all parts of India to gather information and to find out what difficulties industries are contending against?—*A.* I cannot say that I travel particularly for that purpose.

Q. You take that up as part of your work?—*A.* Yes.

Q. How do you encourage industrialists in solving their difficulties? Do you correspond with any technical experts of Government?—*A.* Yes. I correspond for instance with Pusa, the Agricultural Adviser. I correspond also with the Tinctorial Expert at Madras, and with other scientific experts.

Q. Do you help these trades, by being the means of communication, between them and the experts to solve their difficulties?—*A.* No. I usually put the enquirer direct on to the

expert. For instance I got an enquiry the other day about pulp in Madras and I was able to refer the enquirer directly to the expert in Madras.

Q. Are many difficulties referred to you by correspondents apart from what you may gather in your tours?—A. Yes. They are mostly of the nature of asking for reductions in railway freight in which I cannot be of very much help.

Q. Except as Director-General of Commercial Intelligence have you given any particular study to the history of the growth of trade and commerce in other countries? Have you made any study of it?—A. That has always been a hobby with me.

Q. Have you studied the growth of commerce and industry in Japan and the United States?—A. Yes.

Q. You say here that India is primarily an agricultural country and that the natural bent of the people is agriculture. Do you know what the percentage of raw exports from Japan was 20 or 30 years ago and what it is now?—A. I should think it was then very big indeed.

Q. You have said that agriculture is the primary industry of India?—A. Yes. Even now 75 per cent. of her exports are represented by raw products.

Q. Would you say that Japan was also an agricultural country primarily?—A. Yes.

Q. You say that the natural bent of the people is agriculture and that to stimulate the development of Indian manufacturers is indeed from some points of view distinctly dangerous. I want to understand where the element of danger comes in stimulating the Indian manufactures, and for that reason I want to know whether you have really studied the conditions of Japan and India and compared them?—A. I should think that the state of the manufacturing industry in Japan is a distinctly dangerous model. Japan is just the country that affords an example of the dangers of over-rapid development.

Q. Where do you think the element of danger comes in?—A. You have had in Japan an unhealthy stimulus—an artificial stimulus. The result has been a very great deterioration of quality.

Q. Have you been to Japan?—A. No.

Q. You are speaking about deterioration of quality?—A. The Japanese Government have recently instituted a censorship of all exports from Japan just to make an attempt at keeping their quality up to standard.

Q. We have been told that the Japanese manufacturer makes a better class of goods for his own use and sends out the worse class of manufactured goods to other countries. Therefore you should not easily assume that all their manufactures are as bad as the samples that are seen here. As you have not been to Japan you cannot say whether their manufactures are really so nasty as they are represented to be. Can you?—A. I can only judge by samples.

Q. What have you to say about their ship-building industry and their munitions? Do you think they have not done well in that direction?—A. I don't think so to judge from the reports that one receives of the criticisms of Russia regarding the manufacture of munitions by the Japanese. That is after all the most independent view one can get.

Q. Do you know that they have built up a very great manufacturing industry during the last 30 years and that they have prospered very much. The national wealth has gone up. Is there anything in the conditions of India which you can mention which will stand in the way of similar progress being achieved in India?—A. I think one of the greatest obstacles is distance by railway.

Q. That may be a disadvantage. Is there anything which stands in the way of India developing into a great manufacturing country? You have got the raw materials and the labour and the market?—A. Everything depends on prices.

Q. Has not India a large home market of its own?—A. Yes, but there are the difficulties of distance and climate.

Q. You say climate is one of the difficulties. Don't you know that we already have many big manufacturing industries, for instance, sugar, indigo, railway construction and now munition making. All these are flourishing. Is there any reason that India should not develop further in all these directions?—A. No.

Q. Climate will not stand in the way of developing in these directions?—A. No.

Q. Of course in some cases climate may be an important consideration. Some things might be done better in colder climates, but for that reason you cannot say that the climate of India offers an obstacle to the development of Indian manufactures generally?—A. Of course there are only some cases where climatic conditions need be considered. I do not think climate has a bearing on all industries.

Q. You say that Indian labour has yet got to be educated. Labour has got to be educated in every country which wishes to develop manufactures. Don't you think that problem can be solved?—A. That can be solved in the course of a period of years.

Q. You say that "indigenous capital is already actively employed in agriculture and that business organisation which is essential for manufacture on a large scale is at present lacking with the result that capital does not easily come forward readily to support indigenous enterprises." Has that not also been the experience of other countries which have now developed into big manufacturing countries? Don't you think that also could be got over

by the spread of business education?—A. I quite agree with you there. My only point is that it must take a period of years. It must be a long time. It was thirty years in the case of Japan and Japan is only one-tenth of the size of India:

Q. Do you think that in 30 years you can bring India to the level of Japan?—A. I quite agree that you can do that in 30 years in the case of a country which is only one-tenth of India.

Q. But then India has ten times as great resources as Japan has and the vastness of the country is also an advantage?—A. I think it makes organisation all the more difficult.

Q. We have got the necessary raw materials, the labour and the markets. We have also a strong system of administration. The Japanese have not the advantage of the Indian Civil Service?—A. No.

Q. We are an ancient country with a great industrial past. If the Government in this country took steps similar to those the Japanese Government took, don't you think that it is possible to accomplish the industrial regeneration of the country?—A. It is possible.

Q. Then you agree that the difficulties that you have mentioned can be got over and that progress in manufacturing industry can be made both rapid and satisfactory?—A. Certainly satisfactory, but not too rapid. That is where the danger lies.

Q. The Government is not satisfied with the progress that has been made and it wants to make greater progress. This Commission has been appointed to advise how progress can be accelerated?—A. It is an index of what can be done in the future.

Q. The last difficulty that you mention is that of competition from overseas producing manufactures on a large scale and dumping their goods in this country? Have you any suggestions to make as to how to fight against this difficulty?—A. I suppose there is nothing that will prevent the foreign competitor from marketing his goods at a lower price here than he sells them for at home.

Q. Because of the subsidies?—A. Because of the protective tariffs and the subsidies. He can get a high rate of prices in his own country.

Q. Have you no remedy to suggest in order to give the indigenous manufacturers a chance?—A. I know of no remedy except that of tariffs.

President.—If you start an industry you will find that if you cannot start it on a scale that will attempt at introducing the very best economies then you cannot be on a par with the foreigner. If you have got a plant for instance which is designed to produce 100 tons a day you cannot produce 50 tons a day with regard to economy. If the local consumption is only 50 tons you have got to dispose of the rest of the 50 tons somehow, even below cost price. You cannot prevent dumping in that case.

Hon'ble P'andit M. M. Malaviya.—Q. You think then that the only remedy is tariffs, apart from what the President has been good enough to explain?—A. I would by no means prevent competition. What I say is that unfair competition should be prevented. I am in favour of healthy competition.

Q. Have you then any remedy to suggest to help the indigenous industry to establish itself?—A. The obvious remedy is to encourage the local manufacturers so as to enable them to compete.

Q. You say in your note that what the State is required to do is not to find the capital itself but to encourage the conditions in which capital is attracted to manufacturing enterprises. What is the way in which the State can help to attract capital. Do you think that Government should guarantee interest or dividends?—A. The remedies that I suggest are indicated in paragraphs (c) and (d).

Q. You are not in favour of Government guaranteeing interest on the capital invested?—A. No.

Q. Are there not precedents which show that the Government has helped industries by guaranteeing dividends, for instance, the railway industry? Don't you think that the same principle might be applied to some other industries?—A. I think that is a special case.

Q. You do not think that the same principle could be applied to some other select cases?—A. I do not think you would secure the object which you have in view.

Q. If Government decided to guarantee interest in any case will it not make a proper and full enquiry before it will give a guarantee? The question is whether you are opposed to the principle of it?—A. I am opposed to the principle.

Q. With regard to the Stores Rules, in your note you say "There are two directions in which I would be glad to see existing rules improved. In the first place, I think that it would be an excellent thing if branches of the best British firms were encouraged to settle in this country and stores usually indented from home were imported through them." You said a little while ago that you are not opposed to healthy competition. Would you shut out articles manufactured in other countries and give preference to articles manufactured in England, or would you let firms of other nations also compete?—A. I am in favour of free competition.

Q. Would you allow American and German firms also to compete?—A. There is at present no prohibition.

Q. I am speaking of the future?—A. From the industrial point of view I would allow all to compete. From the political point of view the answer will vary.

Q. Are not the two intermingled?—A. They are not quite independent?—A. I think they are different aspects of the same thing.

Q. You say that the purchasing officers in this country should have full discretion to purchase through the Stores Department or direct. You say that this is very much the system adopted by the self-governing Colonies. Have you studied their systems?—A. They buy through their agents or not as they choose. They do it in Australia and I believe the same is the case in Canada. I am talking only of the self-governing Dominions.

Q. Have you studied the system on the spot so as to be able to say what the local feeling is on the subject, whether it is regarded as a sound system?—A. I cannot say what the Australian opinion is about it.

Q. You are in favour of it because in the abstract it appears to you to be a good system?—A. It seems to me that the purchasing officers are men of experience and that their experience ought to be trusted in the matter.

Q. Do you think they possess the technical knowledge which they should have in order to decide whether an article should or should not be purchased?—A. They certainly have the knowledge.

Q. You do not apprehend bad dealing?—A. No.

Q. You say under "Financial aid" that you are of opinion that any form of direct subsidy should be avoided and that the assistance given should be general, by technical instruction, advice, etc. Would you also be in favour of Government extending banking facilities?—A. Banking facilities would be dealt with under the same head as the proposal that Government should guarantee interest. I would deal with both on the same principle.

Q. Are you in favour of Government extending banking facilities to trade? Do you think there is need for it?—A. I have not studied the subject.

WITNESS No. 190.

THE BENGAL CHAMBER OF COMMERCE, Calcutta.

*Bengal Chamber of
Commerce.*

* WRITTEN EVIDENCE.

Q. 1.—The Committee of the Chamber believe they are correct in saying that, when conditions were normal, the members of the Chamber experienced no difficulty in raising capital for industrial purposes, provided that the industry was sound, and the particular enterprise was being floated under well-established auspices.

Q. 2.—In Calcutta the sources from which capital is drawn for enterprises with which the members of the Chamber are connected are mainly two-fold:—

- (1) European sources in India; and
- (2) The United Kingdom.

In addition to these there are numerous enterprises, such as oil and flour mills, jute presses, soap works, etc., which are under Indian control, and the capital in which has been derived almost entirely from Indian sources.

Q. 4.—The Committee of the Chamber have no experience in this connection, except as regards light railways. In these cases ordinary joint-stock companies have been guaranteed interest on their capital for a certain fixed period.

Q. 5.—Dealing with the various alternatives in the order given the views of the Committee of the Chamber may be summarised as follows:—

- (1), (2) and (3). They would be on general grounds adverse to grants-in-aid, but if it should be considered to be advisable at any time to give such form of assistance, they are distinctly of opinion that it should be limited to the period of the experimental stage of the industry to be assisted. The plan of guaranteed dividends for a limited period has been successfully adopted in the case of light railways; and it might perhaps be extended to other projects of a similar nature.
- (4) Government loans might also be useful, the Committee think, while an industry is in the experimental stage, but they ought certainly to bear interest. For if they were granted without interest applications would be made on account of schemes having no prospect of maturing profitably, with the result that the loss would be borne not by the promoters but by the Government.
- (5) The Committee would be generally against the idea of the Government supplying machinery and plant on the hire-purchase system.
- (6) The Committee do not think that the Government should become a shareholder in a company. Its assistance should be, in their opinion, restricted to some form outside direct participation in the share capital.

(7) There would be no objection, the Committee think, to the Government guaranteeing to buy, for a limited period, the products of an entirely new industry. But there would be, they consider, the strongest possible objection to the purchase with public funds, of the products of any particular factory, if such factory were in competition with other concerns established and maintained by private enterprise.

Q. 6.—The control should be exercised by a Government auditor and a Government director. The latter should not take part in the actual management of the concern, but should be kept informed of its affairs, and should be able to advise the Board. The auditor should be not an officer of Government but an approved firm of Chartered Accountants.

Qs. 7 & 8.—The Committee of the Chamber have no experience of Government pioneer factories. They would, however, favour Government starting factories in a new industry or the understanding that as soon as the results indicate that there is a reasonable prospect of the industry being carried on satisfactorily the Government aid should be withdrawn. For example they think that a pioneer tanning factory might be established in Bengal; it should be worked on the most modern methods, and be managed by first class experts. Care should be taken when the pioneer factory is being established to ensure that it does not in any way overlap existing private enterprise. The Committee would be also distinctly opposed to converting successful pioneer State experiments into permanent State enterprises.

Q. 10.—The conditions prevailing in Calcutta are such that the banking facilities have always been found to be adequate. Any sound proposition that is put before the banks or financial houses is always sympathetically considered.

Qs. 11 & 12.—The Committee believe that co-operative societies would be most useful in the distribution of the following commodities, coal and coke, agricultural seeds, agricultural implements, and manures. It has been reported to them that one great difficulty in most of the industries in India is the proper organisation of adequate distributing facilities; and the few industries can afford to establish selling agencies all over the country for the one particular commodity produced. By the establishment of co-operative societies which would distribute many commodities this difficulty would be overcome. Co-operative societies might usefully take up for instance the retailing of coal to the populace in the United Provinces and other provinces, in which wood and dung fuel are now being used.

Q. 13.—The Committee would be opposed to Government competition in existing industries. Government should, in their opinion, give assistance in the way of expert advice etc., rather than compete with private enterprise in any existing industries. And in all cases due enquiry should be made before Government think of entering any particular industry.

Q. 14.—In the opinion of the Committee each case must be judged on its own merits.

Q. 15.—It is known to the Committee that the Geological Survey of India and the Government Research Institute at Pusa have given technical and scientific aid to industrial and agricultural enterprise. The scientific department of the Indian Tea Association, which is supported financially by the Government of India, also seems to them to be an example of how technical assistance may be given to industries.

Q. 17.—In the case of the scientific department of the Indian Tea Association the estates contribute towards the cost, and in like manner if there are other industries desirous of obtaining advice from Government scientific experts they should be required to pay fees.

Q. 18.—The results of the researches ought not to be published except with the approval of the owner of the private business, particularly if he has paid any fee in connection with them.

Q. 21.—The experience of the Chamber is limited to the assistance which has been given recently by the Imperial Institute in the matter of the hide trade. The Committee believe that the institute has been successful in directing the attention of British tanners to India hides. Such assistance, if it can be afforded in other industries, would appear to be advantageous to India.

Q. 22.—It would appear to the Committee to be advantageous to provide for such research for many scientific experts who would not be likely to visit India if it were available in the United Kingdom. Research regarding the extended use of Indian products, such as jute, hides, etc., would be probably more successfully undertaken in the United Kingdom than in India.

Q. 23.—The only suggestion which the Committee can make in this connection is that the results obtained in England and in India should be interchanged.

Q. 24.—In the opinion of the Committee such supplementary surveys are required, the information available surely cannot be complete. In point of fact in private enterprise surveys are constantly being undertaken in connection with developments in various fields.

Q. 28.—The Committee believe that a fully developed system of commercial museums would be of advantage. The promotion of such museums is, in their opinion, distinctly a step in the right direction. The museums in the presidency towns should be open to the public daily from 9 A.M. to 6 or 7 P.M. For with the openings confined to business hours it is a matter some difficulty for business men to take full advantage of the museums.

Q. 29.—They might be in the first place established in the presidency towns and principal industrial centres, and thereafter gradually extended to the smaller towns.

Q. 64.—Trade representatives are probably not necessary in Great Britain, but India should certainly be represented by trade representatives in foreign countries and also probably in the Colonies.

The trade representatives should be Government servants, of the same class as the Civil Service, attached to the British Consulates, and before being appointed to foreign countries they should be trained by being attached to the Commerce and Industry Department in India, and should be given every opportunity of studying the trade and industry of India.

It would probably be exceedingly difficult to get business men of sufficient experience and standing for this work, and it is important that they should be independent.

Their duties would be to watch the development of any industries in the foreign country, prejudicial, or of benefit, to Indian trade, to report on imports from or exports to other countries which could be imported from or exported to India, to assist merchants in the foreign countries to get into communication with merchants in India, to report on methods of encouraging or assisting agriculture, industry or commerce in the foreign country which might with advantage be applied to India, and generally to keep India so closely in touch with the agriculture, industry and commerce of the foreign country that India would be at once aware of any possible change in the current of trade and would be able to take advantage of the same.

Q. 35.—It appears to the Committee that it might be desirable in some cases to appoint temporary Commissions for special enquiries.

Q. 36.—It does not appear to the Committee to be necessary for such appointments to be made: the enterprise of traders should be sufficient to deal with internal conditions.

Q. 37.—The lists might be published in the *Indian Trade Journal*; and samples might be made available in the commercial museums.

Q. 39.—So far as the mofussil is concerned by the development of co-operative credit societies.

Q. 41.—Difficulties connected with titles at times constitute a serious check on industrial development. Instances have arisen in which good coal properties cannot be opened up, as exploiters are unwilling to take the responsibility attaching to titles which no solicitors will pass as sound.

Q. 46.—The Committee are without special knowledge or experience of this matter. They have however been permitted to examine the system which is in force on the Bengal-Nagpur Railway, and concerning which the Chief Mechanical Engineer of that line is submitting evidence to the Commission. This system appears to them to be valuable, and to be worthy of close consideration.

Qs. 56—67.—In reply to these questions the Committee desire to say that in their opinion a Director of Industries should be appointed for each province.

It would be, they fear, a difficult matter to establish Boards of Industries in each province as business men would not be able to spare the time necessary to serve upon them.

The Director of Industries should be an officer of the Local Government, and it would appear to be highly desirable that he should be a man with expert industrial and commercial knowledge and experience. The Committee fear however that the remuneration which a really able man with this experience would expect would be greater than could be offered. It seems to them therefore that the best arrangement would probably be for the appointment to be held ordinarily by an Indian Civil Servant. In order that too frequent transfers, and the selection of inexperienced men, might be as much as possible avoided some such arrangement as is in existence in respect of the Customs Service might be made.

For scientific and technical advice there might be established an organisation of experts subject to the control of the Imperial Government.

The services of these experts might be loaned to the Local Governments, and when deputed to a Local Government in this way the experts should be subject to the control of that Government.

There might also be experts in the service of the Local Government for work in connection with industries in which the particular province may be interested. These experts would be subject to the control of the provincial Director of Industries.

Q. 94.—The Committee are of opinion that the existing Indian law relating to trade marks and descriptions is satisfactory and sufficient. They have no suggestions to offer for its amendment. And they would be opposed to any legislation requiring trade marks to be registered.

Q. 96.—The Bengal Chamber of Commerce has for many years past strongly urged the introduction of a law requiring the registration of partnerships. But the Government of India, while viewing the proposal sympathetically, have been deterred from undertaking legislation by reason of the admittedly difficult legal questions with which it is surrounded.

Qs. 97—99. (a) In connection with these questions the Committee quote the following resolution which was unanimously adopted at a special general meeting of the Bengal Chamber of Commerce, held on the 3rd May 1912:—

“Whereas it is expedient and desirable, in view of the great administrative changes which are now being undertaken, and their probable effect on the development of

the trade and commerce of Bengal, that the question of the continued application to all Indian railways of uniform minima mileage rates should be reconsidered; resolved that the members of the Bengal Chamber of Commerce strongly endorse the protest that they made, against the continuance of this system, in their letter, dated 12th September 1906, to the Government of India, and that they re-affirm their conviction that the device of uniform minima mileage rates ignores the natural advantage attaching to any particular line of railway; that it imposes with undue and unnecessary severity upon the eastern ports, such as Calcutta, which are served by railways working at low cost, inasmuch as it forces these railways to charge needlessly high rates of freight; and that it consequently gives an unfair and unjustifiable preference to the western ports, which are served by railways working at high cost, but which enjoy lower rates of sea-freight to Europe."

(b) A most important and pressing railway extension in Bengal is that of the conversion to standard gauge of the existing metre gauge line from Santahar to Siliguri. This has been most strongly urged by the Committee as being an immediate necessity if the trade of Northern Bengal is to be properly developed.

(c) The provision of a bridge at Mokamch Ghat to connect the Bengal and North-Western Railway and the East Indian Railway is another urgent transport necessity. It is true that Mokamch is not in Bengal, but the bridge is intended to facilitate the interchange of traffic between the United Provinces and Firpoet and Calcutta. The Committee urged the proposal upon the attention of the Government of India in a letter, dated 8th April 1909; and they understand that the need for a bridge is admitted. It is not of course expected that the project can be financed during the war; but on the cessation of hostilities it ought certainly to be regarded as of urgent importance.

(d) Another recommendation which the Committee of the Chamber wish to make as regards transport facilities is that the management of the Oudh and Rohilkhand Railway should be transferred from the State to the East Indian Railway Company. The Oudh and Rohilkhand Railway consists largely of branches taking off from the East Indian main line; and it has junctions with that line at numerous points. To work economically and effectively, by a separate management, a line so situated is admittedly very difficult. And the financial results of the working of the Oudh and Rohilkhand Railway suggest that it could be more successfully and economically managed if it were merged in the East Indian system. The Committee of the Chamber represented this view to the Government of India in a letter, dated 27th June 1912. They showed that during the decennial period 1902-11 the State had sustained a net loss of Rs. 26 lakhs on the working of the Oudh and Rohilkhand Railway. They also quoted figures of the proportion of working expenses to earnings. This proportion had varied in the decennial period from 48.16 per cent. (1903), the lowest point, to 72.76 per cent. (1909), the highest point, as against 44.90 per cent. and 38.25 per cent. highest and lowest points on the East Indian Railway. For the year 1914-15 the percentage on the Oudh and Rohilkhand Railway was 56.71 and on the East Indian 38.16. These statistical results show that a strong case has been made out for the proposed transfer of the line.

ADDITIONAL WRITTEN EVIDENCE.

Copy of letter No. 879, dated 27th March 1917, from the Secretary, Bengal Chamber of Commerce.

I am directed to refer to your letter, No. 2546, dated 5th January 1917, and your demi-official, No. 2555, of the same date, in which you ask to be furnished with the views of the Chamber on questions 89 and 90.

2. You drew the attention of the Committee to the following remarks which were made by Mr. J. B. Lloyd of Messrs. Shaw, Wallace & Co., in the course of a written statement submitted by him to the Commission:—

"It would undoubtedly facilitate the business of shippers if Government certificates of quality and weights were enforced and had to be accepted by buyers. When claims are made at buyers' ports, the shippers have to pay on the c.i.f. price of the goods, which in certain cases is very considerably greater than local value. Also the shippers have to wait for some considerable time before they know if there is any claim on their shipments which, in some cases, may prevent them from entertaining further business in the meantime. Government certificates could probably, with advantage, be enforced for the commodities which are shipped in large quantities from Calcutta, such as jute, gunnies, rice, wheat, and linseed, but I doubt whether it would be possible for Government to arrange to grant certificates for the two latter commodities, unless some system of bulking the stuff could be arranged in Calcutta. It would be necessary for such certificates to be compulsory, or some shippers would continue to offer buyers on the old terms, and this would tend to cost shippers who might only be willing to do business on Government certificates."

3. The Committee of the Chamber placed the questions, together with Mr. Lloyd's remarks, before the members, and also before the various mercantile associations interested. In response to a request for opinions the Committee received a number of communications, the general purport of which is distinctly unfavourable to the proposal for the establishment of Government certificates of quality. Taking the staple commodities specifically referred to by Mr. Lloyd, I am to say that as regards jute, the Baled Jute Shippers Association has

definitely expressed the opinion that the proposal would be unworkable. The Jute Fabric Shippers Association has said that, so far as the export trade in jute manufactured goods is concerned, the idea is impracticable owing to the enormous number of inspections that would be required. These inspections would have to be made at the mills, where appliances are available for checking weights and measurements; and as the mills number more than forty it is obvious that a large staff of experts would be needed. The Association has also pointed out that no certificates granted in Calcutta would necessarily bind the buyer at the port of destination, and unless he could be so bound by it, which is very doubtful, the certificate would be of no value.

4. Wheat is exported from Calcutta in small quantities only; and the Calcutta Wheat and Seed Trade Association suggest therefore that Karachi—which is the principal port of exportation—should be consulted. As regards linseed, the Association is of opinion that no good would result from any scheme for Government certificates of quality and weight.

5. The rice trade is not represented in Calcutta by any organisation or association, but judging by the replies which have been received from members of the Chamber it would appear that shippers do not favour the proposal. Members interested in the hide export trade have also condemned it, on the ground that a Government certificate would mean nothing to the buyer unless Government standards were likewise established. The various shippers have at present their own standards, and obviously a Government certificate, testifying that a particular shipper's hides were up to his standard would be of no value. There would be also practical difficulties in the application of the scheme to the hide trade, as under present conditions each particular hide, or skin, as the case may be, is selected before baling.

6. The foregoing paragraphs summarise the opinions received and they show that, as regards the export trade generally, the idea is considered to be impracticable. The Committee agree with this view, as they think that the staple exports from Calcutta are not readily adaptable to any such scheme. There would be practical difficulties in the way of arranging for the issue of the certificates; distant buyers also would be naturally reluctant to relieve their sellers of any responsibility; and it is apprehended that the system might tend to promote speculation which both the Government and the trade are of course anxious to avoid.

In your letter you also refer to question 91. The fear was expressed by Mr. Lloyd that adulteration may in the future be practised in the trade in fertilisers. At the present time this trade is in an early stage of development, and there is not much scope for adulteration. But it has been pointed out by members of the Chamber, as well as by Mr. Lloyd, that at present there is no regulation in India to prevent a dealer from selling anything as a fertiliser. Nor are there any regulations fixing standards, or limits of error, in the analysis of fertilisers. In Great Britain the Fertilisers and Feeding Stuffs Act of 1906 compels the seller to certify his products, and to give a guarantee. The Act also empowers the Board of Agriculture to fix limits of error for both feeding-stuffs and fertilisers. It was suggested by Mr. Lloyd that an Act on similar lines might be introduced into India; and other members of the Chamber interested in fertilisers have supported the suggestion. The Committee think that the proposal is one which might be carefully examined by the Government, and that the question of legislating might be seriously considered. As regards the application of question 90 to fertilisers, it has been recommended that instead of appointing official analysts the Government should empower approved public analysts to make analyses under the Act at certain fixed charges.

Copy of letter No. 955, dated 10th April 1917, from the Secretary, Bengal Chamber of Commerce.

In continuation of my No. 879, dated 27th March 1917, I am now directed to hand you, for your information, the accompanying copy of a short report on the Philippine system of grading hemp. This report has been compiled by one of the largest shipping firms in Manila, and has been communicated to the Committee by a member of the Chamber.

Philippine system of grading hemp.

Grading of hemp under Government control came into force on 1st January 1915. There are 20 Government grades and the various baling establishments are permitted to register their own private marks for each grade but every bale has to be stamped before being exported with the Government grade as well as carrying the private mark. Baling establishments are visited daily by Government Inspectors; the time they spend at any one warehouse depending on the amount of work being done there. In this manner Inspectors keep some sort of general control over the classifying and grading done at each establishment; besides this before granting certificate of inspection and grading of any parcel inspectors draw at random 2-3 bales of most marks in a lot to be opened and examined. Bales found incorrectly graded have to be reclassified and repressed at the expense of the establishment. Inspectors have on occasions ordered whole parcels or all the bales of one grade in a parcel to be repressed on account of improper grading. Government can cancel the license of an establishment for consistent bad grading or false packing.

Hemp from points at which the trade not large enough to maintain Inspectors is brought either to Manila or Cebu to be examined and graded by Government Inspectors.

License for baling establishment costs P25 to P1,000 per annum according to the number of bales pressed and charge of 10 centavos per bale pressed is also payable as inspection fee.

Result of Government control has certainly been to produce more regular classification and hemp is sold to London now-a-days with no further guarantee as to quality than that given by the Government certificate. Exporters of hemp to America however have still to give their personal guarantee as to quality in order to do business and it is very doubtful if American buyers will ever get sufficient confidence in Government certificates to buy without other guarantee as to quality than the official certificate.

The London market takes mostly the coarsest and lowest grade of hemp which is undoubtedly the easiest quality to maintain uniformly classified. The American market requires medium to high grade and apparently require more precise information as to quality of fibre than is given by Government certificates.

The quality of fibre cleaned has not, in our opinion, been improved by the operation of the new law. As in the past grade of fibre cleaned by the natives is largely dependent on values. When the margin of difference in values of high, medium and coarse is small poor fibre is cleaned as it is more easily made and a larger quantity obtainable; as the value of coarse fibre declines or the value of fine advances and the difference between selling prices of high, medium and coarse gets larger, so does the quality of fibre produced improve.

In our opinion whilst the operation of the law enforcing Government inspection has not yet achieved all that was desired it has undoubtedly produced many good results at not a heavy cost.

NOTE.—The Bengal Chamber of Commerce did not give oral evidence.

WITNESS No. 191.

Hon. Mr. C. H. Bompas.

HON'BLE MR. C. H. BOMPAS, B.A., I.C.S., J. P., Bar-at-Law, Chairman of the Calcutta Improvement Trust, Calcutta.

WRITTEN EVIDENCE.

I venture to call the attention of the Members of the Industries Commission to a matter relating to the industrial development of the country, which I submit is deserving of their attention. When after the invention of the steam engine, the great industrial movement set in England there was a great influx of operatives to the towns. Owing to defective sanitation, and want of arrangements, for proper housing, these operatives lived under most deplorable conditions; and probably no class of the population, at any time in the history of England, was ever so steeped in disease, degradation and crime, as the operative classes in some of the manufacturing towns in England in the middle of the nineteenth century. Even at the present day when vast improvements have been effected, the physique of townspeople is unsatisfactory, and the town population would tend to die out, if it were not constantly receiving recruits from the country.

If there is to be large industrial development in India, it would be wise to take steps to avoid those concomitant evils, which experience shows to exist. Apart from humanitarian considerations it pays to have a healthy and contented labour force, and not only good housing but also those external advantages which town planning aims at securing are necessary to secure this.

I suggest that it ought to be made a condition of Government help or support being given to any industry, that provision should be made for accommodation for the labour force—whether by the employer or by local authorities of a thoroughly satisfactory type, and that in selecting the site of any new industrial undertaking, consideration should be given to its suitability for development, as a place of residence for the labour force.

NOTE.—Hon'ble Mr. C. H. Bompas did not give oral evidence.

WITNESS No. 192.

Mr. J. H. H. Rolfe.

MR. J. H. H. ROLFE, Messrs. Rolfe, Morris & Co., Mechanical, Civil, Mining and Consulting Engineers, Calcutta.

WRITTEN EVIDENCE.

The want of initial capital in a large number of cases has deterred the development of many industries which would have otherwise been valuable assets to the country.

In a large number of cases adequate capital has not been subscribed owing to distrust among the organisers and subscribers.

Where the European element has been supreme many industries have been developed successfully. I would draw special attention to the following:

- 1st. It is recognized that capital is available in India from Europeans and Indians if safe investments can be found.
- 2nd. Foreign Governments help their subjects to trade in India to the detriment of British subjects, and the Britisher is not supported by his Government even when it comes to choice of purchasing from Britisher or Foreigner.
- 3rd. To make an industry a success it is necessary that the demand should be as great as the supply and the production rate capable of competing with the imported article.
- 4th. Investors should be given some guarantee that they will receive the support of Government after the war when it comes to competition with foreigners.

I think it is a fairly well established fact that raw materials exist to such an extent in India that India could, in many cases, be independent of other countries for importation. Without doubt considerable scope exists for development and the absence of support and no facilities offered by Government, has been in many cases the deterrent feature. Manganese ore is a case in point. It was due to the failure of Russia to meet the Continental demand that India was in a position to develop its resources. In a few years manganese mines were opened out in India and with low steamer and railway freights it was found that Indian manganese could be shipped to Europe at a profit. Both Europeans and Indians were ready to invest their capital. When Russia was again able to export, prices fell and a large number of those who had invested money in their enterprise had to close down their mines and sustain a financial loss. Fifty per cent. of those left in were foreigners, who reaped the benefit and maintained their position by being assisted by their Government, and there is no doubt that the large quantity of manganese they were able to export under these conditions, has helped the German Government in particular, to strengthen its hands in the present war. These foreign firms by the profits they made by the assistance of their Government, were able to establish agencies in London and were able to compete with the Britisher in his own country and sold Indian manganese ore to the British Government and the British manufacturers.

Taking this as a specific case, it clearly demonstrates that India was willing to find and invest capital and if the British Government had been in a position to step in and assist those who had come forward with such capital, the loss to a large number of investors would have been minimised.

There are at present other minerals which India can produce but the investor is backward to lay out money on the chance of making a profit during the war to stop when the war ends.

To make this more clear we give a specific case.

We have now a project in view of preparing graphite for the local market. We have secured our supply of crude graphite and to make it marketable will necessitate our putting down plants at a cost of Rs. 30 to 40,000. As long as the war lasts we can continue the business and make a profit, but we are doubtful what the position will be after the war. The question is, are we to invest this money with the off-chance of having to close down after the war, owing to the home supply being put into India at lower rates.

This is difficult to procure in India and if it can be obtained, the fees are usually so heavy that it cannot be availed of. Want of expert advice.

Experts should be available for each industry and the fees regulated so that all can avail themselves of the opportunity.

My firm has already gone into this question with the Chamber of Commerce and at their suggestion, I have placed these views before the Industrial Commission. I can only again add, that if the mineral trade of India is to be developed, railway freight will play a most important part in its success. I attach some correspondence which my firm has had with the Bengal Chamber of Commerce on this subject.

What is absolutely necessary is a low and uniform rate for minerals over all railways in India.

I have directed my attention to the utilization of forest products for paper making and the production of fibre. My experience has not been very encouraging from any help given by the Provincial Governments. I quite understand the reluctance to give promissory concessions, but on the other hand no firm or syndicate can be expected to place a large capital in any industry dependent on local supplies unless some fixed areas are granted and the investing firm protected to some extent.

I am strongly in favour of industrial banks being established in each Presidency.

These banks should be limited and capital subscribed by the Government and public. The directors should be chosen from leading commercial men and Government appointed officials. Industrial banks.

The banks to have power to encourage approved industries and such industries requiring financial assistance and while such assistance is being given they should act as managing agents to the concern.

The bank should maintain its own staff of experts and their advice should be available at reasonable fees.

I am not in favour of direct Government assistance. This would lead to red-tapism and consequent delay in settling the point under enquiry, which no business can stand.

The industrial banks on the other hand, if worked on my suggestion, would act promptly and the directorate being partly commercial men would understand more readily which schemes are worth financing.

Also, having control as managing agents, the bank would have the opportunity of seeing that the scheme is being worked economically, of securing the best advice, and of finding a market for products.

These banks would in time control the sale of products in India and receive greater assistance in finding markets than the individual concern, and would soon become a power in the industrial world.

No. W.-398, dated the 26th May 1916.

To—The Secretary, Bengal Chamber of Commerce, 20, Strand Road, Calcutta.

FREIGHTS ON MINERALS.

The development of mineral industries in India has been active during the war, and although large supplies of the raw materials are obtainable in India the high railway freight charged on these minerals to carry them to sea-board is so excessive that business is debarred.

2. Certain minerals, such as coal and manganese, owing to large quantities carried, have been considered, and railways have fixed uniform rates that allow of large development.

3. Certain minerals have been neglected by the railways as far as freight towards the sea-board is concerned owing to such minerals being imported in the refined state from Europe before the war. One instance we quote is graphite.

The supply of graphite to India before the war was controlled by a London syndicate and the local graphite was a neglected commodity. Owing to imports being heavily reduced an impetus has been given to the local supply. The present price allows of business being done on a small scale. To prepare the graphite a certain outlay is necessary, say from Rs. 20,000 to 30,000.

The present railway freights to bring graphite from Ajmer to Howrah is Rs. 70-10-0 per ton, the distance being 1,026 miles. Whereas coal is carried from the Bengal coalfields to Bombay at Rs. 11-4-0 per ton, a distance of say 1,200 miles.

As soon as the war ends and steamer freights are reduced, graphite will again be imported and the local suppliers who have invested their Rs. 20,000 or Rs. 30,000 will have to close their works down. Yet this graphite has been shipped say from Ceylon to England, prepared there and sent out again to India.

If the railway companies would assist in establishing uniform rates towards the sea-board, there is no reason why money should not be safely invested in preparing graphite locally and competing with the home market.

We quote this one specific case to verify our argument.

4. If railways could introduce a uniform rate for minerals, for wagon load traffic, it would help the mineral trade in India considerably. We give a specific case to verify the utility of such a procedure.

If gypsum is carried from Khewra on the North-Western Railway to Porebunder, the following rates are quoted:—

	Rs.	A.	P.
Khewra to Delhi, North-Western Railway, 481 miles	0	4	7
Delhi to Wadhwan, Bombay Baroda and Central India Railway, 519 miles	0	7	8
Wadhwan to Dhosa, Bhavnagar State Railway, 81 miles	0	2	8
Dhosa to Porebunder, Great Indian Peninsula Railway, 143 miles	0	8	9
per maund	1	1	16

Here is an instance of each railway treating this commodity on a different scale, whereas if it is possible to get all railways to quote a uniform rate of say one-tenth of a pie per maund per mile, in wagon loads, it would be an easy matter for a merchant to calculate that it would cost Rs. 17 per ton for the distance of 1,114 miles.

We, therefore, suggest that you should move the Railway Board to induce all railways—

- (1) to classify all minerals for quoting a railway freight,
- (2) that the lowest possible freight should be quoted by all railways for minerals according to class,
- (3) that all railways should quote a uniform rate for freight on all classified minerals.

We consider the subject is of sufficient importance to facilitate the establishing of important local industries and would benefit those interested in a body rather than individually.

No. 1125—1916, dated Calcutta, the 17th June 1916.

From—The Secretary, Bengal Chamber of Commerce,

To—Messrs. ROLFE, MORRIS & Co., Calcutta.

RAILWAY RATES FOR MINERALS.

I am directed to acknowledge the receipt of your letter No. W.—398, dated 26th May 1916, with regard to the rates charged by Indian Railways for the carriage of minerals.

2. You refer specifically to graphite and gypsum; and you suggest also that the Chamber should move "the Railway Board to induce all railways—

- "(a) to classify all minerals for quoting a railway freight;
- "(b) that the lowest possible freight should be quoted by all railways for minerals according to class; and
- "(c) that all railways should quote an uniform rate for freight on all classified minerals."

3. The Committee of the Chamber have consulted the East Indian Railway authorities, with whom they understand you have also been in correspondence, on the subject of the rates for graphite and gypsum. To deal first with these two minerals it appears that the rate hitherto charged for graphite from Ajmer to Howrah is Rs. 2-9-10 per maund, namely, Bombay, Baroda and Central India Railway 10 annas 1 pie; and East Indian Railway Re. 1-15-9. The East Indian Railway have now expressed their willingness to reduce the rate over their section (*vid* Agra to Howrah) to 9 annas 3 pies; and this rate you have, the Committee believe, accepted. It is also the opinion of the General Traffic Manager of the East Indian Railway that the Bombay, Baroda and Central India Railway authorities will probably be disposed to make a corresponding reduction in the charge over their section.

4. You institute a comparison between the rate for graphite and the rate for coal. But as the value of a commodity is one of the various factors which determine railway rates there would naturally be a difference; for graphite is a much more valuable commodity than coal, and bearing in mind the difference in rate does not seem to the Committee to be unreasonable.

5. As regards gypsum the Committee gather that you have applied to the East Indian Railway for a special rate from Khewra, on the North-Western Railway, to Katni and Howrah; and that they have quoted, as their share from *vid* Delhi 0-5-3 to Katni, and 0-8-5 to Howrah. This works out to something like one-ninth of a pie per maund per mile; and it suggests that the railway is endeavouring to meet your requirements.

6. The Committee have carefully examined the general suggestions which you make, and which I have set out in paragraph 2 above. They are not, however, altogether clear as to your precise meaning. But they would point out, with reference to your first suggestion, that all minerals are already classified on the various railways. But if your meaning is that uniform schedule rates—*i.e.* rates calculated on a basis below the maximum—should be quoted for all minerals, they question if such a proposition would be accepted. It is the practice on all railways for the freight charges to vary with the value of the commodity, and the general conditions under which it is offered for carriage. The Committee doubt therefore if any useful purpose would be served by advancing this particular proposal.

7. Your other proposal for the quotation of uniform schedule rates on all railways is one which has been already under the consideration of the Railway Conference Association. The Committee understand, however, that the subject is one of difficulty, although the reform is admittedly desirable. It is in point of fact now engaging the attention of the Goods Classification Committee of the Conference at their meeting at Simla.

No. W.-472, dated the 19th June 1916.

From—Messrs. ROLFE, MORRIS & Co., Calcutta,

To—The Secretary, Bengal Chamber of Commerce, Calcutta.

YOUR No. 1125—1916, DATED 17TH INSTANT, RAILWAY RATES FOR MINERALS.

We have to thank you for your above letter and the interest you have taken in dealing with the subject.

2. Both the East Indian Railway and the Bombay, Baroda and Central India Railway have met us in the reduction of freight from Ajmer to Howrah, and we quote the letter we have received from the General Traffic Manager, Bombay, Baroda and Central India Railway.

Memorandum.—"With effect from the 15th June 1916, Graphite stone in wagon loads at owner's risk (subject to the charge on the marked carrying capacity of wagons used) from Ajmer to *via* Agra East Bank (for traffic to Howrah which includes Sealdah, Chitpore and *via* Ultadanga, Cossipore Road and Kidderpore Docks) will be charged Re. 0-8-8 per maund over this railway.

"The through rate from Ajmer to Howrah *via* Agra East Bank will be Re. 0-12-9 per maund thus :—

	Per maund.
	Rs. A. P.
Bombay, Baroda and Central India Railway	0 8 6 Special
East Indian Railway	0 9 8 "
	<u>0 12 9</u>

"loading and unloading to be done by owners."

It is gratifying to note that the rate has been reduced from Rs. 79-10-0 per ton to Rs. 21-8-8 per ton.

3. With reference to your paragraph 4, allowing that graphite is a much more valuable commodity than coal, yet there are other factors to be taken into consideration, for example, the cost of raising coal is about Rs. 1-12-0 per ton for which it can be loaded at the colliery, whereas we are informed by our suppliers that it costs Rs. 75 per ton to put the crude graphite at the railway station. We quote the following from his letter :—

"With regard to the cost of working this mineral, the seams are small and difficult to manipulate, the faults being frequent, and these require to be removed by blasting. A pair of miners with 3 women to remove the debris can only win from 5 to 7 seers of crude graphite per diem, so that a ton at the pit's mouth will cost us roughly Rs. 6-8-0. It has then to be broken up and cleaned, a tedious process, and I estimate, that with bagging, cartage, royalty and other Government and supervision charges, we shall not be able to land the graphite at the nearest railway station at an *actual* expenditure of anything less than Rs. 75 per ton."

The crude graphite has to go through a further process to make it marketable—a ton of crude graphite would probably produce about 8 cwt. of prepared graphite, so that in every 100 tons of crude graphite carried by the railway about 35 tons is put into the market.

Roughly speaking the cost price of prepared graphite is Rs. 293 per ton.

When considering the classification of freight these are points railways should take into consideration. It therefore is in our opinion not unreasonable to make a comparison in the rate for graphite and coal.

4. With reference to paragraph 6 of your letter, what we did mean about classifying minerals on a basis as we have quoted in our paragraph 3, is that the railway companies should not consider they are justified in charging an exorbitant higher rate for graphite because it is sold for Rs. 300 per ton, than they would for coal that is sold at Rs. 4 per ton.

This argument applies to other minerals besides graphite, we quote graphite as a specific case.

We shall be glad if your Committee will reconsider this point and take it up as they may think fit.

5. With reference to your paragraph 7, from a merchant's point of view the quotation of uniform schedule rates on all railways is one that would help trade considerably, and we cannot too strongly urge a reform on these lines. There may be difficulties due to some railways having to be worked more expensively than others, but we submit that such a system would allow merchandise to be booked by the shorter routes for export, a decided advantage to trade.

In going into the reduction of freights we have had considerable correspondence with the East Indian Railway and the Great Indian Peninsula Railway, and have been given every assistance by both these railways, but with other railways we have found great reluctance on their part to consider reductions.

No. 1251—1916, dated Calcutta, the 6th July 1916.

To—The Secretary, Chamber of Commerce, Calcutta.

RAILWAY RATES ON MINERALS.

In continuation of correspondence we have had with you on the subject of uniform rates over all railways for minerals, we gave you specific cases of graphite and gypsum. We have had some correspondence with various railways regarding a uniform reduced rate for China-clay.

We send you a copy of a letter addressed to the General Traffic Manager, East Indian Railway, and we also addressed the—

Madras and Southern Mahratta Railway,
Bengal Nagpur Railway, and
Great Indian Peninsula Railway, on the same subject.

2. In April 1916 the rates for China-clay from Bhagalpore were to—

	Rs.	A.	P.
Howrah per mannd	0	7	10
Cawnpore "	0	13	5
Lucknow "	0	14	0
Bombay "	2	0	8
Bawar "	1	9	5

The Bombay rate works out to 55-2-2 per ton.

It cost about Rs. 50 per ton to prepare China-clay without machinery and put it on rail at Bhagalpore.

The market rate for China-clay to-day in Bombay is Rs. 85 per ton for local produce and Rs. 95 for the imported.

The price of China-clay before the war was about £4 per ton.

3. Kaolin from which China-clay is prepared is plentiful in Bengal.

The cost of plant, etc., to prepare China-clay is about Rs. 25,000.

To put down this money and have to close down after the war, owing to the imported China-clay being delivered at much lower rates than what the local production can be sold at, requires forethought. Two factors have to be taken into consideration.

(1) Reduction in the price in manufacture.

(2) Reduction in transport charges.

The first can be effected and should be reduced by about 50 per cent. by the introduction of machinery, etc. Even then the high railway freight debars the local production competing with the imported.

4. We enclose a letter we have received from the East Indian Railway which in itself is most satisfactory and which shows their willingness to encourage such industries.

Much depends on the action of other railways and if you can take this matter up, further, we think it would benefit the China-clay industry considerably.

No. 1584—1916, dated Calcutta, the 12th August 1916.

From—The Secretary, Bengal Chamber of Commerce, Calcutta,
To—Messrs. ROLFE, MORRIS & Co., Calcutta.

RAILWAY RATES ON MINERALS.

I am directed to acknowledge the receipt of your letter No. W.—651, dated 31st July 1916, with reference to railway rates on China-clay.

2. In reply I am to say that the Committee of the Chamber have considered the points which you raise, and they observe that the reductions made by the East Indian Railway in the rates for China-clay are satisfactory. They think that the other railways will also be willing to meet you in the matter as the East Indian Railway has done. But it occurs to them that the question of manufacturing China-clay might be brought to the notice of the Indian Industrial Commission, and they suggest that you make a representation to the Secretary of the Commission, defining any proposals which you may wish to put forward for establishing the industry. The address of the Secretary is R. D. Bell, Esqr., I.C.S., Secretary, Indian Industrial Commission, Camp.

No. W.-781, dated 6th September 1916.

From—Messrs. ROLFE, MORRIS & Co., Calcutta,

To—B. D. BELL, Esq., I.C.S., Secretary, Indian Industrial Commission, Camp.

MINERAL INDUSTRY IN INDIA.

At the suggestion of Committee of the Bengal Chamber of Commerce, we have much pleasure in forwarding copies of correspondence we have had with the Chamber.

From the correspondence you will glean that our contention that the rates charged for freight for minerals is not conducive to encourage mineral industry in India. We have given specific cases in which we have pointed out that excessive railway freights debar money being invested in furthering the industry.

We consider if all railways would introduce a reasonable uniform rate for minerals as is done for coal it would help to develop the Indian mineral industry.

Demi-official No. 498, dated the 22nd September 1916.

From—R. D. BELL, Esq., I.C.S., Secretary, Indian Industrial Commission,

To—Messrs. ROLFE, MORRIS & Co., 3-1, Mangoe Lane, Calcutta.

I am directed to acknowledge receipt of your letter, reference No. W.—781, dated the 6th September 1916, and to say that the question of railway freights is one that will receive consideration by the Indian Industrial Commission.

NOTE.—Mr. Rolfe did not give oral evidence.

WITNESS No. 193.

Mr. H. W. Newby.

Mr. H. W. Newby, *Tea Cess Commissioner for India, Calcutta.*

WRITTEN EVIDENCE.

Q. 38.—I suggest that the Government departments should buy tea in accordance with the suggestion embodied in the letter* from the Indian Tea Cess Committee, No. 43-T.C., of the 20th June 1916, to the Quartermaster-General in India. In view, however, of the alterations already made by the Director of Supply and Transport, which partly meet the case the Committee may think it inadvisable to again raise the question.

Qs. 91 & 92.—I suggest that—

Whosoever shall keep a room or rooms where tea is blended and packed shall declare the same to the Health Officer or incur a heavy penalty, and

Whosoever shall colour tea after it has once left the original factory shall incur a heavy penalty, and

Whosoever shall blend with tea any substance other than tea (such foreign substances to include parts of the tea plant which do not pass the standard for the necessary composition of tea) shall incur a heavy penalty. (The necessary composition of tea should be that given in Allen's Commercial Organic Analysis, Volume VI), and

Whosoever shall sell any tea waste without fully satisfying himself that the purchaser himself, or his firm, will use the tea waste for chemical purposes only, shall incur a heavy penalty.

NOTE.—Mr. Newby did not give oral evidence.

WITNESS No. 194.

Hon. Mr. B.
Chakravarti.

HON'BLE MR. B. CHAKRAVARTI, *Bar-at-Law, Calcutta.*

WRITTEN EVIDENCE.

The reports on the industrial survey of Bengal by Messrs. Collin, Cumming and Samman contain the history of the present condition of the very few industries which now exist in Bengal. I can hardly add anything new to the points discussed by them. I am however making a few suggestions and observations of a more or less general nature, specially with reference to Bengal.

New materials.

Of these, coal and iron have been the foundation of all industrial progress in the West. We had both of these in abundance in old Bengal. Valuable stores of mineral wealth in Behar, Chota Nagpur and Orissa, have been assigned ever since the last redistribution of territories, to the sister province. It has become more difficult for Bengal capitalists to get

* Not printed.

prospecting leases from the Behar Government, unless the managing agency is given to a European firm. Perhaps, the Commission might see its way to recommend that the two Governments should have a Joint Board to control mineral and mining industries with its head office at Calcutta. Such a Board can deal with all matters relating to the development of mineral resources of the country.

If we take away coal and iron, Bengal, as at present bounded would be only an agricultural province. Industrial progress here must mainly depend on raw materials supplied by agricultural and allied occupations. In order to increase the quality and quantity of such raw materials we must resort to improved agricultural methods. The Agriculture Department of the Government has done a great deal and recently there has been renewed activity. But the department loses in its usefulness as it is not equipped with a single laboratory dealing with agricultural chemistry, nor is it in a position to make experiments in scientific agricultural methods on modern lines. Perhaps Cirencester used to be nearer the Bengal cultivator than Pusa and Sabour are at present. The agricultural methods should therefore be brought nearer home. The department should be strengthened by the addition of qualified commercial experts and agricultural and technological chemists, to advise it as to the quality and nature of the raw materials required for industrial operations. The Department of Agriculture and the Department of Industry must, in Bengal at any rate, work hand in hand.

With a little organisation of labour and capital, the volume of industry that can be built up in Bengal with the raw materials now available is simply enormous. I venture to think that industrial progress will solve not only the question of economical distress but of political unrest to a considerable extent. I will illustrate what I mean by a few examples.

(1) *Tobacco*.—The finest variety of leaf can be grown in North Bengal, specially in the Rangpur and Cooch Behar Districts. Here it is to be noted that a few experts in curing are locally available. With some capital and the introduction of modern scientific methods for growing, rearing and manufacturing tobacco there is no reason why Bengal should not be able to be one of the largest exporters of cigars and cigarettes.

(2) *Silk*.—The story about His Excellency Lord Carmichael's silk handkerchief made in Berhampore is well known and would show that this home-industry can hold its own if well organized. But the art of sericulture must be kept on a high level. I may be permitted here to mention that the silk manufacture on a factory scale which was carried on only in one place, at Mr. Ariff's factory at Ultadinghi near Calcutta, is capable of expansion. But this single factory has recently had to practically close down owing to the difficulty about aniline dyes. In this matter we are at present helpless. The result is that the Calcutta market is being flooded with cheap Japanese flimsy silk. This problem requires immediate solution.

(3) *Paper manufacture*.—Apart from cotton rags and other cotton waste, straw and various kinds of suitable grass and other raw materials for paper making are available and can be largely grown. The Bally and Titaghur paper does not seem to have the necessary strength to bear the strain of the rotary press. But this defect can surely be got over by scientific experiments in suitable mixing.

(4) *Pen, pencil and match manufacture*.—There seem to be several competent young men trained in Japan who know the technical side of these industries. But the chief difficulties in these industries seem to be (1) want of commercial training and (2) want of suitable wood in proper quantities.

The wood problem has been noticed by the writers of the Reports mentioned above. But there does not seem to be any reason why the suitable wood cannot be produced in abundance by the rich plains of Lower Bengal or the hilly tracts of the Eastern and Western Bengal. Forests of suitable plants could be grown. Local Boards could easily add to their income if they went in for forestation of a portion of their lands. This could be done under the supervision of competent forest officials who have some knowledge of these industries. This source of supply of the necessary wood may take time to develop, perhaps a generation. In the meantime, the Forest Department might yet be coaxed into activity as suggested by Mr. Samman, and the railways might be induced to give favourable rates to carry these woods from the Himalayas.

(5) *Timber trade*.—I may by the way add here that the timber trade can also be a very profitable industry. There is no reason why with a little organisation Bengal should not produce its own timber and undertake its own wood manufacture, instead of importing wood from Burma and Australia and its skilled carpenters from China.

(6) *Spirit distilling* specially of denaturalised spirit, for industrial and domestic purposes. This is another industry which depends largely on agricultural improvements. We grow plenty of potatoes, corn and fruits for this industry.

(7) *Jute industry*.—Bengal has the world's monopoly of jute. There is no reason why she should export practically the whole of her produce in raw materials and not manufacture the same into hessian, and gunny and canvas. Just as Lancashire controls the textile market of the world, Bengal could, if properly organised, do the same regarding jute. This would require plenty of capital which could be induced to flow into the industry, as explained later on. This would also require considerable scientific experiments in growing longer fibres, and in more convenient methods of bleaching, retting, and extracting the fibre. If we began manufacture on any large scale, Dundee might feel hurt, and Hamburg might be angry. I may discount Hamburg but there seems to be room for all in this large industry.

Rope and net making.—A small sister industry, that of rope and net making, might also be profitably undertaken under proper conditions.

(8) *Cotton industry.*—Some say that this industry is not suited to Bengal. But she was famous for her muslins and she still weaves practically all the finer *dhotis* and *saries* used by the higher and middle class people. But the whole of this industry is a home-industry. The weaver's chief difficulty now is to get the finer counts of yarn. Though he has not as yet taken kindly to the fly shuttle, this only shows the necessity of organising the industry and making full use of demonstration stations. As regards the difficulty about the finer counts of yarn, this can probably be met by encouraging yarn manufacture as a home-industry. Millions of agriculturists in Bengal work only for about three months in the year in the fields. If organised, they can easily turn their hands to home spinning.

The experiences of the Banga Luxmi Cotton Mills notwithstanding adverse circumstance^s also show that with proper management there is a great future for the cotton industry even on a factory scale.

But here again, scientific agriculture must come in. The British Cotton Growing Association, with its large Government subsidy, has not as yet made any serious attempt to grow cotton in Bengal. The rich red clay of East Bengal can yet produce the long staple cotton with which she manufactured and to some extent still manufactures the yarn for the Dacca muslin.

(9) *Wool.*—As long as Tibet sends her wool to the Kalimpong market for sale, Bengal ought to be well provided with all the raw materials she requires. For the finer and softer variety, we may have to depend on outside markets. But the chief difficulty in the woollen industry has been a technical one, *vis.*, proper bleaching. These could be easily got over by scientific experiments on a commercial scale at the central chemical laboratories. We import millions of half-woollen German "wrappers" and socks. There is no reason why we should not supply the whole of this want ourselves, instead of being satisfied with producing a few coarse blankets only.

(10) *Sugar industry.*—A good deal of attention has lately been given to this industry, especially in the Upper Provinces. It seems to be difficult to compete with Java. But if Java has to be met, it must be met with Java methods. They produce their sugar on a most extensive scale under the supervision of highly trained scientific agricultural experts who are continually making experiments in order to improve the yield of the cane.

The date palm should also be given a thorough chance. There are millions of trees in Bengal alone, and thousands of expert tappers are available. Necessary agricultural experiments should be made to find out how to grow date palm to yield the maximum quantity of juice and palms suitable for sugar manufacture and the best methods of manufacturing date sugar.

(11) *Leather.*—We are one of the largest exporters of raw hide, a very large portion of which we import back after it has been at all events dressed and tanned if not manufactured. This is one of the industries with a brilliant future. Here again technological chemistry would be able to give the greatest assistance to this industry. There are now several young men who have been trained in this industry in Japan, England and America. But they lack commercial experience without which technical skill avails nothing. We ought to be able to retain all the raw materials now exported and manufacture leather goods for our own use and for export.

In connection with this, attention should also be given to cattle breeding on a scientific basis. The bullock cart will for generations yet remain the chief means of goods transport over country roads. The cart and the plough will require the best breed of bulls. The cows can yield sufficient milk which may be made the foundation of yet another industry, namely, butter and cheese making.

Not only is it necessary to improve the breed of cattle, but something must be done to stop the immense waste of cattle food and manure which is going on now on account of the wholesale export of oil seeds.

(12) *Oils and tallow trade, soaps and candles.*—We produce enough quantity of oil seeds which we are content merely to export. We can vastly improve the quality and yield with a little scientific attention. There is no reason why seed crushing should not be undertaken on a large scale. This will leave in the country large quantities of very valuable manure and cattle food. The soap, candle, and tallow industries have all the raw materials here. It only requires sound management to make these trades flourish.

(13) *Small industries.*—Home industries will always form a large part of the industrial activities of Bengal. It will therefore be necessary to organise these. How to supply the raw material to the home workers, to collect the finished articles, to teach the workers the best and most profitable of work—these would be the problems of the future. I have made some suggestions later on under the heading of organisation.

Small industries like hand-loom weaving, yarn spinning, knitting, fish curing (for tinning purposes), basket making, toy making, etc., can be profitably undertaken as a secondary occupation by millions of cultivators who sit idle for about 9 months in the year. Small capitalists from the middle classes, male and female, would be glad to go back to their villages if they could earn a livelihood by taking up such small industries as hosiery, brush

and button manufacture, bone and fancy articles, shell and *sankha* goods, toy making, lac-work, embroidery and lace work, small garment making (e.g., silk and muslin handkerchiefs), tinsmith work, small iron and metal industries (e.g., locks, nails, screws, hinges, cutlery), wood carving, and manufacture of baskets, such and other articles of furniture.

In this matter, the Government could afford great assistance to the small workers by supplying machinery and plant on the hire purchase system. The small capital required for these industries would be forthcoming either from the co-operative credit societies, or from the workers themselves. We know that if a cashier's post with cash security is advertised hundreds of applications flow in and the candidates are willing to pay down cash. There is no reason why small capitalists should not be forthcoming if these industries are properly organised.

(14) *Electric and water power.*—Besides having plenty of coal we can perhaps develop the power industry and utilise the enormous water-power available in Bengal. The Mourbhanj and the Darjeeling hydro-electric schemes, if properly organised, could supply enormous quantity of power necessary for various industries. The Bengal delta with its hundreds of outlets into the sea, through which a strong tide travels up and down for about 70 miles from the sea, twice every day, should, if properly harnessed produce an unlimited quantity of power. But these schemes would require big minds to work them out and such minds would probably be able to get together the large capital required.

Under present circumstances, it is absolutely necessary that the State should organise capital and labour. Indigenous capital is shy and will not flow in. It is a case of once bit, twice shy. Several recent failures in swadeshi enterprises have created an impression that the Bengali is unable to carry on and manage any profitable industry. Dishonest swindlers have often exploited the swadeshi enthusiasm, and commercial dreamers have tried to carry on industries relying on men with some technical but no commercial training. They have built hopes of a dividend to be paid for by consumers who were expected to buy "even at a sacrifice." This enthusiasm is good for the purpose of the building up of a new market, but cannot be the permanent basis of a business. Not being carried on on business lines, many have failed, and in their fall have frightened away Indian capital. As to labour also, the educated middle classes do not take kindly to any industry or business. But there is no doubt that a change has, of recent years, taken place. The educated young man no longer hankers to the same extent after a clerkship as he used to do. Dignity of labour is being more and more recognised. This is the right moment for the State to step in and with the help of eminent captains of industry and commercial magnates, to organise this educated class for the progress of industry in Bengal. Instead of curbing the enthusiasm for higher education, the State should make the fullest use of those who come out of the University intellectually fully equipped. Instead of refusing a grant for the laboratories and workshops of an institution like the University College of Science in Calcutta, the State should also provide, to the utmost of its power, for central commercial laboratories, commercial museums, laboratories for agricultural and technological chemistry, where the best minds can do good work. Instead of allowing thousands of graduates to shift for themselves and get discontented with their life when they cannot find work, the State should try and utilise them and find an outlet for their energies by organising as it were a vast commercial service.

There are, for instance, over 2,500 (two thousand five hundred) graduates who are to-day reading law in Calcutta alone. Some of them are Masters of Arts and not a few are Masters of Science. Bengal does not need such an enormous supply of lawyers. And yet it is difficult to see what these young men are to do. The remedy does not lie in insisting on a "low percentage of passes", nor in curbing by artificial means the enthusiasm for higher education. It seems obvious that if some scheme could be organised by which the energy of these young men could be diverted into a proper and prosperous industrial channel, much of the present day problems in Bengal will be solved thereby. There is no reason why a graduate should go in for a three year's course of law studies with its uncertain future, if he was reasonably certain of a more or less prosperous career in the commercial line.

If, then, these young men could be utilised and trained by commercial and industrial experts, brought out, if necessary from Europe, a class of trained supervisors of superior grade and skilled managers of industries would in time be produced. For instance, some of the more brilliant of them could take to research work in technological and agricultural chemistry. Others could be utilised in making known and popularising the valuable commercial intelligence collected by the Government departments. The home industries could be organised through them. They could be used for supervising such work as travelling agents, or as distributors of raw materials and collectors of finished work, and they could be usefully employed as sale agents on a large scale. Graduates in economics, for instance, could be used as lecturers, and writers of popular articles relating to industries, some could be used for demonstration work and lantern lectures. And there would be a large number, who would go in for actual manual industrial training, if only there was a decent prospect before them. They would of course refuse to work for all time as an apprentice and day labourer, with no prospects of being a foreman mechanic, or a manager of works.

These schemes would require that the Government should for sometime at any rate be a large industrial owner. This can be done either by the Government being substantial shareholders in demonstration factories, or by guaranteeing a dividend, in exchange for fully paid up shares. The Government would thereby be entitled to nominate its experts and perhaps its

monograph writers, as directors of such companies. The managing director should, for the present, be a European expert in the industry but must be wholly unconnected with any of the local competing firms. The result to be aimed at should be two-fold. *Firstly* to divert the educated young men into the commercial and industrial line and in time enable them to undertake and carry on businesses unaided by the State. *Secondly*, to create a new confidence in our business capacity then the capital would naturally flow in. The guardians of these young apprentices would probably take considerable amount of shares in such companies, once confidence is established. When such a company proves successful and pays regularly a good dividend, the Government would then be justified in selling off at the market value the shares belonging to it. If properly organised, I do not see why the State should not even make a profit out of a scheme like this, specially when we know that the Government itself is a large consumer.

Ineducated labour.

The question of the building up of an artisan population would be largely solved if educated labour can be organised and utilised on some such lines as indicated above. When the educated class takes to industry, an artisan class is bound to arise. It would then be much easier to solve the problem of the industrial education of the masses, because the teachers would come from the educated industrial classes. In large manufacturing centres, near towns for instance, where the factory system would naturally prevail, other problems besides industrial problems would arise. For instance, the proper housing of the artisans would have to be looked after. Otherwise the home-loving villager would not be induced to come and live near a factory even for higher wages. Recreations and amusements would have to be provided on an organised scale. Many of our skilled artisans have no broader outlook on life than working hard for six days and then not turning up for work next week till the wages which he had earned have disappeared in toddy shops and public houses. In time, there must be provisions made for workmen's evening classes, for elementary instruction (by demonstration and otherwise) upon economic, historical and other subjects. Libraries and reading rooms suitable for them, experimental farms, and demonstration stations, etc., would all have to be provided—all with the one purpose of making labour more efficient, more self-reliant and more dignified.

Capital.

Lastly, capital now lying idle must be drawn out. This can only be done, as indicated above, if confidence is once created in industrial ventures. This again can easily be done if the State takes a substantial interest in establishing industries, as I have stated above. If there is some guarantee, and if possible a State guarantee, for efficient supervision, and if at the same time people feel that a body of young men would be carefully trained up by commercial expert-managers and in time would be able to hold their own, I have no doubt that capital would flow in and industrial progress in Bengal would be assured.

NOTE.—Witness did not give oral evidence.

WITNESS No. 195.

Mr. J. K. Sircar.

MR. J. K. SIRCAR, Sukchar, 24-Parganas.

WRITTEN EVIDENCE.

It is a recognized fact that India possesses a vast resource in her vegetable fibres. There are among others, three distinct fibre-yielding plants of considerable commercial value. I have been engaged for a number of years in making experiments in this direction, the results of which I now beg to lay before you in the hope that it will contribute to the development of this industry.

1.—*Agaves*.

The Aloe plants especially *Agave Americana*, *Vivipara* and *Fourcroya Gigantea*, grow wildy throughout India. Experiments made with these plants go to show that *Agave Vivipara* and *Fourcroya* are the best varieties that could be chosen for planting. The fibre of the former is as good as sisal hemp. The price of these fibres vary from £20 to £30 per ton. An expenditure of £12 more or less is incurred in making a ton of fibre ready for export. The fibres can be sold here as well for making twines, ropes and matting. Lately they are being used to a certain extent in making brushes.

2.—*Sansevieria*.

Sansevieria Zeylanica grows wild in some parts of Bengal and Southern India. It yields a very valuable fibre commercially known as bow-string hemp. As far as my information goes no attempt on a commercial basis has yet been made to utilise this fibre. The fibre, though short in length, is silky white and very strong. A local market can easily be created for the purpose of making canvas, etc. This will command a fair price in London as well.

3.—*Plantains*.

It is cultivated in almost all the provinces chiefly for its fruit, but no systematic attempt has yet been made to utilise its fibre, which is of great commercial value. There is no efficient machine, to extract it on a commercial scale.

The samples sent by me to several firms of fibre importers in London, were reported upon favourably. The price quoted was £24 to £27 per ton. They wanted to close with me for 9 to 10 tons per shipment.

Messrs. Moll Schutte & Co., of Clive Buildings, Calcutta, pronounced my samples to possess certain merits and they asked me to supply them with 300 maunds of fibre of different qualities for the present. This fibre can also be used locally for a variety of purposes.

People of small means cannot take to this profitable business for want of cheap machines. I have after many experiments succeeded in making simple and at the same time cheap machines for the purpose of extracting leaf as well as stem-fibres.

To embark on this business the planter has to serve no apprenticeship, for technicalities appear conspicuous by their absence. Beyond confidence and a small capital required to make a beginning one need have no other qualifications. All that is required is support from the Government in the shape of long lease of lands on favourable terms and financial aid when and were necessary through co-operative banks. Our Rajahs and zamindars can give an impetus to this fibre industry by granting lands free for a certain number of years and a small capital to deserving men.

NOTE.—*Witness did not give oral evidence.*

WITNESS No. 196.

THE INDIAN ENGINEERING ASSOCIATION, Calcutta.

WRITTEN EVIDENCE.

Indian
Engineering
Association.

Introductory.

The object of the Indian Engineering Association in compiling the following note is to draw attention to the difficulties with which the engineering industry in India has had, and still has, to contend with in its efforts to secure a fair share of Government orders. The great majority of these orders are placed out of India, to the detriment not only of an important manufacturing industry but, the Association contends, of the country generally. The withdrawal of funds from the country that could be profitably employed in it must, the Association consider, result in an ultimate loss to the country's prosperity, and it is desirable that this point should be kept in view.

In the following pages a brief resumé of the question is given, together with the Association's suggestions for remedying the present unsatisfactory position.

The official correspondence* on the subject, and extracts* from the Association's proceedings, in connection with it, are appended to the note, for reference.

Note on the position of the engineering industry in India.

The engineering trade in India has been developed from small beginnings until, at the present time, the capital invested in it amounts to about four millions sterling, approximately. The trade has achieved this position in the face of the strong prejudice against locally made articles, and discouragement of many kinds; consequently the concerns which have survived feel themselves fully capable of holding their own on equal terms with any competitors, British or Foreign.

In the year 1905 the Association memorialised the Government of India regarding the stringent restrictions then existing against the local purchase of material or plant. This led to a consideration of the question by Government and to the appointment, in February 1906, of a Committee to enquire into the procedure prescribed for the purchase of stores for the use of Government departments in India. The Committee visited the important manufacturing centres, obtained the views of the representatives of the various firms, and presented their report to the Government in July 1906. The Government of India in due course submitted proposals to the Secretary of State and, in July 1909, published a resolution reviewing the whole subject, and describing the alterations which it had been decided to make in the rules. The revised rules, from the point of view of the Association, still left much to be desired. The Government of India intimated, however, that the rules had been the subject of the lengthy correspondence with the Secretary of State for India, and they were unable to refer them to any public body for consideration previous to issue.

The next step taken by Government was to establish an inspecting staff for the purpose of testing and passing supplies purchased in India. The Association had advocated this and suggested that the staff of the Superintendent should be highly qualified in their particular branches, such as bridge work and railway waggons. This matter is further dealt with towards the end of this note.

The working of the stores rules continued to form the subject of correspondence with the Government of India, and of interviews with the Member in Charge of the Department.

* Not printed.

of Commerce and Industry. This resulted in amended rules being published with a resolution of the Government of India, dated 12th September 1912. In one respect the Association has failed to bring about an alteration which appears to them to be most essential. This is in connection with rule No. 8, which reads as follows:—

RULE 8.—Forecast of requirements.

"All requirements should be fulfilled locally in accordance with the provisions of the Resolution No. 4941-4988-102, dated the 14th July 1909, provided that quality and price are not unfavourable and provided that such purchase does not violate any of the instructions contained in these rules. In cases, however, in which stores have to be obtained through the India Office, every effort should be made to foresee requirements so that the indents may be despatched in ample time. Persistent failure of any officer to make such efforts should be brought to notice by the Local Government or other authority, which may at its discretion, cancel or reduce the powers of sanction entrusted to the officer at fault."

The objection to this rule, from the Association point of view, is that the last sentence might be regarded as an *incentive* to prepare home indents. While there was this incentive to the preparing of home indents, there was no corresponding incentive as regards local indents.

A further step taken by the Government of India was to publish, for the information of the Association, a half-yearly list of indents sent to the Secretary of State, the idea being that members of the Association would thereby be placed in a position to submit quotations to the departments concerned, for similar articles of their own manufacture, or imported articles which they might be able to supply. The drawback here, of course, is that the indents have already gone forward, and quotations from local firms are by that time of little more than academical interest to the officer or department concerned. The Association submits that the remedy for this is that all indents, before despatch to the India Office, should be submitted to the local Government concerned, or to the Department of Commerce and Industry of the Government of India to be dealt with by a special officer whose duty it would be to recommend which of the indents could be satisfactorily placed in the country.

The Indian engineering industry is at present passing through a very critical stage. Modern equipment, skilled labour and experienced supervision are ready at hand, but there is not sufficient work to keep the shops going, and large numbers of workmen have had to be disbanded. The Association submits that the time has arrived for a careful consideration of the position. Side by side with the scarcity of working the country there is the object lesson of the half-yearly lists of indents sent to the India Office. The list for the half-year January-June 1914, total 290 printed pages of foolscap size and the list for the half-year July-December 1914, consisted of 215 pages. Both lists show that a considerable amount of work could have been given out in the country had there been a department charged with the special duty of scrutinising the indents before they were sent home. Attention is here invited to the Association's letter* to the Government of India, No. 11-I. E., dated 3rd February 1915, bringing to their notice the unsatisfactory state of the engineering trade. In it the Association states:—

"During the past few months there has been a very considerable falling off in orders. As existing contracts have been completed there has been little or no new work to take their place, and the necessary consequence has been a reduction in establishments. This being the case as regards the works with which the individual members of the Committee are connected, the question arose as to whether works in other parts of India were similarly affected. The Committee accordingly issued a circular to all members of the Association, asking how far their works were affected, or were likely to be affected, as regards reductions of establishment owing to decrease of orders. The replies received in response to this enquiry show that the slackness of trade is wide-spread. A summary of the replies is appended hereto for the information of Government. In the case of one establishment alone, it will be seen that the reductions which have been made, and those in prospect, mean a loss in wages of over Rs. 76,000 per month. The Committee feel that comment on these figures is superfluous; their significance as an indication of the distress entailed on the workers through the loss of this large sum monthly, in wages, is plain and unmistakable.

In these circumstances the Committee consider it to be their duty to approach Government, with a view to enlist their sympathy and assistance in the critical position in which the industry is at present placed. The Committee respectfully urge that expenditure under the forthcoming budget, on such requirements in connection with railways and public works as can be produced in this country should be curtailed as little as possible, in order to keep the works going and to provide against unemployment, as far as possible. And the Committee would further ask that stringent orders be issued by Government in order to ensure that all such work shall be confined to India. The Committee feel that without this the sanctioning of expenditure will be of little avail in helping to tide over the present trouble. They cannot too strongly urge upon Government the need for insisting upon this point, as upon it depends the question as to whether such expenditure as is sanctioned is to provide employment for the workers in this country, or is to go to home manufacturers, as has been so largely the case for years past. Rule No. 8 of the revised rules, for the purchase of stores for the public services, has so far not fulfilled the expectations to which it gave rise. It is the view of the members of the Association generally, that it has had no appreciable effect on local indents. In the opinion of the Committee, the most scathing indictment against the working of the stores rules in general, as of rule 8 in particular, is furnished by the latest published list of Home Indents, *viz.*, that for the six months, January--June 1914, a volume which extends to 290 pages and in which instances of orders sent home which could have been executed in India are very numerous. The stores rules as they now stand leave little to be desired; it is the apparent want of recognition, by the departments and officials concerned, of the spirit of the rules and of the purpose of the Government of India in framing them, *viz.*, the encouragement of local industry, of which the Association has so greatly to complain. If the rules were interpreted in *practice*, in the spirit in which they have been framed, the present position of the industry would have been, the Committee venture to think, very different."

The Association feel that it is unnecessary to deal further with the defects of the system in this note, and they will now state what they consider to be necessary in order to bring about an improvement, and secure to the industry a fair share of Government work. The Association's recommendations are as follows :—

- (a) That there should be attached to each Local Government or to the Department of Commerce and Industry of the Government of India, a special officer whose duty it should be to examine indents and to recommend which orders should be placed in India. It would be necessary, of course, that such officer should visit the various works in order to satisfy himself as to their capabilities.
- (b) That certificate granted by the Superintendent of Local Manufactures should be accepted in the case of delay due to causes beyond the contractor's control on the same being explained to the satisfaction of the Superintendent.
- (c) That the concluding sentence of Rule No. 8, of the stores rules, to which attention has been drawn in this note should be deleted. The Association believes that the wording of this part of the rule is responsible for a large amount of work being sent out of the country.
- (d) That indenting officers should be encouraged to visit local engineering works. Such visits would be useful from more than one point of view—they would not only be instructive to the officers, as regards the capabilities of the works, but they would also bring about personal acquaintance on both sides which could not fail to be useful in connection with references regarding the execution or progress of work.

NOTE.—The Indian Engineering Association did not give oral evidence.

WITNESS No. 197.

SIR DANIEL M. HAMILTON.

*Sir D. M.
Hamilton.*

WRITTEN EVIDENCE.

The Commission were good enough to ask me for any remarks I might like to make in connection with the industrial development of India. In the first place I should like to say I am unable to find the time to sit down and answer in detail the numerous questions set out in the printed papers you sent me. My remarks must, therefore, be only of a general nature.

The first essential in the starting of any industry is money. Therefore, in my opinion, the first thing the Industrial Commission have to do is to find the money, or rather to show where the money is to be found, to set industry agoing. If the people of India have no money, and are deep in debt, it is difficult to see where the money for industrial development is to come from. When the people are out of debt, and have the command of money, industry will hum, for they will then have the money to put into industry, and to buy its products.

It may, of course, be possible to collect enough capital for particular industries, or even to double industries already existing, but to develop industrial life generally, among three hundred millions of people, is a big job requiring practically unlimited capital. You might, for example, find money enough to increase the cotton industry sufficiently to capture the whole of the Manchester cotton trade, but its capture would mean the employment of only another half million or so of people, and what are these among so many? You might set up Tata's iron works agoing, but these would provide employment for only another 120,000.

In my opinion the only sound way to develop Indian industries, on a scale proportionate to the population, is to develop the credit of the people and the Government. Credit is purchasing power, and if you increase the purchasing power of 300 millions of people by even £1 per annum you will have a demand springing up for all kinds of manufactures, both Indian and European. Why, for example, is there no woollen industry to speak of in India? Is it because the people prefer to shiver in cotton these cold days and nights, or is it because they have not the money to buy wool? On my property in the Sunderbans I see the neighbouring Mahajan walking around wearing a nice woollen shawl and patent leather shoes. He belongs to the cultivating class, the difference between him and them being that he has the money to buy warm clothing and they have not. Increase their purchasing power by improving their credit, and they too will buy warm shawls and patent leather shoes, and you will have woollen mills and leather and shoes factories springing up all over the country. In my address to the students of the Scotch Churches College the other day, of which I enclose a copy,* I instanced, from my own observation, how the sugar and handloom industries of the Deccan were being starved for want of money. People who have no money can buy nothing nor start anything new. When the money problem is solved the rest will follow.

How then is the money problem to be solved? It is idle as well as unnecessary to look to London for money, for if India could not get enough money from London in the palmy days when it was plentiful and cheap, she is not likely to get it when the war is over. India must develop her own money power. Credit, which is becoming more and more the money power of the world, is neither gold nor silver but a spiritual quality represented in its material.

* Not printed.

aspect by paper money in its various forms. It follows, therefore, that the salvation of India lies in the development of her credit and her paper currency along sound lines. Unfortunately, India is so far behind the rest of the civilised world in monetary development, that she cannot yet dispense with a considerable metallic backing for her paper money, but this need cause no anxiety, for there is a steady stream of gold flowing into India in payment of the balance of trade, and all that Government need do is to catch and divert the current into the Government Treasuries, there to support the paper issues. Council bills form the trap or bait for catching the gold fish, and the bait (or rate) should not be made too "high" if the Government want to catch the fish.

The additional paper issues would be made for value received or for value to be created; and it is here that the co-operative credit movement can be made a powerful auxiliary in the development of the paper currency. Government might, for example, entrust the co-operative societies with the management of its takavi loans, issuing the loans to the societies in the form of paper money. The money would be spent in solid assets, such as well construction, and would be repaid by instalments as arranged. India is thirsting for water, and if water can be brought to a thirsty land by a papermache channel it is folly to construct channels of silver or of gold, especially when these cannot be got. The value is not in the channel whether it be gold or silver or paper, but in the well which the money constructs and the crops which result from the well. And if the well can be made from paper it is folly to waste silver and gold.

In the same way Government can go on with the construction of its own irrigation projects by paying for these with paper currency. Every rupee so issued would be represented by so much canal constructed. Issue and construction would balance each other, so that there could be no inflation of the currency.

As the co-operative movement grows, the capital available for industrial development will grow. The people's surplus, which now falls to the Mahajan, will fall to the people and become deposits in the co-operative banks. Working for themselves instead of for others, the people will work with greater heart, and their crops and deposits will grow in proportion. When each family in India has at its credit the modest sum of £10, there will be £500,000,000 available for industrial development; but the money cannot accumulate while the Mahajan is India's banker. The capital available for industry will grow only as the co-operative credit movement grows. Therefore, it is the duty of Government to provide more men for the development and organisation of the people's credit by the only method which has proved equal to the task, viz., the co-operative method. As the co-operative movement and the paper currency develop, the coinage of silver will automatically cease. This may not suit the London silver brokers or the Bombay silver gamblers, but it will save India six or seven millions of gold every year to still further back her paper currency and help on the industrial development of the country.

That the people have more confidence in the co-operative banks than in any other is clearly shown in Sir Edward Maclagan's co-operative report, paragraph 210. And as the confidence of the people is, according to the Maclagan report, based on the Government's connection with the movement, there is here a clear call from the people for Government to associate itself definitely with the banking requirements of the country. I would further refer you to paragraphs 212 to 220 of the Maclagan Commissions' report where it is clearly hinted that an Apex State Bank may be advisable in order to provide the fluid resources required by the people for the proper financing of their industry. The framework of such an apex bank already exists in the presidency banks which might easily be made the medium or channel through which the fluid resources referred to, in the form of paper currency, would flow out to the people as required. Being issued only on the joint security of the people and under Government audit, the money would be certain to return. If the people have confidence in the paper, it is folly to keep the land derelict waiting for silver and gold. "*A Bank*," says Dunning Macleod, the standard authority on banking, "*is not an institution for borrowing and lending money. It is a manufactory of credit*," and it rests with Government to manufacture and issue in the form of paper currency whatever additional credit may be necessary to use up, in productive industry, the entire labour supply of India. The smaller the note the less silver will be required.

The gold standard reserve of £29,000,000 ought now to be made a base for a great addition to the paper currency. The war has shown it to be no longer required to keep exchange from falling below 1-4d. In the case of an adverse trade balance Government can pay the debt by paper in the form of three or six months bills on the basis of 1-4d for demand, and redeem the bills by the gold received when the trade balance turns and runs the other way as it does in nine years out of ten. The Home Government is paying for its American munition purchases, running into hundreds of millions sterling, with paper—the paper to be redeemed at leisure. India's small adverse balance comes round not oftener than once in ten years, and amounts to no more than ten millions sterling. Yet to meet this small bill no less than £29,000,000 of the money for which India is starving, is locked up in London. India gets the interest on a portion of this money, but she loses the principal. If the £29,000,000 were invested in irrigation, she would get the canals and wells and crops besides. Now she gets only the interest, while the London financiers get the principal. The Government of India should have charge of India's money. Control by the Secretary of State means control by London financiers who naturally study their own interests first and India's afterwards. In

this big gold reserve lies a powerful backing for India's paper currency and for the development of Indian industry.

One is loth to suggest revolutionary changes while the war is on, but if India is to go ahead in industry or anything else there must be revolutionary changes in the finances of both the Government and the people at the earliest possible moment. There is something extraordinarily far wrong with the finances of India when she cannot raise a few millions for public works which would remain a boon and a blessing to the country for all time, while Great Britain, with only a seventh of the population, can raise two thousand millions a year to blow away in shells. Even Australia, with only four or five millions of people, is at the present moment raising a war loan of £18,000,000 in addition to several others, while India with 320,000,000 of people can find practically nothing either for war or for peace. Some drastic changes are badly wanted, and I hope the Industrial Commission will not overlook the all important question of finance and its bearing on industrial development.

NOTE.—*Sir D. M. Hamilton did not give oral evidence.*

WITNESS No. 198.

HON'BLE MR. L. E. COBDEN RAMSAY, C.I.E., I.C.S., *Political Agent, Orissa Feudatory States, Hon. Mr. L. E. Cobden Ramsay, Sambalpur.*

The written evidence of this witness is confidential. He did not give oral evidence.

WITNESS No. 199.

MR. J. A. CRAVEN, *Dewan of Gangpur.*

Mr. J. A. Craven,

The written evidence of this witness is confidential. He did not give oral evidence.
